One of the major objectives of Business Education is the development of entrepreneurial skills that enable graduates to secure employment, become self-employed, and contribute to national economic development. Entrepreneurial skills are the practical, cognitive, managerial, technological, and interpersonal competencies that enable individuals to identify opportunities, create innovative business ideas, mobilize resources, manage enterprises, and respond effectively to changing economic conditions. Shaibu and Ebenezer-Nwokeji (2024) described entrepreneurial skills as the practical abilities and competencies required to establish, manage, and sustain business ventures successfully. They emphasized that entrepreneurial skill acquisition equips individuals with the capacity to create value, generate employment, and contribute to sustainable national development. These competencies include creativity, innovation, opportunity recognition, critical thinking, digital marketing, financial literacy, leadership, communication, decision-making, negotiation, business planning, collaboration, and risk management. Ariwodo and Emeasoba (2023) reported that practical entrepreneurial skill acquisition is fundamental to preparing Business Education students for decent work in the digital era. They emphasized that practical, competency-based training enhances students' employability and equips them with the entrepreneurial competencies required for self-employment and sustainable career development. Likewise, Enang (2023) explained that entrepreneurial skills required of Business Education students in the digital era include communication, creativity, innovation, problem-solving, decision-making, digital literacy, teamwork, and technological skills necessary for successful business operations. The growing digitalization of business activities has further expanded the entrepreneurial competencies expected of graduates, making Artificial Intelligence an important instructional resource for developing these competencies among Business Education students. Among these competencies, creativity skills and digital literacy skills have become increasingly important in the era of Artificial Intelligence because they enable graduates to function effectively in technology-driven business environments. Business Education programmes are expected to adopt instructional approaches that deliberately promote the acquisition of these competencies through innovative curriculum implementation.

Creativity skills refer to the ability to generate original ideas, identify business opportunities, think innovatively, and develop practical solutions to business challenges. These skills enable individuals to transform ideas into products, services, or business ventures capable of creating economic value. According to Dada, Adegbuyi, and Ogbari (2023)**,** creativity is one of the entrepreneurial attributes that significantly contributes to opportunity identification, business planning, venture creation, and entrepreneurial success among students. They recommended that tertiary institutions should deliberately develop creativity through entrepreneurship education to enhance graduates' employability and business start-up potential. Since Artificial Intelligence provides access to intelligent learning platforms, simulations, and generative technologies that stimulate idea generation and collaborative problem-solving, an AI-driven innovative curriculum is expected to facilitate the acquisition of creativity skills among Business Education students.

In addition to creativity, digital literacy skills have become indispensable entrepreneurial competencies for graduates in the digital economy. Digital literacy refers to the ability to access, evaluate, create, communicate, and utilize information effectively through digital technologies for learning, business operations, and decision-making. Awoniyi and Owolabi (2025) asserted that digital literacy has become an essential employability and entrepreneurial competency because it equips graduates with the knowledge and skills required to utilize digital technologies, online business platforms, and emerging technologies for entrepreneurial development and sustainable career success. The integration of Artificial Intelligence into Business Education curriculum implementation is expected to strengthen students' digital literacy skills by providing opportunities for technology-supported learning, intelligent assessment, virtual business simulations, and authentic digital learning experiences.

Business Education students require entrepreneurial competencies to function effectively in an increasingly digital business environment characterized by automation, intelligent decision-making systems, e-commerce, data analytics, and virtual business operations. AI technologies expose students to authentic business simulations, intelligent business planning tools, automated financial analysis, digital marketing applications, and virtual entrepreneurial environments that enhance experiential

learning. Onuotu, Nwaokokorom, Benstowe and Akiebie (2025) identified AI competencies as essential skills required of Business Education students for effective job performance and sustainable career development in the new era. This finding indicates that the acquisition of entrepreneurial competencies through AI-supported learning largely depends on the quality of curriculum implementation within tertiary institutions where Business Education programmes are offered.

Tertiary institutions are institutions of higher learning established to provide advanced education, research, innovation, and community service for national development. In Nigeria, tertiary institutions include universities, colleges of education, polytechnics, and other specialized institutions approved by the relevant regulatory agencies. The National Universities Commission (2023) stated that universities are established to provide undergraduate and postgraduate education, conduct research, promote innovation, and contribute to national development through teaching, research, and community service. Similarly, colleges of education are responsible for preparing professionally competent teachers equipped with pedagogical, vocational, technological, and entrepreneurial competencies for national educational development. In Anambra State, Business Education programmes are offered in both universities and colleges of education, making these institutions appropriate settings for examining the implementation of AI-driven innovative curricula. These institutions are therefore expected to provide enabling learning environments through curriculum innovation and technology integration that will facilitate entrepreneurial skills acquisition among Business Education students.

Despite these expectations, evidence indicates that the integration of Artificial Intelligence into Business Education curriculum implementation remains inadequate in many Nigerian tertiary institutions because of poor technological infrastructure, inadequate lecturer training, high cost of AI facilities, resistance to technological change, and insufficient institutional support. Studies by Ikpeama, Ekoh-Nweke, Paul-Mgbeafulike and Nwaokokorom (2025) revealed that although Business Education lecturers are aware of Artificial Intelligence, its integration into curriculum implementation is still low due to inadequate technological infrastructure, insufficient training, high cost of AI facilities, and limited institutional support. Consequently, many Business Education graduates continue to exhibit deficiencies in digital entrepreneurship, innovation, business problem-solving, and technology application, thereby reducing their employability and capacity for self-employment. Although previous studies have examined Artificial Intelligence integration in Business Education and entrepreneurial skills acquisition separately, empirical evidence on the extent to which an AI-driven innovative curriculum facilitates entrepreneurial skills acquisition among Business Education students in tertiary institutions in Anambra State remains limited. It is this identified gap that necessitated the present study, which sought to determine the extent to which an AI-driven innovative curriculum facilitates the acquisition of entrepreneurial skills by Business Education students in tertiary institutions in Anambra State.

Statement of the problem

Artificial Intelligence (AI) has become an important educational innovation that is transforming curriculum implementation, teaching, learning, and assessment across higher education institutions. As a vocational and skill-oriented programme, Business Education is expected to integrate AI-driven innovative curricula to equip students with entrepreneurial competencies such as creativity, innovation, critical thinking, problem-solving, digital literacy, and business management skills required for employment, self-employment, and sustainable national development. Despite the growing importance of AI in education, its integration into the Business Education curriculum in many tertiary institutions remains inadequate. Inadequate technological infrastructure, insufficient lecturer competence, limited institutional support, and the high cost of AI facilities have constrained the effective implementation of AI-driven instructional practices. As a result, many Business Education students and graduates are without adequate entrepreneurial skills needed to adapt to the demands of the modern business environment and the digital economy.

Although several studies have examined Artificial Intelligence in education and entrepreneurial skills acquisition, there is limited empirical evidence on the extent to which an AI-driven innovative curriculum facilitates the acquisition of entrepreneurial skills among Business Education students in tertiary institutions in Anambra State. This gap in knowledge necessitated the present study, which sought to determine the extent to which an AI-driven innovative curriculum facilitates the acquisition of entrepreneurial skills by Business Education students in tertiary institutions in Anambra State.

Research Questions

The following research questions guided the study:

i. To what extent does an AI-driven innovative curriculum facilitate the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State?
ii. To what extent does an AI-driven innovative curriculum facilitate the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State?

Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

$H0_1$: There is no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State.

$H0_2$: There is no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State.

Methodology

A descriptive survey research design was adopted for this study. The design was considered appropriate because it enabled the researcher to collect data from Business Educators on the extent to which an AI-driven innovative curriculum facilitates the acquisition of entrepreneurial skills by Business Education students in tertiary institutions in Anambra State. The study was conducted in universities and colleges of education in Anambra State offering Business Education programmes. The institutions comprised Nnamdi Azikiwe University, Awka; Chukwuemeka Odumegwu Ojukwu University, Igbariam; Federal College of Education (Technical), Umunze; and Nwafor Orizu College of Education, Nsugbe. The population of the study comprised 73 Business Educators, consisting of 41 Business Educators from universities and 32 Business Educators from colleges of education. A census approach was adopted because the population was relatively small and manageable; therefore, the entire population was used for the study and no sampling was carried out. The instrument for data collection was a structured questionnaire titled AI-Driven Innovative Curriculum for Entrepreneurial Skills Acquisition Questionnaire (AIDICESAQ)**.** The instrument consisted of two sections. Section A elicited information on the respondents' demographic characteristics, while Section B contained 14 questionnaire items developed in line with the two research questions, with seven items measuring creativity skills and seven items measuring digital literacy skills**.** The 14 items were considered adequate because they were developed to capture the major dimensions of the two constructs as identified from the literature and the objectives of the study. The questionnaire was structured on a four-point rating scale of Very High Extent (VHE) = 4, High Extent (HE) = 3, Low Extent (LE) = 2, and Very Low Extent (VLE) = 1**.**

The instrument was face validated by three experts, comprising two experts in Business Education from the Department of Agricultural and Vocational Education and one expert in Measurement and Evaluation**,** all from Nnamdi Azikiwe University, Awka**.** Their observations and recommendations were incorporated into the final version of the instrument to ensure that the questionnaire adequately measured the constructs of the study. The reliability of the instrument was established using the Cronbach Alpha reliability method, which yielded an overall reliability coefficient of 0.86, indicating that the instrument possessed satisfactory internal consistency for data collection. The researcher, with the assistance of one trained research assistant, administered the questionnaire using the direct delivery and retrieval method. All the 73 copies of the questionnaire administered were successfully retrieved, representing a 100% response rate. The complete retrieval of the questionnaires eliminated non-response bias and ensured that every member of the study population was represented in the analysis. The data collected were analyzed using mean and standard deviation to answer the research questions, while the independent samples t-test was used to test the null hypotheses at the 0.05 level of significance. The criterion mean of 2.50 was used for decision-making. Mean ratings of 2.50 and above were regarded as accepted, while mean ratings below 2.50 were regarded as rejected. The null hypotheses were rejected where the calculated t-value exceeded the critical t-value at the 0.05 level of significance; otherwise, the null hypotheses were not rejected.

Results

Research Question One: To what extent does an AI-driven innovative curriculum facilitate the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State?

Table 1: Mean and Standard Deviation of the Responses of Business Educators on the Extent to which an AI-Driven Innovative Curriculum Facilitates the Acquisition of Creativity Skills by Business Education Students in Tertiary Institutions in Anambra State.

S/N	Item Statement	Mean	SD	Remark
1	AI-driven innovative curriculum enhances students' ability to generate original business ideas.	3.35	0.62	High Extent
2	AI-driven learning encourages students to develop creative solutions to business problems.	3.28	0.58	High Extent
3	The use of AI applications improves students' innovative thinking during entrepreneurial activities.	3.31	0.64	High Extent
4	AI-supported instruction promotes originality in completing business-related tasks.	3.22	0.60	High Extent
5	AI-driven curriculum helps students identify new business opportunities creatively.	3.38	0.57	High Extent
6	AI technologies stimulate students' imagination and innovation in business planning.	3.30	0.61	High Extent
7	AI-driven learning enhances students' ability to develop creative entrepreneurial products and services.	3.26	0.63	High Extent
	Cluster Mean	**3.30**	**0.61**	**High Extent**

Table 1 shows the mean ratings and standard deviations of Business Educators on the extent to which an AI-driven innovative curriculum facilitates the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State. The mean ratings for all the seven items ranged from 3.22 to 3.38, which are above the criterion mean of 2.50. This indicates that the respondents agreed to a high extent that an AI-driven innovative curriculum facilitates the acquisition of creativity skills. The cluster mean of 3.30 further confirms a High Extent, while the cluster standard deviation of 0.61 indicates that the respondents' opinions were relatively homogeneous.

$H0_1$: There is no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State.

Table 2: Independent Samples *t*-Test Analysis of the Mean Ratings of Business Educators in Universities and Colleges of Education on Creativity Skills

Respondents	N	X̄	SD	DF	t-cal.	t-crit.	Decision
Universities	41	3.34	0.59				
				71	0.56	1.99	Not Significant
Colleges of Education	32	3.26	0.63				

The result in Table 2 shows that the calculated *t*-value of 0.56 is less than the critical *t*-value of 1.99 at 0.05 level of significance. Therefore, the null hypothesis was not rejected. This implies that there is no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State.

Research Question Two: To what extent does an AI-driven innovative curriculum facilitate the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State?

Table 3: Mean and Standard Deviation of the Responses of Business Educators on the Extent to which an AI-Driven Innovative Curriculum Facilitates the Acquisition of Digital Literacy Skills by Business Education Students in Tertiary Institutions in Anambra State

S/N	Item Statement	Mean	SD	Remark

1	AI-driven innovative curriculum enhances students' ability to use digital technologies for business operations.	3.39	0.60	High Extent
2	AI-supported learning improves students' ability to use online collaboration tools effectively.	3.28	0.58	High Extent
3	AI applications enhance students' competence in digital communication for business purposes.	3.34	0.63	High Extent
4	AI-driven instruction improves students' ability to search, retrieve, and manage digital business information.	3.20	0.65	High Extent
5	AI technologies enhance students' competence in using digital tools for entrepreneurial decision-making.	3.31	0.59	High Extent
6	AI-supported curriculum develops students' ability to utilize digital platforms for marketing business products and services.	3.36	0.61	High Extent
7	AI-driven learning improves students' ability to apply digital technologies in solving business-related problems.	3.27	0.64	High Extent
	Cluster Mean	**3.31**	**0.61**	**High Extent**

Table 3 shows the mean ratings and standard deviations of Business Educators on the extent to which an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State. The mean ratings for the seven items ranged from 3.20 to 3.39, which are above the criterion mean of 2.50. This indicates that the respondents agreed to a high extent that an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills among Business Education students. The cluster mean of 3.31 further indicates a High Extent; while the cluster standard deviation of 0.61 shows that the respondents' opinions were relatively homogeneous.

$H0_2$: There is no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State.

Table 4: Independent Samples *t*-Test Analysis of the Mean Ratings of Business Educators in Universities and Colleges of Education on Digital Literacy Skills

Respondents	N	$\bar{X}$	SD	DF	t-cal.	t-crit.	Decision
Universities	41	3.35	0.58	71	0.59	1.99	Not Significant
Colleges of Education	32	3.27	0.61				

The result in Table 4 indicates that the calculated *t*-value of 0.59 is less than the critical *t*-value of 1.99 at the 0.05 level of significance. Therefore, the null hypothesis was not rejected. This implies that there is no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State.

Discussion of findings

AI-Driven Innovative Curriculum and the Acquisition of Creativity Skills by Business Education Students

The findings of the study revealed that an AI-driven innovative curriculum facilitates the acquisition of creativity skills by Business Education students in tertiary institutions in Anambra State to a high extent, with a corresponding null hypothesis which revealed that there was no significant difference between the mean ratings of Business Educators in universities and those in colleges of education regarding the extent to which an AI-driven innovative curriculum facilitates the acquisition of creativity skills by Business Education students. This implies that integrating Artificial Intelligence into curriculum implementation enhances students' ability to generate original business ideas, develop innovative solutions to business problems, identify entrepreneurial opportunities, and apply creative thinking in business-related tasks. The finding is in agreement with UNESCO (2024), which maintained that Artificial Intelligence promotes creativity through personalized, interactive, and inquiry-based learning

experiences that encourage learners to think critically and innovate. The finding also corroborates the study of Ariwodo and Emeasoba (2023), who found that competency-based Business Education enhances entrepreneurial skills acquisition and prepares students for decent work and self-employment in a technology-driven economy. The effective integration of Artificial Intelligence into Business Education curriculum implementation promotes innovative teaching and enhances students' entrepreneurial competencies despite existing implementation challenges.

AI-Driven Innovative Curriculum and the Acquisition of Digital Literacy Skills by Business Education Students

The findings of the study also revealed that an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills by Business Education students in tertiary institutions in Anambra State to a high extent, with a corresponding hypothesis which showed that there was no significant difference between the mean ratings of Business Educators in universities and those in colleges of education on the extent to which an AI-driven innovative curriculum facilitates the acquisition of digital literacy skills by Business Education students. This indicates that the integration of Artificial Intelligence into curriculum implementation enhances students' ability to utilize digital technologies, communicate through digital platforms, retrieve and manage information, collaborate online, and apply digital tools in entrepreneurial activities. The finding demonstrates that AI-supported instructional strategies expose students to technology-rich learning environments that strengthen the digital competencies required for employment and entrepreneurship in the twenty-first-century workplace. The finding agrees with Awoniyi and Owolabi (2025), who maintained that digital literacy is an essential employability and entrepreneurial competency because it enables graduates to utilize digital technologies, Artificial Intelligence applications, and electronic business platforms effectively. In the same vein, the finding corroborates Emeasoba and Akiebie (2025), who reported that the application of Artificial Intelligence in Business Education enhances students' digital competencies and prepares them for effective workplace performance. Competencies in digital technologies, search engines, and email marketing are critical entrepreneurial skills required for self-employment among Business Education students.

Conclusion

Based on the findings of the study, it was concluded that an AI-driven innovative curriculum facilitates the acquisition of entrepreneurial skills by Business Education students in tertiary institutions in Anambra State to a high extent. Specifically, the study established that the integration of Artificial Intelligence into curriculum implementation significantly enhances the acquisition of creativity skills and digital literacy skills, which are indispensable entrepreneurial competencies required for innovation, employability, self-employment, and effective participation in the contemporary digital economy. The study further concluded that Business Educators in universities and those in colleges of education held similar views regarding the effectiveness of an AI-driven innovative curriculum in facilitating the acquisition of these skills, as there was no significant difference in their mean ratings. The study therefore concludes that the effective integration of Artificial Intelligence into the Business Education curriculum will better prepare students with the entrepreneurial competencies required to adapt to technological changes, create innovative business opportunities, and contribute meaningfully to national economic development.

Recommendations

Based on the findings of the study, the following recommendations were made:

1. Business Educators should integrate AI-driven innovative curriculum into the teaching of Business Education courses to enhance the acquisition of creativity skills among students.
2. Management of tertiary institutions should provide adequate Artificial Intelligence facilities and continuous training for Business Educators to facilitate the acquisition of digital literacy skills by Business Education students.

REIMAGINING BUSINESS EDUCATION FOR THE ARTIFICIAL INTELLIGENCE ERA: IMPLICATIONS FOR ENTREPRENEURIAL TRANSFORMATION IN AFRICA

[1]Brown, Barisoma Maxwell, [2]Udeh, Chinyere Patience & [3]Aburime, Ehikioya Frank
Accounting Education Department
School of Secondary Education (Business),
Federal College of Education (Technical) Omoku, Rivers State.
dorcasharry83@gmail.com 08038858031

Abstract
The rapid advancement of artificial intelligence (AI) is transforming the nature of work, business operations, entrepreneurship and the competencies required for effective participation in the digital economy. This transformation presents both opportunities and challenges for Business Education in Africa, where the programme is expected to prepare learners for employment, entrepreneurship and productive participation in a technology-driven society. This opinion paper examines the need to reimagine Business Education for the AI era and discusses its implications for entrepreneurial transformation in Africa. The paper argues that conventional approaches to Business Education may no longer be sufficient for preparing learners for emerging AI-mediated workplaces and entrepreneurial environments. It discusses the changing landscape of Business Education, emerging AI competencies, AI-enabled entrepreneurial opportunities, curriculum transformation, changing roles of Business educators, and ethical and infrastructural challenges associated with AI adoption. Drawing on contemporary literature and developments in Business Education, the paper advocates purposeful integration of AI literacy, generative AI, data-informed decision-making, digital office applications, entrepreneurial problem-solving and responsible AI use into Business Education curricula. It concludes that AI should be viewed not merely as a technological innovation but as an important component of contemporary entrepreneurial competence. The researchers recommend continuous curriculum renewal, capacity development for Business educators, improved digital infrastructure and stronger industry-institution collaboration to position Business Education as a catalyst for AI-driven entrepreneurial transformation in Africa.
Keywords: artificial intelligence, Business Education, entrepreneurial transformation, digital competence, entrepreneurship, Africa

Introduction
Business Education occupies an important position in preparing individuals for employment, entrepreneurship and effective participation in the economic activities of society. Its relevance is increasingly determined by its capacity to respond to technological changes affecting business organisations, workplaces and entrepreneurial activities. Contemporary business environments are characterised by digital communication, electronic transactions, data analytics, automation and, increasingly, artificial intelligence. Consequently, Business Education cannot remain substantially unchanged while the environment for which it prepares graduates is being transformed.

The changing technological environment has created a need for Business Education graduates to possess competencies extending beyond traditional occupational skills. Nwaokokorom and Ikpeama (2023) established that accounting and problem-solving skills are highly required of Business Education students for effective job performance in organisations in the digital era. This reinforces the position that contemporary Business Education should develop competencies that enable graduates to analyse problems, make informed decisions and operate effectively in technology-mediated workplaces.

Artificial intelligence has intensified this demand. AI systems can support activities involving data processing, content generation, communication, forecasting, customer interaction, financial analysis and administrative decision-making. Wang et al. (2024) showed that AI applications in education span adaptive learning and personalised tutoring, intelligent assessment and management, profiling and prediction, and emerging AI products. For Business Education, therefore, AI has implications for both the content students need to learn and the ways teaching and learning may be organised.

Evidence within Nigerian Business Education already demonstrates this emerging concern. Onuotu et al. (2025) identified AI-related accounting and electronic-office skills as relevant to Business Education students' job performance in the new era. Similarly, Ikpeama et al. (2025) found that AI integration in

Business Education curriculum implementation is affected by issues including availability, utilisation, technical know-how and training. These findings suggest that meaningful AI integration requires more than awareness; it requires curriculum responsiveness, educator competence and practical learning opportunities.

The issue is particularly important within the broader objective of entrepreneurial transformation in Africa. Entrepreneurship increasingly operates within digital ecosystems in which entrepreneurs use technology to identify opportunities, reach customers, manage financial information, communicate with stakeholders and develop innovative products and services. Bell and Bell (2023) argued that generative AI has important implications for entrepreneurship education, including idea development, business-model analysis, marketing and entrepreneurial decision-making. Business Education graduates therefore need to move beyond being consumers of digital technologies towards becoming critical and responsible users of AI for entrepreneurial problem-solving, innovation and value creation.

Against this background, this paper argues for the reimagination of Business Education for the artificial intelligence era. The central position is that AI should neither be treated as a replacement for Business educators nor merely as an additional technological tool. Instead, it should be understood as part of the changing business and entrepreneurial environment for which Business Education prepares learners. The paper examines Business Education in the AI era, emerging AI competencies, implications for entrepreneurial transformation, curriculum and instructional requirements, the changing role of Business educators, associated challenges and strategic directions for repositioning the programme.

Business Education in the Artificial Intelligence Era

Business Education may be understood as education for and about business, designed to develop occupational, entrepreneurial and transferable competencies necessary for productive participation in business organisations and enterprise creation. Historically, its curriculum has responded to transformations in business practices, progressing from manual office procedures and bookkeeping towards computerised accounting, electronic communication, digital office technologies and other technology-enabled operations.

The AI era represents another important stage in this evolution. Unlike earlier digital technologies that primarily facilitated predefined tasks, contemporary AI systems increasingly assist users in generating content, analysing information, recognising patterns, automating routine activities and supporting decisions. Chen et al. (2020) observed that AI applications in education include intelligent tutoring, personalised learning and other forms of technology-supported instruction. Consequently, AI competence within Business Education should encompass not only the ability to operate particular applications but also the capacity to determine when and how AI should be used, evaluate AI-generated information and apply it responsibly to business and entrepreneurial problems.

Business Education in the AI era should therefore integrate business knowledge, entrepreneurial competence, digital competence and responsible AI capability. This conception moves the discussion beyond whether students should be exposed to AI towards the more important question of how AI can be integrated into learning experiences that develop entrepreneurial judgement, creativity, problem-solving and sustainable value creation.

Emerging AI Competencies Required in Business Education

Reimagining Business Education for the AI era requires a clear understanding of the competencies students and educators need in increasingly intelligent business environments. AI competence extends beyond the ability to operate a particular application. It involves understanding AI capabilities and limitations, selecting appropriate tools, interacting effectively with AI systems, evaluating generated outputs, applying AI to practical problems and using the technology ethically and responsibly.

UNESCO (2024) organises teacher AI competence around a human-centred mindset, ethics of AI, AI foundations and applications, AI pedagogy and AI for professional learning. Chiu et al. (2025) similarly conceptualise teacher AI competence as multidimensional, including AI knowledge, pedagogy, assessment, ethics, human-centred education and professional engagement. These perspectives are useful to Business Education because they show that meaningful AI competence combines technological understanding with pedagogy, ethics and professional judgement.

Within Business Education, students require basic AI literacy that enables them to understand how AI systems support contemporary business operations. They also require AI-supported accounting and financial competence, digital communication and electronic-office competence, data literacy, AI-supported decision-making and entrepreneurial problem-solving. Onuotu et al. (2025) provide Nigerian evidence that AI-related skills are relevant to the job performance expected of Business Education students.

Data literacy is particularly important because entrepreneurship requires individuals to interpret market information, understand customer behaviour, assess alternatives and make decisions under

uncertainty. AI can assist with analysing information and identifying patterns, but students require sufficient business knowledge to question outputs and determine whether recommendations are reasonable. Thus, Business Education should integrate AI competence with analytical and critical thinking rather than present AI as a substitute for thinking.

Ethical AI competence is equally indispensable. Students need to understand issues involving privacy, intellectual property, misinformation, bias, transparency, academic integrity and accountability. Sperling et al. (2024) found that AI literacy in teacher education encompasses theoretical, practical and ethical knowledge, while UNESCO (2024) places ethics and human agency at the centre of responsible AI competence. Business Education should therefore prepare learners to use AI in ways that protect professional judgement and responsibility.

Artificial Intelligence and Entrepreneurial Transformation in Africa

Entrepreneurial transformation involves more than increasing the number of individuals establishing businesses. It encompasses changes in how opportunities are identified, enterprises are created, resources are managed, customers are reached and value is generated. AI presents opportunities to reshape these processes by making analytical, communication and creative capabilities increasingly accessible to entrepreneurs and small enterprises.

Generative AI is especially relevant to entrepreneurship education because it can support idea development, communication, business-model analysis and market exploration. Bell and Bell (2023) explained that generative AI can be integrated into entrepreneurship curricula through activities such as reviewing business models and plans, analysing marketing campaigns and interpreting market data. Short and Short (2023) likewise demonstrated how generative AI can support entrepreneurial rhetoric and content creation, while also drawing attention to limitations that require critical human oversight.

AI can support entrepreneurial opportunity recognition by helping learners organise market information, explore customer needs, examine competing products and identify possible gaps in existing markets. It can also support business planning and decision-making by assisting students to organise information, consider alternative scenarios and examine marketing or financial options. However, AI-generated suggestions should be treated as inputs into entrepreneurial decision-making rather than substitutes for market investigation, experience and human judgement.

AI also provides opportunities for innovation and product development. Entrepreneurship involves transforming ideas into value, and generative AI can support brainstorming, preliminary product conceptualisation and the development of alternative responses to customer problems. The educational objective should nevertheless remain the development of the learner's entrepreneurial capability. Students should therefore be required to justify, modify and critically evaluate AI-supported ideas instead of accepting machine-generated solutions without intellectual engagement.

These possibilities are particularly relevant to African economies where entrepreneurship and small businesses contribute substantially to livelihood creation. Business Education should consequently prepare graduates capable of combining entrepreneurial knowledge with emerging technological capabilities. AI competence can serve both employability and entrepreneurial objectives when integrated appropriately into Business Education.

Reimagining the Business Education Curriculum for the AI Era

The emergence of AI raises important questions about the continuing relevance of existing Business Education curricula. Curriculum renewal should not merely involve adding a stand-alone course titled Artificial Intelligence. A more sustainable approach would integrate relevant AI competencies across accounting, office technology, marketing, entrepreneurship, management and other Business Education components.

Ikpeama et al. (2025) provide Nigerian evidence concerning AI integration in Business Education curriculum implementation and highlight the importance of availability, utilisation, technical competence and training. Adewole (2025) also reported challenges surrounding the application of AI in teaching Business Education courses, while Atah et al. (2025) examined AI applications in delivering Business Education curriculum content. These studies suggest that curriculum reform must address both what students should learn and the institutional capacity required to implement such learning.

AI competencies could consequently be embedded across existing Business Education courses. Accounting Education could incorporate AI-supported financial analysis and intelligent accounting applications. Office Technology and Management could incorporate AI-assisted administrative processes, digital communication and information management. Entrepreneurship Education could integrate AI-supported opportunity recognition, market research, business planning and customer engagement. Marketing-related courses could expose students to AI-supported consumer analysis and digital-content development.

Curriculum transformation should also give greater attention to practical application. Students should encounter realistic business problems requiring them to determine whether AI is appropriate, select suitable technologies, analyse outputs and justify their decisions. Ayeni et al. (2025) emphasised both opportunities and challenges associated with integrating AI into Business Education. Thus, curriculum reimagination should be guided by relevance, integration and responsibility: relevance to changing workplaces, integration across appropriate courses, and responsibility in the ethical use of AI.

Changing Role of Business Educators in the AI Era

The growing availability of generative AI does not diminish the relevance of Business educators; rather, it changes aspects of their professional responsibility. When students can obtain explanations, business ideas and generated content rapidly, lecturers need increasingly to emphasise evaluation, application, reflection and professional judgement.

Business educators therefore require competence not only in operating AI applications but also in determining their pedagogical appropriateness. Chiu et al. (2025) emphasise teacher AI competence as important to effective and responsible engagement with AI. Similarly, UNESCO (2024) identifies AI foundations and applications, AI pedagogy, ethics, human-centred thinking and professional learning as important dimensions of teacher competence.

For Business Education specifically, lecturer competence should extend to AI application within occupational and entrepreneurial contexts. An Accounting Education lecturer, for example, should be able to design activities requiring students to critically examine AI-supported financial analysis. Entrepreneurship lecturers could engage students in evaluating AI-generated business ideas or market proposals, while Office Technology and Management lecturers could demonstrate responsible AI-assisted communication and information management.

The Business educator must equally serve as an ethical facilitator. Students need guidance concerning confidentiality, privacy, intellectual property, academic integrity, misinformation and accountability for AI-generated outputs. Continuous professional development is therefore essential. Institutions cannot expect meaningful AI integration merely by providing access to technological tools; educators need structured opportunities to acquire, practise and continually update relevant competencies.

Challenges to Reimagining Business Education for the AI Era

Despite its potential, integrating AI into Business Education in Africa presents substantial challenges. Digital infrastructure remains fundamental. AI-supported learning depends upon access to suitable devices, electricity, internet connectivity and relevant digital platforms. Institutions experiencing deficiencies in basic ICT infrastructure may find advanced AI integration particularly difficult.

A second challenge is educator competence. AI technologies evolve rapidly, meaning that knowledge acquired at one point may become insufficient as technologies and their applications change. Sperling et al. (2024) show that AI literacy in teacher education remains an emerging area requiring greater attention to practical and ethical knowledge. Continuous professional learning is therefore necessary.

Ethical and privacy concerns also require attention. Students and lecturers may upload confidential, personal or institutional information to AI platforms without understanding how such information is processed. AI-generated content may contain errors, fabricated information or biased representations. Samson and Baraya (2025) emphasised ethical considerations including bias, fairness, privacy and responsible student-data use in Business Education curriculum development.

Another concern is overdependence on AI. Business Education is intended to develop reasoning, communication, creativity and problem-solving abilities. If students routinely delegate intellectual tasks to AI without critically engaging with underlying problems, technology could undermine rather than enhance competency development. Assessment practices therefore need to emphasise application, justification, reflection and demonstration of competence rather than reproduction of information.

Finally, inequality of access could widen existing educational disparities. Students and institutions with reliable connectivity, suitable devices and access to advanced AI systems may gain advantages over those without these resources. AI integration policies should therefore incorporate inclusion and accessibility rather than assume equal technological conditions across African educational institutions.

Strategic Directions for AI-Driven Business Education

Reimagining Business Education requires coordinated action rather than isolated adoption of AI applications. First, Business Education curricula should undergo periodic review to identify competencies becoming necessary in AI-mediated workplaces and entrepreneurial environments. Curriculum review should involve Business educators, professional bodies, employers, entrepreneurs and technology practitioners.

Second, institutions should establish sustained AI professional-development programmes for Business educators. Such programmes should move beyond awareness seminars towards hands-on application of AI to accounting, entrepreneurship, office administration, research and instructional activities. This is

consistent with the competence-development orientation advanced by UNESCO (2024) and Chiu et al. (2025).

Third, greater emphasis should be placed on experiential AI learning. Students should work on realistic entrepreneurial problems, business simulations and projects requiring responsible application of AI. Bell and Bell (2023) demonstrate the potential of generative AI to support entrepreneurship-learning activities, provided students are required to review and critically analyse outputs.

Fourth, tertiary institutions should strengthen industry-institution partnerships. Businesses and technology organisations can provide current knowledge, practical cases, mentorship and exposure to emerging applications. Such partnerships can help reduce the gap between curriculum content and rapidly changing business practices.

Fifth, institutions should establish clear ethical guidelines for AI use. These should address academic integrity, privacy, intellectual property, verification of AI-generated information and appropriate disclosure of AI assistance. Responsible use should become part of professional preparation rather than merely an institutional disciplinary issue.

Finally, AI integration should remain human-centred. Wang et al. (2024) show that AI in education offers substantial opportunities while also raising adoption, impact and implementation challenges. The objective should therefore not be to automate Business Education indiscriminately but to enable learners to combine technological capability with creativity, ethical judgement, critical thinking and contextual understanding.

Conclusion

Artificial intelligence is reshaping business activities, workplaces, entrepreneurship and educational practices, thereby creating an important responsibility for Business Education in Africa. Preparing graduates for an AI-mediated economy requires more than introducing students to emerging technological tools. It demands a reimagination of curriculum content, instructional practices, educator competence and entrepreneurial learning. Business Education should develop graduates capable of understanding AI, applying it to authentic business problems, critically evaluating its outputs and using it ethically for entrepreneurial value creation. When appropriately integrated, AI can strengthen rather than diminish the occupational and entrepreneurial mandate of Business Education. The future relevance of the programme will therefore depend considerably on its capacity to combine enduring business and entrepreneurial competencies with emerging technological capabilities.

Recommendations

1. Business Education curricula should be periodically reviewed to integrate AI literacy, AI-supported accounting, data-informed decision-making, digital communication and AI-enabled entrepreneurial problem-solving.
2. Tertiary institutions should organise continuous practical professional development for Business educators to strengthen their technological, pedagogical and ethical competence in applying artificial intelligence.
3. Government and institutional authorities should improve the technological infrastructure supporting Business Education, particularly reliable internet connectivity, appropriate digital devices and access to relevant AI-enabled learning facilities.
4. Business Education departments should strengthen partnerships with industries, entrepreneurs and technology organisations to expose lecturers and students to contemporary AI applications and authentic technology-supported entrepreneurial practices.
5. Business Education programmes should establish clear institutional guidelines for responsible AI use, particularly regarding privacy, intellectual property, academic integrity, verification of generated information and accountability.
6. Business educators should employ experiential AI-supported learning activities involving business simulations, market investigation, business planning, financial analysis and entrepreneurial problem-solving so that students develop practical rather than merely theoretical AI competence.

Abstract

The study examined artificial intelligence literacy and future world-of-work competencies among undergraduate Business Education students at the University of Nigeria, Nsukka. The study is necessitated by the increasing integration of artificial intelligence and digital technologies into contemporary workplaces and the need for graduates to possess relevant technological, cognitive, interpersonal and adaptive competencies. A descriptive survey research design was used for the study. The population comprised 110 undergraduate Business Education students, consisting of 64 students at the 300 level and 46 students at the 400 level. Total population was used, while data was collected using a structured questionnaire titled Artificial Intelligence Literacy and Future World-of-Work Competencies Questionnaire (AIL-FWWCQ). The data was analysed using mean and standard deviation to determine the level of students' artificial intelligence literacy and future world-of-work competencies. The study found out that the students recognize the importance of ongoing skill development, that students possess a generally high level of AI literacy, particularly in their awareness of AI limitations, human judgment and responsible use. However, the results also suggest the need to strengthen practical AI-use skills, particularly effective prompting and critical evaluation of AI-generated information. It was recommended that Business Education programs should provide more practical AI-based learning activities, Lecturers should incorporate critical evaluation of AI-generated information into classroom activities. Students should be taught to verify AI-generated content, identify possible errors and distinguish reliable information from misleading outputs.

Keywords: Artificial intelligence literacy, future of work, world-of-work competencies, Business Education, undergraduate students

Introduction

The contemporary world is experiencing rapid technological transformation driven by digitalization, automation, artificial intelligence (AI) and other emerging technologies. Artificial intelligence has moved beyond specialized technological environments into education, business, finance, communication, administration and everyday decision-making. Its growing presence is changing how information is produced, tasks are performed, decisions are supported and services are delivered. Consequently, higher education institutions are increasingly confronted with the responsibility of preparing students for a world in which interaction with intelligent technologies will form part of academic and professional life. UNESCO (2024) emphasized that education systems need to prepare students to engage with AI safely, ethically and meaningfully, while the World Economic Forum (2025) identified AI and big data, technological literacy, analytical thinking and creative thinking among the skills gaining increasing importance in the changing labor market.

The increasing presence of AI in education has also changed the meaning of technological preparedness among university students. Students are no longer expected merely to possess general computer or digital skills; they increasingly need to understand what AI is, how it works at a basic level,

what it can and cannot do, how it can be applied, and how its outputs should be examined before being accepted or used. This broader preparedness is captured in the concept of artificial intelligence literacy. Chiu et al. (2024) distinguished AI literacy from mere technical knowledge by explaining that literacy concerns knowledge and skills for understanding AI, while competency extends to the ability to apply such knowledge effectively. Similarly, Kassorla et al. (2024) described AI literacy in higher education as technical understanding, evaluative skills, practical application and ethical considerations. Thus, AI literacy represents a broader educational competence through which students can understand, use, question and responsibly interact with AI technologies.

A major dimension of AI literacy is therefore the understanding of AI concepts and applications. Students need foundational knowledge of AI, including awareness of common AI technologies and their applications in academic and workplace contexts. Beyond understanding, however, AI literacy requires practical application, that is the ability to use AI tools appropriately to support learning, information processing, communication, problem-solving and other legitimate tasks. UNESCO (2024) similarly identifies understanding and application as important stages in the development of students AI competencies. This means that a student who knows that AI exists but cannot meaningfully and appropriately use an AI tool demonstrates a different level of preparedness from a student who can apply AI tools to accomplish tasks effectively.

Yet, effective AI literacy cannot stop at the ability to use AI. The capacity to critically evaluate AI-generated information is equally important because AI systems can produce inaccurate, incomplete, biased or misleading outputs. Students therefore need to examine AI-generated information, verify important claims and recognize situations in which human judgment remains necessary. The EDUCAUSE AI literacy framework for higher education places particular emphasis on critical evaluation and awareness of bias, misuse and misapplication of AI technologies (Kassorla et al., 2024). Zhong and Liu (2024) also conceptualized AI literacy around knowledge, affective dispositions and AI thinking, highlighting the importance of higher-order thinking in students engagement with AI. Thus, critical evaluation provides an important bridge between knowing AI and using AI responsibly.

Another important dimension of AI literacy is ethical and responsible use. The increasing ability of AI systems to generate text, images, analyses and recommendations raises questions relating to privacy, academic integrity, bias, transparency, accountability and appropriate human oversight. Students need to understand that technological capability does not automatically make every use of AI appropriate. UNESCO's AI Competency Framework for Students places ethics of AI and a human-centred mindset alongside AI techniques and applications, emphasizing responsible and meaningful engagement with AI (Miao et al., 2024). Ethical AI literacy therefore requires students to understand the responsibilities associated with AI use, protect personal information, acknowledge appropriate AI assistance and maintain human judgment when using AI-supported outputs.

The relevance of these competencies becomes clearer within the context of Business Education. Business Education is designed to provide learners with knowledge, skills and competencies for participation in business, office, accounting, entrepreneurship, management and related occupational activities. As business processes become increasingly digitalized and AI supported, the preparation of Business Education students can no longer depend solely on traditional business knowledge and conventional occupational skills. The Nigerian Business Education literature has increasingly drawn attention to the importance of digital competencies for students employability and workplace preparedness. Amesi and Allison (2022) examined digital skills acquired by university Business Education students for employability, while Okonkwo and Agwazie (2023) reported the importance of digital technologies in supporting Business Education students' acquisition of employability skills. These developments position AI literacy as an emerging extension of the technology-related competencies required within contemporary Business Education.

The transformation of the workplace also gives greater significance to the concept of the future world of work. The future world of work refers to the changing conditions, technologies, practices and competency demands that characterize emerging workplaces. Technological advancement, automation, artificial intelligence, digitalization and changing organizational practices are altering the tasks workers perform and the competencies required to perform them effectively. Davey and Harney (2023) noted that higher education has an important role in nurturing skills needed for future forms of work, particularly within an increasingly digital environment. The World Economic Forum (2025) similarly reported that employers expect technological skills to grow rapidly while human-centered competencies such as analytical thinking, creative thinking, resilience, flexibility, agility, curiosity and lifelong learning remain important.

Within this changing work environment, future world-of-work competencies extend beyond technical knowledge. They encompass a combination of digital, cognitive, interpersonal and self-

management competencies that enable individuals to perform effectively in changing workplace contexts. Digital competence enables workers to use technological tools appropriately; critical thinking supports the analysis and evaluation of information; problem-solving enables workers to respond to workplace challenges; creativity supports the generation of new ideas; communication and collaboration facilitate effective interaction with colleagues and clients; while adaptability, initiative, time management and continuous learning enable workers to respond to changing technologies and job requirements. The World Economic Forum (2025) identifies analytical thinking, creative thinking, resilience, flexibility and agility, technological literacy, curiosity and lifelong learning among important skills for the evolving labor market. These competencies therefore represent important dimensions of preparedness for the future world of work.

For Business Education students, the development of future world-of-work competencies is particularly important because the program is directly concerned with preparing learners for participation in business and occupational environments. Nigerian studies have continued to emphasize the importance of digital skills, employability skills and work readiness among Business Education students and graduates. Amesi and Allison (2022) reported attention to digital skills for employability among university Business Education students, while studies on digitalization have highlighted the need for Business Education programs to respond to changing workplace skill requirements. More recent Nigerian research has also examined AI adoption and its implications for the development of Business Education students, indicating that AI is becoming an increasingly relevant issue within the discipline.

The connection between AI literacy and future world-of-work preparedness is therefore conceptually important. AI literacy equips students with the capacity to understand and appropriately engage with an emerging workplace technology, while future world-of-work competencies equip them with the broader cognitive, digital, interpersonal and adaptive capacities required to function in changing work environments. AI literacy provides the technological foundation for responsible engagement with AI, while competencies such as critical thinking, problem-solving, creativity, communication, collaboration and adaptability provide the human capacities needed to use technology effectively rather than depend on it uncritically. In this sense, preparing Business Education students for the future of work requires attention to both their ability to engage with AI and their broader capacity to function effectively in technology-rich workplaces.

However, the growing discussion of AI in education does not automatically establish that students possess adequate AI literacy or future world-of-work competencies. Existing literature has examined AI adoption, digital skills, employability and the use of AI in Business Education from different perspectives, but there remains a need for institution-specific empirical evidence on the current levels of these competencies among undergraduate Business Education students. This is particularly important because students' preparedness cannot be assumed solely from the increasing availability of AI tools or from the presence of technology-related content within an academic program. Empirical assessment is necessary to identify the areas in which students demonstrate stronger preparedness and the areas requiring further development. The present study therefore examines the level of artificial intelligence literacy and future world-of-work competencies among undergraduate Business Education students at the University of Nigeria, Nsukka.

Statement of the problem

Ideally, undergraduate Business Education students should possess adequate artificial intelligence literacy and future world-of-work competencies before entering a workplace increasingly shaped by digital technologies and AI. They should understand basic AI concepts, apply AI tools appropriately, evaluate AI-generated information critically, use AI ethically and demonstrate competencies such as digital competence, critical thinking, problem-solving, creativity, communication, collaboration, adaptability and continuous learning.

However, the rapid development of AI and changing workplace demands have created new competency expectations, while there is limited empirical evidence showing the extent to which undergraduate Business Education students possess these competencies, particularly within Nigeria. Although studies have examined digital skills, employability and AI adoption in Business Education, less attention has been given to an integrated assessment of students' AI literacy and broader future world-of-work competencies.

Thus, Business Education students in Nigeria, are being prepared for workplaces in which digital technologies and AI-supported activities are increasingly relevant. Without evidence of their current levels of AI literacy and future world-of-work competencies, areas of strength and areas requiring further development may remain unclear. The problem of this study, therefore, is to determine the levels of artificial intelligence literacy and future world-of-work competencies among undergraduate Business Education students in Nigeria.

Significance of the study

The findings of the study may be useful to Business Education lecturers, students, curriculum planners, university administrators and researchers. The findings may help lecturers identify areas of AI literacy and future world-of-work competencies requiring greater attention in teaching and learning. Students may gain greater awareness of the competencies required for effective participation in technology-driven workplaces. Curriculum planners may use the findings as evidence for reviewing Business Education content in response to emerging technological and workplace demands. University administrators may use the findings to inform training and capacity-building initiatives, while researchers may find the study useful as a basis for further investigation into AI literacy and future-of-work preparedness in Business Education.

Purpose of the study

The main purpose of the study is to examine artificial intelligence literacy and future world-of-work competencies among undergraduate Business Education students in Nigeria. Specifically, the study seeks to:

1. Determine the level of artificial intelligence literacy among undergraduate Business Education students in Nigeria.
2. Determine the level of future world-of-work competencies among undergraduate Business Education students in Nigeria.

Research questions

1. What is the level of artificial intelligence literacy among undergraduate Business Education students in Nigeria?
2. What is the level of future world-of-work competencies among undergraduate Business Education students in Nigeria?

Methodology

The study adopted a descriptive survey research design. The design is considered appropriate because the study seeks to obtain information on the existing levels of artificial intelligence literacy and future world-of-work competencies among undergraduate Business Education students without manipulating any variable or introducing a treatment. The design will enable the researcher to collect and describe respondents' views and self-reported competencies as they exist at the time of the study.

The study was carried out at the University of Nigeria, Nsukka, Enugu State. The university provides an appropriate setting for the study because it has undergraduate students enrolled in Business Education and provides an academic environment in which students are exposed to business, professional and technology-related learning experiences.

The population of the study comprised 110 undergraduate Business Education students at the University of Nigeria, Nsukka. The population consists of 64 students at the 300 level and 46 students at the 400 level. The study will focus on these levels because the students are relatively advanced in their undergraduate program and are closer to transitioning into the world of work.

Since the population of 110 students is manageable, the study adopted total enumeration sampling. Consequently, all the 110 undergraduate Business Education students in the 300 and 400 levels was included in the study, subject to their availability and willingness to participate.

The instrument for data collection was a structured questionnaire titled "Artificial Intelligence Literacy and Future World-of-Work Competencies Questionnaire (AIL-FWWCQ)." The questionnaire was developed in line with the research questions and consist of three sections. Section A was to obtain relevant demographic information from the respondents. Section B contained items measuring artificial intelligence literacy, while Section C contained items measuring future world-of-work competencies. The questionnaire items was be structured on a four-point Likert scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD), weighted 4, 3, 2 and 1 respectively.

The questionnaire was subjected to face and content validation by experts in Business Education and measurement and evaluation. The experts examined the items in terms of clarity, relevance, appropriateness, coverage of the concepts and alignment with the research questions. Their observation and suggestion was used to improve the final version of the instrument before administration.

A pilot study was conducted using students with characteristics similar to those of the study population but who are not part of the main study. The response obtained from the pilot study was used to determine the internal consistency of the questionnaire using Cronbach's alpha reliability coefficient. A reliability coefficient of 0.70 was obtained.

Data collected for the study was analyzed using mean and standard deviation. Mean scores was used to determine the level of artificial intelligence literacy and future world-of-work competencies among the respondents, while standard deviation was used to determine the extent to which

respondents responses vary around the mean. The research questions was answered using the mean scores and standard deviations obtained from the responses. No inferential statistical test was used because the study is a pure descriptive survey.

Results and discussion of findings

Research Question 1: What is the level of artificial intelligence literacy among undergraduate Business Education students in Nigeria?

Table 1: Mean and Standard Deviation of Respondents' Artificial Intelligence Literacy

SN	ARTIFICIAL INTELLIGENCE LITERACY ITEMS	MEAN	SD	DECISION
1	I understand the basic meaning and uses of artificial intelligence	3.42	0.62	HIGH
2	I can identify AI-powered tools commonly used in education and business	3.36	0.67	HIGH
3	I can use AI tools to support academic or business-related tasks	3.28	0.71	HIGH
4	I can give appropriate prompts or instructions to AI tools to obtain useful responses	3.11	0.78	HIGH
5	I can evaluate AI-generated information before using it	3.18	0.73	HIGH
6	I understand that AI-generated information may contain errors or misleading information	3.51	0.59	VERY HIGH
7	I am aware of the capabilities and limitations of AI technologies	3.24	0.70	HIGH
8	I understand ethical issues associated with the use of artificial intelligence	3.30	0.69	HIGH
9	I understand the importance of protecting personal information when using AI tools	3.47	0.61	HIGH
10	I understand the importance of human judgement when using AI for important decisions	3.55	0.57	VERY HIGH

Cluster Mean| 3.34| 0.67| High

Discussion of Findings

The findings presented in Table 1 indicate that undergraduate Business Education students at the University of Nigeria, Nsukka demonstrated a high level of artificial intelligence literacy, as shown by the cluster mean of 3.34. The result suggests that the students generally possess an understanding of artificial intelligence, its applications and some of the considerations necessary for its responsible use. The highest mean score was recorded for the statement that students understand the importance of human judgment when using AI for important decisions (M = 3.55, SD = 0.57), followed by their understanding that AI-generated information may contain errors or misleading information (M = 3.51, SD = 0.59). This suggests that the respondents show considerable awareness that AI should not be relied upon without human oversight. The relatively high score for protecting personal information when using AI tools (M = 3.47, SD = 0.61) also indicates awareness of responsible use of AI technologies. The lowest mean score was recorded for the ability to give appropriate prompts or instructions to AI tools to obtain useful responses (M = 3.11, SD = 0.78). Although the item was still rated high, the comparatively lower score may indicate that students' practical ability to interact effectively with AI tools requires further development. Similarly, the ability to evaluate AI-generated information before using it recorded a mean of 3.18, suggesting that critical evaluation of AI-generated information remains an important area for continued development. Overall, the findings indicate that the students possess a generally high level of AI literacy, particularly in their awareness of AI limitations, human judgment and responsible use. However, the results also suggest the need to strengthen practical AI-use skills, particularly effective prompting and critical evaluation of AI-generated information.

Research Question 2

What is the level of future world-of-work competencies among undergraduate Business Education students in Nigeria?

Table 2: Mean and Standard Deviation of Respondents' Future World-of-Work Competencies

SN	FUTURE WORLD OF WORK COMPETENCY	MEAN	SD	DECISION
1	I can use digital technologies effectively to perform work-related tasks	3.38	0.65	HIGH
2	I can analyse information before making work-related decisions	3.31	0.68	HIGH

3	I can identify problems and develop practical solutions.	3.25	0.72	HIGH
4	I can generate new ideas for improving a task, service or business activity	3.20	0.75	HIGH
5	I can communicate my ideas clearly in a work environment	3.43	0.63	HIGH
6	I can work effectively with others in a team.	3.52	0.58	VERY HIGH
7	I can adapt when workplace technologies, tasks or procedures change	3.16	0.76	HIGH
8	I can learn to use new digital tools when required	3.54	0.57	VERY HIGH
9	I can use initiative when a task requires a new approach	3.19	0.74	HIGH
10	I am willing to continue developing my skills as workplace demands change	3.61	0.52	VERY HIGH

Cluster Mean| 3.36| 0.66| High

Discussion of Findings

The findings in Table 2 show that undergraduate Business Education students at the University of Nigeria, Nsukka demonstrated a high level of future world-of-work competencies, with a cluster mean of 3.36. This indicates that the students generally perceive themselves as possessing competencies needed to function effectively in a changing and technology-driven workplace. The highest mean score was recorded for the willingness to continue developing skills as workplace demands change (M = 3.61, SD = 0.52). This was followed by the ability to learn to use new digital tools when required (M = 3.54, SD = 0.57) and the ability to work effectively with others in a team (M = 3.52, SD = 0.58). These findings suggest that continuous learning, adaptability to technological demands and collaboration are relatively strong areas among the respondents. The lowest mean score was recorded for the ability to adapt when workplace technologies, tasks or procedures change (M = 3.16, SD = 0.76), followed by the ability to use initiative when a task requires a new approach (M = 3.19, SD = 0.74). Although these competencies were still rated high, their comparatively lower mean scores suggest that students may require additional opportunities to develop practical adaptability and initiative. The findings are particularly relevant to Business Education because graduates are expected to function in workplaces where digital technologies, changing procedures and new forms of work continue to emerge. The relatively high rating for continuous learning suggests that the students recognize the importance of ongoing skill development, while the comparatively lower ratings for adaptability and initiative point to areas that may benefit from greater emphasis in Business Education programs.

Conclusion

Based on the findings of the study, it is concluded that undergraduate Business Education students at the University of Nigeria, Nsukka demonstrate a high level of artificial intelligence literacy and future world-of-work competencies. The students appear to have good awareness of the meaning, applications, limitations and responsible use of artificial intelligence, while also demonstrating competencies considered important for functioning in a changing workplace.

However, the findings also indicate that some areas require further attention. In particular, practical skills in prompting AI tools and critically evaluating AI-generated information recorded comparatively lower mean scores within the area of AI literacy. Similarly, adaptability to changing workplace technologies and procedures and the use of initiative when approaching new tasks recorded comparatively lower mean scores among the future world-of-work competencies.

The study therefore concludes that although the students possess a generally positive foundation for an AI-driven and changing world of work, Business Education programmes should continue to provide practical learning experiences that strengthen students' ability to use AI effectively, evaluate its outputs critically, adapt to technological changes and take initiative in solving emerging workplace problems.

Recommendations

Based on the findings, the following recommendations are made:

1. Business Education programs should provide more practical AI-based learning activities that enable students to interact with different AI tools and develop effective prompting and task-specific application skills.
2. Lecturers should incorporate critical evaluation of AI-generated information into classroom activities. Students should be taught to verify AI-generated content, identify possible errors and distinguish reliable information from misleading outputs.

3. Business Education curriculum and instructional practices should place greater emphasis on adaptability and initiative. Students should be exposed to practical tasks, simulations, projects and problem-solving activities that require them to respond to unfamiliar workplace situations.
4. Universities should encourage continuous digital skills development among Business Education students. Workshops, seminars and practical training can be used to expose students to emerging technologies relevant to accounting, business, education and office-related occupations.
5. Students should be encouraged to practice responsible and ethical use of AI. This should include attention to privacy, human judgment, responsible use of AI-generated information and appropriate academic use of AI tools.
6. Business Education lecturers should model the appropriate integration of AI into teaching and learning. This can help students understand not only how to use AI tools but also when, why and when not to rely on them.

LEVERAGING ARTIFICIAL INTELLIGENCE AND AUTOMATION FOR ENTREPRENEURIAL LEARNING IN AFRICAN BUSINESS EDUCATION

Sulaiman Ahmad
Federal Polytechnic Kabo, Kano state
Kabo Town, Nigeria
babamakama@yahoo.com

Abstract

The rapid advancement of Artificial Intelligence (AI) and automation is fundamentally transforming global business operations, entrepreneurial practices, and the competencies required for success in the 21st century. In the African context, this transformation presents a unique duality of opportunities and challenges for business education systems striving to remain relevant in an increasingly digital economy. This paper critically examines how business education can strategically leverage AI and automation to drive digital and entrepreneurial transformation across African institutions. Adopting a conceptual and analytical research design, the study explores the integration of AI-powered tools, automated learning systems, and digital simulation environments in enhancing entrepreneurial knowledge, innovation capacity, and data-driven decision-making skills among students. The paper further evaluates the extent to which African higher education institutions are incorporating these technologies into their curricula and pedagogical practices. Findings reveal that AI and automation have significant potential to improve curriculum relevance, foster experiential learning, and bridge the gap between theoretical instruction and real-world entrepreneurial practice. However, challenges such as inadequate digital infrastructure, limited faculty capacity, and policy gaps continue to hinder widespread adoption. The study emphasizes the need for strategic investment in digital ecosystems, continuous professional development for educators, and stronger collaboration between academia and industry. The paper concludes that proactive integration of AI and automation into business education can empower students with critical digital competencies, enhance innovation, and position African graduates to compete effectively in global, technology-driven markets. Practical recommendations are provided to guide policymakers, educators, and institutions toward building sustainable and future-oriented entrepreneurial learning environments.

Keywords: *Business Education, Artificial Intelligence, Automation, Entrepreneurship Education, Digital Transformation, Africa*

Background of the Study

The global economy is undergoing a profound transformation driven by rapid advancements in Artificial Intelligence (AI), automation, big data analytics, and digital technologies. These innovations are reshaping how businesses operate, compete, and create value. AI technologies—including machine learning, natural language processing, and intelligent automation—are increasingly being deployed to enhance decision-making processes, optimize operations, and generate predictive insights (Brynjolfsson & McAfee, 2014; Kaplan & Haenlein, 2020).

Automation has significantly altered the nature of work by reducing reliance on manual and repetitive tasks while increasing demand for cognitive, analytical, and creative skills. As routine business functions become automated, entrepreneurs and employees are expected to focus more on innovation, strategic thinking, and problem-solving. This shift has major implications for business education, which must evolve to prepare students for technology-driven environments.

In Africa, the digital transformation of business presents both significant opportunities and structural challenges. On one hand, AI and automation offer the potential to accelerate economic development, improve productivity, and foster innovation-driven entrepreneurship. On the other hand, many African educational institutions face constraints such as limited access to digital infrastructure, inadequate funding, and insufficient integration of emerging technologies into curricula (Abdullahi et al., 2020; World Bank, 2021).

Traditionally, business education in many African institutions has emphasized theoretical instruction, basic accounting, and general management principles, often with limited exposure to digital tools and real-world entrepreneurial applications. Consequently, graduates may lack the practical competencies required to operate in modern digital economies, including data literacy, technological adaptability, and innovation skills (Chigona & Chigona, 2013).

To remain relevant, business education must transition from conventional teaching approaches to more dynamic, technology-enhanced learning models. Integrating AI and automation into entrepreneurship education can facilitate experiential learning, improve student engagement, and equip learners with the skills needed to thrive in increasingly complex and competitive markets.

Problem Statement

Despite the growing importance of AI and automation in modern business environments, many business education programs in Africa continue to rely heavily on traditional teaching methods that prioritize theoretical knowledge over practical application. This has resulted in a significant disconnect between the skills students acquire during their education and the competencies required in the digital economy. Graduates often lack exposure to AI tools, data analytics platforms, and automated business systems, which are increasingly essential for entrepreneurial success. This skills gap limits their employability, reduces their capacity for innovation, and constrains their ability to establish and manage technology-driven enterprises (Abdullahi et al., 2020; OECD, 2019).

Furthermore, institutional challenges such as inadequate digital infrastructure, limited faculty expertise in emerging technologies, and absence of supportive policy frameworks hinder the effective integration of AI and automation into business education. Without deliberate intervention, this gap may widen, leaving African graduates at a disadvantage in the global marketplace.

Objectives

The main objective of this study is to examine the role of Artificial Intelligence and automation in transforming business education and entrepreneurial learning in Africa.

Specifically, the study aims to:

1. Analyze the impact of AI and automation on entrepreneurial learning processes and business practices.
2. Assess the extent of integration of AI and automation technologies in African business education curricula.
3. Identify effective strategies for enhancing digital literacy, innovation, and entrepreneurial competencies among students.
4. Explore institutional and policy factors influencing the adoption of AI-driven education systems.

Research Questions

The study seeks to answer the following research questions:

1. In what ways does Artificial Intelligence influence entrepreneurial learning, innovation, and business practices in Africa?
2. To what extent are AI and automation technologies currently integrated into business education programs in African institutions?
3. What strategies can be implemented to enhance the adoption and effective use of AI and automation in entrepreneurship education?
4. What challenges hinder the integration of digital technologies in African business education systems?

Significance of the Study

This study is highly significant in several respects:

1. **Educational Significance:** It provides insights into how business education can be restructured to align with digital transformation trends, thereby improving teaching effectiveness and student learning outcomes.
2. **Policy Significance:** The findings offer guidance for policymakers in developing frameworks that support the integration of AI and automation into education systems.
3. **Economic Significance:** By equipping students with relevant digital and entrepreneurial skills, the study contributes to workforce development, innovation, and economic growth in Africa.
4. **Institutional Significance:** Higher education institutions can use the recommendations to redesign curricula, invest in digital infrastructure, and enhance faculty capacity.

Concept of Business Education

Business education is a multidisciplinary field that focuses on equipping learners with the knowledge, skills, and attitudes required for effective participation in business environments, entrepreneurship, and organizational management. It encompasses areas such as accounting, finance, marketing, management, and entrepreneurship, with an increasing emphasis on digital competencies and innovation (Robinson & Hayes, 2020).

Modern business education extends beyond theoretical instruction to include experiential learning, problem-based approaches, and real-world applications. This shift is necessary to prepare students for

dynamic and complex business environments characterized by rapid technological change. In the digital era, business education must incorporate emerging technologies such as AI, data analytics, and automation to remain relevant.
Furthermore, business education plays a critical role in fostering entrepreneurial mindsets by encouraging creativity, risk-taking, and opportunity recognition. It is a key driver of economic development, particularly in developing regions like Africa, where entrepreneurship is essential for job creation and poverty reduction.

Digital Transformation in Business Education

Digital transformation refers to the integration of digital technologies into all aspects of business and education, fundamentally changing how value is delivered and how learning occurs. In the context of business education, digital transformation involves the adoption of e-learning platforms, AI-powered systems, virtual simulations, and data-driven instructional methods (Westerman et al., 2014).
These technologies enable more personalized, flexible, and interactive learning experiences. For example:

1. **AI-driven learning platforms** adapt content based on student performance.
2. **Virtual simulations** allow students to practice business decision-making in risk-free environments.
3. **Learning analytics** provide real-time feedback to improve student outcomes.

Digital transformation also supports blended learning approaches, combining traditional classroom instruction with online and technology-enhanced methods. This approach enhances accessibility, especially in regions where physical educational resources may be limited. However, successful digital transformation requires not only technological infrastructure but also institutional readiness, faculty competence, and supportive policies.

Artificial Intelligence and Automation in Entrepreneurship

Artificial Intelligence (AI) and automation are transforming entrepreneurial ecosystems by enabling data-driven decision-making, operational efficiency, and innovative business models. AI technologies such as machine learning, natural language processing (NLP), and computer vision allow entrepreneurs to analyze large datasets, predict market trends, and personalize customer experiences (Kaplan & Haenlein, 2020; Dwivedi et al., 2021).
AI-powered tools are increasingly used in:

1. Market analysis and forecasting (predictive analytics)
2. Customer relationship management (CRM) through chatbots and recommendation systems
3. Financial decision-making, including risk assessment and fraud detection
4. Supply chain optimization

Automation complements AI by handling repetitive and routine tasks such as bookkeeping, inventory management, and customer service interactions. This allows entrepreneurs and learners to focus on strategic and creative functions, which are critical for innovation.
In entrepreneurship education, AI-driven platforms and simulation tools create immersive learning environments where students can experiment with business ideas, test strategies, and receive real-time feedback. According to OECD (2019), such technologies enhance experiential learning and reduce the risks associated with real-world business experimentation.
Moreover, AI fosters entrepreneurial innovation by enabling the creation of new products and services, such as fintech solutions, e-commerce platforms, and digital marketplaces, which are particularly relevant in the African context.

Entrepreneurial Learning in the Digital Era

Entrepreneurial learning in the digital era is characterized by a shift from traditional classroom instruction to technology-enhanced, learner-centered approaches. This form of learning emphasizes the development of critical competencies such as digital literacy, problem-solving, creativity, adaptability, and innovation.
Digital technologies enable:

1. Collaborative learning environments through online platforms

2. Access to global knowledge resources
3. Real-time data analysis for decision-making
4. Simulation-based learning for practical experience

Students are expected not only to understand business concepts but also to apply them using digital tools. For instance, learners may use data analytics software to identify market opportunities or AI tools to design marketing strategies. Chigona and Chigona (2013) argue that integrating digital technologies into education enhances student engagement and improves learning outcomes. Additionally, digital entrepreneurial learning encourages self-directed learning, where students take responsibility for their educational progress.

In Africa, digital learning platforms have expanded access to education, particularly in remote areas. However, disparities in access to technology and internet connectivity remain a significant challenge.

Case Studies in Africa

Several African institutions have begun integrating AI and automation into business education, demonstrating the transformative potential of these technologies:

University of Cape Town (South Africa):

The University utilizes virtual business simulations and digital case studies to enhance entrepreneurial decision-making. These tools allow students to manage virtual enterprises and respond to real-time business challenges.

Covenant University (Nigeria):

Incorporates AI-based tools and digital platforms into entrepreneurship education, enabling students to analyze business data and develop innovative solutions.

Strathmore University (Kenya):
Employs data analytics and automated learning systems to track student performance and improve instructional delivery.

Ashesi University (Ghana):
Focuses on integrating technology and leadership training, promoting innovation-driven entrepreneurship among students.
These case studies highlight the growing recognition of AI and automation as essential components of modern business education in Africa. However, adoption remains uneven across institutions due to resource constraints and varying levels of digital readiness.

Theoretical Framework
This study is anchored on the Diffusion of Innovation Theory developed by Rogers (2003). The theory explains how new ideas, technologies, and innovations spread within a social system over time.

According to Rogers, the adoption of innovation is influenced by:

1. Relative advantage (perceived benefits over existing methods)
2. Compatibility (alignment with existing values and practices)
3. Complexity (ease of use)
4. Trialability (ability to test the innovation)
5. Observability (visibility of results)

In the context of this study, AI and automation represent innovations that must be adopted by educational institutions. The theory helps explain why some institutions adopt these technologies quickly while others lag behind.
It also highlights the importance of:

1. Institutional leadership

2. Faculty readiness
3. Policy support
4. Technological infrastructure

Understanding these factors is crucial for designing effective strategies to promote the integration of AI and automation in business education.

Research Methodology

Research Design

This study adopts a conceptual and analytical research design, which involves the systematic review and synthesis of existing literature on AI, automation, and entrepreneurship education. This approach is appropriate because it allows for the exploration of theoretical perspectives, emerging trends, and best practices without relying on primary data collection.

Population and Sample

The population of the study consists of scholarly articles, policy reports, institutional publications, and conference proceedings related to business education, AI, and entrepreneurship in Africa

A purposive sampling technique was used to select relevant materials published between 2015 and 2025, ensuring that the study reflects current developments in technology and education.

Data Collection Methods

Data were collected from:

1. Peer-reviewed academic journals
2. Books and scholarly publications
3. Reports from international organizations (e.g., World Bank, OECD)
4. Institutional case studies
5. Credible online databases

This multi-source approach enhances the reliability and validity of the study.

Data Analysis

A thematic analysis was employed to identify key patterns and themes in the literature. The analysis focused on:

1. AI applications in education
2. Automation tools in entrepreneurship
3. Curriculum integration strategies
4. Pedagogical innovations

This method enabled the identification of gaps, challenges, and opportunities in the integration of AI and automation in African business education.

Discussion of Findings

Impact of AI on Entrepreneurial Learning

The findings indicate that AI significantly enhances entrepreneurial learning by improving students' ability to analyze data, identify opportunities, and make informed decisions. AI tools provide real-time insights, enabling learners to simulate business scenarios and evaluate outcomes effectively (Dwivedi et al., 2021).

Students exposed to AI-driven learning environments demonstrate:

1. Improved critical thinking skills
2. Enhanced innovation capacity
3. Better risk assessment abilities

Integration of AI and Automation in African Institutions

Although some institutions have made progress, the integration of AI and automation in African business education remains limited. Key barriers include:

1. Inadequate digital infrastructure
2. Limited funding
3. Lack of faculty expertise
4. Policy constraints

These challenges hinder the widespread adoption of digital technologies in education.

Strategies for Effective Integration

1. Curriculum Redesign

Curricula should incorporate AI tools, data analytics, and digital business models. Courses should emphasize practical applications and real-world problem-solving.

2. Faculty Development

Continuous training programs should be provided to equip educators with the skills needed to use AI technologies effectively.

3. Policy Support
Governments and institutions should develop policies that promote digital transformation and provide funding for technological infrastructure.

4. Industry Collaboration
Partnerships with technology companies can provide students with hands-on experience and exposure to real-world business environments.

Implications

The integration of AI and automation has far-reaching implications:

1. **Educational:** Enhances teaching and learning effectiveness
2. **Economic:** Promotes innovation and entrepreneurship
3. **Social:** Improves employability and digital inclusion

Limitations

The study is limited by its reliance on secondary data. Future research involving empirical methods such as surveys and interviews could provide deeper insights.

Future Research
Future studies should:

1. Examine specific AI tools in education
2. Conduct cross-country comparative studies
3. Investigate long-term impacts of automation on employment and entrepreneurship

Conclusion

The study concludes that AI and automation are critical drivers of transformation in business education and entrepreneurship. Their integration enhances learning outcomes, fosters innovation, and prepares students for the demands of the digital economy.
For Africa to remain competitive, educational systems must embrace these technologies and adapt to changing global trends.

Recommendations

1. Integrate AI and automation into entrepreneurship curricula.
2. Provide continuous professional development for educators.
3. Invest in digital infrastructure and policy frameworks.
4. Promote industry-academia collaboration.
5. Encourage research and innovation in digital entrepreneurship.

SUB-THEME 3

DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNO-PRENEURSHIP IN AFRICA

REIMAGINING BUSINESS EDUCATION FOR DIGITAL TRANSFORMATION AND TECHNO-PRENEURSHIP SKILL ACQUISITION IN AFRICA: A SYSTEMATIC LITERATURE REVIEW:

Abstract
Digital transformation is reshaping how entrepreneurial competence is taught, learned and practised, yet Business Education programmes across Africa continue to grapple with curricula, infrastructure and staff capacity that lag behind the technologies their graduates are expected to master. This systematic literature review (SLR), undertaken in accordance with the PRISMA 2020 framework, synthesizes evidence from 30 peer-reviewed studies published mainly between 2020 and 2026 to examine how Business Education can be reimagined to support digital transformation and techno-preneurship skill acquisition in Africa. Organized around three research questions and examined through the lens of the Theory of Planned Behaviour, the review identifies six overarching themes: curricular and pedagogical transformation; institutional, infrastructural and leadership enablers; conceptualization of techno-preneurial competencies; the role of artificial intelligence and digital platforms as skill-development tools; access, gender and inclusion; and policy, sustainability and labour-market alignment. Findings show that while digital transformation is expanding opportunities for experiential, technology-mediated entrepreneurship learning, its benefits in Africa remain unevenly distributed because of infrastructural deficits, inconsistent policy implementation, and gaps in educators' own digital competence. The review concludes that reimagining Business Education for techno-preneurship requires coordinated curriculum reform, sustained investment in digital infrastructure and lecturer capacity building, and closer alignment between training institutions, government policy and the labour market. Implications for theory, practice and future research are discussed.
Keywords: *Business Education, Digital Transformation, Techno-preneurship, Skill Acquisition*

Introduction
Some persons have defined Business Education in several ways; some sees Business Education as teacher education, education for secretaries, management education, and lots more. For a better understanding of business education, the concept can be better understood by considering its historical, contemporary and future orientations. Nolan, Hayden, and Malsbary (1967), in Ekpenyoung (2015), described business education as programmes and courses in business subjects commonly offered at the secondary-school level. Popham (1975), sought the views of several individuals on the meaning of business education, and their responses were as follows: a business executive replied, "Business Education is education to produce goods and services." A radical responded that it is "the avenue to enormous profit." One teacher responded with "economic concepts necessary for living in a business economy," while another answered "learning skills to enter a business or distributive job." Business education may therefore be interpreted across historical, contemporary and future contexts as technology, innovation and creativity continue to evolve. This means that the discipline must continually adjust to changing conditions and emerging trends.
Osuala (1989), regarded business education as a vital component of preparing young people for productive life. In 2004, Osuala further explained that business education consists of two broad instructional components: office education, which provides vocational preparation and continuing development for office careers, and general business education, which develops the knowledge and competencies required to manage personal business matters and make effective use of business

services. Njoku (1997), defined Business Education as an area of educational preparation that enables individuals to develop practical skills relevant to everyday life, while Njoku, in NOUN (2020), viewed business education as a programme designed to develop the functional skills, knowledge, attitudes and values that enable individuals to participate effectively in their environment. These definitions represented the field until more recent scholarship extended the concept further.

Bassey (2015), viewed Business Education programme as one whose curriculum is oriented toward developing graduates who can function independently and productively. To Enang and Okute (2019), Business Education develops competencies for specific office responsibilities while also providing the understanding required to engage effectively with business services and practices. Oyerinde, Onajite and Aina (2020), in Ukata and Amini (2022), saw, Business Education as a core component of vocational education intended to prepare learners for entrepreneurship through the development of relevant digital business competencies, making them functional in the society. Iyoha et al. (2023), in Nebolisa and Okeke (2024), described Business Education as structured instruction and training in business operations, including management, finance, marketing and entrepreneurship, aimed at equipping students with the knowledge, competencies and dispositions required to operate effectively within complex business environments to make informed professional decisions.

Business education develops competencies across fields that include Office Technology and Management, Management Information Systems, management, marketing, digital marketing, entrepreneurship, cooperative studies, insurance and accounting. Effective delivery of these components is expected to prepare learners for entrepreneurship and strengthen their digital entrepreneurial capabilities. Business education in the future refers to the purposeful incorporation of emerging digital technologies into teaching and learning so that students are better prepared for contemporary employment. In this vein, Onyeson, Egbute and Okwuokenye (2017), in Oluwo, Soneye and Apetu (2025), described Business Education as a field that combines conceptual knowledge with practical experience to prepare learners for business-related careers, including management, accounting, marketing, finance, entrepreneurship and business law. Over time, the concept has continued to develop in response to shifting economic needs, technological progress and changing educational philosophies.

The NUC Core Curriculum and Minimum Academic Standards, in Edeh and Olumakinwa (2025), describes Business Education as a specialized professional field intended to develop the knowledge, skills and competencies required for employment and career progression in office-related occupations, pedagogical skill for teaching business subjects, and capacity for self-employment or employing others. Within vocational education and training, business education connects theoretical learning with practice by combining general education with specialized preparation in areas such as accounting, entrepreneurship, marketing and office management. Edeh et al. (2025), citing the NUC CCMAS (2023), further noted that the philosophy of the Business Education programme emphasizes developing the knowledge and competencies needed for self-reliance, economic independence, gainful employment, meaningful living and contribution to societal progress. Atah, Nwuso and Bessong (2022), in Edeh et al. (2025), opined that, Business Education is structured to prepare graduates for employment and career development in office-based occupations, to develop expertise in delivering business instruction, and to enable self-employment. The core curriculum minimum academic standards have increasingly oriented business education toward the development of twenty-first-century entrepreneurial and employability skills, including digital citizenship, digital literacy, media literacy, teamwork, multitasking, information literacy, capacity building, adaptability, critical thinking, business analytics, customer service, research, communication, problem-solving and flexibility. Taken together, these conceptions confirm that business education, as a course of study, must continually respond to changing times and emerging trends.

Digital Transformation

Digital transformation represents a far-reaching change in how technology is embedded in everyday activities, with digital systems increasingly underpinning domains such as education and business. Developments in artificial intelligence, the Internet of Things (IoT) and big data are reshaping how people live, work and learn. Park and Kim (2025), describe digital transformation as a broad restructuring of educational ecosystems and value-creation processes driven by the rapid growth of intelligent technologies, including artificial intelligence, big data and learning analytics. Such developments create new possibilities such as personalized learning pathways and real-time formative feedback alongside complex challenges for present-day educational practice. Bouwmans, Lub, Orlowski and Nguyen (2024), note that, accelerating developments in automation, artificial intelligence, big data, cloud computing, robotics and the IoT have transformed organizational operations by

expanding capacities for information processing, storage and retrieval, enabling real-time analysis and supporting gains in productivity, efficiency and quality.

Techno-preneurship Skill Acquisition:
Techno-preneurship can be defined as the ability to effectively use digital technologies to drive business goals and foster innovation, playing a vital role in the development of technology-based enterprises. Among the associated benefits include wider access, stronger learner participation and the development of digital capabilities increasingly required by contemporary entrepreneurs. A major benefit of digital transformation is its capacity to broaden participation in education. Eze et al. (2024), note that, digital technologies can narrow educational inequalities by expanding access to high-quality learning resources that many learners might otherwise be unable to reach, ensuring that aspiring technopreneurs irrespective of location or socio-economic circumstances can develop the knowledge and competencies required for entrepreneurial success. Digital tools can also strengthen student engagement by supporting interactive and immersive learning. Multimedia resources, including videos, podcasts and interactive quizzes, can maintain interest, aid retention and accommodate varied learning preferences, thereby improving inclusion and instructional effectiveness. The integration of digital technologies into Business Education is therefore an important avenue for advancing techno-preneurship and stimulating innovation across African countries. Available digital resources now extend from basic internet connectivity to advanced technologies such as artificial intelligence and virtual reality revolutionizing how entrepreneurship is taught and practised.
The digitalization of entrepreneurship education has become a major development in contemporary education, altering the ways entrepreneurship is taught, learned and applied. It involves embedding digital tools and technologies within curricula to support learning experiences that are more flexible, accessible, interactive and personalized (Othman et al., 2021). This systematic literature review examines how Business Education can be reimagined to support digital transformation and techno-preneurship skill acquisition among African learners. The review synthesizes evidence from 30 recent scholarly studies appearing mainly from 2020 through 2026, with particular attention to Business Education, digital transformation and techno-preneurship skills. The review was guided by three research questions focusing on Business Education, digital transformation, and the techno-preneurship skills required by recipients of Business Education.

Statement of the Problem: Emerging technologies present transformative opportunities for Business Education, enabling students to adapt to future trends associated with digital transformation. Digital transformation opens avenues for reimagining Business Education, enabling students to acquire techno-preneurship skills that lead organizations toward innovation and sustainable growth. However, achieving this vision requires a shift away from traditional pedagogical methods toward embracing innovative digital skills, a shift that involves curriculum, lecturers, students, infrastructure, institutional policy, and the connection between educational institutions and the labour market. Despite the rapid growth of techno-preneurship in Africa, challenges such as low technology adoption in underdeveloped areas, limited access to funding for tech start-ups, gaps in education and digital skills remain prevalent. By addressing this gap, this study integrated existing literature to establish how Business Education can be reimagined to respond to digital transformation and techno-preneurship in Africa.
Purpose of the Review: This systematic literature review aims to integrate recent empirical and scholarly evidence concerning the role of Business Education in promoting digital transformation and techno-preneurship acquisition skill in Africa.
Research Questions: Three research questions guided this systematic literature review:

1. to what extent is Business Education being reimagined and transformed to respond to the changing demands of digital transformation in Africa
2. to what extent does Business Education prepare learners to adapt to techno-preneurship skills in Africa
3. to what extent does Business Education integrate digital transformation for techno-preneurship skill acquisition in Africa

Theoretical Framework
The Theory of Planned Behaviour (TPB) provided the theoretical foundation for this systematic literature review propounded by Ajzen's (1985). TPB is a cognitive framework which holds that, an individual's intention is a central predictor of whether a particular behaviour will be performed (Brookes, 2026). The TPB is highly relevant to understanding entrepreneurial intentions, especially within the realm of digital transformation and techno-preneurship skills acquisition. The theory posits that behavioural intention is

influenced by three principal factors: attitude toward the behaviour, subjective norms and perceived behavioural control. TPB remains a robust lens for this study because the perceived benefits and strengths of digital transformation can shape attitude, subjective norms and perceived behavioural control, thereby shaping intention and subsequent use. Lopes, Cunha, Silva and Martins (2026), note that, in entrepreneurial settings this theory is relevant because, digital transformation can support opportunity exploration, content generation and preliminary market analysis, thereby influencing how individuals evaluate the desirability and feasibility of entrepreneurial action in a digital environments.

Research Methods and Design

This study systematically examines peer-reviewed scholarly evidence on Business Education, Digital Transformation and Techno-preneurship Skill Acquisition. The review procedure was structured in accordance with PRISMA 2020 (see Supplementary Materials, figure 1, PRISMA Checklist) and proceeded through four stages: identification, screening, eligibility assessment and final inclusion of relevant studies (Figure 1).

Identification: The literature search was conducted through the Google Scholar database, covering the period 2020 to 2026. The search strategy combined key expressions including "Business Education", "Digital Transformation" and "Techno-preneurship Skill Acquisition", combined with Boolean operators (AND/OR) and applied to titles, abstracts and keywords. Additional records were sought by manually examining the reference lists of retrieved articles through a snowballing approach in order to identify additional eligible studies not captured by the database search terms.

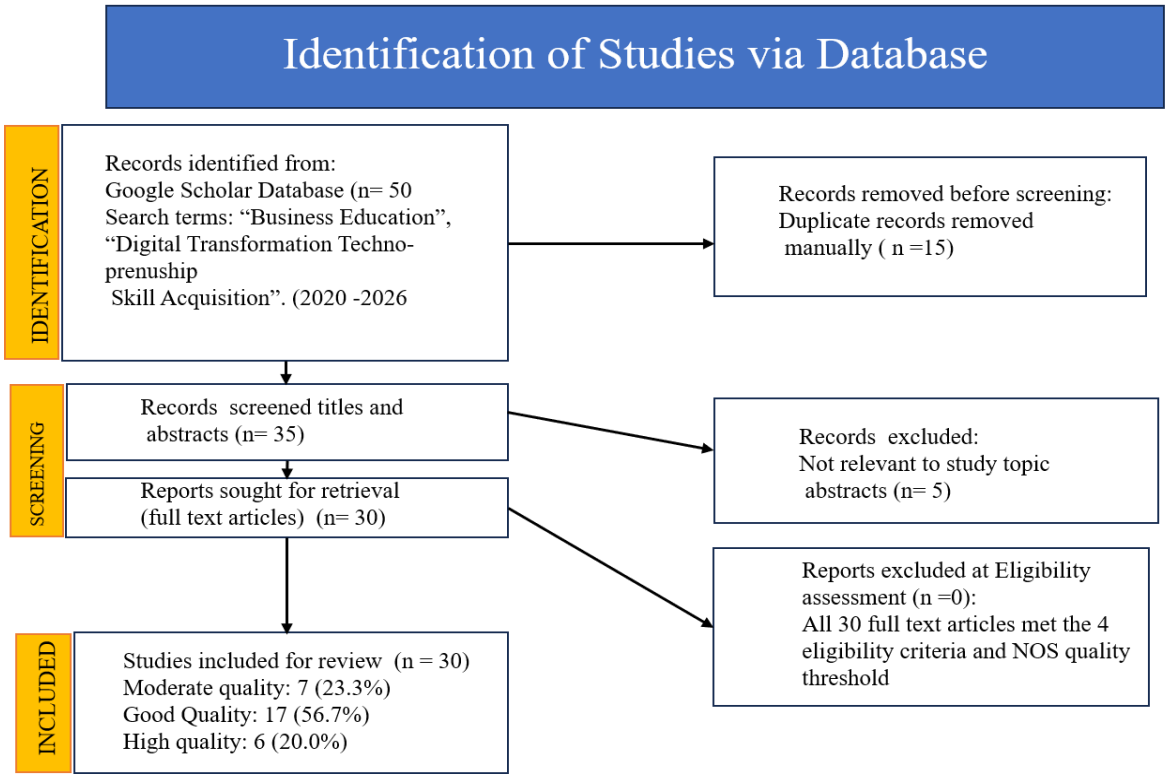

Figure 1. PRISMA 2020 flow diagram outlining systematic review process.

Screening

The search produced 50 records. Manual removal of 15 duplicates reduced the pool to 35. Two research assistants then independently assessed the titles and abstracts for eligibility. Five records were excluded because they were not sufficiently relevant to the topic, leaving 30 articles for full-text assessment. Agreement between the reviewers was evaluated with Cohen's κ and produced a coefficient of 0.88, reflecting a high level of inter-rater agreement (κ ≥ 0.75). Differences concerning three records were settled through discussion and, when required, a final determination by a third researcher.

Eligibility

All 30 records that advanced beyond screening were obtained in full text and evaluated using four eligibility criteria: relevance to the review topic, methodological quality, implications for educational theory or practice, and the specificity with which digital technologies were applied. Two researchers

assessed the papers independently, and differences concerning two articles were resolved by discussion and consensus. Study quality was subsequently appraised with the Newcastle-Ottawa Scale (NOS): 7 studies (23.3%) were rated moderate (score ≤ 6), 17 (56.7%) were rated good (score = 7), and 6 (20.0%) were rated high quality (score ≥ 8). Each of the 30 studies satisfied the minimum quality requirement and was retained for analysis.

Inclusion

At the inclusion stage, no additional study was removed for inadequate educational relevance, uncertain peer-review status or methodological weakness. Consequently, the 30 studies meeting both the eligibility and quality requirements formed the final review dataset. Supplementary Table S2 provides details of the included studies.

Data Extraction and Synthesis

For the final body of studies, two researchers independently extracted information with a pre-established codebook. The extracted fields covered: (1) author(s) and publication year, (2) research design and analytical procedures, (3) sample characteristics, (4) digital technologies examined, and (5) major educational outcomes and entrepreneurial-competency variables. Data organization was checked through repeated comparison and consensus between the researchers.

The thematic synthesis applied Braun and Clarke's six-stage process: becoming familiar with the data, generating initial codes, identifying candidate themes, reviewing those themes, defining and naming them, and preparing the report. MaxQDA 24 supported visualization of coding frequencies and relationships among categories. The researchers held repeated discussions and refinement sessions to strengthen interpretive agreement. Saturation was considered achieved when additional analysis produced no new themes; six broad themes accompanied by fourteen sub-themes were then finalized. Supplementary Table S3 presents the detailed thematic structure with illustrative examples.

Risk of Bias Assessment

The quality of the included studies was assessed using a modified Newcastle Ottawa Scale (NOS). Evaluation criteria were adapted as follows: (1) the clarity and representatives of sampling procedures, including the absence of exposure bias in the comparison group; (2) the control of major confounding variables; and (3) the reliability and validity of measurement tools, procedures to prevent observer bias, and the completeness of outcome reporting. Each item was rated on a scale of 0-3 points. Based on the total score, studies were categorized as high quality (≥7 points), moderate quality (4–6 points), or low quality (<4 points). The overall average score across studies was 7.2 (±1.1).

Data Analysis

Data analysis was conducted in alignment with the study's three research questions (RQs), with analytical categories structured accordingly. First, in response to RQ1, the analysis explored structural transformations in the educational landscape induced by digital transformation, particularly their contextual and environmental implications for entrepreneurship education. Second, addressing RQ2, the review investigated how entrepreneurial competencies are conceptualized, categorized and interrelated within the framework of digital transformation. Third, in relation to RQ3, the analysis identified empirical cases involving the application of digital technologies such as AI, large language models (LLMs) and online collaborative platforms to the development of entrepreneurial competencies, and assessed their educational effectiveness.

Results

The thematic synthesis of the 30 included studies produced six broad themes accompanied by fourteen sub-themes, distributed across the three research questions as summarized in Table 1 and discussed in turn below.

Theme 1: Curricular and Pedagogical Transformation in Business Education (RQ1)

A recurring finding across the reviewed literature is that Business Education curricula are being actively redesigned to accommodate digital transformation. Zeng, Chieng and Liu (2024) propose a conceptual curriculum development framework that bridges theory and practice for digital transformation, while Kamsker and Slepcevic-Zach (2021) examine what the digital change of vocational training demands of Business Education in preparing students for future labour-market challenges. In the Nigerian context specifically, Ufondu, Obi and Chiedozie (2023), document the digital transformation of Business Education programmes in Nigerian universities for twenty-first-century skill acquisition, Wahab and Akintade (2025), analyse the incorporation of digital technologies within entrepreneurship education, and Ogwunte, Okah and Micah (2026), map emerging trends and challenges confronting Business Education in Rivers State universities. Arya (2025), similarly frames digital transformation in Business Education as preparation for the future of work. Collectively, these studies indicate that curricular reform is progressing through the redesign of course content, the introduction of digital tools into instructional

delivery, and closer attention to employability outcomes that, reform is proceeding faster in policy documents than in classroom practice.

Theme 2: Institutional, Infrastructural and Leadership Enablers of Digital Transformation (RQ1)

A second cluster of studies situates digital transformation at the institutional rather than the classroom level. Benavides, Tamayo Arias, Arango Serna, Branch Bedoya and Burgos (2020), conducted a systematic review examining digital transformation across higher education institutions and identify governance, infrastructure and organizational culture as decisive factors. Rof, Bikfalvi and Marques (2020, 2023), examine digital transformation as a driver of business-model innovation in higher education and the associated tensions institutions must overcome to sustain it, while Pridmore and Godin (2021), link business process management with digital-transformation outcomes in higher education. Leadership emerges as a distinct enabler: Cheng (2026) models how digital leadership by principals and the prevailing school digital culture together influence organizational digital agility and digital transformation in secondary education, and Kikomeko (2026), reports that, artificial intelligence adoption in strategic management improved organizational performance in a Ugandan university case study. Al-Abdallat, Al-Abdallat and Al-Abdallat (2026), and Saeed and Taher (2026), both find that, faculty and administrators regard institutional digital transformation as still uneven, with infrastructural and change-management gaps constraining implementation. At continental scale, Kangwa, Msafiri, Charles and Antony (2026), argue that advancing SDG4 through systemic digital transformation in African higher education requires coordinated investment across infrastructure, policy and staff capacity. A conclusion consistent with the Nigeria-specific findings of Nebolisa and Okeke (2024), Edeh and Olumakinwa (2025), Atah, Onwubuya and Bessong (2024) and Oluwo, Soneye and Apetu (2025), on the implementation gaps affecting the Core Curriculum Minimum Academic Standards applicable to Business Education.

Theme 3: Conceptualizing Techno-preneurial Competencies (RQ2)

The second research question is addressed most directly by studies that conceptualize and classify the competencies digital transformation demands of entrepreneurs. Park and Kim (2025), in a systematic review addressing entrepreneurial competencies within the digital-transformation era, synthesize the field into digital literacy, adaptive innovation and opportunity-recognition competency clusters. Bouwmans, Lub, Orlowski and Nguyen (2024), developed a framework of digital-transformation skills through systematic literature review, distinguishing technical, cognitive and socio-behavioural skill dimensions. Country-specific applications of these frameworks appear in Masenya's (2021), analysis of technopreneurship development as a digital strategy for youth self-employment, in Smidt and Jokonya's (2023), framework for developing technopreneurs within South Africa's digital agriculture value chains. Musa, Slamet and Abubakari (2025), extended this conceptual work empirically, showing that gender and educational level both moderate technopreneurial skills development in higher education.

Theme 4: AI, Digital Platforms and Emerging Technologies as Skill-Development Tools (RQ3)

A substantial and rapidly growing body of literature examines specific digital technologies as mechanisms for building entrepreneurial and techno-preneurial competence directly addressing RQ3. Bell and Bell (2023), discuss entrepreneurship education within the emerging context of generative artificial intelligence, and Lopes, Cunha, Silva and Martins (2026), showed how digital competencies shape entrepreneurial success in AI-powered ventures, with implications for how attitude and perceived behavioural control (per the TPB) are formed around AI tools. Cantú-Ortiz, Galeano Sánchez, Garrido, Terashima-Marin and Brena (2020), propose an AI-based educational strategy intended to support digital transformation, and Duan (2026), describes a teaching approach that integrates deep learning and case analysis for entrepreneurship education in an increasingly intelligent digital environment. At the level of specific market-facing skills, Ismiyanti et al. (2026), find that, technopreneurship training enhances student-run MSMEs' competitive edge through digital marketing, while Zulkarnaen Khidzir, Mat Daud and Hamid (2023), show how creative techno-preneurship can be accelerated through innovative design and technology integration. Broader smart-education infrastructure is illustrated by Pan, Ren, Peng, Liu and Zeng's (2026), analysis of nearly a thousand smart-education cases in China, and by Demartini, Benussi, Gatteschi and Renga's (2020), account of Italy's "Riconnessioni" digital-transformation project, both offering models, if not direct African evidence, for how large-scale technology-enabled skill development can be organized.

Theme 5: Access, Gender and Inclusion in Techno-preneurship Skill Acquisition (RQ2)

A fifth theme concerns who benefits from digital-transformation-enabled business education. Emah, Doneys, Kusakabe and Pathak (2025), apply a gender perspective to TVET skill development and pathways to employment in Nigeria, finding persistent disparities in outcomes. Musa, Slamet and Abubakari (2025), similarly, report gender- and education-level-based variation in technopreneurial

skills development. Studies focused on Generation Z learners. Hasan, Januddin and Tahir (2026), on the mediating power of digital business and financial literacy in technopreneurial intention, and Hasan, Nurhaliza, Nurjannah, Melati and Dewi (2026), on self-directed entrepreneurship education and digital literacy suggest that, younger cohorts show stronger baseline digital fluency but still require structured educational scaffolding to convert that fluency into venture-relevant competence. Gupta and Jeswal (2026), extended the inclusion lens to employability, examining how entrepreneurship education develops employability skills among Indian youth, a comparison that underscores how much variation exists in institutional support across emerging economies.

Theme 6: Policy, Sustainability and Labour-Market Alignment (RQ3)

The final theme links digital transformation and techno-preneurship education to policy and sustainability outcomes. Bello and Zakari (2026), argue that, digital economy and techno-preneurship-oriented economics education can advance sustainable development, poverty reduction and global prosperity in Nigeria, while Ogongo, Oduwole, Medetaji and Ehinmonorin (2025), trace the impact that digital technology has on entrepreneurship and innovation among business education graduates in Lagos State. Mohammed, Mustapha and Lawan (2025), provided firm-level evidence that digital transformation and technological orientation improve the performance of small and medium enterprises, and Wu, Zhu and Qu (2024), drawing on the China General Social Survey, confirm a positive relationship between digital technology use and entrepreneurship at national scale. Arce Paul (2026), models digital transformation, innovation capability and sustainable entrepreneurial learning structurally in higher education, and Xiao and Dahlstrand (2023), showed how skill-biased technology acquisition shapes human-capital development and employee mobility within small technology firms throgh a labour-market dynamic with direct relevance for how Business Education graduates are absorbed into technopreneurial employment. Baloyi and Obokoh (2026), framed technopreneurship as a sustainable employment pathway for youth in South Africa, and cross-cutting review evidence from Kissoka (2026), on training-needs assessment and Mwasi and Wanami (2026), on pedagogical and institutional factors influencing TVET skills acquisition in Kenya reinforces that policy coherence and institutional readinessare not technology availability alone but determine whether digital transformation translates into usable techno-preneurship skills.

Summary of Findings

Theme	Focus	Illustrative Studies
RQ1	Curricular & pedagogical transformation	Zeng et al. (2024); Ufondu et al. (2023); Wahab & Akintade (2025); Ogwunte et al. (2026); Arya (2025)
RQ1	Institutional, infrastructural & leadership enablers	Benavides et al. (2020); Rof et al. (2020, 2023); Cheng (2026); Kangwa et al. (2026); Saeed & Taher (2026)
RQ2	Conceptualizing techno-preneurial competencies	Park & Kim (2025); Bouwmans et al. (2024); Masenya (2021); Smidt & Jokonya (2023)
RQ3	AI & digital platforms as skill-development tools	Bell & Bell (2023); Lopes et al. (2026); Cantú-Ortiz et al. (2020); Ismiyanti et al. (2026)
RQ2	Access, gender & inclusion	Emah et al. (2025); Musa et al. (2025); Hasan et al. (2026a, 2026b); Gupta & Jeswal (2026)
RQ3	Policy, sustainability & labour-market alignment	Bello & Zakari (2026); Mohammed et al. (2025); Wu et al. (2024); Baloyi & Obokoh (2026)

Across all six themes, a consistent pattern emerges: digital transformation is expanding the range of tools available for techno-preneurship skill acquisition, but the realization of this potential in African contexts is bottlenecked less by technology itself than by curriculum lag, uneven institutional infrastructure, gaps in educator digital competence, and inconsistent policy implementation.

Discussion

Theoretical Implication

Through the Theory of Planned Behaviour, the findings suggest that digital transformation operates on all three antecedents of entrepreneurial intention identified by Ajzen (1985). Exposure to AI-powered tools, digital marketing platforms and generative-AI applications (Theme 4) shapes attitude toward

techno-preneurial behaviour by making entrepreneurial action feel more achievable and less resource-intensive. Institutional culture, leadership and peer norms around digital adoption (Theme 2) function as subjective norms that either encourage or discourage students from pursuing digital ventures. Curriculum design and access to infrastructure (Themes 1, 5 and 6) shape perceived behavioural control by determining whether students believe they possess the competence and resources to act on entrepreneurial intent. This synthesis therefore extends TPB's application beyond individual psychology to the institutional level: for African Business Education, attitude, norms and perceived control are not purely individual constructs but are actively constructed or constrained by curriculum, infrastructure and policy choices made at the institutional and national level.

Practical Implications

For curriculum planners, the review suggests that reimagining Business Education for techno-preneurship requires embedding digital tools (AI applications, digital marketing platforms, e-commerce systems, data analytics) directly into core Business Education courses rather than treating digital literacy as a stand-alone add-on module. For institutional leaders, the consistent finding that leadership and organizational culture shape digital transformation outcomes (Theme 2) imply that, technology investment alone is insufficient without deliberate change management and lecturer capacity building. For policymakers, the recurring gap between the Core Curriculum Minimum Academic Standards and their classroom implementation in Nigerian universities (Theme 1; Theme 2) points to a need for implementation monitoring, not just standard-setting. For labour-market alignment, the review's Theme 6 findings suggest that techno-preneurship education is most effective for employability and venture creation when institutions build structured links to industry, funding bodies and digital economy initiatives rather than treating skill acquisition as purely classroom-bound.

Research Synthesis and Future Directions

Drawing together evidence from the three research questions, the review indicates that Business Education in Africa is in a transitional rather than a transformed state: reform is visible in policy documents, curriculum frameworks and pilot initiatives (RQ1), and there is a growing conceptual consensus on what techno-preneurial competence entails (RQ2), but the systematic integration of digital transformation into everyday teaching and assessment practice (RQ3) remains the weakest link, constrained by infrastructure, funding and educator readiness. This pattern is broadly consistent across the Nigerian-focused studies and the wider African and comparative-international literature reviewed, suggesting the transitional gap is structural rather than institution-specific. Future research would benefit from more African-based empirical (rather than conceptual or review) studies that measure actual learning and venture-creation outcomes from digitally integrated Business Education curricula, longitudinal studies tracking graduates' techno-preneurial trajectories, and comparative studies examining why some African institutions have progressed further than others in translating digital transformation policy into classroom practice.

Conclusions /Summary

This systematic literature review synthesized 30 studies to examine how Business Education can be reimagined for digital transformation and techno-preneurship skill acquisition in Africa. The evidence shows that digital transformation is reshaping the conceptual and curricular foundations of Business Education (RQ1), that a coherent set of techno-preneurial competencies is emerging in the literature (RQ2), and that specific digital technologies, particularly, AI-based tools and digital platforms are being applied with promising but still limited evidence, to build these competencies in African higher education contexts (RQ3). Across all three questions, institutional infrastructure, educator capacity, and policy implementation consistently emerged as the factors separating stated ambition from realized outcomes.

Research Integration, Limitations and Future Research Directions

Integrating these findings, the review recommends that Business Education programme in Africa pursue curriculum reform, lecturer digital-capacity building, infrastructure investment and stronger institution and industry policy linkages as a coordinated package rather than an isolated interventions, since the reviewed evidence suggests that progress on only one of these fronts is insufficient to produce measurable techno-preneurship outcomes. The review is subject to several limitations. First, the search was restricted to Google Scholar and to publications from 2020 through 2026, which may have excluded relevant earlier or non-indexed African scholarship; future reviews should extend the search strategy to additional databases, including Scopus, Web of Science and African Journals Online to strengthen comprehensiveness. Second, the review draws on a mix of conceptual, review-based and empirical studies, and relatively few of the included studies report African, empirical, classroom-level outcome data specifically on techno-preneurship skill acquisition gap, this review itself highlights rather than resolves. Third, as with any thematic synthesis, the interpretation of themes involved a degree of researcher judgement, mitigated here through dual independent coding, inter-rater reliability checks,

and NOS-based quality appraisal, but not eliminated. Future research should prioritize empirical, outcome-focused studies conducted within African Business Education institutions, comparative cross-country research within Africa, and longitudinal tracking of graduates' techno-preneurial outcomes, in order to move the field from conceptual consensus toward evidence-based curricular reform.

DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNOPRENEURSHIP AMONG UNDERGRADUATES OF BUSINESS EDUCATION IN CROSS RIVER STATE.

BY

OTUM, NNEKA IHEKAUGWU (Ph.D); INGWE, MARIA
Department Of Business Education
Faculty Ofvocational And Entrepreneurial Education
University Of Calabar.
otumnneka@gmail.com

Abstract

This study examined the relationship between digital transformation, digital skills acquisition and technopreneurial skills among undergraduates of Business Education in Cross River State. Specifically, the study examined the extent of digital transformation, the extent to which digital skills acquisition enhances technopreneurial skills, and the relationship between digital transformation and technopreneurial skills among the respondents. Three research questions and three null hypotheses guided the study. A correlational research design was adopted for the study. The population comprised 200 undergraduates of Business Education in Cross River State, and the entire population was studied. Data were collected using a structured questionnaire, while mean and standard deviation were used to answer the research questions. Pearson Product-Moment Correlation was used to test the null hypotheses at the 0.05 level of significance, with a criterion mean of 2.50. The findings revealed that digital transformation was evident to a high extent, with a cluster mean of 3.05 and standard deviation of 0.53. Digital skills acquisition was also rated high, with a cluster mean of 3.07 and standard deviation of 0.53, while technopreneurial skills recorded a cluster mean of 3.08 and standard deviation of 0.53. The hypothesis tests revealed significant positive relationships between digital transformation and digital skills acquisition ($r = .419$, $p < .001$), digital skills acquisition and technopreneurial skills ($r = .527$, $p < .001$), and digital transformation and technopreneurial skills ($r = .405$, $p < .001$). Accordingly, all three null hypotheses were rejected. The study concludes that digital transformation, digital skills acquisition and technopreneurial skills are positively related among Business Education undergraduates in Cross River State. It recommends, among others, stronger integration of digital technologies into Business Education, improved access to digital infrastructure, practical digital skills training, and greater emphasis on technology-based venture development and technopreneurship education.

Keywords: digital transformation, digital skills acquisition, technopreneurial skills, Business Education, undergraduates, technopreneurship

Introduction

The twenty-first century has witnessed remarkable advances in digital technologies, resulting in profound changes in the way individuals, organisations and economies operate. Technologies such as artificial intelligence (AI), cloud computing, big data analytics, the Internet of Things (IoT), blockchain, mobile applications and digital communication platforms have transformed business processes, service delivery, communication, knowledge management and value creation. These technologies have not only changed the tools used in economic activities but have also altered the competencies required to participate effectively in contemporary workplaces and entrepreneurial environments. Consequently, individuals and organisations are increasingly expected to possess the digital knowledge, technical competencies, adaptability, creativity and problem-solving abilities required to function effectively in a technology-driven economy. The educational sector has equally experienced this transformation, as higher education institutions increasingly integrate digital technologies into teaching, learning, assessment, research and administrative activities. Universities are therefore expected to move beyond the transmission of theoretical knowledge to the development of digital competencies, innovation

capabilities, problem-solving skills and entrepreneurial mindsets that can prepare graduates for the changing world of work (Musa & Auwalu, 2024).

The growing integration of digital technologies into organisational activities has given rise to what is broadly described as digital transformation. Digital transformation is more comprehensive than the mere adoption or use of computers and other electronic devices. It involves a fundamental reconfiguration of organisational processes, capabilities, practices and value-creation mechanisms through the strategic application of digital technologies (Egodawele et al., 2022). Val in Zeng, Chieng and Liu (2024) defined digital transformation as a fundamental change process enabled by the innovative use of digital technologies, together with the strategic leveraging of resources and capabilities to improve an entity and redefine its value proposition to stakeholders. From this perspective, digital transformation represents an ongoing process through which organisations and institutions use technology to improve performance, enhance innovation, expand opportunities and respond to changing environmental demands. Technology and digitalisation-based industries continuously develop tools that promote business activities, strengthen human resources and enable competitive technopreneurs to optimise creativity, innovation, knowledge, experience and skills for improved productivity. Digital transformation has therefore become an important driver of innovation, productivity, entrepreneurship and economic development in both developed and developing economies (Musa & Auwalu, 2024).

The implications of digital transformation are particularly significant within higher education because universities serve as major institutions for developing the human capital required by contemporary economies. The increasing use of digital learning management systems, online learning platforms, virtual classrooms, electronic resources, collaborative technologies and digital assessment tools has changed how students acquire knowledge and develop practical competencies. Rather than relying exclusively on conventional classroom instruction, students can now access current information, collaborate across geographical boundaries, engage with digital content and develop competencies through technology-supported learning environments. This transformation creates opportunities for Business Education students to acquire skills that are directly relevant to modern business practices. However, the availability of digital technologies alone does not guarantee meaningful skills development. Students must have regular opportunities to use these technologies in authentic academic, business and entrepreneurial contexts. Thus, effective digital transformation in higher education should be understood not simply in terms of technological availability but also in terms of its capacity to facilitate meaningful learning, competence development, innovation and practical application.

One of the important areas in which digital transformation has influenced contemporary economic activities is entrepreneurship. Traditional entrepreneurship generally emphasises opportunity identification, resource mobilisation, innovation and value creation for the establishment and growth of business ventures. However, the increasing digitalisation of economic activities has changed the nature and processes of entrepreneurship. Entrepreneurs now rely on digital technologies for identifying market opportunities, developing products and services, communicating with customers, conducting market research, promoting products, processing payments, managing operations and accessing markets beyond their immediate geographical locations. Social media, e-commerce platforms, digital payment systems, mobile technologies, cloud-based applications and other digital tools have consequently created new possibilities for establishing and expanding businesses. This transformation has contributed to the emergence of technopreneurship as an important dimension of contemporary entrepreneurship.

Technopreneurship refers to the systematic application of technological knowledge, digital tools, experiences, skills and entrepreneurial competencies in identifying opportunities, creating ventures and achieving business growth and expansion. According to Atanasova in Shahrim, Azman, Sufian and Jamel (2026), technopreneurship involves entrepreneurial activities in which digital technologies constitute a core platform for opportunity recognition, venture creation and business growth. It therefore represents the intersection between technology and entrepreneurship, where technological knowledge and entrepreneurial thinking are combined to create innovative products, services, processes and business models. Technopreneurs do not merely use technology as an operational tool; they identify ways in which emerging technologies can be transformed into economic opportunities and innovative business solutions. The ability to combine technological competencies with creativity, opportunity recognition, risk-taking, problem-solving and business management is consequently becoming increasingly important for graduates entering the contemporary labour market.

The growth of technopreneurship makes digital skills acquisition an essential component of contemporary education. Skills acquisition refers to the systematic process through which individuals

develop practical, technical, cognitive, managerial and entrepreneurial competencies required to perform effectively in employment or establish and manage enterprises. Within the digital economy, these competencies extend beyond basic computer literacy to include digital communication, information search and evaluation, data management, digital marketing, business analytics, software application, online collaboration, content creation, problem-solving, innovation and creative thinking. Okute et al. (2023) noted the importance of such competencies in enabling graduates to identify opportunities within the digital economy and transform innovative ideas into viable business ventures. Thus, digital skills acquisition provides an important foundation upon which students can develop the technological confidence and practical capabilities necessary for technopreneurship.

The relationship between digital skills and technopreneurship is particularly relevant to Business Education. Business Education occupies a strategic position in preparing individuals for employment, self-employment and participation in business and economic activities. Traditionally, the programme has focused on areas such as accounting, commerce, office technology, marketing and business management. However, the rapid digitalisation of business operations has expanded the knowledge and competencies expected of Business Education graduates. Contemporary Business Education increasingly requires exposure to digital literacy, electronic commerce, digital marketing, financial technology (FinTech), business analytics, cloud computing, cybersecurity awareness and other technology-enabled business practices. Ufondu et al. (2023) and Enang (2024) emphasised the need for Business Education curricula to respond to changing technological and labour-market demands. The implication is that Business Education can no longer be effectively delivered through predominantly traditional approaches if graduates are to function competitively in technology-driven business environments.

The integration of digital transformation into Business Education therefore provides an opportunity to connect classroom learning with emerging workplace and entrepreneurial realities. Through meaningful exposure to digital technologies, students can learn to search for and evaluate business information, communicate with customers through digital platforms, promote products and services online, use digital payment systems, create business content, analyse business problems and identify technology-enabled opportunities. Such experiences can strengthen students' confidence and readiness to apply technology in business settings. More importantly, they can help students move from being passive consumers of technology to becoming innovative users and creators of technology-enabled business solutions. Digital transformation can thus contribute to the development of the digital competencies upon which technopreneurial skills are built.

Empirical evidence supports the importance of digital transformation and digital skills in preparing Business Education students for contemporary economic activities. Ekoh-Nweke and Ikpeama (2024) found that digitalisation significantly enhances entrepreneurial and managerial skills acquisition among Business Education students in public universities in South-East Nigeria. Their findings suggest that exposure to digital technologies can improve students' readiness for self-employment and their ability to function effectively in digitally enabled workplaces. Similarly, David et al. (2024) reported that digitalisation of skills acquisition improves the employability of Business Education graduates by equipping them with competencies required in modern organisations and digital enterprises. These findings indicate that digital transformation has implications that extend beyond academic learning to students' employability and entrepreneurial preparedness.

The role of digital skills in entrepreneurial development is further demonstrated by Falobi (2023), who observed that Business Education students with digital entrepreneurial skills are better positioned to exploit opportunities in areas such as online business, digital marketing, e-commerce and technology-enabled service delivery. Enang (2024) similarly emphasised that digital entrepreneurial competencies have become indispensable for Business Education graduates because employers and contemporary business environments increasingly demand technology-oriented competencies for productivity and innovation. In a related study, Okiridu and Smart (2024) investigated digital entrepreneurial skills acquisition and self-empowerment among postgraduate Business Education students in Rivers State Universities. Using a correlational research design and Pearson Product-Moment Correlation, the study found that data visualisation skill and app development skill acquisition enhanced the self-empowerment of postgraduate Business Education students. The finding provides further evidence that specific digital competencies can contribute to students' capacity for self-reliance and productive engagement.

Evidence from outside the university student population also reinforces the connection between digital skills and entrepreneurial engagement. Adeniyi, Fasanmi and Olawemo (2024) examined the relationship between digital skills acquisition and entrepreneurial interest among business owners in Ekiti State. Using a descriptive survey design and a sample of 1,200 respondents, the study found a

significant relationship between digital skills acquisition and the intention to start a business, as well as between digital skills acquisition and the nature of enterprise engagement among business owners. The finding demonstrates that digital skills are relevant not only to students and graduates but also to individuals already engaged in business activities. It further suggests that the development of digital competencies can strengthen entrepreneurial orientation and participation in technology-enabled business activities.

The importance of digital transformation and technopreneurship is particularly pronounced within the Nigerian context. The Federal Government has increasingly recognised entrepreneurship education and digital skills development as important mechanisms for addressing graduate unemployment, encouraging self-employment, promoting innovation and supporting economic diversification. Entrepreneurship education has consequently been incorporated into university curricula to encourage students to develop entrepreneurial competencies and consider enterprise creation as an alternative or complement to conventional wage employment. Nevertheless, the persistence of graduate unemployment and underemployment suggests that curricular inclusion alone may not be sufficient. Many graduates may still lack the practical digital competencies, technological confidence and entrepreneurial capabilities required to identify opportunities and establish sustainable technology-driven businesses. This situation makes it necessary for higher education institutions to strengthen the practical connection between digital transformation, skills acquisition and entrepreneurial development.

Despite the opportunities presented by digital transformation, its effective implementation in Nigerian higher education continues to face challenges. Inadequate ICT infrastructure, unreliable internet connectivity, unstable electricity supply, insufficient digital learning resources, inadequate funding, outdated curricula, limited practical exposure and low digital competence among some educators may constrain the effective integration of technology into teaching and learning (Ufondu et al., 2023; Musa & Auwalu, 2024). These challenges can limit students' opportunities to acquire the practical competencies required for technology-driven entrepreneurship. Where students have limited access to appropriate digital tools or encounter digital technologies primarily as theoretical concepts rather than practical instruments, their capacity to translate digital knowledge into business innovation may remain constrained. Consequently, the effectiveness of digital transformation should be assessed not only by the presence of technology but also by its contribution to students' actual skills development and entrepreneurial preparedness.

The situation is also relevant to Cross River State, where digital technologies are increasingly becoming part of educational, commercial, banking, governmental and small-business activities. Business Education institutions in the state have a responsibility to prepare graduates whose competencies correspond with these emerging realities. As businesses increasingly rely on digital platforms for marketing, communication, payment, customer engagement and service delivery, Business Education undergraduates require opportunities to develop practical competencies that enable them to participate effectively in such environments. They also need to develop the capacity to recognise technology-enabled opportunities and transform them into viable business ideas. Therefore, integrating digital transformation into Business Education has the potential to contribute significantly to the development of students' digital and technopreneurial competencies.

However, concerns remain about whether the existing level of digital transformation within Business Education programmes in Cross River State is sufficiently connected to the acquisition of skills required for technopreneurship. Challenges such as inadequate ICT facilities, unstable electricity supply, poor internet connectivity, insufficient digital learning resources and limited collaboration between educational institutions and industry may restrict students' practical exposure to technology-driven business activities. These conditions may create a gap between the digital competencies students are expected to acquire and the competencies they actually need to create and manage technology-based enterprises. Thus, there is a need for empirical evidence concerning the extent to which digital transformation is associated with digital skills acquisition and the extent to which those skills are connected with students' technopreneurial capabilities.

The available empirical literature provides useful evidence on digitalisation, digital skills, employability, entrepreneurial interest and entrepreneurship among Business Education students and other business-related populations. However, relatively limited attention has been given specifically to the interconnected relationship among digital transformation, digital skills acquisition and technopreneurial skills among undergraduates of Business Education in Cross River State. Existing studies have examined related issues in other geographical contexts, among postgraduate students, business owners or in relation to employability and self-empowerment. The contextual evidence required to understand the situation among undergraduate Business Education students in Cross River

State remains comparatively limited. This creates a contextual and empirical gap that warrants further investigation.

It is against this background that the present study examines the relationship between digital transformation, digital skills acquisition and technopreneurial skills among undergraduates of Business Education in Cross River State. Specifically, the study seeks to establish the extent of digital transformation and digital skills acquisition among the students, determine the extent to which students demonstrate technopreneurial skills, and examine the relationships between digital transformation, digital skills acquisition and technopreneurial skills. The study is expected to provide empirical evidence that can guide curriculum improvement, strengthen digital skills development, support educational policy and inform strategies for preparing Business Education graduates for employment, self-employment, innovation and technology-driven entrepreneurship.

Statement of the Problem

The rapid advancement of digital technologies has significantly transformed the nature of education, business, employment and entrepreneurship. Technologies such as artificial intelligence, cloud computing, social media, e-commerce platforms, digital payment systems and other emerging technologies have created new opportunities for individuals to acquire skills and establish technology-driven businesses. Consequently, universities are increasingly expected to equip students with relevant digital and entrepreneurial competencies that can enable them to become innovative, self-reliant and employable in a technology-driven economy. Business Education is particularly important in this regard because its curriculum is designed to develop students' knowledge and skills in business, office technology, entrepreneurship, management and related areas. However, the extent to which undergraduates of Business Education are acquiring the digital and entrepreneurial skills required for successful technopreneurship remains a concern. Some students may have access to digital technologies without necessarily possessing the practical competencies required to use them for identifying business opportunities, developing digital products and services, marketing online, managing digital businesses and creating innovative technology-based ventures.

In Cross River State, undergraduates of Business Education are expected to graduate with competencies that can enable them to participate effectively in the emerging digital economy. Nevertheless, challenges such as inadequate access to digital infrastructure, limited practical exposure to emerging technologies, insufficient opportunities for technology-based entrepreneurship training and gaps in digital business skills may restrict students' ability to translate their academic knowledge into viable technopreneurial activities. If these gaps persist, graduates may experience difficulties competing in an increasingly technology-driven labour market and may remain dependent on conventional employment opportunities. The problem, therefore, is that despite the growing importance of digital transformation and technopreneurship, it is not sufficiently clear whether undergraduates of Business Education in Cross River State are acquiring the digital, entrepreneurial and technological skills necessary to take advantage of emerging technology-based business opportunities. It is against this background that this study investigated digital transformation and skills acquisition for technopreneurship among undergraduates of Business Education in Cross River State.

Objectives of the Study

The study examined **Digital Transformation and Skills Acquisition for Technopreneurship among Undergraduates of Business Education in Cross River State**. Specifically, the study sought to:

1. examine the extent to which digital transformation influences digital skills acquisition among undergraduates of Business Education in Cross River State;
2. determine the extent to which digital skills acquisition enhances technopreneurial skills among undergraduates of Business Education in Cross River State; and
3. examine the relationship between digital transformation and the acquisition of technopreneurship skills among undergraduates of Business Education in Cross River State.

Research Questions

The following research questions guided the study:

1. To what extent does digital transformation influence digital skills acquisition among undergraduates of Business Education in Cross River State?
2. To what extent does digital skills acquisition enhance technopreneurial skills among undergraduates of Business Education in Cross River State?

3. What relationship exists between digital transformation and the acquisition of technopreneurship skills among undergraduates of Business Education in Cross River State?

Research Hypotheses

The following null hypotheses were formulated in line with the objectives and research questions of the study:

H_{01}: Digital transformation has no significant influence on digital skills acquisition among undergraduates of Business Education in Cross River State.

H_{02}: Digital skills acquisition has no significant influence on technopreneurial skills among undergraduates of Business Education in Cross River State.

H_{03}: There is no significant relationship between digital transformation and the acquisition of technopreneurship skills among undergraduates of Business Education in Cross River State.

Methods

The study adopted a correlational survey research design. The design was considered appropriate because the study sought to examine the relationships among digital transformation, digital skills acquisition, and technopreneurial skills among undergraduates of Business Education without manipulating the study variables. According to Creswell and Creswell (2018), survey research is useful for collecting data from a population to describe trends, attitudes, opinions, and relationships among variables. Similarly, correlational research enables researchers to determine the degree of association between two or more variables (Cohen, Manion, & Morrison, 2018). The study was conducted in Cross River State, Nigeria. The area was considered suitable for the study because undergraduates of Business Education are being prepared for careers in business, education, entrepreneurship, and technology-related occupations. Furthermore, the increasing use of digital technologies in teaching, learning, business communication, marketing, and entrepreneurial activities makes Cross River State an appropriate setting for investigating digital transformation and skills acquisition for technopreneurship.

The population of the study comprised all final-year undergraduates enrolled in Business Education programmes in three selected universities in Cross River State, namely, the University of Calabar (54 students), University of Cross River State (312 students), and Cross River State University of Education and Entrepreneurship (62 students). The total population was 428 students. The choice of this population was based on the assumption that final-year students had been exposed to courses and learning experiences relating to Business Education, entrepreneurship, information and communication technology, and other related areas. A 50% sampling fraction was used to select 214 respondents from the population of 428 students through a simple random sampling technique.

The instrument used for data collection was a structured questionnaire titled “Digital Transformation and Skills Acquisition for Technopreneurship Questionnaire (DTSATQ).” The questionnaire was developed by the researchers based on the objectives and research questions of the study, as well as relevant literature on digital transformation, digital skills acquisition, and technopreneurship. The questionnaire consisted of two sections. Section A elicited demographic information from the respondents, including gender, age, level of study, and institution. Section B contained statements relating to the major variables of the study. The items were organised into three clusters: Cluster A: Digital Transformation; Cluster B: Digital Skills Acquisition; and Cluster C: Technopreneurial Skills. The items were measured using a four-point Likert scale of Strongly Agree (SA) = 4, Agree (A) = 3, Disagree (D) = 2, and Strongly Disagree (SD) = 1. The four-point scale was adopted to eliminate a neutral midpoint and encourage respondents to indicate the direction of their opinions. The questionnaire was subjected to face and content validation by experts in Business Education, Educational Measurement and Evaluation, and Educational Technology. The observations and suggestions of the experts were used to revise and improve the instrument before its final administration.

To establish the reliability of the instrument, a pilot test was conducted using Business Education students at the Federal College of Education, Obudu, who were not part of the study population. The responses obtained from the pilot test were subjected to Cronbach's alpha reliability analysis to determine the internal consistency of the instrument. A reliability coefficient of 0.76 or above was obtained, indicating an acceptable level of internal consistency for the study (Taber, 2018). The researchers, assisted by three trained research assistants, administered the questionnaires directly to the selected respondents through online WhatsApp platforms and hard-copy questionnaires. At the end of the administration, 200 completed questionnaires were retrieved and found usable for data analysis. The data collected were coded and analysed using appropriate statistical techniques. Mean and

standard deviation were used to answer the three research questions, while Pearson Product-Moment Correlation (PPMC) was used to test the three null hypotheses at the 0.05 level of significance. For the hypotheses, a null hypothesis was rejected when the calculated p-value was less than 0.05 and retained when the p-value was greater than or equal to 0.05. These analytical procedures enabled the researchers to determine the extent of digital transformation, digital skills acquisition, and technopreneurial skills, as well as the relationships among the variables among Business Education undergraduates in Cross River State.

Results

Research Question One

To what extent does digital transformation influence digital skills acquisition among undergraduates of Business Education in Cross River State?

Table 1: **Mean and Standard Deviation of Respondents' Ratings on Digital Transformation**

S/N	Digital Transformation Items	Mean	SD	Decision
1	Digital technologies are regularly used in teaching and learning Business Education courses.	3.04	0.54	High Extent
2	Access to computers and other digital devices has improved my learning experience.	3.1	0.51	High Extent
3	The use of online learning platforms has improved my ability to acquire digital skills.	2.99	0.53	High Extent
4	Digital transformation has increased my exposure to modern business practices.	3.07	0.53	High Extent
5	The use of digital technologies enables me to access current business information and learning resources.	3.16	0.52	High Extent
6	Social media platforms provide opportunities for me to learn modern business and marketing practices.	3.09	0.52	High Extent
7	Digital payment technologies have improved my understanding of electronic business transactions.	2.94	0.54	High Extent
8	The use of digital tools in Business Education encourages me to develop technology-based business ideas.	3.01	0.54	High Extent
9	Digital transformation has increased my awareness of emerging employment and entrepreneurial opportunities.	3.15	0.53	High Extent
10	My institution provides adequate opportunities for students to use digital technologies for learning and business activities.	2.98	0.54	High Extent
	Cluster Mean	**3.05**	**0.53**	**High Extent**

The results presented in Table 1 show that all ten items measuring digital transformation had mean scores above the criterion mean of 2.50. The item means ranged from 2.94 to 3.16, while the cluster mean was 3.05, with a standard deviation of 0.53. The highest mean score of 3.16 was recorded for access to current business information and learning resources through digital technologies, while the lowest mean score of 2.94 was recorded for the contribution of digital payment technologies to understanding electronic business transactions. Overall, the cluster mean of 3.05 indicates that digital transformation influences digital skills acquisition to a high extent among Business Education undergraduates in Cross River State.

Research Question Two

To what extent does digital skills acquisition enhance technopreneurial skills among undergraduates of Business Education in Cross River State?

Table 2: **Mean and Standard Deviation of Respondents' Ratings on Digital Skills Acquisition**

S/N	Digital Skills Acquisition Items	Mean	SD	Decision
11	I can effectively use a computer to perform basic business-related tasks.	3.07	0.54	High Extent
12	I can use word-processing and spreadsheet applications for business purposes.	3.13	0.52	High Extent
13	I can search for and evaluate relevant business information online.	3.1	0.54	High Extent
14	I can communicate effectively with customers and business partners through digital platforms.	3.01	0.54	High Extent
15	I can use social media platforms to promote a business or product.	3.15	0.53	High Extent
16	I can conduct basic business transactions using digital payment platforms.	3.03	0.52	High Extent
17	I can create and manage basic digital business content.	3.09	0.53	High Extent
18	My Business Education programme has improved my ability to identify business opportunities.	3	0.53	High Extent
19	I can use digital technologies to solve business-related problems.	3.11	0.53	High Extent
20	I have acquired digital skills that can enable me to start and manage a technology-based business.	3.05	0.54	High Extent
	Cluster Mean	**3.07**	**0.53**	**High Extent**

Table 2 indicates that all the items had mean scores above the criterion mean of 2.50. The item means ranged from 3.00 to 3.15, with a cluster mean of 3.07 and a standard deviation of 0.53. The highest mean score was recorded for the ability to use social media to promote a business or product (3.15), whereas the lowest was recorded for the ability to identify business opportunities through the Business Education programme (3.00). The cluster mean of 3.07 indicates that digital skills acquisition enhances technopreneurial skills to a high extent among the respondents.

Research Question Three

What relationship exists between digital transformation and the acquisition of technopreneurial skills among undergraduates of Business Education in Cross River State?

Table 3: Mean and Standard Deviation of Respondents' Ratings on Technopreneurial Skills

S/N	Technopreneurial Skills Items	Mean	SD	Decision
21	I can identify business opportunities created by emerging digital technologies.	3.11	0.52	High Extent
22	I can develop innovative business ideas using digital technologies.	3.04	0.53	High Extent
23	I can use online platforms to market products and services.	3.16	0.5	High Extent
24	I can develop a basic business model for a technology-based venture.	2.96	0.55	High Extent
25	I can use digital technologies to reach potential customers beyond my immediate environment.	3.13	0.52	High Extent
26	I can identify and use appropriate digital tools to improve business operations.	3.08	0.53	High Extent
27	I am confident in using technology to create or support a small business venture.	3.01	0.54	High Extent
28	I can use digital platforms to obtain information about customers' needs and preferences.	3.05	0.54	High Extent
29	I can adapt my business ideas in response to changes in digital technology.	3.1	0.54	High Extent
30	My digital skills have increased my readiness to become a technopreneur after graduation.	3.15	0.52	High Extent
	Cluster Mean	**3.08**	**0.53**	**High Extent**

The results in Table 3 show that all ten indicators of technopreneurial skills recorded mean scores above the criterion mean of 2.50. The mean scores ranged from 2.96 to 3.16, while the cluster mean was 3.08, with a standard deviation of 0.53. The highest mean score was obtained for the ability to use online platforms to market products and services (3.16), whereas the lowest was recorded for the ability to develop a basic business model for a technology-based venture (2.96). The overall cluster mean of 3.08 indicates that the respondents possessed technopreneurial skills to a high extent.

Test of Hypotheses

Hypothesis One

H_{01}: *Digital transformation has no significant influence on digital skills acquisition among undergraduates of Business Education in Cross River State.*

Table 4: Pearson Product-Moment Correlation between Digital Transformation and Digital Skills Acquisition

Variables	N	r	p-value	Decision
Digital Transformation	200	0.419	< .001	Reject H_{01}
Digital Skills Acquisition	200			

The results in Table 4 show a positive and statistically significant relationship between digital transformation and digital skills acquisition among Business Education undergraduates, r = .419, p < .001. Since the p-value is less than the 0.05 level of significance, the null hypothesis is rejected. This implies that greater exposure to digital transformation is significantly associated with higher levels of digital skills acquisition among the respondents. The relationship is moderate and positive, indicating that improvements in digital transformation tend to be accompanied by corresponding improvements in digital skills acquisition.

Hypothesis Two

H_{02}: *Digital skills acquisition has no significant influence on technopreneurial skills among undergraduates of Business Education in Cross River State.*

Table 5: **Pearson Product-Moment Correlation between Digital Skills Acquisition and Technopreneurial Skills**

Variables	N	r	p-value	Decision
Digital Skills Acquisition	200	0.527	< .001	Reject H_{02}
Technopreneurial Skills	200			

Table 5 indicates a positive and statistically significant relationship between digital skills acquisition and technopreneurial skills, r = .527, p < .001. Since the p-value is less than 0.05, the null hypothesis is rejected. This finding indicates that respondents with higher levels of digital skills acquisition tend to demonstrate higher levels of technopreneurial skills. The correlation coefficient of .527 indicates a moderate positive relationship between the two variables.

Hypothesis Three

H_{03}: There is no significant relationship between digital transformation and the acquisition of technopreneurship skills among undergraduates of Business Education in Cross River State.

Table 6: **Pearson Product-Moment Correlation between Digital Transformation and Technopreneurial Skills**

Variables	N	r	p-value	Decision
Digital Transformation	200	0.405	< .001	Reject H_{03}
Technopreneurial Skills	200			

The results presented in Table 6 reveal a positive and statistically significant relationship between digital transformation and technopreneurial skills among Business Education undergraduates, r = .405, p < .001. Since the p-value is less than 0.05, the null hypothesis is rejected. This indicates that greater exposure to digital transformation is significantly associated with higher levels of technopreneurial skills. The correlation coefficient indicates a moderate positive relationship between the two variables. The findings indicate that digital transformation, digital skills acquisition, and technopreneurial skills were all rated at a high extent among the respondents, with cluster means of 3.05, 3.07, and 3.08, respectively. The hypothesis tests further showed statistically significant positive relationships between digital transformation and digital skills acquisition (r = .419, p < .001), digital skills acquisition and technopreneurial skills (r = .527, p < .001), and digital transformation and technopreneurial skills (r = .405, p < .001). Accordingly, all three null hypotheses were rejected at the 0.05 level of significance.

Overall, the results suggest that digital transformation is an important factor associated with the development of digital skills among Business Education undergraduates, while digital skills acquisition is positively associated with the development of technopreneurial skills. The findings also suggest that increased exposure to digital technologies may strengthen students' readiness to identify opportunities, develop technology-based business ideas, market products and services digitally, and engage in technology-driven entrepreneurial activities.

Discussion of Findings

Digital Transformation and Digital Skills Acquisition

The first finding revealed that digital transformation influences digital skills acquisition among Business Education undergraduates to a high extent, with a cluster mean of 3.05. The individual item means ranged from 2.94 to 3.16, indicating that respondents generally perceived digital technologies as contributing positively to their acquisition of relevant digital competencies. In particular, access to current business information and learning resources recorded the highest mean, while the use of digital payment technologies recorded the lowest mean, although the latter still fell within the high-extent

category. This suggests that digital transformation is increasingly embedded in the learning experiences of Business Education students and provides opportunities for them to develop competencies relevant to contemporary business practices. The finding is in agreement with Ekoh-Nweke and Ikpeama (2024), who reported that digitalisation significantly enhances entrepreneurial and managerial skills acquisition among Business Education students in public universities in South-East Nigeria. The present finding reinforces their position by demonstrating that exposure to digital technologies is associated with the development of practical digital competencies among Business Education undergraduates. The agreement may be attributed to the fact that digital technologies provide students with opportunities to interact with online learning platforms, business information, digital communication tools, electronic payment systems and other technology-enabled resources that support experiential learning.

The finding also agrees with David et al. (2024), who found that digitalisation of skills acquisition improves the employability of Business Education graduates by equipping them with competencies required in modern organisations and digital enterprises. The present study extends this argument by situating digital skills acquisition within the broader context of technopreneurship. While digital competencies improve employability, they also provide a foundation upon which students can identify opportunities, develop technology-based business ideas and participate in digital markets. The significant positive relationship obtained between digital transformation and digital skills acquisition ($r = .419$, $p < .001$) further strengthens this interpretation. Since the relationship is statistically significant and positive, the null hypothesis that digital transformation has no significant influence on digital skills acquisition was rejected. This means that greater exposure to digital transformation is associated with higher levels of digital skills acquisition among the students. The finding therefore supports the argument of Ufondu et al. (2023) and Enang (2024) that Business Education must continually respond to technological developments by incorporating digital competencies into teaching and learning. However, the finding should not be interpreted to mean that digital transformation alone guarantees effective skills acquisition. The literature identifies inadequate ICT infrastructure, poor internet connectivity, unstable electricity, inadequate funding and insufficient practical exposure as important barriers to digital transformation in higher education (Ufondu et al., 2023; Musa & Auwalu, 2024). Thus, although the present result indicates a positive association, the effectiveness of digital transformation is likely to depend on the availability, accessibility and practical use of digital resources within Business Education programmes.

Digital Skills Acquisition and Technopreneurial Skills

The second finding showed that digital skills acquisition was high among the respondents, with a cluster mean of 3.07. The findings indicate that students perceived themselves as possessing competencies such as computer use, spreadsheet and word-processing applications, online information search, digital communication, social media marketing, electronic transactions and digital content creation. Importantly, respondents also indicated that their acquired digital skills could enable them to start and manage technology-based businesses. This finding is consistent with the conceptual position of Atanasova, as cited in Shahrim, Azman, Sufian and Jamel (2026), which conceptualises technopreneurship as entrepreneurial activity in which digital technologies constitute a core platform for opportunity recognition, venture creation and business growth. The finding demonstrates that technopreneurship cannot be separated from the digital competencies required to identify opportunities, communicate with customers, market products, conduct transactions and manage technology-enabled ventures. Digital skills therefore constitute an important foundation for the development of technopreneurial capacity.

The result also agrees with Okute et al. (2023), who emphasised that digital-era competencies such as digital literacy, data management, digital marketing, business analytics, creativity, communication, critical thinking and problem-solving enable graduates to identify opportunities within the digital economy and transform innovative ideas into viable business ventures. The present finding provides empirical support for this position because students who reported relatively high levels of digital skills acquisition also demonstrated relatively high levels of technopreneurial skills. More importantly, the significant positive relationship between digital skills acquisition and technopreneurial skills ($r = .527$, $p < .001$) provides strong empirical support for the importance of digital competencies in technopreneurship. The null hypothesis that digital skills acquisition has no significant influence on technopreneurial skills was therefore rejected. The coefficient represents the strongest relationship among the three relationships examined in the study. This suggests that, within the context of the present study, developing students' practical digital competencies may be particularly important for strengthening their readiness to engage in technology-based entrepreneurship.

This finding is also in agreement with Adeniyi, Fasanmi and Olawemo (2024), who found a significant relationship between digital skills acquisition and entrepreneurial intention as well as enterprise engagement among business owners in Ekiti State. Although the populations and contexts differ, both studies point to the same broad conclusion: digital skills are increasingly relevant to entrepreneurial participation. The present study extends their finding to Business Education undergraduates by showing that digital skills are not only associated with entrepreneurial intentions but are also related to broader technopreneurial competencies such as opportunity recognition, digital marketing, technology-based business modelling and customer engagement. The finding further supports Falobi (2023), who observed that students with digital entrepreneurial skills are better positioned to exploit opportunities in online business, digital marketing, e-commerce and technology-enabled service delivery. Similarly, Enang (2024) argued that digital entrepreneurial competencies are indispensable to Business Education graduates because contemporary employers and business environments increasingly require technology-oriented skills. Thus, the present finding provides further evidence that digital skills acquisition should not be treated as an optional component of Business Education but as a central element of preparation for employment and self-employment in the digital economy.

Digital Transformation and Technopreneurial Skills

The third finding revealed that respondents possessed technopreneurial skills to a high extent, with a cluster mean of 3.08. The highest-rated areas included the ability to use online platforms to market products and services and the ability to develop innovative business ideas using digital technologies. The lowest-rated item concerned the ability to develop a basic business model for a technology-based venture, although its mean remained above the criterion mean. This pattern is noteworthy because it suggests that students may be relatively more confident in using digital platforms for marketing and opportunity exploitation than in the more advanced task of converting an idea into a structured technology-based business model. The significant positive relationship between digital transformation and technopreneurial skills ($r = .405$, $p < .001$) further indicates that increased exposure to digital technologies is associated with stronger technopreneurial competencies. Consequently, the third null hypothesis, which stated that there is no significant relationship between digital transformation and the acquisition of technopreneurship skills, was rejected.

This finding agrees with Iwuoha et al. (2025), who argued that digital transformation has redefined entrepreneurship by changing the ways entrepreneurs develop products, engage customers, market goods and services, conduct financial transactions and manage businesses. Their position is supported by the present finding because students who experience greater exposure to digital transformation also tend to report stronger capabilities for engaging in technology-driven entrepreneurial activities. The finding is also consistent with the broader conceptualisation of technopreneurship provided by Atanasova, as cited in Shahrim et al. (2026). If technopreneurship involves the innovative application of digital technologies to opportunity recognition, venture creation and business growth, then students' exposure to digital technologies should reasonably contribute to their capacity to engage in such activities. The present finding provides empirical support for this proposition among Business Education undergraduates in Cross River State.

Furthermore, the finding supports Falobi (2023) and Enang (2024), who emphasised the importance of digital entrepreneurial competencies for exploiting opportunities in the contemporary business environment. It also complements Adeniyi et al. (2024), whose findings demonstrated that digital skills are significantly associated with entrepreneurial intentions and enterprise engagement. Taken together, these studies and the present finding suggest that the movement from conventional entrepreneurship towards technopreneurship requires a corresponding movement from traditional business competencies towards technology-enabled competencies. Nevertheless, the result does not imply that digital transformation automatically produces successful technopreneurs. The relatively lower rating for the ability to develop a basic business model suggests that students may require more structured practical experiences in venture planning, business modelling, financial management, market validation and technology-based enterprise development. This observation is particularly important for Business Education curriculum development because knowledge of digital tools must be complemented by the ability to apply those tools in developing viable and sustainable enterprises.

Overall Interpretation of the Findings

Taken together, the findings indicate a coherent relationship among digital transformation, digital skills acquisition and technopreneurial skills. The three cluster means—3.05 for digital transformation, 3.07 for digital skills acquisition and 3.08 for technopreneurial skills—show that the

respondents generally perceived all three constructs to be present to a high extent. More importantly, the three correlation coefficients were positive and statistically significant: digital transformation and digital skills acquisition ($r = .419$), digital skills acquisition and technopreneurial skills ($r = .527$), and digital transformation and technopreneurial skills ($r = .405$), all at $p < .001$. The pattern of findings provides a logical explanation of how digital transformation can contribute to technopreneurship. Digital transformation creates an environment in which students interact with digital tools and platforms; such exposure facilitates the acquisition of digital competencies; and these competencies, in turn, provide students with capabilities that can be applied to technology-driven entrepreneurial activities. The relatively stronger relationship between digital skills acquisition and technopreneurial skills suggests that skills acquisition may serve as an important link between digital transformation and technopreneurial readiness.

The findings therefore largely agree with the reviewed empirical and conceptual literature. They support the arguments of Ekoh-Nweke and Ikpeama (2024), David et al. (2024), Falobi (2023), Enang (2024), Okute et al. (2023), Adeniyi et al. (2024), and Iwuoha et al. (2025), all of whom emphasise the growing importance of digital competencies and technology-enabled practices for entrepreneurship, employability and business development. The findings also provide empirical support for the conceptual position that technopreneurship represents the integration of technology, innovation and entrepreneurial activity for opportunity recognition, venture creation and business growth. At the same time, the findings draw attention to an important qualification in the literature. Digital transformation should not be viewed merely as the provision of computers, internet connectivity or digital platforms. Its contribution to technopreneurship depends substantially on whether students are given opportunities to use digital technologies to solve authentic business problems, develop innovative ideas, market products, interact with customers, analyse information, develop business models and create technology-enabled ventures. Consequently, Business Education programmes should move beyond basic digital literacy towards practical and innovation-oriented digital entrepreneurship.

Overall, the findings suggest that strengthening digital transformation and practical digital skills acquisition within Business Education could contribute meaningfully to the development of technopreneurial capabilities among undergraduates in Cross River State. This has important implications for curriculum development, teaching methods, digital infrastructure, industry collaboration and experiential learning. Business Education institutions should therefore provide students with sustained opportunities to apply digital technologies to real or simulated entrepreneurial activities so that digital knowledge can be transformed into practical competencies, innovative business ideas and sustainable technology-driven enterprise opportunities.

Conclusion

The study concludes that digital transformation is an important factor in the development of digital skills and technopreneurial capabilities among Business Education undergraduates in Cross River State. The respondents reported a high extent of exposure to digital transformation, particularly in the use of digital technologies for teaching and learning, access to current business information and learning resources, exposure to modern business practices, use of social media for learning and marketing, and awareness of emerging employment and entrepreneurial opportunities. The overall cluster mean of 3.05 indicates that digital transformation is well integrated into the learning experiences of the respondents. The study further concludes that the acquisition of digital skills among Business Education undergraduates was high, with a cluster mean of 3.07. The respondents demonstrated competence in using computers, word-processing and spreadsheet applications, searching for business information online, communicating through digital platforms, promoting products through social media, conducting digital transactions, creating digital content, and using technology to address business-related problems. These competencies provide an important foundation for participation in technology-driven business activities and entrepreneurial ventures.

The study also concludes that the respondents possessed technopreneurial skills to a high extent, as indicated by the cluster mean of 3.08. In particular, the respondents reported strong abilities to use online platforms for marketing, identify opportunities created by emerging technologies, reach customers beyond their immediate environment, adapt business ideas to technological changes, and use digital technologies to support business ventures. However, the relatively lower mean for developing a basic business model for a technology-based venture suggests that practical venture-development competencies may require further strengthening. The hypothesis tests provide further evidence of meaningful relationships among the major variables. Digital transformation was positively and significantly related to digital skills acquisition ($r = .419$, $p < .001$), indicating that greater exposure to digital technologies is associated with higher levels of digital skills. Digital skills acquisition also had

a positive and significant relationship with technopreneurial skills ($r = .527$, $p < .001$), suggesting that students with stronger digital competencies are more likely to demonstrate stronger technopreneurial capabilities. Similarly, digital transformation was positively and significantly related to technopreneurial skills ($r = .405$, $p < .001$). Consequently, all three null hypotheses were rejected at the 0.05 level of significance.

Overall, the study establishes that digital transformation, digital skills acquisition and technopreneurial skills are positively interconnected among Business Education undergraduates in Cross River State. The findings underscore the importance of providing students with meaningful opportunities to use digital technologies not merely for academic purposes but also for practical business creation, innovation, marketing, problem-solving and venture development. Strengthening these areas can better position Business Education graduates to participate effectively in the increasingly technology-driven world of work and to pursue sustainable technology-based entrepreneurial opportunities.

Recommendations

Based on the findings and conclusion of the study, the following recommendations are made:

1. Business Education programmes should strengthen the integration of digital technologies into teaching and learning. Universities and other tertiary institutions should provide students with regular opportunities to use relevant digital platforms, business software, online learning resources and emerging technologies as integral components of Business Education courses.
2. Institutions should provide adequate access to digital infrastructure and learning resources. Computers, reliable internet connectivity, digital learning platforms, electronic payment technologies and other relevant digital tools should be made sufficiently available to Business Education students to enable them to develop practical digital competencies through continuous use.
3. Business Education curricula should place greater emphasis on practical digital skills development. Students should be engaged in activities involving spreadsheet applications, digital communication, social media marketing, digital content creation, online research, e-commerce and digital payment systems so that digital skills acquired in the classroom can be transferred to real business situations.
4. Technopreneurship education should be strengthened through practical enterprise activities. Business Education students should be required to identify technology-based business opportunities, develop digital business ideas, prepare basic business models, create digital marketing strategies and test their products or services through real or simulated online markets.
5. Institutions should establish digital business incubation and mentorship initiatives for Business Education students. Such initiatives could provide students with access to entrepreneurs, technology professionals and business mentors who can guide them in transforming digital skills and innovative ideas into viable technology-based ventures.
6. Greater emphasis should be placed on developing students' business-model and venture-development competencies. Since developing a basic business model for a technology-based venture recorded the lowest mean among the technopreneurial skills, practical exercises should focus on opportunity identification, value proposition development, customer analysis, revenue models, digital marketing, financial planning and venture sustainability.
7. Business Education lecturers should continually update their digital and entrepreneurial competencies. Institutions should organise professional development programmes that expose lecturers to emerging digital technologies, artificial intelligence, digital entrepreneurship, e-commerce, social media marketing and other contemporary tools that can enrich students' learning experiences.
8. Business Education students should be encouraged to use digital platforms for innovation and enterprise creation. Rather than limiting digital technology to academic activities, students should be encouraged to explore online marketplaces, social media platforms, digital payment systems and other legitimate digital channels for developing, promoting and managing business ventures.

DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNOPRENEURSHIP IN AFRICA: IMPERATIVES, CHALLENGES AND PATHWAYS FOR SUSTAINABLE DEVELOPMENT

Enang, Christiana Etong, PhD
Learning and Development Department
Office of the Head of Civil Service of the Federation
Federal Secretariat, Phase II, Abuja – Nigeria
christianaenang@yahoo.co.uk
christianaenang@gmail.com

Abstract

The paper examines the relationship between digital transformation, skills acquisition and technopreneurship in Africa, arguing that the rapid expansion of digital technologies has fundamentally changed economic systems, labour markets and entrepreneurial ecosystems. Within the African context, these developments are particularly significant because the continent faces persistent challenges of unemployment, poverty, economic dependency and underdevelopment, while simultaneously possessing a very large and youthful population. The paper therefore presents technopreneurship as a strategic pathway through which Africa can transform its demographic potential into productive economic activity. The study adopts a conceptual and analytical approach, drawing on existing literature, theoretical perspectives and selected African experiences from Nigeria, Kenya, Rwanda and South Africa. These cases demonstrate different approaches to digital entrepreneurship, ranging from Nigeria's fintech-driven ecosystem and Kenya's mobile financial innovation to Rwanda's government-led digital transformation and South Africa's relatively advanced infrastructure and innovation ecosystem. The central argument is that sustainable technopreneurship requires the simultaneous development of digital infrastructure, human capital, entrepreneurial education, innovation ecosystems, financing mechanisms and supportive policy environments. Business education is identified as particularly important because it can bridge the gap between formal education and the practical competencies demanded by technology-driven economies. The paper consequently recommends curriculum reform, competency-based and experiential learning, stronger industry-academia collaboration, educator capacity building, innovation centres, inclusive digital education, improved financing and regional policy harmonization.

Keywords: Digital Transformation; Skills Acquisition; Technopreneurship; Business Education; Sustainable Development.

Introduction

The twenty-first century has witnessed rapid technological advancement that has transformed the way economies, organizations and individuals operate. Digital technology has altered traditional approaches to production, communication, commerce, education and governance. The emergence of artificial intelligence, blockchain, big data analytics, cloud computing, robotics, fintech, e-commerce and the Internet of Things has created new opportunities for enterprise development and wealth creation (Schwab, 2017; OECD, 2020). The paper links these developments to a movement from conventional entrepreneurship toward technology-driven entrepreneurship, or **technopreneurship**. Technopreneurship represents an important shift because entrepreneurs are no longer limited to conventional trading and business ownership. Instead, technology provides opportunities to create scalable products, digital services and innovative business models that can respond to emerging societal and market needs (Acs et al., 2018). The African context makes this transformation particularly important. Africa has one of the world's youngest populations, with more than 60% of its population below 25 years of age, and the continent is projected to account for a substantial proportion of the global labour force by 2050 (AfDB, 2022; United Nations, 2022). This demographic structure creates a major opportunity for economic development, but it can also become a liability if young people do not acquire the skills necessary for productive participation in changing labour markets. The International Labour Organization therefore emphasizes the importance of skills development and productive engagement in preventing youth unemployment, social instability and economic stagnation (ILO, 2022).

Furthermore, Africa is experiencing expanding mobile connectivity, internet access, digital financial services and technology hubs. Nigeria, Kenya, Rwanda, South Africa, Ghana and Egypt are

identified as countries where digital innovation has developed particularly in fintech, agritech, edtech, health-tech, e-commerce and digital services. Kenya's M-Pesa, Nigeria's fintech ecosystem, Rwanda's digital governance reforms and South Africa's technology startup ecosystem demonstrate the possibilities created by digital entrepreneurship (GSMA, 2023; AfDB, 2022; WEF, 2022). However, digital literacy and technical competence are unevenly distributed, while many graduates leave educational institutions without the practical competencies demanded by digital labour markets (UNESCO, 2021; Okolie et al., 2020). The paper consequently argues that business education must be reoriented. Rather than focusing predominantly on preparing learners for clerical, administrative and conventional managerial occupations, it should develop innovation, digital literacy, creativity, adaptability and entrepreneurial thinking (Amoor, 2021; Nwosu & Iwu, 2021).

Skills acquisition is therefore presented as an essential foundation of technopreneurship. Technical competencies such as coding, software development, data analytics and cybersecurity must be combined with digital marketing, financial literacy, innovation management, opportunity recognition and entrepreneurial orientation (Dutta & Lanvin, 2023; European Commission, 2022).

The paper consequently examines the intersection of digital transformation and skills acquisition for technopreneurship in Africa. Its purpose is to explain how digital transformation can stimulate enterprise development, employment and sustainable development; identify the challenges limiting this process; examine selected African experiences; and propose pathways for strengthening business education and the broader technopreneurial ecosystem.

Conceptual Clarifications and Theoretical Framework

Digital Transformation: Digital transformation is defined in the paper as the systematic integration of digital technologies into organizational, economic, educational and social processes in order to improve efficiency, innovation, service delivery and competitiveness. It is more than simply digitizing existing processes. It involves fundamental changes in institutional culture, operating models and systems of value creation (Vial, 2019). The transformation is facilitated by technologies including artificial intelligence, cloud computing, blockchain, big data analytics, robotics and the Internet of Things (Schwab, 2017). In the economic context, digital transformation involves the development of infrastructure, digital skills, digital financial services and innovation ecosystems that enable wider economic participation (World Bank, 2021). In education, digital transformation means incorporating technology into teaching, learning and skills acquisition so that learners are prepared for digitally driven economies (UNESCO, 2021). In Africa, this is linked to the broader objectives of economic diversification, industrialization and employment generation. The paper's operational understanding of digital transformation is therefore strategic: it is the adoption and use of digital technologies to improve entrepreneurial activities, productivity, innovation and sustainable development.

Skills Acquisition: Skills acquisition refers to the process by which individuals obtain practical knowledge, competencies, technical expertise and employable capabilities required for professional, personal and entrepreneurial activities. It encompasses formal, informal and non-formal learning and extends beyond theoretical knowledge to practical competence, creativity, adaptability, critical thinking, communication and problem-solving (Okorie & Ezeji, 1988). The digital economy has expanded the meaning of skills acquisition to include digital competencies such as programming, software development, cybersecurity, data analytics, digital marketing, e-commerce, artificial intelligence and information management (European Commission, 2022). The importance of skills acquisition is particularly pronounced in Africa because of youth unemployment, poverty and changing labour-market requirements. The paper therefore conceptualizes skills acquisition as the development of practical digital and entrepreneurial competencies necessary for participation in technology-driven ventures and digital economic activities.

Technopreneurship: Technopreneurship combines technology and entrepreneurship. It involves using technological knowledge, innovation and entrepreneurial skills to create, manage and scale enterprises that respond to market and societal needs (Bailetti, 2012). The distinction between traditional entrepreneurship and technopreneurship lies particularly in the latter's emphasis on technological innovation, research, product development, scalability and commercialization. Technopreneurs use technology to develop products, services and business models capable of creating economic and social value. The Fourth Industrial Revolution has increased the importance of technopreneurship through sectors such as fintech, artificial intelligence, blockchain, health-tech, edtech, agritech and e-commerce. African examples include M-Pesa in Kenya, Nigeria's fintech ecosystem, Rwanda's digital public services and South Africa's technology innovation hubs (Schwab, 2017; WEF, 2022). The paper therefore defines technopreneurship as technology-driven

entrepreneurial activity that uses digital innovation to create sustainable business opportunities, employment and socio-economic development in Africa.

Theoretical Framework

The study is anchored on four complementary theories: **Human Capital Theory, Innovation Diffusion Theory, Digital Economy Theory, and Entrepreneurial Ecosystem Theory**.

Human Capital Theory: Human Capital Theory, associated with Schultz (1961) and Becker (1964), emphasizes investment in education, training and skills as a means of improving productivity, income and economic performance. Digital and entrepreneurial skills are treated as forms of human capital that can improve the ability of African youths to establish technology-based enterprises, create employment and contribute to sustainable development. Conversely, inadequate investment in digital education limits entrepreneurial productivity. The theory therefore supports the paper's argument for practical, technology-oriented business education.

Innovation Diffusion Theory: Rogers' Innovation Diffusion Theory explains how innovations spread through societies. Adoption depends on characteristics such as relative advantage, compatibility, complexity, observability and trialability. Rogers identifies innovators, early adopters, early majority, late majority and laggards as categories of adopters (Rogers, 1962, 2003). The theory helps explain differences in digital entrepreneurship across African countries. Digital transformation depends not merely on technological availability but also on societal readiness, infrastructure, knowledge and digital literacy. Kenya, Rwanda and South Africa are presented as examples of countries where supportive policies, infrastructure and skills programmes have facilitated technological adoption.

Digital Economy Theory: Digital Economy Theory explains the role of digital technologies in production, value creation, market interaction and entrepreneurship. Tapscott (1996) emphasizes the transformational effects of digital technologies, while Bukht and Heeks (2017) conceptualize the digital economy around digital interactions among individuals, organizations, devices and businesses. The theory supports the paper's contention that technopreneurship is fundamentally embedded in digitally enabled economic systems. As fintech, e-commerce, digital services and remote business models expand, digital competencies become essential to economic participation.

Entrepreneurial Ecosystem Theory: Entrepreneurial Ecosystem Theory emphasizes that entrepreneurship is influenced by the interaction of institutions, policies, finance, culture, infrastructure, education and support networks (Isenberg, 2010; Stam, 2015). The theory is important because the paper does not regard individual skills as sufficient for technopreneurial success. Entrepreneurs also require finance, infrastructure, mentorship, government support, incubators, innovation hubs and favourable policies. The four theories collectively establish the paper's central conceptual position that **skills,** technology, innovation and enabling ecosystems must operate together if technopreneurship is to contribute to sustainable development in Africa.

Overview of Digital Transformation and Entrepreneurship

Digital transformation has become a major driver of socio-economic restructuring. It changes business operations, education, governance and economic systems while creating new opportunities for technology-based entrepreneurship (Vial, 2019). The Fourth Industrial Revolution has accelerated these changes through the convergence of digital, physical and biological technologies. AI, blockchain, robotics, cloud computing, big data and IoT have altered production systems and created opportunities for new forms of entrepreneurship (Schwab, 2017). Technopreneurship consequently contributes to economic diversification, employment, innovation and competitiveness. However, entrepreneurial outcomes depend on access to infrastructure, education, finance and innovation-support systems. Countries with stronger digital ecosystems are better positioned to exploit these opportunities (World Bank, 2021).

Africa's digital transformation has accelerated through increased mobile penetration, internet connectivity, digital financial services and innovation hubs. Mobile technology has been especially important because it has expanded access to financial services, education, e-commerce and entrepreneurship. M-Pesa in Kenya is used as an important example of mobile technology facilitating financial inclusion and small-business participation in digital commerce. Rwanda has developed digital governance and smart-city initiatives, while Nigeria has experienced strong growth in fintech and startup activity. South Africa possesses a relatively advanced digital entrepreneurial ecosystem. Despite these achievements, transformation remains uneven. Poor electricity supply, weak broadband infrastructure, high internet costs, regulatory barriers and digital inequality restrict participation. Women, rural populations and marginalized groups are particularly vulnerable to exclusion (UNESCO, 2021; World Bank, 2021).

Digital entrepreneurship requires a combination of technical, entrepreneurial, managerial and socio-emotional skills. These include digital literacy, coding, software development, cybersecurity, data

analytics, AI, digital marketing, financial literacy, opportunity recognition, innovation management, communication, resilience and problem-solving. The paper highlights the continuing mismatch between educational outputs and labour-market expectations. Many graduates possess theoretical qualifications but lack practical digital and entrepreneurial competencies (Okolie et al., 2020; Nwosu & Iwu, 2021). This skills gap makes curriculum transformation essential. Business education should become more practical and competency-based and should expose learners to technologies and entrepreneurial environments.

Technopreneurship and Economic Development in Africa: Technopreneurship is presented as a catalyst for employment generation, financial inclusion, innovation and productivity. Digital startups in Nigeria, Kenya, Egypt and South Africa demonstrate how technology-enabled enterprises can contribute to economic transformation. M-Pesa illustrates how technological innovation can expand financial inclusion, while Nigeria's fintech ecosystem demonstrates how digital entrepreneurship can attract investment and generate employment. Rwanda's digital governance illustrates how technology can improve business efficiency. However, weak entrepreneurial ecosystems continue to constrain these benefits. Inadequate financing, infrastructure deficits, inconsistent policy implementation, gender inequality and rural-urban disparities limit the expansion of digital entrepreneurship.

Business Education and Technopreneurial Skills Development: Business education traditionally focused on office administration, accounting, marketing and management, particularly for salaried employment. The digital economy requires a shift toward entrepreneurship, innovation, digital literacy and practical technology applications (Amoor, 2021). The paper argues that experiential learning—including internships, startup incubation, innovation laboratories, mentorship, digital simulations and industry partnerships—is needed to prepare graduates for technology-driven business environments. The paper identifies a gap in existing literature. Although digital transformation, entrepreneurship and skills development have each been extensively studied, they are often treated separately. There is comparatively limited integrated analysis of how digital transformation, skills acquisition and technopreneurship interact within African business education systems. The author also identifies insufficient contextual attention to African realities such as infrastructural deficits, policy inconsistency, digital inequality and educational limitations. The paper therefore seeks to provide an integrated analysis that places **business** education at the intersection of digital transformation, skills acquisition and sustainable technopreneurship.

Digital infrastructure provides the foundation for digital enterprise. Broadband, electricity, cloud computing, mobile technologies and data centres are necessary for technology-driven business. **Innovation hubs and business incubators** provide mentorship, technical support, networking and access to investors. Examples identified in the paper include CcHub and Ventures Platform in Nigeria, Kenya's Silicon Savannah ecosystem and Kigali Innovation City in Rwanda. **Startup financing** is another critical component. Venture capital, digital finance, crowdfunding and other financing mechanisms have expanded opportunities, but investment remains concentrated in a limited number of countries and sectors. **Government policies and regulatory systems** determine whether entrepreneurs can operate in supportive environments. Startup legislation, digital economy policies, tax incentives and broadband investment can facilitate entrepreneurship, while regulatory uncertainty and bureaucratic bottlenecks can discourage it. **Educational institutions** provide the human capital needed by the ecosystem. Universities, technical institutions and business education programmes therefore need to integrate technology, entrepreneurship and practical learning.

The paper identifies several rapidly developing sectors. **Fintech** has transformed digital payments, financial inclusion and cross-border transactions. **Agritech** uses digital platforms, mobile applications and AI to improve agricultural productivity, market access and food security. **Edtech** has expanded through online courses, virtual classrooms and mobile education platforms. **Health-tech** is improving healthcare access through telemedicine, mobile diagnostics and digital patient-management systems. **E-commerce** is expanding online buying and selling, logistics and digital services. The paper also identifies AI, blockchain, cybersecurity, digital manufacturing and green technologies as emerging areas of opportunity. AfCFTA is presented as a potential mechanism for expanding cross-border digital entrepreneurship and regional markets.

Skills acquisition is presented as indispensable for sustainable participation in the digital economy. Digital entrepreneurship requires more than traditional business knowledge because it combines technology, innovation, data systems and digital market access. The paper divides relevant competencies broadly into **digital/technical skills, entrepreneurial skills, business management skills and socio-emotional competencies**. Digital literacy provides the basic foundation for using computers, smartphones, software and internet-based tools. Programming and software development enable entrepreneurs to create digital products and platforms. Data analytics supports market and

operational decision-making, while AI facilitates automation, prediction and customer engagement. Cybersecurity has become essential because digital businesses face growing cyber risks. Digital marketing—including social media management, SEO, content marketing, email marketing and online branding—is important for reaching customers and expanding markets. Entrepreneurial competencies include opportunity recognition, innovation, creativity, risk assessment, adaptability and resilience. Management competencies include financial management, strategic planning, business modelling, customer segmentation and leadership. Communication and networking are also emphasized because entrepreneurs must engage customers, investors, partners and mentors and continuously update their knowledge as technology evolves.

Approaches to Skills Acquisition for Digital Entrepreneurship

The paper identifies several mechanisms for developing digital entrepreneurial skills. **Educational institutions** can integrate entrepreneurship and digital literacy into curricula, although the author notes that many continue to emphasize theory over practical experience. **TVET institutions** provide hands-on training in ICT, programming, business management and technical innovation. **Online learning platforms and MOOCs** provide opportunities for African youths to obtain globally relevant competencies despite geographical barriers. **Technology hubs and startup incubators** provide technical training, mentorship, networking and acceleration support. **Informal learning** through peer mentoring, digital communities, internships and workplace experience also contributes to skills development.

The major challenges include inadequate digital facilities, outdated curricula, insufficiently trained instructors, poor internet connectivity, inadequate electricity and the high cost of digital devices and training. The paper also highlights gender and social inequalities. Women and marginalized groups frequently experience reduced access to digital technologies and entrepreneurial opportunities. The continuing mismatch between educational outcomes and labour-market needs is particularly important. Graduates may possess qualifications without the practical competencies necessary for digital entrepreneurship. The paper consequently calls for curriculum reform, infrastructure investment, stronger partnerships between educational institutions and technology firms, expansion of innovation hubs and inclusive digital education.

African Case Studies: Digital Transformation and Skills Acquisition for Technopreneurship:

The paper examines Nigeria, Kenya, Rwanda and South Africa to demonstrate different approaches to digital transformation and technopreneurship.

Nigeria: Fintech Revolution and Youth-Led Digital Entrepreneurship: Nigeria is presented as one of Africa's leading technology and startup ecosystems. Its large population, youthful demographic structure, expanding internet use and growing digital financial services provide substantial opportunities for technology-driven entrepreneurship. The fintech sector is particularly significant. Flutterwave, Paystack, Moniepoint, Interswitch and Opay are identified as examples of enterprises that have transformed digital payments, online transactions and financial inclusion. Nigeria has also developed edtech, agritech, logistics and health-tech activities. CcHub, Ventures Platform and the Tony Elumelu Foundation Entrepreneurship Programme provide mentorship, incubation, skills training and investor access. Government and private initiatives—including the National Digital Economy Policy and Strategy, Digital Nigeria Programme, Google Digital Skills for Africa and Andela programmes—are identified as supporting digital skills development. However, Nigeria continues to experience inadequate electricity, rural broadband limitations, digital inequality, financing gaps and policy inconsistency. The paper nevertheless presents Nigeria as evidence that digital transformation, skills acquisition and startup ecosystems can promote technopreneurship and employment.

Kenya: The Silicon Savannah and Mobile Financial Innovation: Kenya is described as a major African digital entrepreneurship success story, particularly because of its **Silicon Savannah** ecosystem. The most prominent example is **M-Pesa**, launched in 2007. The platform transformed financial inclusion by allowing millions of people to send, receive and save money digitally. It also enabled small businesses to participate more effectively in digital commerce. Kenya's iHub and other innovation centres and accelerators provide mentorship, networking, technical support and access to investment. Skills acquisition has been supported through public-private partnerships, universities, coding academies, entrepreneurship boot camps and ICT training programmes. Government investment through initiatives such as the National ICT Master Plan and digital literacy programmes has also strengthened the ecosystem. Kenya nevertheless faces youth unemployment, rural-urban digital inequalities and startup financing challenges. Its experience demonstrates the value of combining mobile technology, infrastructure, skills development and entrepreneurial support.

Rwanda: Digital Governance and Innovation-Driven Entrepreneurship: Rwanda demonstrates the importance of strong government leadership in digital transformation. Over the past two decades, the country has made technology, innovation and human capital central to national development. Investment in broadband, digital infrastructure, e-governance and smart-city initiatives has supported Rwanda's ambition to become a regional technology hub. **Kigali Innovation City** is identified as a major component of this ecosystem. Digital registration, online tax systems, e-payments and simplified regulatory processes reduce bureaucratic barriers for entrepreneurs. Rwanda has also prioritized ICT education, coding, digital literacy and entrepreneurship training. Government-backed incubation, financing and innovation programmes further support technology-driven enterprises. Its limitations include the small domestic market, startup financing challenges and dependence on external investment. Nonetheless, Rwanda illustrates how coordinated government policy, infrastructure and skills development can accelerate technopreneurship.

South Africa: Advanced Digital Infrastructure and Innovation Ecosystems: South Africa possesses one of the continent's more advanced digital economies, supported by comparatively stronger infrastructure, financial systems and internet penetration. The country's technology sectors include fintech, e-commerce, software development, digital services and artificial intelligence. Cape Town, Johannesburg and Pretoria have developed startup ecosystems supported by venture capital, innovation hubs and research institutions. The Silicon Cape Initiative and technology incubators provide mentorship, training, funding access and networking. Universities contribute through research commercialization and entrepreneurship. South Africa's relatively developed financial markets facilitate startup financing and venture capital. However, inequality, youth unemployment and uneven digital access remain significant challenges. The South African experience therefore demonstrates the importance of infrastructure, higher education and innovation financing in developing technopreneurship.

The four cases reveal different pathways for instance; Nigeria demonstrates the power of youth-driven fintech innovation but also the consequences of infrastructure deficits and policy inconsistency. Kenya demonstrates the transformative impact of mobile financial innovation and entrepreneurial hubs. Rwanda demonstrates the importance of government-led digital reforms, infrastructure and skills development. South Africa demonstrates the value of relatively advanced infrastructure, higher education and startup financing. The common lesson is that no single intervention is sufficient. Successful technopreneurship requires **digital infrastructure, entrepreneurial education, supportive policies, startup financing, innovation ecosystems and skills acquisition** working together. The paper therefore argues that Africa's broader technopreneurial potential depends on reducing infrastructure gaps, expanding digital skills, strengthening business education and creating inclusive entrepreneurial ecosystems.

Challenges, Opportunities, and Policy Implications of Digital Transformation and Skills Acquisition for Technopreneurship in Africa

Digital transformation has created substantial opportunities for economic modernization, but Africa's ability to realize these opportunities remain constrained by structural, institutional and socio-economic barriers. Reliable internet, broadband, electricity and digital communication infrastructure remain unevenly distributed. Urban communities generally enjoy better access than rural communities, while affordability continues to limit digital inclusion. Poor electricity supply increases the cost of operating digital enterprises and reduces their competitiveness. Many young people and graduates lack practical technological skills. Educational systems often emphasize theoretical learning instead of coding, software development, digital marketing, AI, cybersecurity and business analytics. This creates a mismatch between education and labour-market requirements and contributes to unemployment and entrepreneurial stagnation. Startup financing remains a major constraint. Young entrepreneurs struggle to access venture capital, grants, loans and investment. Traditional lenders often consider startups high-risk and require collateral that young entrepreneurs may not possess. Venture capital has expanded but remains concentrated in a few countries and sectors. Policy inconsistency, bureaucratic bottlenecks, unstable tax systems and regulatory uncertainty can discourage innovation and investment. The lack of harmonized regional digital regulations also restricts cross-border entrepreneurship and digital trade. Women, rural populations, persons with disabilities and economically disadvantaged groups frequently experience weaker access to digital technologies, finance and training. Gender disparities are particularly important because unequal access to digital devices, internet services and technology education limits women's participation in technopreneurship.The migration of skilled technology professionals to developed economies reduces the supply of talent available to local innovation

ecosystems. Better employment opportunities, infrastructure and financial rewards abroad contribute to this movement.

Opportunities for Digital Transformation and Technopreneurship in Africa

Africa's youthful population represents a major potential workforce for innovation and entrepreneurship. If appropriately equipped with digital skills, young people can drive enterprise development in fintech, e-commerce, agritech, health-tech and digital services. Mobile technology facilitates digital payments, online education, communication, e-commerce and remote business operations. Growing smartphone use therefore creates new market opportunities. **African Continental Free Trade Area (AfCFTA) c**reates opportunities for startups to expand across borders, access larger markets and strengthen regional value chains. Digital trade can stimulate innovation, investment and employment. AI, blockchain, cloud computing, cybersecurity and fintech create opportunities for new enterprises. Africa's demand for financial inclusion and digital payment services provides particularly strong opportunities for fintech innovation. Growing international investment creates opportunities for startup expansion, mentorship, partnerships and innovation. However, the paper emphasizes the need for broader access to financing beyond established countries and sectors.Online platforms such as Coursera, Udemy, Google Digital Skills for Africa, Microsoft Learn and LinkedIn Learning provide opportunities for youths to acquire digital competencies regardless of geographical location.

Policy Implications for Strengthening Technopreneurship in Africa

Strengthening Digital Infrastructure: Governments should invest in broadband, electricity, digital communication systems and affordable internet, using public-private partnerships to extend access to rural communities.

Reforming Educational Systems and Curricula: Educational institutions should integrate coding, AI, fintech, digital marketing, business analytics, cybersecurity, entrepreneurship and innovation management. Business education should emphasize competency-based and experiential learning.

Expanding Access to Startup Financing: Governments and financial institutions should develop innovation grants, youth entrepreneurship funds, venture capital schemes and low-interest digital enterprise loans. Angel investment, crowdfunding and fintech-enabled financing should also be supported.

Strengthening Innovation Ecosystems: Technology hubs, incubators, innovation parks and digital laboratories should be established and expanded. Universities, private companies and development organizations should collaborate in mentorship and entrepreneurial training.

Promoting Inclusive Digital Participation: Digital literacy programmes should specifically target women, rural populations and disadvantaged youths. The goal is to prevent digital transformation from reinforcing existing inequalities.

Harmonizing Regional Digital Policies: African governments should cooperate on digital trade, startup laws, cybersecurity and digital taxation. Such harmonization would facilitate cross-border entrepreneurship and strengthen AfCFTA implementation.

Implications for Business Education: Repositioning Business Education Institutions for Digital Transformation and Technopreneurship Development in Africa

The paper argues that digital transformation fundamentally changes the role of business education. Traditional programmes designed mainly for clerical, administrative and conventional managerial employment are no longer sufficient. Business education must become a platform for developing digital competence, entrepreneurial creativity, innovation and enterprise development. Curricula should integrate: Digital Marketing and Social Media Management, E-Commerce and Digital Business Models, Financial Technology (FinTech), Artificial Intelligence in Business, Data Analytics and Business Intelligence, Cybersecurity and Digital Ethics, Business Innovation and Design Thinking, Coding and Digital Product Development, Blockchain and Digital Finance, Cloud Computing Applications in Business. The fundamental objective is to move from curriculum models centred on theoretical knowledge toward programmes that prepare students to create enterprises and solve problems using technology.

Business education should shift from predominantly teacher-centred approaches to competency-based and experiential learning. Students should undertake digital business simulations, startup projects, coding workshops, innovation challenges and incubation activities. Learners should develop prototypes and practical solutions to societal and market problems, including mobile applications, e-commerce platforms and fintech innovations. Institutions should develop partnerships with technology companies, startups, financial institutions and innovation hubs to expose students to

real-world digital business environments. Business education institutions should incorporate Learning Management Systems, Virtual Learning Environments, AI tools, business simulation software, data analytics platforms, e-commerce platforms, virtual laboratories and digital innovation spaces. Blended learning, online simulations and virtual entrepreneurship laboratories can help learners understand the practical realities of digital business. Students need creativity, innovation, critical thinking, problem-solving, opportunity recognition, leadership, collaboration, resilience, adaptability, risk management and decision-making. The paper proposes pitch competitions, innovation fairs, hackathons, startup exhibitions and mentorship programmes as mechanisms for developing entrepreneurial culture.

Business education institutions should establish stronger relationships with technology companies, startups, fintech organizations, telecommunications firms, innovation centres and financial institutions. Such partnerships can support curriculum development, internships, mentorship, technology transfer, commercialization, incubation and funding. Educators themselves must acquire contemporary competencies. Professional development should cover digital pedagogy, AI applications, business analytics, fintech, e-commerce, entrepreneurship education, innovation management and digital marketing. Teacher retraining, workshops, industry immersion and international collaboration can strengthen instructional capacity. Institutions should create centres that provide: Startup incubation, Business mentorship, Product development, Digital skills training, Innovation research, Enterprise funding support, such centres can help students move from classroom ideas to viable technology-driven enterprises. Institutions should improve access for women, rural learners, persons with disabilities and disadvantaged populations. The paper proposes affordable digital devices, scholarships, gender-inclusive entrepreneurship programmes, rural technology outreach and accessibility-focused digital learning systems. Business education should be repositioned from a narrow academic function into a catalyst for innovation, entrepreneurship and socio-economic transformation. This requires curriculum redesign, pedagogical transformation, infrastructure investment, staff development and stronger industry engagement. Educational institutions must prepare learners to become innovators, digital entrepreneurs and creators of economic opportunities. The paper regards the transformation of business education as both **urgent and strategic**. Curriculum reform, experiential learning, educator retraining, innovation centres, digital inclusion and industry collaboration are presented as the principal mechanisms for bridging Africa's digital skills gap. Business education consequently has the potential to prepare a new generation of technopreneurs capable of contributing to sustainable economic development.

Conclusion

The paper concludes that digital transformation is now one of the major forces shaping economic restructuring, entrepreneurship and social progress. In Africa, digital technologies create substantial possibilities for innovation, enterprise creation, employment generation and sustainable development. However, technopreneurship does not develop through technology alone. It requires an enabling ecosystem comprising infrastructure, entrepreneurial competencies, supportive policies, startup financing, innovation hubs and technology-oriented education. The experiences of Nigeria, Kenya, Rwanda and South Africa demonstrate different ways in which digital transformation and skills acquisition can stimulate technology-driven enterprise creation. Their experiences also show that infrastructure, policy, finance and education determine how successfully technological opportunities are converted into sustainable enterprises. Africa's youthful population is identified as a major demographic advantage, but the advantage can only be realized if young people possess digital literacy, coding, business analytics, cybersecurity, digital marketing, problem-solving, creativity and innovation-management skills. At the same time, inadequate infrastructure, unreliable electricity, limited internet access, skills deficits, financing constraints, policy inconsistency and digital inequality continue to restrict participation. Business education is therefore strategically positioned to address the skills deficit. Its transformation must include curriculum reform, competency-based learning, industry collaboration, educator retraining and investment in innovation ecosystems. The paper ultimately argues that Africa should move beyond being predominantly a consumer of imported technologies and strengthen its capacity to produce innovative solutions. Technopreneurship, if appropriately supported, can contribute to reducing unemployment, promoting innovation, diversifying economies and advancing sustainable development.

Recommendations

i. Business education institutions should redesign curricula around AI, fintech, coding, software development, data analytics, digital marketing, e-commerce, cybersecurity, digital ethics, innovation management and design thinking.

ii. Governments should increase investment in broadband, affordable internet, reliable electricity, rural digital infrastructure, technology parks and digital innovation ecosystems.
iii. Continuous digital skills programmes should target youths, graduates, women and vulnerable groups, covering digital literacy, software development, cybersecurity, AI, business automation, digital finance and entrepreneurial innovation.
iv. Governments and higher institutions should expand technology hubs, incubators, accelerators, innovation laboratories and entrepreneurship development centres that provide technical support, mentorship, networking and funding.
v. Partnerships with technology companies, fintech organizations, digital startups, telecommunications companies, innovation centres and financial institutions should be strengthened to improve practical exposure and graduate employability.
vi. Digital policies should deliberately support women, rural entrepreneurs, persons with disabilities and economically disadvantaged youths through scholarships, devices, subsidized internet and targeted entrepreneurship programmes.
vii. Governments and development institutions should establish youth entrepreneurship funds, startup grants, innovation financing schemes, venture capital mechanisms and low-interest technology loans.
viii. Business educators should receive continuous professional development in digital pedagogy, AI, fintech, digital business models, data analytics, entrepreneurship education and innovation management.
ix. African governments should harmonize policies relating to digital trade, cybersecurity, startup laws, cross-border entrepreneurship and technology investment in support of AfCFTA.
x. Governments and institutions should establish monitoring and evaluation systems covering digital skills outcomes, entrepreneurship programmes, startup sustainability and labour-market relevance of educational programmes.

The purpose of these recommendations is to move digital transformation from isolated technological adoption toward a coordinated ecosystem involving governments, educational institutions, private-sector actors, development partners and entrepreneurs.

DIGITAL ENTREPRENEURSHIP IN AFRICA: BRIDGING THE BUSINESS EDUCATION GAP

Oguche, Inikpi Comfort
Department of Office Technology and Management
The Federal Polytechnic, Idah, Kogi State
nikpiousgirl@gmail.com

Abstract

Digital entrepreneurship spanning fintech, e-commerce, and platform-based ventures is reshaping African economies by expanding market access, driving innovation, and creating employment, as illustrated by the growth of firms such as M-Pesa, Jumia, Paystack, and Flutterwave. Yet the sustainability of this growth remains constrained by a persistent gap in business education, particularly in strategic planning, market research, financial literacy, business model design, and digital marketing. This paper examines that gap, identifying three interlocking constraints: curriculum deficiencies that emphasize theory over applied, digital-centric practice; accessibility barriers rooted in regional, infrastructural, and gender disparities; and limited mentorship and industry linkages that leave entrepreneurs without practical guidance. Drawing on evidence from across the African digital entrepreneurship landscape, the paper argues that these gaps are mutually reinforcing and therefore require coordinated, rather than isolated, solutions. It proposes a set of strategies for bridging the divide, including curriculum reform centred on applied digital tools and iterative business-model methodologies, technology-enabled and low-bandwidth learning approaches to widen access, and formalized partnerships between educational institutions and industry to embed mentorship and real-world experience into training. The paper concludes with recommendations for educators, policymakers, and entrepreneurs aimed at building a more inclusive and resilient digital entrepreneurship ecosystem across the continent.

Keywords: Digital Entrepreneurship, Business Education, Africa, Innovation, Curriculum, Entrepreneurial Competencies

Introduction

Africa has witnessed exponential growth in digital technologies over the past decade. The proliferation of mobile broadband, expanding fintech ecosystems, and the growth of digital platforms has created fertile ground for entrepreneurial activity (Nambisan, 2017; Ndung'u & Signé, 2018). Platforms such as mobile money services, e-commerce marketplaces, and digital service applications have proliferated across Kenya, Nigeria, Ghana, and South Africa, demonstrating the potential of technology-driven entrepreneurship to drive socio-economic transformation. Despite this progress, digital entrepreneurs in Africa face significant challenges that undermine the performance and scalability of their ventures. One of the most pervasive challenges is the business education gap the disconnect between the competencies needed to build and manage successful digital enterprises and the training provided through formal and informal educational institutions (Boso, Story, & Cadogan, 2013). Consequently, many digital startups struggle with strategic execution, market validation, financial management, sustainable business modelling, and online customer engagement. This paper explores the nature of the business education gap in African digital entrepreneurship, analyses its root causes, and proposes structured solutions for bridging the divide.

Digital Entrepreneurship and Its Scope

Digital entrepreneurship refers to entrepreneurial activity that leverages digital technologies to create, deliver, and capture value. Nambisan (2017) defines it as the creation of new ventures and the transformation of existing businesses through novel digital technologies such as cloud computing, big data, artificial intelligence, and digital platforms; he argues that these technologies reduce entry barriers, enable rapid scalability, and foster innovation ecosystems. Zhao & Collier (2016) similarly frame digital entrepreneurship as the pursuit of opportunities that are enabled or constrained by digital technologies, emphasizing digital ecosystems and network effects. Kraus et al. (2019) focuses on the platform economy, social media ventures, and digital transformation, while Hair, Wetsch, & Hull (2012) treats digital entrepreneurship as a subcategory of entrepreneurship in which activities that would traditionally be physical are instead digitized, citing e-commerce and platform-based firms as examples. Taken together, these perspectives converge on a single working definition: digital entrepreneurship is the process of identifying, creating, and exploiting entrepreneurial opportunities through digital

technologies, platforms, and online ecosystems to develop innovative products, services, or business models. This aligns with Gartner's (1988) broader views that entrepreneurship is not solely about identifying opportunity but about mobilizing resources to create long-term value a process that, in digital contexts, depends heavily on sound business strategy. The scope of digital entrepreneurship spans several categories. E-commerce and online retail businesses operate through digital marketplaces such as Amazon & Jumia, engaging in online sales, dropshipping, and related activities. Platform-based businesses, such as Uber and Airbnb, connect users and providers to facilitate transactions. Fintech and digital financial services encompass payment solutions such as Paystack and Flutterwave, along with blockchain and crypto currency ventures. Digital content and social media ventures involve entrepreneurs monetizing content on platforms such as YouTube and TikTok, including influencer marketing and digital advertising. Software and application development covers mobile apps, SaaS platforms, and AI-driven solutions, particularly in edtech, healthtech, and agritech. Finally, the digital transformation of traditional businesses involves the integration of e-commerce, digital marketing, and automation into existing firms, alongside broader emerging technologies such as AI, blockchain, IoT, and cloud computing. According to Nambisan (2017) and Kraus et al. (2019), digital entrepreneurship as a whole is characterized by scalability, low marginal cost, global reach, rapid innovation, and platform dependency.

Digital Entrepreneurship in the African Context

Digital entrepreneurship in Africa is shaped by distinctive socio-economic and technological dynamics. Friederici, Wahome, & Graham (2020) observes that African digital entrepreneurs creatively adapt technologies to local markets, building sustainable businesses by scaling through relationships and customizing platform business models to fit local infrastructure constraints. Mobile technologies and digital platforms have lowered barriers to entry, allowing innovators to reach customers directly (Donner, 2015), fueling growth in fintech, e-commerce, health technology, and agritech. However, this growth has not translated into consistently high survival rates. Ndung'u & Signé (2018) finds that limited business management training, constrained access to funding, inadequate infrastructure, and regulatory hurdles all suppress the scalability and sustainability of digital startups. They emphasize the need for supportive ecosystems including access to finance, mentorship, and digital infrastructure as well as stronger government policy support. Reported failure rates are substantial: Ndung'u & Signé (2018, Brookings Institution report) cite an early-stage failure rate for African digital startups of approximately 54% over the 2010–2018 period, attributed primarily to limited funding, inadequate digital infrastructure, regulatory hurdles, and skills gaps. Readers seeking the underlying dataset should consult the original Brookings report, as figures of this kind vary across sources and time periods. Contextualized business training has been identified as a key mitigating factor. Dutta, McKellen, Boating, & Donner highlights the value of tailoring training programmes to local market conditions incorporating African case studies, addressing market-specific challenges such as mobile payment systems and regulatory frameworks, and leveraging local mentor and peer networks. Such contextualization helps entrepreneurs develop practically relevant skills and improves their prospects of building sustainable ventures. Governments can play a catalytic role in addressing these challenges by developing supportive regulatory frameworks, investing in digital infrastructure, expanding access to funding, implementing digital skills training, and encouraging public-private partnerships. Rwanda and Kenya illustrate this potential, having introduced tax incentives, startup incubators, and investment funds that actively promote digital entrepreneurship.

Current Landscape of Digital Entrepreneurship in Africa

The digital entrepreneurship landscape in Africa is undergoing significant transformation, driven by technological advancement, a youthful demographic and increasing investment. Several converging trends illustrate this shift.

a. Rapid Growth of Internet Penetration
   Expanding mobile and internet connectivity has been pivotal in fostering digital entrepreneurship across the continent. The International Telecommunication Union (2021) reports that Africa has seen a marked increase in internet users, surpassing 500 million people online connectivity that allows entrepreneurs to reach larger markets and engage consumers in new ways (Makhubela, 2022).
b. A Youthful Population
   With approximately 60% of Africa's population under the age of 25, the continent has a demographic advantage well suited to digital entrepreneurship, as younger populations tend to be more receptive to technology and innovation. Afolabi & Olorunfemi (2021) notes that this demographic are driven growth in tech startups, particularly in urban centres where resources are more accessible.

Emerging Technology Hubs Cities such as Nairobi, Lagos, and Cape Town have emerged as prominent technology hubs, home to incubators and accelerators that support early-stage ventures. Ojo, (2020) notes that these hubs facilitate collaboration among entrepreneurs, investors, and mentors cultivating an environment conducive to innovation and growth. They also provide entrepreneurs with access to essential resources, networking opportunities, business support services, and mentorship, thereby strengthening their capacity to develop innovative ideas, establishes viable ventures, and sustains entrepreneurial activities.

c. Diverse and Expanding Sectors

Digital entrepreneurship in Africa spans fintech, e-commerce, healthtech, and agritech. The fintech sector has seen particularly rapid growth: mobile payment solutions such as M-Pesa have revolutionized financial transactions (Jack & Suri, 2011), substantially increasing financial inclusion for previously unbanked populations.

Case Studies of Successful Digital Startups in Africa

The African digital entrepreneurship landscape has produced several notable startups that illustrate how technology can be leveraged to create innovative, scalable solutions. M-Pesa: Launched by Safaricom in 2007, M-Pesa is among Africa's most successful mobile money platforms, enabling users to transfer money, pay bills, and conduct transactions via mobile phone. Jack & Suri (2011) documents its transformative effect on financial inclusion in Kenya; by 2020, the platform had over 40 million users. Jumia: Often described as the "Amazon of Africa," Jumia is an e-commerce platform operating across multiple African countries. Founded in 2012, it has expanded into food delivery, travel, and logistics. Afolabi & Olorunfemi (2021) attributes its success to its adaptation to local market conditions; the company listed on the New York Stock Exchange in 2019.Andela: Founded in 2014, Andela identifies and trains software developers across Africa and connects them with global technology companies, addressing the sector's skills gap. Hwang (2018) notes that Andela has trained thousands of developers and raised significant funding, including a $100 million Series D round in 2020.Paystack: Founded in 2015, Paystack enables businesses to accept online payments and processed over $1 billion in transactions within three years. Its acquisition by Stripe in 2020, for approximately $200 million, marked one of the largest exits in African technology (Higgins, 2020). Flutterwave: Founded in 2016, Flutterwave facilitates cross-border payments for African businesses and has raised over $225 million in funding from investors including Tiger Global Management and Y Combinator (Oluwaseun, 2021). These cases demonstrate that digital startups in Africa can innovate and disrupt traditional markets while contributing meaningfully to economic development and job creation, provided they can navigate the structural constraints discussed in the following section.

Challenges and Barriers Facing Digital Entrepreneurs

Despite this promising landscape, digital entrepreneurs face considerable challenges, including inadequate infrastructure, limited access to funding, and regulatory hurdles. Abor & Quartey (2010) argues that these systemic barriers stifle innovation and constrain the ability of startups to scale effectively. Governments are increasingly recognizing the importance of supporting the digital economy, introducing measures such as reduced regulatory burdens and tax incentives (Akpan & Adebayo, 2020); however, the implementation and effectiveness of these policies vary considerably across countries. International investment has also grown, with venture capital and global technology firms showing increasing interest in African startups. Chisanga & Mbewe (2021) argues that such global partnerships are essential for knowledge transfer and capacity-building, both of which are vital for local entrepreneurs to thrive. In sum, the current landscape is vibrant and full of potential, yet remains constrained by structural barriers. Addressing these barriers through targeted policy and investment in education and infrastructure will be essential to unlocking the continent's full digital economic potential.

The Role of Business Education in Africa's Entrepreneurship Landscape

Business education is vital for fostering an entrepreneurial mindset and equipping individuals with practical skills. Nabi et al. (2017) argues that business education enhances critical thinking, problem-solving and decision-making competencies essential to successful entrepreneurship while also improving understanding of market dynamics, financial management, and strategic planning (Rae, 2006). Kauffman (2016) similarly finds that well-structured business education programmes substantially increase the likelihood of entrepreneurial success by equipping students with the tools to develop viable business models. Business education and entrepreneurial competency encompass formal and informal learning that strengthens business knowledge, strategic thinking, and management capability (Volery & Mueller, 2006). For digital entrepreneurs specifically, this includes competencies in strategic planning, market research, financial literacy, business model design, and digital marketing. Entrepreneurs with strong business competencies are more likely to innovate, grow, and sustain their

ventures (Man, Lau, & Chan, 2008; Morris, Kuratko, & Cornwall, 2013). However, entrepreneurship education in many African nations remains largely theoretical and poorly aligned with real-world practice and the demands of digital ecosystems (Akanbi & Akinbinu, 2017), leaving many entrepreneurs ill-equipped to navigate complex markets or scale their ventures effectively.

Current State of Business Education in Africa

The state of business education across Africa is uneven. Many universities and colleges offer business programmes, but their quality and relevance vary considerably. A report by the African Development Bank (2019) finds that while some institutions have begun adapting their curricula to the demands of the digital economy, many continue to rely on traditional teaching methods that do not adequately prepare students for entrepreneurial ventures. Makhubela (2022) similarly finds that many programmes lack experiential learning opportunities such as internships and real-world projects that are crucial for developing practical entrepreneurial competencies. Beyond curriculum content, the business education gap is also a matter of pedagogical approach. Passive, theory-heavy teaching fails to cultivate the applied competencies needed to navigate digital markets (Kolb, 1984), whereas integrative and experiential learning case studies, simulations, and field projects has been shown to deepen entrepreneurial capability across these competencies (Rae & Carswell, 2000).

Identifying Gaps in Business Education for Entrepreneurship in Africa

The disconnect between what African business education delivers and what digital entrepreneurship demands is not a single deficiency but a cluster of interlocking gaps. These gaps operate at different levels of the education system what is taught, who can access it, and what surrounds the learner outside the classroom and each compounds the others. A curriculum gap without an accessibility gap might still be closed by motivated self-learners; an accessibility gap without a mentorship gap might still leave students able to find guidance elsewhere. It is the layering of all three that produces the persistently low entrepreneurial performance documented across the region.

i. Curriculum Deficiencies: Theory versus Practice

Many business education programmes in Africa emphasize theoretical knowledge at the expense of practical skills. Akpan & Adebayo (2020) finds that curricula often focus on traditional business theory without integrating experiential learning that reflects the real-world challenges entrepreneurs' face. Makhubela (2022) similarly finds that limited hands-on training and project-based learning constrain students' ability to apply their knowledge in practice, while Ojo (2020) notes that outdated curricula fail to keep pace with rapid changes in technology and market dynamics, leaving graduates ill-prepared for the modern business landscape.This theory–practice imbalance is particularly consequential for digital entrepreneurship because the underlying technologies and business models change faster than conventional curriculum review cycles can accommodate. A business plan module built around static market analysis, for instance, does little to prepare a student to iterate a digital product based on real-time user data, run A/B tests on a landing page, or interpret platform-level analytics from a service such as Paystack or Jumia's seller dashboard. Osterwalder & Pigneur's (2010) business model canvas and Blank & Dorf's (2012) lean startup methodology both widely used internationally to teach iterative, evidence-based venture design remain marginal in many African curricula relative to older, plan-driven approaches to business education (Akanbi & Akinbinu, 2017). The result is a structural mismatch: graduates are trained to write a business plan once, rather than to test, discard, and rebuild a business model repeatedly, which are the core discipline digital markets actually reward. The gap also extends into functional competency areas specific to digital ventures. Financial literacy modules frequently address budgeting and accounting fundamentals but rarely extend to digital-specific financial skills such as reading unit economics for platform businesses, managing cash flow under delayed payment-gateway settlement cycles, or evaluating equity dilution in venture funding rounds of the kind Flutterwave and Paystack has raised (Oluwaseun, 2021; Higgins, 2020). Similarly, marketing curricula often remain anchored in traditional four-P frameworks with limited coverage of digital marketing analytics, search and social advertising, or conversion funnel design (Chaffey & Ellis-Chadwick, 2019; Tiago & Veríssimo, 2014) precisely the skill set that determines customer acquisition cost and survival for early-stage digital ventures.

ii. Accessibility: Location, Resources, and Technology

Access to quality business education varies significantly across regions. Rural areas often lack educational institutions altogether, producing marked disparities in access (Chisanga & Mbewe, 2021). The African Development Bank (2019) reports that limited resources textbooks, technology, and infrastructure further compound these issues, while outdated facilities

constrain the learning experience more broadly (Abor & Quartey, 2010). The digital divide compounds these constraints: many students in underserved areas lack reliable internet access, limiting their ability to engage with online learning resources (Afolabi & Olorunfemi, 2021). This accessibility gap creates a paradox worth making explicit: digital entrepreneurship education is disproportionately delivered through digital means online courses, cloud-based tools, virtual mentorship yet the students most in need of digital-entrepreneurship training are often the least well connected to consume it. Fatoki & Asah (2011) notes that entrepreneurial skill acquisition is closely tied to the learning infrastructure available to a student; where that infrastructure is itself digital, connectivity becomes a precondition for the very competencies the curriculum is meant to build, not simply a delivery-channel inconvenience. Regional disparities also carry a gender dimension: women entrepreneurs in rural and peri-urban areas face a compounding of geographic and social access barriers, limiting their participation in both formal business education and informal digital-skills communities that often substitute for it in urban hubs such as Lagos, Nairobi, and Cape Town (Ojo, 2020).

Resource constraints extend beyond connectivity to the tools of digital practice itself. Effective digital-entrepreneurship pedagogy increasingly assumes access to functioning e-commerce sandboxes, analytics dashboards, cloud computing credits, and even reliable electricity for sustained coursework none of which can be assumed uniformly across institutions (African Development Bank, 2019). Where such resources are available only intermittently, students can acquire conceptual familiarity with digital tools without ever developing the hands-on fluency that distinguishes competent practice from theoretical awareness.

iii. Limited Mentorship and Networking Opportunities

Mentorship is critical to entrepreneurial development, yet many students in Africa struggle to access it. Nabi et al. (2017) finds that effective mentorship significantly enhances the entrepreneurial experience by providing guidance, support, and industry insight; however, the absence of established mentorship programmes within many institutions means students miss valuable connections and learning opportunities (Ojo, 2020). Chisanga & Mbewe (2021) argues that stronger partnerships between educational institutions and industry stakeholders could help close this gap by creating structured networking opportunities for aspiring entrepreneurs.

The mentorship gap is especially costly in digital entrepreneurship because much of the tacit knowledge required how to price a subscription product, when to pivot a business model, how to negotiate with a payment processor, how to structure an early funding round is rarely codified in textbooks and is instead transmitted informally through networks of practitioners. Case studies such as Andela, which was built in part around structured mentorship pairing junior developers with experienced technologists (Hwang, 2018), illustrate what formal mentorship infrastructure can accomplish when it exists; its relative rarity in mainstream business education programmes is precisely the deficit this section identifies. Without comparable structures, students graduate with formal credentials but without the informal network capital that experienced entrepreneurs rely on to navigate early-stage uncertainty.

Addressing these three interlocking gaps curriculum deficiencies, accessibility constraints, and limited mentorship is essential to improving the quality and relevance of business education across Africa.

Strategies for Bridging the Education Gap

The gaps identified above suggest that no single intervention can close the business education deficit on its own; curriculum reform without access, or access without mentorship, addresses only part of the problem. The strategies below are therefore presented as complementary and mutually reinforcing rather than as alternatives, and are sequenced roughly from the classroom outward from what is taught, to how it is delivered, to who surrounds the learner.

a. Curriculum Development: Integrating Practical Skills and Digital Tools Curricula should be redesigned to combine theoretical grounding with practical, experiential components such as internships, live projects, and case studies reflecting real business challenges (Akpan & Adebayo, 2020). Makhubela (2022) emphasizes the importance of embedding digital tools directly into coursework, giving students hands-on experience with the technologies reshaping the business landscape and cultivating an entrepreneurial mindset through applied problem-solving. Concretely, this reform can draw on frameworks already well-established in international entrepreneurship pedagogy but underused in African programmes. Adopting the business model canvas (Osterwalder & Pigneur, 2010) and lean startup methodology (Blank & Dorf, 2012) as core teaching tools, rather than supplementary readings, would shift students

from writing static plans to practicing iterative validation testing assumptions about customers, pricing, and channels against real feedback before committing resources. Coursework built around live, revenue-generating digital ventures (however small) gives students direct exposure to the metrics that matter in digital markets: customer acquisition cost, retention, and unit economics, echoing the applied, data-driven competencies that Kraus et al. (2019, 2023) identify as central to digital business model innovation. Embedding basic financial-literacy instruction specific to digital ventures reading platform payout structures, projecting cash flow under variable transaction volume, and understanding early-stage equity terms directly targets the functional skills gap identified in the preceding section (Lusardi & Mitchell, 2014). Institutions should also treat curriculum reform as continuous rather than periodic. Given how quickly digital business models evolve as the trajectories of Paystack, Flutterwave, and Jumia themselves illustrate over just the past decade a curriculum locked to a multi-year review cycle will structurally lag the market it is meant to prepare students for (Ojo, 2020). Lightweight, annually revisited modules built and updated in collaboration with industry practitioners offer one practical route to keeping pace without requiring a full curriculum overhaul each time.

b. Leveraging Technology for Remote Learning and Access
The COVID-19 pandemic underscored the value of technology-enabled learning. Chisanga & Mbewe (2021) notes that digital platforms can extend access to quality education, particularly for students in remote or underserved areas, while Afolabi & Olorunfemi (2021) highlights the benefit of blended learning approaches in enhancing engagement and broadening access to educational resources. Online communities for collaboration and knowledge-sharing can further enrich this experience. Because the accessibility gap identified above is partly a connectivity problem, technology-enabled learning strategies need to be designed for low-bandwidth and intermittent-connectivity conditions rather than assuming continuous broadband access. Low-data-mode course delivery, downloadable offline modules, and SMS- or USSD-based components modeled on the same lightweight mobile infrastructure that made M-Pesa usable across low-connectivity environments (Jack & Suri, 2011) can extend reach into precisely the rural and peri-urban areas where institutional access is thinnest (Chisanga & Mbewe, 2021). Blended models that pair a compact digital core curriculum with in-person facilitation at local hubs or partner institutions can also reduce dependence on any single student's personal connectivity or device access, addressing the resource constraints noted in the accessibility discussion above.

c. Partnerships Between Educational Institutions and Industry Partnerships between universities and industry stakeholders help align academic programmes with market demands. Nabi et al. (2017) finds that such collaborations facilitate mentorship, internships, and joint projects that give students real-world experience, while Ojo (2020) notes that industry involvement in curriculum design helps keep programmes current and responsive to a fast-changing business environment. These partnerships also expand students' professional networks within their chosen industries. Such partnerships also offer the most direct route to closing the mentorship gap described earlier. Structured mentorship programmes pairing students with practitioners from fintech, e-commerce, and platform businesses can replicate at institutional scale what companies such as Andela have demonstrated works at organizational scale: that structured, sustained mentorship measurably accelerates the transition from formal training to practical competence (Hwang, 2018). Guest lectures and short-term placements with firms such as Paystack, Flutterwave, or Jumia would additionally expose students directly to the operational realities payment processing, logistics, cross-border compliance that case-study teaching can only approximate. Formalizing these arrangements through memoranda of understanding, rather than relying on ad hoc guest lectures, would help ensure continuity of access across cohorts rather than depending on individual staff relationships (Chisanga & Mbewe, 2021).

Implemented together, curriculum reform, technology-enabled access, and industry partnership offer a coherent pathway to improving the quality and relevance of business education across Africa, better preparing students for the demands of entrepreneurship and strengthening the continent's broader economic development.

Findings and Discussion

Curriculum gaps remain pervasive across African business schools and technical colleges, with insufficient emphasis on applied, digital-centric business competencies. Entrepreneurial support programmes such as incubators and accelerators often provide useful skills training, but remain fragmented and lack standardization, limiting their scalability. Industry–education linkages are generally weak, producing a disconnect between academic knowledge and industry requirements. Gender and

regional disparities further compound the business education gap, with women and rural entrepreneurs facing disproportionately limited access to quality training. The
findings align with broader research showing that entrepreneurial education incorporating experiential learning, mentorship, and digital tools significantly enhances venture performance (Pittaway & Cope, 2007; Kolb, 1984). Read together, they suggest that closing the business education gap requires coordinated action across curriculum design, institutional access, and industry engagement, rather than isolated reform in any single area.

Conclusion

This paper has examined digital entrepreneurship in Africa and its relationship to the persistent gap in business education. While the continent is rich in innovative potential, substantial barriers to effective digital entrepreneurship remain ranging from limited access to technology and inconsistent internet connectivity to gaps in essential business education and mentorship. The evidence reviewed suggests that fostering a more robust ecosystem for digital entrepreneurship could meaningfully enhance economic growth and job creation across the continent.

Addressing these challenges will require coordinated effort across several fronts. Educators should integrate technology-focused curricula that prioritise digital skills, entrepreneurship, and practical application. Policymakers should advocate for infrastructure development and support institutions that promote entrepreneurial initiatives, ensuring young entrepreneurs have access to necessary resources. Entrepreneurs themselves should actively engage with community networks and mentorship programmes that can strengthen their skills and knowledge. Collaboration among technology hubs, universities, and businesses can further create the synergy needed to sustain innovation. Future research should examine specific case studies of successful digital entrepreneurs across diverse African contexts, investigate the impact of government policy on digital entrepreneurship, and explore the role of cultural factors in entrepreneurial success. Additional studies assessing the long-term sustainability of digital businesses emerging from improved educational frameworks and their contribution to local economies would further strengthen this evidence base. Through sustained, coordinated effort across these sectors, Africa can build a more vibrant and inclusive digital entrepreneurial landscape, bridging the education gap and empowering the next generation of innovators.

Recommendations

i. Curriculum Reform
   Integrate practical skills: revise curricula to include hands-on experience, case studies, and projects reflecting real-world business challenges, enabling students to apply theoretical knowledge in practice. Embrace digital tools: incorporate training in emerging technologies and digital platforms including e-commerce, digital marketing, and data analytics to prepare students for the digital economy.

ii. Technology Infrastructure and Access
   Invest in connectivity: governments and the private sector should collaborate to improve internet access and digital infrastructure, particularly in rural and underserved areas. Leverage online learning platforms: encourage the development and use of flexible online learning platforms that allow students to learn at their own pace.

iii. Industry Partnerships
   Formalize collaboration with businesses: establish partnerships with local and international firms to create internship, mentorship, and job-placement programmes.Involve industry in curriculum design: use guest lectures, workshops, and collaborative projects to bridge academic knowledge and practical industry needs.

iv. Entrepreneurial Mindset and Mentorship
   Encourage innovation: foster a culture of entrepreneurship by supporting student-led business ideas through incubators and accelerators. Develop mentorship programmes: connect students with experienced entrepreneurs and business leaders who can provide guidance and insight into the entrepreneurial journey.

v. Policy Support
   Strengthen government initiatives: create supportive regulatory and funding environments for startups, including simplified business registration and targeted tax incentives. Prioritize inclusivity: ensure policies address the needs of marginalized groups, including women and rural entrepreneurs, to foster an inclusive entrepreneurial ecosystem.

vi. Continuous Research and Development

Monitor and evaluate: conduct ongoing research to assess the effectiveness of educational programmes aimed at bridging the business education gap, identifying best practices and areas for improvement. Adapt to change: ensure educational programmes remain responsive to evolving market demands and technological advancement. Implementing these recommendations in a coordinated manner can help stakeholders build a more resilient and vibrant digital entrepreneurship ecosystem in Africa empowering the next generation of entrepreneurs while contributing meaningfully to economic development and innovation across the continent.

Abstract

Business education serves as a pivotal mechanism for fostering digital innovation, entrepreneurship, and sustainable economic development in Africa. In an increasingly technology-centric global economy, African nations face the imperative to develop a workforce proficient in digital skills, entrepreneurial capabilities, innovative strategies, and managerial expertise to effectively navigate the challenges posed by the Fourth Industrial Revolution. However, these nations face significant challenges, including high youth unemployment rates, insufficient digital infrastructure, underdeveloped entrepreneurial ecosystems, limited technological adoption, and educational frameworks that frequently misalign with the emerging needs of the labor market. Such challenges have hindered Africa's progress toward achieving meaningful digital and entrepreneurial transformation. This paper examines the crucial role that business education plays in facilitating this transformation. It articulates the concepts of business education as well as digital and entrepreneurial transformation, critiques existing theoretical frameworks, and highlights key challenges that diminish the effectiveness of business education as a catalyst for such transitions. Furthermore, it proposes actionable strategies aimed at fortifying business education to align it with the demands of the digital economy. Employing a qualitative methodology, the study incorporates a comprehensive analysis of relevant scholarly literature, policy documents, and institutional reports. The findings emphasize that business education plays a vital role in equipping learners with essential competencies, including digital literacy, entrepreneurial skills, innovation capabilities, financial management knowledge, leadership skills, problem-solving abilities, and comprehensive business management techniques. These competencies not only enhance individual employability but also foster enterprise creation, technological adaptation, and sustained economic growth. In conclusion, the study posits that strategic investment in business education, modernization of curricula, enhancement of digital infrastructure, development of entrepreneurial initiatives, cooperation with industries, and the implementation of supportive government policies are critical steps towards significantly accelerating digital transformation, fostering entrepreneurial growth, generating employment opportunities, and enhancing economic competitiveness throughout Africa.

Key words: Business education, Critical driver, Innovation, Digital infrastructure, Entrepreneurial transformation, Africa

Introduction

The twenty-first century has marked a significant period of technological progress and globalization, greatly influenced by the fourth industrial revolution (4IR), which encompasses various digital technologies such as artificial intelligence, big data analytics, cloud computing, financial technology (FinTech) and e-commerce. These innovations have transformed global business operations, government services, and educational practices, creating both opportunities for economic growth and challenges necessitating a re-evaluation of educational systems (Adeyemi, et al, 2022). According to Elujekwete et al (2021), and Okafor, et al, (2021) Business Education has become increasingly important as it equips individuals with essential knowledge, attitudes, values, digital skills, entrepreneurial insight, and management capabilities vital for success in the rapidly evolving digital economy. Traditionally centered on clerical and administrative roles, modern business education now encompasses areas like digital literacy, innovation management, and financial technology, aligning closely with evolving labor market demands.

Africa's burgeoning youth population presents a unique opportunity for economic advancement if adequately empowered through quality education, digital skills development, and entrepreneurship.

However, Ojo, et al (2023) submit that challenges such as high youth unemployment, underemployment, weak industrialization, inadequate digital infrastructure, low productivity, and limited technological capability hinder progress. Over the years, millions of young Africans have entered the workforce, but job opportunities have not kept pace, reinforcing calls for educational reforms to focus on digital competencies and entrepreneurship (International Labour Organization, 2022). Digital transformation is a critical driver of economic growth, impacting various sectors by enhancing efficiency and service delivery through the integration of technology (OECD, 2023). In Africa, digital technologies have transformed banking through mobile money and digital payment systems; and have expanded access to education through online learning, and created new opportunities for e-commerce and digital entrepreneurship. Yusuf et al (2022) however aver that despite these remarkable developments, issues of digital inequality remain pervasive, stemming from inadequate infrastructure and digital literacy.

Entrepreneurial transformation is vital for fostering inclusive economic development in Africa. Entrepreneurship education supports the development of skills needed to create and sustain businesses, encouraging innovation and employment. Integrating entrepreneurship education into business education curricula is increasingly recognized as essential for preparing students to navigate complex economic landscapes (Yusuf et al, 2022). Business education acts as a link between digital transformation and entrepreneurship, with curricula designed to impart skills in digital literacy, management, critical thinking, and entrepreneurship, preparing graduates for the demands of the modern workforce.

However, despite advancements, business education in Africa faces numerous obstacles. According to Adebayo et al (2023), these obstacles include outdated curricula, inadequate funding, insufficient digital infrastructure, shortage of qualified educators with digital competencies, weak partnerships between educational institutions and industry, poor internet connectivity, inadequate entrepreneurial support services, and policy implementation gaps, among others. These limitations hinder the effectiveness of educational outcomes, potentially widening the gap between students' skills and labor market needs. Addressing these challenges is imperative for enhancing Africa's global competitiveness in the digital economy. Therefore, this paper emphasizes the urgent necessity to strengthen business education to foster digital entrepreneurial transformation across the continent.

Concept of Business Education

Business Education is an aspect of vocational education concerned with preparing students to acquire knowledge, skills and competencies for teaching of business courses, and employment in business-related fields. In business education, attitudes and skills learnt help the recipients to be efficient and effective in their work in accordance to the needs of the society at any point in time. Elujekwete (2019) and Fayolle et al (2019) consider business education as a comprehensive educational programme designed to prepare students with knowledge and skills for employment in business-related fields and office occupations, entrepreneurship, and leadership. Nwosu and Okoro (2020) cite Edokpolor and Owenvbiugie as asserting that the actual goals of Business Education are to prepare students for specific career in office occupations, equip students with the requisite skills for job creation and entrepreneurship, and expose students with knowledge about business, including a good blend of Information and Communication Technology (ICT). According to Nabi et al (2017), Business education is identified as a vital discipline within vocational and technical training, equipping learners with the necessary knowledge, skills, and competencies to succeed in various business roles, including employment and entrepreneurship. Its curriculum blends theoretical and practical experiences to foster skills in areas like accounting, office technology and management, marketing, finance, entrepreneurship, and ICT, aligning with labor market demands as highlighted by the Federal Republic of Nigeria (FRN, 2018).The ideal of business education curriculum should prepare individuals for productive employment, self-reliance, lifelong learning, and meaningful contributions to economic and national development. Over time, business education has evolved from focusing primarily on traditional office roles such as bookkeeping and secretarial duties to incorporating contemporary elements like digital literacy, e-commerce, FinTech, and innovation management. This shift is a response to globalization and rapid technological advancements. Akinwale and Suleiman (2021) note that a key objective of business education is to cultivate employable skills, empowering graduates with competencies in communication, decision-making, and teamwork, thereby enhancing their employability across various sectors.

Moreover, the integration of digital technologies into business education is becoming increasingly pertinent. Anyadike et al. (2018) argue that digital competencies are vital for leveraging innovations in the business sphere, especially within the context of Africa’s fast-evolving technological landscape. Business education is thus seen as a catalyst for digital and entrepreneurial transformation,

preparing graduates to thrive in the digital economy while contributing to technological progress in Africa.

Digital Transformation

Digital transformation has become one of the most significant developments shaping the global economy, educational systems, public administration, healthcare, manufacturing, agriculture, finance, and business operations in the 21st century. It is characterized as the pervasive integration of digital technologies into organizational, economic, and educational frameworks. It represents a strategic priority for sustainable growth by enhancing efficiency and competitiveness through the modernization of processes and structures (World Bank, 2023; OECD, 2020). UNESCO (2021) considers digital transformation as the integration of digital technologies into educational systems to improve teaching, learning, research, administration and knowledge dissemination. The focus on digital transformation encompasses several emerging technologies from the Fourth Industrial Revolution, including AI, blockchain, and big data analytics, all of which redefine traditional business operations and models.

Hisrich and Peters (2018) emphasize that digital transformation drives innovation, enabling organizations to develop new offerings and streamline current processes in response to market demands, enabling businesses to remain competitive while meeting the expectations increasingly technology-oriented customers. It also fosters a culture of data-driven decision-making. According to International Labour Organization (2022), organizations utilize digital tools to analyze significant volumes of data for strategic insights into business operations and organizational performance. Successful adoption of digital technologies leads to improved productivity, reduced costs, and enhanced market reach, marking a shift in how businesses engage with their customers and operate overall.

Entrepreneurial Transformation

Entrepreneurial transformation refers to the comprehensive policy of developing entrepreneurial knowledge, competences, attitudes, innovative capabilities, and business management skills that enable individuals, organizations, and societies to create, sustain and expand productive enterprises capable of transforming economic and social conditions (Adebayo et al, 2023). Entrepreneurial transformation involves changing individuals from being job seekers into job creators by equipping them with the capacity to identify opportunities, develop innovative solutions, mobilize resources, manage risks, establish enterprises, and contribute to national development through wealth creation and employment generation.

Entrepreneurial transformation has emerged as a pivotal strategy for achieving sustainable economic growth, employment generation, poverty alleviation, industrialization, and technological advancement in the twenty-first century. Increasingly, countries recognize entrepreneurship as a key driver of innovation, competitiveness, productivity, and socio-economic development. Hisrich et al, (2020) submit that in Africa, this transformation is particularly relevant, as it holds the potential to address entrenched developmental challenges including unemployment, poverty, inequality, low industrial productivity, overreliance on government jobs, and weak economic diversification.

Furthermore, entrepreneurial transformation extends beyond mere business ownership; it cultivates an entrepreneurial mindset characterized by creativity, critical thinking, resilience, opportunity recognition, and calculated risk-taking. Individuals equipped with these qualities are better prepared to navigate shifting economic landscapes and competitive environments. According to Hisrich et al, innovation plays a crucial role in this process, as it enables entrepreneurs to launch new products, enhance services, and respond to consumer needs—contributing substantially to industrial growth and economic competitiveness.

Enterprise creation, particularly through micro, small, and medium-sized enterprises (MSMEs), is another significant aspect of entrepreneurial transformation (Elujekwete et al, 2021). These businesses are vital for job creation, income generation, and economic diversification. Moreover, entrepreneurial transformation heavily emphasizes skills development. Entrepreneurs must possess a blend of technical, managerial, and digital competencies, cultivated through education, vocational training, and mentoring, which are essential for establishing and maintaining successful enterprises.

Opportunity identification and resource mobilization are critical components of this transformation. Entrepreneurs must learn to pinpoint unmet market needs and assess viable business opportunities. Yusuf et al (2022) suggest that those adept at recognizing opportunities are more likely to build successful enterprises that generate sustainable income. As entrepreneurial activities grow, they spur job creation, thereby alleviating youth unemployment and reducing dependency on government jobs.

Finally, entrepreneurial transformation fosters economic diversification, moving beyond traditional sectors like agriculture, mining, and oil exports. It encourages investments in varied fields

such as manufacturing, agribusiness, tourism, creative industries, renewable energy, healthcare, and education, all of which are essential for enhancing economic resilience and promoting long-term growth.

Business Education and Entrepreneurial Transformation in Africa

Business education plays a crucial role in promoting digital entrepreneurship, which facilitates entrepreneurial transformation by enhancing market opportunities and increasing business efficiency. According to Fayolle and Gailly (2019), it significantly contributes to the growth of Small and Medium Enterprises (SMEs), essential for most African economies. SMEs are vital as they account for a considerable share of employment, production, innovation, and income generation across the continent. Business education equips entrepreneurs with the skills necessary to establish and sustain SMEs, focusing on areas such as financial management, strategic planning, marketing, accounting, and organizational leadership. The development of strong SMEs bolsters economic diversification, creates jobs, supports industrialization, and helps alleviate poverty. To further enhance its impact, business education must continually modernize its curriculum by incorporating emerging technologies, artificial intelligence, digital entrepreneurship, innovation management, business analytics, financial technology, and sustainable enterprise development.

Theoretical Framework

The study was anchored on Human Capital Theory as proposed by Theodore W. Schultz in 1961 and further developed by Gary S. Becker in 1964. This theory emphasizes the significance of investing in education, training, skills acquisition, health, and knowledge as crucial to enhancing productivity, competence, and earning potential across individuals and organizations. It posits that education functions not just as a social service but as a vital economic investment that reaps returns at various societal levels.

According to Schultz, nations that prioritize education will see improvements in labor productivity and the quality of human resources, with education enabling individuals to engage more effectively in economic activities. Becker expands on the concept by defining human capital as the accumulation of knowledge, skills, competencies, talents, and experiences gained through formal education and ongoing training, which collectively boost individual productivity and organizational effectiveness.

The theory further delves into the intersection of education and digital transformation, highlighting the increasing demand for digitally competent professionals as organizations adopt new technologies—such as artificial intelligence, cloud computing, and e-commerce. Business education emerges as a key investment in digital human capital, equipping learners with essential technological knowledge, digital literacy, and innovation skills necessary for thriving in the digital economy.

Overall, the human capital theory is particularly pertinent to understanding how investments in business education can drive digital and entrepreneurial transformation in Africa. It articulates how such education not only fosters knowledge and managerial skills but also prepares graduates to harness modern digital technologies effectively. Consequently, this effectively enhances their employability and entrepreneurial prospects, while simultaneously contributing to the broader goal of achieving digital transformation across the continent.

Challenges of Business Education for Digital and Entrepreneurial Transformation in Africa

Challenges faced by business education in Africa significantly hinder the development of graduates equipped with essential digital competencies and entrepreneurial skills necessary for success in a competitive global economy. Key concerns include

1. Inadequate funding from governments, leading to poorly equipped facilities and limited resources. Additionally, unreliable electricity and a shortage of qualified educators with up-to-date digital skills contribute to ineffective teaching methodologies.
2. Outdated curricula that fail to integrate emerging technologies like artificial intelligence and blockchain; and insufficient digital infrastructure that constrains hands-on learning experiences. Inadequate practical training results in graduates possessing theoretical knowledge but lacking real-world experience, while weak collaborations between educational institutions and industries limit exposure to current market practices.
3. Inadequate digital Infrastructure. Many educational institutions across Africa operate with inadequate computer facilities, unreliable internet connectivity, insufficient broadband access, outdated software, and limited access to digital learning platforms. These infrastructural deficiencies restrict students' opportunities to acquire practical digital skills.
4. Shortage of Qualified Digital-Skilled Educators. Many educational institutions experience shortages of lecturers who possess adequate knowledge of emerging digital technologies and contemporary entrepreneurial practices. This limits their ability to effectively prepare students for the evolving business environment.

5. Weak Partnerships between Educational Institutions and Industries. Effective business education requires strong collaboration between educational institutions and industries. Unfortunately, partnerships between educational institutions and industry remain weak in many African countries. As a result, students receive limited exposure real world business environments, current industry practices, and emerging technological innovations.
6. Corruption and Mismanagement of Educational Resources. Corruption continue to undermine educational development ion several African countries. Misappropriation of educational funds, poor procurement practices, political interference, and weak accountability reduce investments in educational infrastructure, technology, staff development, and entrepreneurship education programmes. Consequently, business education programmes operate below their expected capacities.

7. Policy inconsistencies create an unstable environment for long-term educational planning, while poor research cultures diminish innovation potential across institutions. There is a noticeable digital skills gap, with many students unable to meet the demands of a technology-driven market, further intensified by corruption and mismanagement of educational resources that diminish investment in vital areas.

Conclusion

Business education has become a fundamental instrument for achieving digital and entrepreneurial transformation in Africa. The rapid advancement of digital technologies, globalization, and the knowledge economy have significantly altered the competences required for business success, employment, innovation, and sustainable economic development. The evolving landscape of the knowledge economy necessitates a shift from traditional educational paradigms to a more dynamic approach, equipping learners with the skills needed for sustainable economic development and innovation. Strategies have to be adopted in order to strengthen business education to take its rightful place towards digital and entrepreneurial transformation in Africa. Through these practical strategies, business education can become a catalyst for employment generation and enhanced economic competitiveness across the continent.

Recommendations

The following recommendations are advanced for strengthening business education for digital and entrepreneurial transformation in Africa::

1. Increased Government Funding: Significant financial investment is necessary to provide modern facilities, digital tools, and resources essential for an effective business education environment. This funding will support curriculum implementation and practical training.
2. Curriculum Modernization: Continuous revisions to business education curricula are essential. Emerging technological areas like artificial intelligence, blockchain technology, FinTech, and digital marketing should be integrated to equip graduates with relevant skills.
3. Provision of Digital Infrastructure: Investment in modern digital infrastructure such as high-speed internet, smart classrooms, and digital libraries is crucial for facilitating effective teaching and learning. Institutions should foster research in digital technologies and entrepreneurship, backed by increased government research grants.
4. Training in Digital Literacy: Comprehensive digital training is paramount for all business education students, covering essential skills. Business education should support continuous professional growth to keep individuals relevant in a fast-paced digital economy.
5. Industry-Institution Collaboration: Establishing partnerships with industries will facilitate internships and mentorships, improving employability, real-world relevance, and enhance resources for entrepreneurship education.
6. Reducing corruption and encouraging accountability in business education programmes particularly and educational institutions generally will ensure transparency and provision of adequate educational resources to enhance digital and entrepreneurial transformation.
7. Policy Consistency and Support: Governments should maintain stable educational policies to foster long-term investments and growth in entrepreneurship education.

DIGITAL SKILLS GAP AND TECHNOPRENEURSHIP: REPOSITIONING BUSINESS EDUCATION FOR NIGERIA'S DIGITAL ECONOMY

Effah, Miriam Anyianwan, Okudare, Juliana Unwanynin (PhD) & Ogbeche, Stephen
Corresponding Email- effahmiriam@gmail.com
Department of Business Education,
Federal College of Education, Obudu,
Cross River State

Abstract

The rapid expansion of Africa's digital economy is transforming the nature of work, enterprise development, and employment, creating both opportunities and challenges for Business Education. While digital technologies, artificial intelligence, e-commerce, Fin-tech, digital marketing, and online platforms are generating new pathways for innovation and entrepreneurship, a significant digital skills gap continues to limit the capacity of many young Africans to participate effectively in the emerging economy. This paper examines the relationship between digital skills development and technopreneurship and argues for the repositioning of Business Education as a strategic vehicle for preparing learners for Africa's technology-driven economic environment. The paper highlights the need to move beyond conventional business competencies towards integrated digital, entrepreneurial, innovative, and problem-solving capabilities. It explores how Business Education can incorporate artificial intelligence literacy, data analytics, digital marketing, e-commerce, financial technology, cyber security awareness, coding fundamentals, digital communication, and technology-enabled enterprise development into its curriculum and instructional practices. The paper further identifies inadequate digital infrastructure, limited access to emerging technologies, insufficiently trained educators, outdated curricula, weak industry–institutional partnerships, and unequal access to digital resources as major barriers to effective digital skills acquisition. It proposes curriculum modernization, continuous professional development for Business Education teachers, technology-supported pedagogies, entrepreneurship incubation programmes, industry partnerships, and stronger institutional investment in digital infrastructure as strategic interventions. The paper concludes that repositioning Business Education towards digital competence and techno-preneurship can strengthen employability, stimulate innovation, support enterprise creation, and contribute to Africa's inclusive participation in the global digital economy.

Keywords: Digital Skills Gap, Technopreneurship, Business Education, Digital Economy

Introduction

Information and communication technologies, artificial intelligence, cloud computing, digital platforms, e-commerce, financial technology, data analytics, and social media are all having a significant impact on how businesses are founded, run, and grow. Due to its big youth population, fast expanding digital infrastructure, and rapidly growing population, Africa is a significant player in this shift. Across the continent, new prospects for employment, entrepreneurship, innovation, financial inclusion, and enterprise development have been made possible by the rise of the digital economy. The nature of occupational competencies needed in modern workplaces has also been altered by digital technologies, making digital literacy and technology-related skills more crucial for people looking for work or planning to start their own firms. According to the World Bank (2023), digital transformation has the potential to create new business, employment, and economic participation opportunities in Africa. However, the actualization of these advantages is heavily dependent on the availability of suitable infrastructure, affordability, digital skills, and supportive institutional environments.

The need for people with skills beyond traditional academic and professional knowledge has subsequently expanded due to the growing significance of the digital economy. The ability to use digital platforms, analyze information and data, communicate through digital channels, use online business applications, engage in e-commerce, use digital financial services, and apply emerging technologies to

solve real-world problems are all examples of digital competence. Workers who can combine technical expertise with creativity, adaptability, problem-solving skills, and entrepreneurial spirit are becoming more and more necessary in the evolving labor market. According to the World Bank (2025), businesses in Africa are requiring skills related to digital marketing, social media, data analysis, programming, and other technology-enabled activities. As a result, digital competences are becoming more and more relevant across various occupational categories. Workers who can combine technical expertise with creativity, adaptability, problem-solving skills, and entrepreneurial spirit are becoming more and more necessary in the evolving labor market. According to the World Bank (2025), businesses in Africa are requiring skills related to digital marketing, social media, data analysis, programming, and other technology-enabled activities. As a result, digital competences are becoming more and more relevant across various occupational categories.

Despite the expansion of digital technologies, Africa continues to experience a substantial digital skills gap. The challenge is not merely the availability of internet connectivity or digital devices but the ability of individuals to utilize these technologies productively for learning, employment, innovation and enterprise development. The World Bank (2023) notes that significant disparities remain in digital access, affordability and skills across African countries, while only a relatively limited proportion of tertiary graduates have received adequate formal digital training. This situation creates a mismatch between the competencies acquired through formal education and those increasingly demanded by employers and digital enterprises. The implication is that young people may have access to smartphones, social media and online platforms without possessing the advanced digital, analytical and entrepreneurial capabilities required to transform those technologies into sustainable economic opportunities. Consequently, addressing Africa's digital skills gap requires educational systems to move beyond access-oriented approaches towards deliberate development of productive and market-relevant digital competencies.

The problem is particularly important given the demographic structure of Africa and the increasing number of young people entering the labour market. The continent requires innovative approaches capable of transforming its youthful population into a productive workforce and entrepreneurial resource. Digital technologies offer opportunities for young people to engage in freelancing, e-commerce, digital marketing, software development, online education, content creation, financial technology and other emerging forms of economic activity. However, these opportunities cannot be fully exploited without appropriate digital and entrepreneurial competencies. The International Labour Organization (ILO, 2024), in collaboration with other international and African institutions, has emphasized the importance of strengthening digital skills, entrepreneurship and employability among African youth as part of efforts to promote decent work and participation in the digital economy. This situation places considerable responsibility on educational institutions to ensure that graduates are equipped not only to search for employment but also to identify opportunities and create technology-enabled enterprises.

Within this changing environment, Business Education occupies a strategic position because of its traditional emphasis on business knowledge, entrepreneurship, management, accounting, communication, office technology and employability skills. However, the transformation of the business environment requires these traditional competencies to be reinterpreted within a digital context. Business Education can no longer be restricted to preparing students for conventional office occupations when business processes are increasingly conducted through digital platforms and technologies. Contemporary Business Education should enable students to understand and apply artificial intelligence, data analytics, digital marketing, e-commerce, financial technology, electronic office applications, social media management, cyber security awareness and other technologies relevant to modern business operations. In Nigeria, the World Bank (2019) identified limited digital skills and gaps in the integration of digital competencies into education as important challenges to the development of an inclusive digital economy. This suggests that strengthening Business Education with relevant digital competencies could contribute to improving the preparedness of graduates for emerging employment and entrepreneurial opportunities.

The concept of techno-preneurship is particularly relevant to this transformation because it combines entrepreneurial thinking with the strategic application of technology to identify opportunities, develop innovative solutions and establish technology-enabled businesses. Techno-preneurship goes beyond the conventional understanding of entrepreneurship by placing technological innovation at the Centre of opportunity identification, product development, marketing, service delivery and business growth. For

Business Education, this represents an opportunity to shift the emphasis from merely preparing students to become users of existing business systems towards developing their capacity to create innovative technology-based solutions and enterprises. A techno-preneurially oriented Business Education programme can expose students to practical experiences involving digital business models, e-commerce platforms, digital payment systems, online marketing, data-driven decision-making and the development of technology-supported products and services. Such an approach could make Business Education more responsive to the realities of Africa's changing economic environment.

Nevertheless, a significant curriculum gap exists between traditional Business Education and the competencies required in the contemporary digital economy. Although conventional business competencies remain relevant, the increasing demand for digital marketing, data analytics, artificial intelligence, e-commerce, digital financial services and technology-enabled entrepreneurship suggests that Business Education curricula need to be continuously updated. The World Bank (2025) indicates that digital competencies are increasingly embedded across occupational categories, implying that graduates require more than basic computer literacy to compete effectively in emerging labour markets. Where curricula remain heavily concentrated on conventional business practices without adequate integration of emerging technologies, graduates may possess theoretical business knowledge but lack the practical competencies needed to create and manage digital enterprises. This curriculum–digital economy gap therefore represents an important challenge to the relevance and effectiveness of Business Education in Africa.

There is also a significant gap between entrepreneurship knowledge and practical techno-preneurial competence. Students may be taught concepts such as opportunity identification, business planning, innovation and enterprise management, yet this does not necessarily mean that they can identify technology-driven business opportunities, develop digital products, operate online enterprises or use digital platforms to reach customers. Entrepreneurship education becomes more meaningful when learners are provided with opportunities to apply knowledge to authentic business problems and develop marketable solutions. Recent evidence from Nigeria suggests that entrepreneurship education continues to face challenges associated with experiential learning and alignment with changing labour-market requirements (Abdulrahman et al., 2026). This indicates the need for Business Education programmes to incorporate practical technology-based entrepreneurial activities through innovation hubs, enterprise projects, digital business simulations, internships, mentorship and collaboration with technology-oriented businesses.

Another important gap concerns the difference between digital access and digital capability. Although internet penetration and mobile technology have expanded considerably across Africa, access to technology does not automatically translate into productive digital participation. The World Bank (2024) notes that substantial usage gaps remain in Africa even where network coverage exists, with affordability, access to appropriate devices, digital literacy and skills continuing to constrain meaningful participation. This distinction is important for Business Education because students may possess smartphones and regularly use social media while lacking the ability to employ digital technologies for business analysis, online enterprise creation, digital marketing, financial management or innovation. Educational institutions therefore need to deliberately transform everyday technology use into structured digital competence capable of supporting productive economic activity.

A further gap relates to the capacity of Business Education teachers and institutions to support emerging digital competencies. The rapid development of artificial intelligence, fin-tech, cloud technologies, data analytics and digital platforms means that teachers require continuous professional development to remain relevant. Where educators lack adequate exposure to emerging technologies, they may be unable to integrate these technologies effectively into teaching and learning. Similarly, inadequate digital infrastructure, unreliable electricity supply, limited access to high-speed internet, insufficient technological equipment and inadequate institutional funding can constrain the implementation of digitally oriented Business Education. These challenges suggest that curriculum reform must be accompanied by investment in teacher development, infrastructure, digital resources and institutional capacity.

There is also an institution–industry gap that limits opportunities for students to acquire practical digital business experience. The digital economy changes rapidly, and educational institutions may struggle to update their programmes at the same pace as technology-driven industries. Strong partnerships between Business Education departments and technology companies, fin-tech organizations, e-commerce enterprises, digital marketing agencies, financial institutions and technology entrepreneurs

can provide students with opportunities for internships, mentorship, industry projects and practical exposure. Such partnerships can also enable institutions to understand emerging industry competency requirements and incorporate them into their curricula. The emphasis placed by the ILO (2024) on partnerships and networks for strengthening digital skills and entrepreneurship among African youth reinforces the importance of connecting educational institutions with the wider digital economy.

The foregoing situation also reveals a research and implementation gap. Discussions about digital skills, entrepreneurship and technology education are often treated as separate areas, whereas Africa's digital economy increasingly requires their integration. Digital skills become more economically valuable when they enable individuals to identify opportunities, solve problems, innovate and create enterprises. Similarly, entrepreneurship education becomes more relevant when it equips learners to exploit digital technologies and develop technology-enabled business models. Business Education therefore provides an appropriate platform for integrating these competencies because of its connection to business knowledge, vocational preparation, entrepreneurship and employability. The challenge is to develop a coherent approach in which digital literacy, technological competence, entrepreneurial thinking, innovation and practical business experience are treated as interconnected outcomes rather than isolated components.

Repositioning Business Education for Africa's digital economy consequently requires a fundamental shift from an education model primarily focused on conventional business operations towards one that promotes digital competence, innovation and techno-preneurship. Such repositioning should involve curriculum modernization, continuous professional development of Business Education teachers, technology-supported pedagogies, practical digital enterprise projects, innovation and incubation programmes, stronger industry partnerships and improved access to digital infrastructure. It should also incorporate emerging areas such as artificial intelligence, data analytics, digital marketing, e-commerce, fintech, cybersecurity awareness and digital communication into relevant Business Education programmes. The objective should not simply be to produce graduates who can use digital technologies but graduates who can use technology creatively to identify opportunities, develop solutions, establish enterprises and contribute to economic development.

Therefore, the central concern of this paper is the persistent digital skills gap and the need to reposition Business Education as a vehicle for developing techno-preneurial competencies among Nigeria learners. The paper recognizes that the digital economy presents substantial opportunities for employment, innovation and enterprise creation but that these opportunities can only be effectively exploited when educational systems produce graduates with relevant digital and entrepreneurial capabilities. By integrating digital skills development with techno-preneurship, Business Education can become more responsive to the changing nature of work and enterprise in Africa and contribute more meaningfully to the development of an innovative, adaptable and digitally competent workforce.

Concept of Digital Skills and Techno-preneurship

Digital skills refer to the knowledge, abilities and attitudes required to use digital technologies effectively, confidently, critically and responsibly for learning, work, communication, problem-solving and participation in society. The European Commission’s Digital Competence Framework (DigComp 2.2) conceptualizes digital competence as a combination of knowledge, skills and attitudes covering information and data literacy, communication and collaboration, digital content creation, safety and problem-solving (Vuorikari et al., 2022). This conceptualization demonstrates that digital skills extend beyond the ability to operate computers or mobile devices. They include the capacity to locate, evaluate and manage digital information, communicate through digital platforms, create digital content, protect personal and organizational information, and apply technology creatively to solve problems. In the context of Business Education, digital skills therefore encompass competencies such as word processing, spreadsheets, presentations, online research, digital communication, social media management, e-commerce, digital marketing, data analysis and the use of emerging technologies such as artificial intelligence.

Digital skills can further be understood as existing along a continuum from basic to intermediate and advanced competencies. Basic digital skills involve foundational abilities such as operating digital devices, using software applications, accessing the internet and performing routine online activities. Intermediate digital skills enable individuals to undertake more complex work-related activities, while advanced digital skills involve specialized competencies in areas such as artificial intelligence, big data, programming, cloud technologies and cyber security (World Bank, 2025). This distinction is particularly

relevant to Africa because increasing access to mobile phones and internet services does not automatically translate into the capacity to participate productively in the digital economy. The World Bank (2025) reports that Sub-Saharan Africa is experiencing increasing demand for digital skills, while significant gaps remain, particularly in intermediate and advanced competencies. Thus, the contemporary concept of digital skills should emphasize not merely technology consumption but the ability to use technology to create value, improve productivity, solve economic problems and participate meaningfully in emerging forms of work and entrepreneurship.

Techno-preneurship, on the other hand, represents the intersection of technology and entrepreneurship, involving the identification and exploitation of entrepreneurial opportunities through technological knowledge, digital platforms and innovative solutions. It involves individuals or organizations using technology to develop new products and services, improve existing business processes, create digital business models and respond to emerging market needs. Giones and Brem (2017) explain that technology entrepreneurship has developed into diverse forms as digital technologies increasingly influence entrepreneurial processes and outcomes. Techno-preneurship therefore differs from conventional entrepreneurship primarily in the central role technology plays in opportunity recognition, innovation, product development, marketing, service delivery and business growth. In the Nigerian context, Umukoro (2021) identifies innovation, networking, frugal processes and resource-conscious approaches as important characteristics associated with techno-entrepreneurial practices in technology-oriented business clusters. Techno-preneurship can consequently be viewed as entrepreneurship in which technological knowledge and innovation are deliberately employed to create economic and social value.

The relationship between digital skills and techno-preneurship is particularly important because effective techno-preneurship requires more than entrepreneurial motivation. An aspiring techno-preneur needs sufficient digital competence to identify opportunities, investigate markets, develop digital products or services, communicate with customers, manage online transactions, analyse business data and adapt to technological change. Digital technologies have also altered how entrepreneurial opportunities are identified and how businesses interact with customers, suppliers, employees and investors. Nambisan (2017) argues that digital technologies have transformed entrepreneurial processes and the nature of entrepreneurial outcomes by changing how opportunities and uncertainty are approached. Similarly, Secundo et al. (2020) identify digital technologies as increasingly important in developing entrepreneurial competencies, discovering entrepreneurial opportunities and building digitally supported entrepreneurial ecosystems. Consequently, digital skills provide an important foundation upon which techno-preneurial capabilities can be developed, while techno-preneurship provides a practical avenue through which digital skills can be transformed into innovation, enterprise creation and economic value.

For Business Education in Africa, the concepts of digital skills and techno-preneurship are therefore inseparable from the preparation of learners for the contemporary economy. Business Education can serve as a platform for developing learners who are capable not only of operating existing digital technologies but also of using them to create business opportunities and innovative solutions. This requires educational programmes to integrate competencies such as digital marketing, e-commerce, data analytics, artificial intelligence, financial technology, online business management, cyber security awareness and digital content creation with traditional business and entrepreneurial knowledge. The World Bank (2025) emphasizes the importance of strengthening digital skills while creating stronger connections between education, industry and emerging technology ecosystems. Repositioning Business Education in this direction can enable students to progress from being passive users of technology to active creators of digital value, thereby strengthening their employability, innovation capacity and potential for technology-enabled enterprise development.

The Changing Nature of Work in Nigeria's Digital Economy

The nature of work in Nigeria is undergoing significant transformation as digital technologies increasingly influence how organizations produce goods and services, communicate with customers, recruit workers and conduct business transactions. The expansion of digital platforms, e-commerce, mobile technologies, fin-tech, Cloud- computing and artificial intelligence is creating new forms of work while simultaneously changing the skills required in traditional occupations. The World Bank (2025) notes that Nigeria's future employment landscape is being influenced by digital technologies, with emerging opportunities in information and communication technology, e-commerce and online services, while traditional occupations are also being reshaped by digital devices, mobile payments and

technology-enabled business processes. Similarly, the International Labour Organization (ILO, 2024) observes that technological change continually alters skills requirements because workers need to acquire new technical and transferable competencies as technologies and business processes evolve. Consequently, Nigerian workers increasingly require digital literacy, adaptability, problem-solving, communication and continuous learning capabilities to remain productive in a rapidly changing labour market.

Another important transformation is the emergence of flexible, platform-based and digitally mediated forms of employment. Digital platforms have enabled individuals to provide services beyond traditional organizational boundaries through freelancing, online tutoring, digital marketing, software development, content creation, e-commerce and other forms of gig work. Nigeria's growing technology ecosystem provides opportunities for young people to connect with customers and employers locally and internationally without necessarily being employed in conventional workplaces. The ILO and ITU identify Nigeria as one of the African countries included in a continental programme designed to expand young people's access to decent work and digital skills, reflecting the growing importance of digital employment pathways (ILO, 2024). However, digital work also creates challenges relating to income stability, social protection, working conditions and the need for continuous reskilling. The transformation of work should therefore be understood not simply as the disappearance of conventional jobs but as a reorganization of tasks, occupations, employment relationships and opportunities for self-employment and entrepreneurship.

The increasing adoption of artificial intelligence further intensifies these changes by altering how tasks are performed and the competencies expected from workers. Rather than relying exclusively on routine knowledge and manual processes, contemporary workplaces increasingly require workers who can collaborate with digital technologies, interpret information, solve complex problems, demonstrate creativity and adapt to technological change. The World Bank (2025) emphasizes that digital skills have become fundamental to participation in evolving job markets, while the ILO (2026) reports that AI adoption is reshaping demand for cognitive, socio-emotional, digital and AI-related competencies across occupations. For Nigeria, this changing work environment creates a strong justification for repositioning education, particularly Business Education, towards practical digital competencies, innovation and techno-preneurship. Business Education graduates need to be prepared not only for existing occupations but also for emerging digital enterprises and technology-enabled forms of self-employment. Such preparation can help bridge the skills mismatch in Nigeria and enable graduates to transform digital technologies into productive employment, innovation and enterprise opportunities.

Business Education Curriculum Repositioning for Digital and Techno-preneurial Competence

Business Education curriculum repositioning has become increasingly necessary as technological advancement continues to transform the nature of business, employment and entrepreneurship in Nigeria and across Africa. Traditionally, Business Education has focused on developing competencies in accounting, office technology and management, economics, entrepreneurship, communication and other business-related areas. While these competencies remain relevant, the emergence of artificial intelligence, e-commerce, fintech, digital marketing, cloud computing, data analytics and online business platforms has expanded the range of skills required for effective participation in the contemporary economy. The World Bank (2025) notes that digital skills are increasingly demanded across different occupations and that education and training systems need to respond to changing labour-market requirements. Consequently, Business Education curricula should be periodically reviewed to incorporate emerging digital competencies rather than treating technology as an auxiliary component of business education. Such repositioning should ensure that learners develop the capacity to use digital tools for communication, information management, financial transactions, data analysis, marketing, business decision-making and enterprise development. (world bank)

A digitally repositioned Business Education curriculum should also move beyond theoretical knowledge towards practical techno-preneurial competence. Techno-preneurial competence involves the ability to identify technology-enabled opportunities, develop innovative solutions, utilize digital platforms, create online business models and apply technology to improve the efficiency and competitiveness of enterprises. Nambisan (2017) argues that digital technologies have transformed entrepreneurial processes by influencing how opportunities are identified, evaluated and exploited, while Secundo et al. (2020) emphasize the importance of digital technologies in developing contemporary entrepreneurial

competencies. Business Education programmes can therefore incorporate practical learning experiences involving e-commerce development, digital marketing campaigns, social media entrepreneurship, financial technology applications, data-driven business decisions, artificial intelligence tools and digital product development. Project-based learning, business simulations, innovation challenges, internships, entrepreneurship laboratories and technology incubators can provide learners with opportunities to transform classroom knowledge into practical digital enterprise competencies. This approach would shift Business Education from preparing learners primarily as employees towards preparing them as employees, innovators and creators of technology-enabled enterprises.

Effective curriculum repositioning, however, requires more than adding isolated technology-related courses to existing programmes. It requires an integrated transformation involving curriculum content, teaching methods, teacher competencies, learning resources, assessment practices and partnerships with industry. Business Education lecturers need continuous professional development in emerging technologies so that they can effectively integrate digital tools and techno-preneurial activities into classroom instruction. Similarly, institutions require reliable internet connectivity, digital devices, appropriate software, innovation spaces and other technological resources to support experiential learning. Strong partnerships with technology companies, fin-tech organizations, e-commerce businesses, financial institutions and digital entrepreneurs can further expose students to current industry practices and emerging employment opportunities. The World Bank (2025) emphasizes the importance of aligning digital-skills development with labour-market needs, while the International Labour Organization (ILO, 2024) highlights partnerships, skills development and entrepreneurship as important mechanisms for strengthening young people's participation in Africa's digital economy. Therefore, repositioning the Business Education curriculum around digital and techno-preneurial competence should seek to produce graduates who can confidently navigate existing workplaces, adapt to technological change, identify emerging opportunities and create innovative digital enterprises capable of contributing to Nigeria's economic transformation.

Digital Entrepreneurship, Innovation and Job Creation

Digital entrepreneurship has become an important pathway for transforming technological advancement into economic opportunities, innovation and employment. It involves the creation and management of businesses that depend substantially on digital technologies, platforms and processes to develop products, deliver services, reach customers and generate value. In Nigeria, the growth of e-commerce, fintech, digital marketing, online education, software development and other technology-enabled activities has expanded opportunities for young people to become entrepreneurs and create employment for themselves and others. However, realizing these opportunities requires appropriate digital skills, entrepreneurial competencies, access to technology and supportive institutional environments. Within Business Education, digital entrepreneurship can therefore be used to develop learners' capacity to identify technological opportunities, innovate and create sustainable enterprises. The following digital entrepreneurship can contribute to innovation and job creation include:

1. E-commerce and Digital Retail Entrepreneurship: Business Education students can develop online businesses through e-commerce platforms, social media stores and digital marketplaces, creating opportunities in online retail, product distribution, customer service and logistics.
2. Digital Marketing and Content Creation: Digital platforms have created employment opportunities in social media management, digital advertising, content development, search-engine marketing and brand promotion. Students with relevant skills can establish digital marketing enterprises or provide services to existing businesses.
3. Fin-tech and Digital Financial Services: The expansion of mobile payments, digital banking and financial technology has created opportunities for innovative financial services. Digital entrepreneurs can develop technology-enabled solutions that improve payment systems, financial access and business transactions.
4. Technology-Based Product and Service Innovation: Digital entrepreneurship enables individuals to develop applications, websites, educational technologies, business-management tools and other technology-supported products that respond to identified social and economic problems. Such innovations can generate new enterprises and employment opportunities.
5. Digital Freelancing and Global Service Markets: Digital platforms allow skilled Nigerians to provide services such as graphic design, programming, data analysis, virtual assistance,

writing, online tutoring and consultancy to clients locally and internationally. This creates opportunities for self-employment while also supporting the growth of digital service enterprises.

Challenges Limiting Digital Skills Acquisition in African Institutions

The acquisition of digital skills in Nigeria educational institutions is constrained by interconnected infrastructural, financial, institutional, pedagogical and human-capacity challenges. Major challenges include:

1. Inadequate Digital Infrastructure – Limited availability of computers, smart devices, digital laboratories, reliable internet connectivity and modern ICT facilities restricts students' opportunities for practical digital learning.
2. Unreliable Electricity Supply – Frequent power interruptions and inadequate alternative power sources affect the regular use of computers, internet facilities and other digital learning technologies.
3. High Cost of Internet Access and Digital Devices – The cost of internet subscriptions, computers, smartphones, software and other digital resources makes technology-based learning difficult for many students and institutions.
4. Limited Digital Competence among Teachers and Lecturers – Some educators lack sufficient knowledge and practical experience in emerging technologies such as artificial intelligence, data analytics, cloud computing and digital entrepreneurship.
5. Outdated Educational Curricula – Some institutional curricula do not adequately reflect emerging digital skills, leaving graduates insufficiently prepared for technology-driven workplaces and enterprises.
6. Inadequate Institutional Funding – Limited financial resources constrain institutions' ability to acquire, maintain and regularly upgrade digital infrastructure and software.
7. Poor Maintenance of ICT Facilities – Existing digital equipment may become obsolete or unusable because of inadequate maintenance, technical support and replacement mechanisms.
8. Limited Industry–Institution Partnerships – Weak collaboration between educational institutions and technology-oriented industries reduces students' exposure to current workplace technologies, internships, mentorship and practical digital projects.
9. Digital Divide and Socioeconomic Inequality – Differences in students' access to devices, connectivity and digital learning opportunities can produce unequal levels of digital competence.
10. Limited Opportunities for Practical Learning – Excessive emphasis on theoretical instruction without sufficient project-based learning, simulations, internships and digital enterprise activities limits students' ability to apply digital knowledge.
11. Cyber security and Digital Safety Concerns – Inadequate awareness of cybersecurity, privacy, online fraud and responsible technology use can discourage institutions and learners from fully exploiting digital platforms.
12. Rapid Technological Change – The speed at which technologies such as AI, fintech and digital platforms evolve makes it difficult for institutions, curricula and educators to remain continuously up to date.

Conclusion

Africa's digital economy is creating a new economic landscape in which digital competence, innovation and techno-preneurship are becoming increasingly important determinants of employability, enterprise development and economic participation. The persistent digital skills gap, however, threatens to limit the extent to which young Africans can benefit from these opportunities. Business Education therefore stands at a critical point where its relevance depends on its ability to move beyond conventional business competencies and embrace the realities of artificial intelligence, e-commerce, fin-tech, digital marketing, data analytics and technology-enabled entrepreneurship. Repositioning the curriculum towards practical digital and techno-preneurial competence can equip learners not only to participate in

existing employment opportunities but also to identify problems, develop innovative solutions and create technology-driven enterprises.

The transformation of Business Education should consequently be viewed as a strategic investment in Africa's future workforce and entrepreneurial capacity. This requires coordinated action involving curriculum modernization, continuous professional development of educators, improved digital infrastructure, affordable connectivity, practical learning opportunities and stronger partnerships between educational institutions and industry. When learners are provided with the knowledge, skills and environment required to transform technology into innovation and enterprise, Business Education can become a powerful platform for developing digitally competent graduates, stimulating entrepreneurship and expanding opportunities for meaningful employment. The ultimate goal should be to transform African learners from passive consumers of digital technologies into innovators, creators, problem-solvers and techno-preneurs capable of shaping Africa's digital economic future.

LEVERAGING ARTIFICIAL INTELLIGENCE FOR INNOVATION AND ENTREPRENEURIAL GROWTH AMONG YOUTHS IN IMO STATE, NIGERIA: OPPORTUNITIES, CHALLENGES AND POLICY PERSPECTIVES

Enwere Ifeoma-Meziem Victoria (Ph.D)
Department of Office Technology & Management
Federal Polytechnic Nekede, Owerri
Imo State, Nigeria
ifeomameziem6@gmail.com

Abstract

Artificial Intelligence (AI) has become one of the most influential technologies shaping contemporary economic, educational and entrepreneurial activities. The rapid development of generative AI, predictive analytics, intelligent automation, chatbots and AI-supported decision-making has created new possibilities for entrepreneurs to develop products, identify market opportunities, engage customers and improve business performance. These developments are particularly relevant to young people in developing economies such as Nigeria, where entrepreneurship is increasingly viewed as an important pathway for employment creation, economic participation and poverty reduction. This opinion paper examines how Artificial Intelligence can be leveraged to promote innovation and entrepreneurial growth among youths in Imo State, Nigeria. Drawing on recent empirical literature published between 2020 and 2026, the paper argues that AI can support youth entrepreneurship through opportunity recognition, product and service innovation, digital marketing, customer relationship management, business planning, market intelligence, productivity improvement and access to wider markets. Recent Nigerian evidence indicates that AI knowledge and technological exposure can strengthen entrepreneurial strategic thinking and cognitive adaptability, while studies of Nigerian SMEs have associated AI adoption with improved enterprise performance and sustainable entrepreneurship. However, the paper contends that access to AI tools alone will not automatically produce entrepreneurial growth. Digital and AI literacy, internet connectivity, electricity, access to finance, entrepreneurial education, ethical awareness, data protection and human oversight are essential for translating technological access into sustainable business value. The paper recommends the establishment of AI-enabled youth entrepreneurship hubs, integration of practical AI competencies into entrepreneurship education, targeted funding for technology-driven youth enterprises, improved digital infrastructure and stronger collaboration among government, tertiary institutions, industry and private technology organisations. The paper concludes that responsible and inclusive AI adoption could position youths in Imo State as important contributors to innovation, enterprise development, employment creation and the emerging digital economy.

Keywords: Artificial Intelligence, innovation, entrepreneurial growth, youth entrepreneurship, digital entrepreneurship, Imo State, Nigeria.

Introduction

The twenty-first century has witnessed remarkable advances in digital technologies, with Artificial Intelligence (AI) emerging as one of the most transformative. AI has moved beyond specialised applications in large corporations and research laboratories and has increasingly become accessible to individuals, small businesses, students and entrepreneurs. Contemporary AI applications can analyse information, generate written and visual content, identify patterns, automate routine tasks, support decision-making, interact with customers and assist users in solving complex problems. The emergence of generative AI has further expanded these possibilities by allowing users with limited technical expertise to interact with sophisticated technological systems through natural language.

The increasing relevance of AI has profound implications for entrepreneurship. Entrepreneurship is fundamentally concerned with identifying opportunities, mobilising resources, developing innovative solutions and creating value. AI can potentially strengthen each of these activities. A young entrepreneur can use AI to investigate customer preferences, generate business

ideas, prepare marketing content, analyse competitors, communicate with customers, develop business plans and explore new markets. Consequently, AI can reduce some of the informational, managerial and creative barriers that traditionally constrain small and emerging enterprises.

This development is particularly significant in Nigeria. Youths constitute an important part of the country's human-capital base and are increasingly involved in trading, agriculture, fashion, creative industries, education, technology, transportation, hospitality, digital marketing and other forms of entrepreneurship. The growth of digital platforms has expanded the possibilities for young people to establish businesses without necessarily requiring extensive physical infrastructure. AI potentially represents another stage in this transformation.

Nigeria has also begun to recognise the strategic importance of AI. The country's National Artificial Intelligence Strategy identifies AI as a tool for promoting sustainable development, innovation, national productivity and human well-being. It also emphasises the development of an AI ecosystem capable of supporting research, innovation, entrepreneurship and economic transformation.

The institutional environment is gradually evolving in response. The National Centre for Artificial Intelligence and Robotics identifies innovation, collaboration, inclusiveness and entrepreneurship among its strategic priorities and emphasises the commercialisation and adoption of emerging technologies. The Federal Ministry of Communications, Innovation and Digital Economy has also supported AI-powered startups through initiatives designed to provide funding, cloud resources, mentorship and access to technology. In 2024, the Ministry and Google announced an AI Fund that selected Nigerian startups for financial and technical support.

Recent empirical research strengthens the argument that AI can contribute to entrepreneurship and business development. Nafizah, Roper and Mole (2024), using data from more than 6,000 micro-businesses, found strong positive effects of AI and machine-learning adoption on innovation outcomes and innovation processes. In Nigeria, Itai, Okorie and Ufua (2024) found a positive relationship between AI innovation indicators and SME growth. More recent evidence from Nigeria also indicates that AI knowledge and technological exposure can enhance strategic thinking and cognitive adaptability among entrepreneurs. Odugbesan, Tafamel and Akrawah (2026) surveyed 376 entrepreneurs in Nigeria's Computer Village and found that both technological exposure and AI knowledge significantly enhanced strategic thinking and cognitive adaptability.

Similarly, recent research among Gen-Z-owned MSMEs in Nigeria found that AI integration, innovation culture and entrepreneurial orientation influenced technology adoption, while technology adoption was associated with improved sales, customer engagement and business growth. These findings demonstrate that AI is increasingly relevant to the entrepreneurial ecosystem within which Nigerian youths operate.

However, the benefits of AI should not be assumed to occur automatically. The existence of AI tools does not necessarily mean that young entrepreneurs possess the knowledge, infrastructure, resources or judgement required to use them effectively. Issues relating to digital literacy, cost, electricity, internet connectivity, data privacy, cybersecurity, misinformation and overdependence on automated systems may limit the benefits of AI.

Against this background, this paper examines how youths in Imo State can leverage AI for innovation and entrepreneurial growth. The paper is an opinion/conceptual paper informed by recent empirical and policy literature. It does not claim to present primary survey data from youths in Imo State. Rather, it uses available evidence to develop a context-specific argument about the opportunities, challenges and policy actions required to promote responsible AI-enabled youth entrepreneurship in the state.

Concept of Artificial Intelligence

Artificial Intelligence refers broadly to computer-based systems capable of performing tasks associated with human intelligence. Such tasks may include learning from information, recognising patterns, generating content, understanding language, making predictions and supporting decisions. AI is not a single technology; rather, it represents a broad collection of computational techniques and applications.

Contemporary AI includes machine learning, natural language processing, computer vision, predictive analytics, recommendation systems, generative AI and intelligent automation. Generative AI is particularly relevant to small businesses because it can generate text, images, ideas, summaries, marketing materials, business proposals and other forms of content with relatively little technical expertise.

For entrepreneurs, the practical significance of AI lies less in the technology itself than in what the technology enables them to accomplish. AI may help an entrepreneur understand customers,

reduce repetitive administrative work, identify trends, improve communication and make more informed decisions. It may also make sophisticated business-support functions more accessible to individuals who cannot afford to employ specialists.

The National Artificial Intelligence Strategy of Nigeria recognises the transformative potential of AI for innovation, productivity and socio-economic development. The strategy seeks to provide a national framework through which Nigeria can harness AI while addressing infrastructure, skills, governance and other barriers to adoption.

Therefore, AI should be regarded not merely as a technological innovation but as a potential entrepreneurial resource. Its usefulness to youth entrepreneurs will depend on their capacity to combine AI with creativity, business knowledge, local market understanding and human judgement.

Youth Entrepreneurship in Nigeria and Imo State

Youth entrepreneurship refers broadly to the participation of young people in the identification, creation, ownership and management of economic ventures. Youth entrepreneurs may establish businesses out of opportunity, necessity or a combination of both. Their enterprises may range from informal micro-businesses to technology-based startups and rapidly growing small and medium-sized enterprises.

In Nigeria, youth entrepreneurship has become increasingly important because of the need to create employment opportunities and broaden economic participation. Digital technologies have also altered the traditional meaning of entrepreneurship. Young people can now market products through social media, provide digital services to customers in different locations and participate in online marketplaces.

Imo State provides a potentially fertile environment for youth entrepreneurship because of its large student and young-professional population, commercial activities, educational institutions and growing engagement with digital technologies. Youths participate in businesses including fashion, agriculture, food processing, education, transportation, beauty and personal-care services, retailing, hospitality, digital marketing, entertainment and technology-enabled services.

Nevertheless, many youth-owned enterprises operate under considerable constraints. Limited capital, inadequate managerial skills, unstable electricity supply, insufficient market information, limited technological capabilities and restricted access to formal business support can affect enterprise survival and growth. These challenges make the potential role of AI particularly important.

AI cannot eliminate all the structural constraints confronting young entrepreneurs. However, it can potentially reduce some information, communication, marketing and administrative barriers. For example, a young entrepreneur who cannot afford a professional marketing consultant may use AI-assisted tools to develop promotional content. A small retailer can use digital tools to analyse customer preferences. A young farmer or agro-entrepreneur can use AI-supported information services to explore market trends and business opportunities.

Thus, the relevant question for Imo State is not whether young people should replace human entrepreneurship with AI. Rather, it is how young entrepreneurs can combine human creativity, local knowledge and entrepreneurial judgement with AI capabilities to create greater value.

Artificial Intelligence as an Enabler of Innovation

Innovation involves the introduction and implementation of new or significantly improved products, services, processes or business methods. It is central to entrepreneurial competitiveness because businesses that continually adapt to customer needs and changing market conditions are more likely to remain relevant.

AI can contribute to innovation in several ways.

First, AI can facilitate idea generation. Entrepreneurs can use generative AI to explore potential products and services, identify possible customer problems and develop alternative solutions. Although AI-generated ideas require human evaluation, the technology can expand the number of possibilities considered by an entrepreneur.

Second, AI can facilitate market intelligence. Entrepreneurs can use AI-enabled systems to organise and analyse large quantities of information relating to customer preferences, competitors and market trends. Better access to information may improve opportunity recognition.

Third, AI can facilitate product and service development. Entrepreneurs can use AI tools to create prototypes, develop promotional materials, improve product descriptions, design customer experiences and obtain feedback on possible business concepts.

Fourth, AI can facilitate process innovation. Routine activities such as responding to common customer enquiries, organising information, scheduling activities and preparing standard documents

can increasingly be automated. This allows entrepreneurs to devote more time to strategic and creative activities.

Empirical evidence supports the relationship between AI adoption and innovation. Nafizah et al. (2024) found strong positive effects of AI and machine-learning adoption on innovation outcomes and innovation processes among more than 6,000 micro-businesses. This is particularly relevant to youth entrepreneurship because many youth-owned businesses begin as micro-enterprises. AI can therefore be conceptualised as an innovation accelerator. However, the technology should complement rather than replace human creativity. An entrepreneur's understanding of local culture, customer behaviour, values and needs remains essential.

How Youths in Imo State Can Leverage AI for Entrepreneurial Growth

❖ AI for Opportunity Recognition

One of the most important entrepreneurial functions is the ability to recognise opportunities. An opportunity may arise from an unmet customer need, an inefficient existing process, an emerging market or a change in consumer behaviour.

AI can support opportunity recognition by helping entrepreneurs analyse market information, customer reviews, online discussions and other available information. A young entrepreneur can use AI-assisted research to explore questions such as:

What products are increasingly demanded by consumers?
What problems do customers frequently complain about?
What services are difficult to access?
What competitors are offering?
What market segments appear underserved?

For youths in Imo State, such capabilities could help identify opportunities connected with agriculture, education, fashion, tourism, food processing, logistics, healthcare support services, creative industries and digital services. The Nigerian evidence provided by Odugbesan et al. (2026) is particularly relevant. Their study of 376 entrepreneurs found that AI knowledge and technological exposure significantly enhanced strategic thinking and cognitive adaptability. Strategic thinking also played an important mediating role in translating technological engagement into adaptive entrepreneurial capabilities.

This suggests that AI literacy can potentially improve not only what entrepreneurs do but also how they think about business opportunities.

❖ AI for Product and Service Innovation

Youth entrepreneurs can use AI to improve existing products and develop new services. For example, a fashion entrepreneur could use AI-assisted design tools to explore design concepts and customer preferences. A food entrepreneur could analyse customer feedback to improve product offerings. An education entrepreneur could use AI to develop personalised learning resources.

In agriculture, AI can support activities such as market information, crop-related decision-making and demand forecasting where suitable systems and reliable data are available. The objective is not to make the entrepreneur dependent on AI but to increase the entrepreneur's ability to experiment and innovate.

❖ AI for Digital Marketing

Marketing is a major challenge for many small businesses because professional advertising services may be expensive. AI can reduce some of these barriers by assisting entrepreneurs in developing social-media content, promotional messages, product descriptions, customer profiles and campaign ideas.

A young entrepreneur in Owerri, for example, could use AI-assisted tools to generate alternative promotional messages for different customer groups, develop content calendars and analyse engagement patterns. The entrepreneur would still need to ensure that the content reflects local culture, brand identity and ethical standards.

The growth of digital entrepreneurship makes this especially relevant. Recent research among Gen-Z-owned MSMEs in Nigeria found that AI integration and innovation culture significantly influenced technology adoption, while adoption of contemporary social commerce was associated with improved sales, customer engagement and business growth.

❖ AI for Customer Relationship Management

Customer retention is essential to entrepreneurial growth. AI-enabled chatbots and automated communication systems can assist businesses in responding to frequently asked questions, providing product information and maintaining communication with customers. For a small business with limited staff, automation can make customer communication more efficient. However, businesses should avoid allowing automation to eliminate human interaction completely. Customers may require empathy, negotiation and personalised assistance that automated systems cannot adequately provide.

❖ AI for Business Planning and Decision-Making

Young entrepreneurs often make business decisions with limited information. AI can support planning by helping entrepreneurs compare alternatives, organise information and identify possible risks.

For example, an entrepreneur planning to open a small food-processing business could use AI as a supplementary tool to analyse potential customer segments, develop a preliminary business model, identify possible competitors and generate questions for further market research. AI-generated recommendations should not be treated as unquestionable facts. Entrepreneurs must verify important information and combine AI suggestions with local market research and professional advice.

❖ AI for Productivity and Cost Reduction

AI-enabled automation can reduce the amount of time spent on repetitive activities. A small business owner may use AI to organise documents, generate routine reports, draft customer communications or assist with data analysis.

Recent Nigerian evidence demonstrates the potential of AI for business performance. Audu, Adejoh and Giehon (2026), in a study of SMEs in the Federal Capital Territory, reported significant positive relationships between AI applications—including predictive analytics, automated chatbots, personalised marketing and process automation—and SME performance. Although findings from Abuja cannot automatically be generalised to Imo State, they provide useful evidence that AI applications can contribute to business performance in a Nigerian environment.

❖ AI for Accessing Wider Markets

One of the greatest opportunities presented by digital entrepreneurship is the possibility of reaching customers beyond the entrepreneur's immediate physical location. AI can support translation, content adaptation, customer communication and digital marketing, thereby helping young businesses reach customers across Nigeria and potentially internationally. For youths in Imo State, this could be particularly valuable for businesses involving fashion, crafts, food products, digital services, creative content and professional services.

Artificial Intelligence and Entrepreneurial Growth

Entrepreneurial growth can be reflected in increased sales, customer numbers, market reach, profitability, productivity, employment and business sustainability. AI can contribute to these dimensions indirectly and directly. Better marketing may increase customer reach. Improved customer analysis may increase customer retention. Automation may reduce operating costs. Better information may improve business decisions. Product innovation may create new revenue streams.

Empirical evidence from Nigeria supports this relationship. Itai et al. (2024) examined AI capabilities and SME growth in Nigeria and reported that AI innovation indicators had positive relationships with SME growth. A 2026 study of Nigerian SMEs similarly examined AI adoption as a mechanism through which organisational capabilities could contribute to sustainable entrepreneurship. The researchers found that AI adoption was important in explaining the relationship between strategic and adaptive organisational capabilities and sustainable entrepreneurship.

These findings suggest that AI should not be considered merely an operational tool. It can become part of the strategic capability of a business. For young entrepreneurs, this distinction is important. The objective should not be to use AI simply because it is fashionable. Instead, AI should be adopted where it solves a genuine business problem or creates measurable value.

Challenges to AI Adoption among Youths in Imo State

Despite the opportunities, several challenges could restrict the effective adoption of AI. They are:

- **Digital and AI Skills Gap:** Access to an AI tool does not guarantee effective use. Entrepreneurs need to understand how to formulate useful prompts, evaluate outputs, verify

information and integrate AI into business processes. A young entrepreneur may have access to generative AI but still lack the entrepreneurial knowledge required to convert AI-generated ideas into viable businesses. Recent Nigerian research supports the importance of AI knowledge. Odugbesan et al. (2026) found that AI knowledge significantly enhanced strategic thinking and cognitive adaptability among entrepreneurs.

- **Internet Connectivity and Electricity**
  AI services generally depend on reliable digital connectivity. Poor internet access, expensive data and unstable electricity can therefore restrict usage. These infrastructural challenges remain particularly important for entrepreneurs operating outside major urban centres. AI entrepreneurship policies must consequently be accompanied by investments in digital infrastructure.

- **Access to Finance**
  Some AI tools are freely accessible, but more advanced services may require subscription fees, specialised hardware or reliable cloud infrastructure. Young entrepreneurs who already struggle with access to finance may find it difficult to invest in advanced digital technologies. This makes youth-focused grants, innovation funds and affordable digital financing important components of an AI entrepreneurship strategy.

- **Data Privacy and Cybersecurity**
  AI adoption creates concerns about the protection of customer and business information. Entrepreneurs who enter confidential customer information into inappropriate AI platforms may expose their businesses and customers to privacy risks. AI literacy must therefore include data protection and cybersecurity.

- **Accuracy and Reliability of AI Outputs**
  AI systems can generate inaccurate or misleading information. Entrepreneurs who blindly rely on AI-generated information may make poor business decisions.
  Human verification is therefore essential. AI should serve as an assistant rather than the final authority on important business decisions.

- **Ethical and Intellectual Property Concerns**
  AI-generated content raises questions about copyright, originality, attribution and ownership. Young entrepreneurs need adequate awareness of these issues to avoid legal and reputational problems.

- **Risk of Overdependence**
  AI can improve productivity, but excessive dependence may weaken human creativity and critical thinking. Entrepreneurial education should therefore encourage human-AI collaboration rather than complete substitution of human judgement.

Theoretical Perspective

Resource-Based View

The Resource-Based View (RBV) provides a useful theoretical lens for understanding AI-enabled entrepreneurship. The theory suggests that organisations can achieve competitive advantage by developing and effectively deploying valuable resources and capabilities. From this perspective, AI tools alone may not provide a sustainable competitive advantage because many entrepreneurs can access similar technologies. The competitive advantage may instead arise from the entrepreneur's ability to combine AI with unique knowledge, creativity, local market understanding, customer relationships and entrepreneurial judgement.

For youths in Imo State, AI literacy can therefore be considered a strategic capability. A young entrepreneur who knows how to identify appropriate AI applications, formulate useful queries, evaluate outputs and integrate the results into business activities may have an advantage over another entrepreneur who merely has access to the same technology.

Recent Nigerian research provides support for this perspective. Obasi, Kuye and Alaneme (2026) examined AI adoption among Nigerian SMEs using the Resource-Based View and Dynamic Capabilities Theory and investigated the role of AI adoption in sustainable entrepreneurship.

Dynamic Capabilities Perspective

The Dynamic Capabilities perspective also provides a useful explanation. Entrepreneurial success in rapidly changing environments depends on the ability to sense opportunities, seize them and reconfigure resources. AI can strengthen these processes. It can help entrepreneurs sense market changes, generate alternatives and make faster decisions. However, entrepreneurs still need the capacity to interpret information and reconfigure their businesses.

The combination of RBV and Dynamic Capabilities Theory therefore suggests that the value of AI depends on both possession of technological resources and the ability to deploy them strategically.

Discussion

The evidence reviewed in this paper supports the argument that AI has considerable potential to strengthen youth entrepreneurship. However, AI should not be presented as a magic solution to unemployment or business failure. The central argument is that AI can amplify entrepreneurial capabilities. It can help an entrepreneur work faster, process more information, experiment with ideas and reach more customers. However, it cannot replace the need for entrepreneurial judgement, persistence, creativity, ethics and knowledge of the local market.

The experience of Nigeria's entrepreneurs provides useful evidence. Odugbesan et al. (2026) demonstrated that AI knowledge and technological exposure can enhance strategic thinking and cognitive adaptability among entrepreneurs. This finding is particularly significant for youths because entrepreneurship requires continuous adaptation to changing markets.

Similarly, evidence from micro-businesses shows that AI adoption can improve innovation processes and outcomes. Evidence from Nigerian SMEs also points towards positive relationships between AI capabilities and business performance.

The implication is that Imo State should not approach AI solely as an ICT issue. It should be treated as an entrepreneurship-development issue. This requires collaboration among educational institutions, government agencies, technology companies, financial institutions, entrepreneurship-development organisations and young entrepreneurs.

Tertiary institutions in Imo State can play a particularly important role. Entrepreneurship education should move beyond teaching students how to write traditional business plans. Students should learn how to identify problems, use AI responsibly to investigate opportunities, validate business ideas, create digital products, market services and analyse business information. Such an approach would be consistent with emerging Nigerian initiatives that seek to connect youth innovation, technology and enterprise development. The Federal Ministry of Innovation, Science and Technology's Youths and Students in Innovation initiative, for example, explicitly seeks to bridge the gap between creative research and market-ready enterprises by providing youth with technology and entrepreneurial competencies.

The implication for Imo State is that young entrepreneurs should not simply be trained as users of AI. They should be encouraged to become creators of AI-enabled solutions to local problems. For instance, youths could develop AI-supported solutions for agricultural market information, educational support, local tourism, small-business bookkeeping, logistics, customer service, healthcare information and creative industries.

This approach could transform AI from a consumption technology into a production and innovation technology.

Policy and Practical Implications

The findings and arguments advanced in this paper have several implications.

- Government: Government should develop youth-focused AI entrepreneurship programmes that provide training, mentorship, access to technology and financing. State-level initiatives should complement the national AI strategy by translating national objectives into locally relevant programmes.
- Tertiary Institutions: Universities, polytechnics and colleges should integrate practical AI applications into entrepreneurship and business education. Students should learn how to use AI for opportunity recognition, business modelling, innovation, marketing and decision-making.
- Financial Institutions: Banks, microfinance institutions and development-finance organisations should consider specialised financing schemes for youth-owned technology-enabled enterprises.
- Technology Companies: Technology firms can contribute through training, cloud credits, mentorship, innovation competitions and partnerships with educational institutions.

- Youth Entrepreneurs: Young entrepreneurs should approach AI as a strategic tool rather than a substitute for entrepreneurial thinking. They should continuously develop AI literacy while maintaining critical thinking, ethical awareness and knowledge of their customers.

Conclusion

Artificial Intelligence is rapidly changing the entrepreneurial landscape. Its capacity to analyse information, generate ideas, automate routine activities, support decision-making and improve customer engagement creates significant opportunities for young entrepreneurs. For youths in Imo State, AI presents an opportunity to overcome some traditional barriers to entrepreneurship by providing relatively affordable access to information, creativity, marketing and analytical capabilities. It can support opportunity recognition, product and service innovation, digital marketing, customer management, productivity and market expansion.

Recent empirical evidence provides grounds for optimism. Studies involving Nigerian entrepreneurs and SMEs indicate that AI knowledge, technological exposure and AI adoption can contribute to strategic thinking, cognitive adaptability, enterprise performance and sustainable entrepreneurship. International evidence also demonstrates that AI adoption can enhance innovation among micro-businesses.

Nevertheless, technology alone cannot guarantee entrepreneurial success. The ability of youths to benefit from AI will depend on their digital skills, entrepreneurial competencies, access to finance, internet connectivity, electricity, institutional support and understanding of ethical and responsible AI use.

The central proposition of this paper is therefore that Imo State should move beyond simply encouraging youths to use AI and begin deliberately building an AI-enabled youth entrepreneurship ecosystem. Such an ecosystem should combine technology, entrepreneurship education, mentorship, finance, infrastructure and responsible innovation. If properly implemented, AI could help young people in Imo State move beyond small-scale survival entrepreneurship towards innovative, productive and scalable enterprises capable of creating employment and contributing to regional economic development. The opportunity is significant, but it requires coordinated action from government, educational institutions, the private sector and the youths themselves.

Recommendations

Based on the arguments presented, the following recommendations are proposed:

1. Establish AI-enabled youth entrepreneurship hubs in Imo State: The state should encourage the establishment of innovation hubs where young entrepreneurs can access AI tools, internet facilities, mentorship, training and business incubation services.

2. Integrate practical AI literacy into entrepreneurship education: Business Education, Office Technology and Management, Entrepreneurship, Computer Science and related programmes should include practical AI applications in their curricula.

3. Create AI-focused youth innovation grants: Government and private organisations should establish competitive grants for young entrepreneurs developing AI-enabled solutions to local economic and social problems.

4. Improve digital infrastructure: Affordable broadband internet and reliable electricity are necessary conditions for meaningful AI adoption. AI entrepreneurship programmes will have limited impact if young entrepreneurs cannot reliably access digital infrastructure.

5. Promote human-AI collaboration: Training should emphasise that AI is an assistant rather than an unquestionable authority. Young entrepreneurs should learn to verify AI-generated information and apply human judgement.

6. Provide ethical AI training: Entrepreneurs should be trained in data privacy, cybersecurity, intellectual property, responsible AI use and the risks associated with inaccurate AI outputs.

7. Encourage local AI innovation: Young people should be encouraged to develop AI solutions addressing problems specific to Imo State and the wider Southeast region. This could include agriculture, education, commerce, transportation, tourism, creative industries and small-business management.

8. Strengthen partnerships: Government, tertiary institutions, technology companies, financial institutions and entrepreneurship organisations should collaborate in developing sustainable youth AI-entrepreneurship ecosystems.
9. Promote women's participation in AI entrepreneurship: Special attention should be given to young women entrepreneurs to ensure that the emerging AI economy does not reproduce existing gender inequalities in access to technology and finance.

10. Encourage continuous research: Researchers should conduct future empirical studies involving young entrepreneurs in Imo State to determine the actual level of AI adoption, the factors influencing adoption and the relationship between AI utilisation, innovation and business growth.

Abstract
Digital transformation is increasingly reshaping higher education by changing how teaching, learning, assessment, communication, and entrepreneurial skills are developed. It is a significant driver of innovation, academic excellence, and institutional competitiveness across higher education systems worldwide. Digital advancements reshaping business education in Nigeria include e-learning platforms, cloud computing, artificial intelligence (AI), virtual collaboration tools, learning management systems (LMS), and digital entrepreneurship resources. The study investigated the potential, challenges, and implications of technology adoption and the impact of digital transformation on business education in Nigeria. The study indicates that digital transformation enhances teaching effectiveness, fosters students' entrepreneurial skills, encourages collaborative learning, and contributes to the development of digital competencies. However, challenges remain, including poor infrastructure, low digital literacy, unreliable power supply, limited internet access, and limited funding. The report calls on governments to modernize curricula, provide ongoing digital training for educators, increase investment in educational technology infrastructure, and promote strategic partnerships between academia and industry. The study contributes to the growing discourse on digital transformation by highlighting the need to align technology, human capacity, curriculum, governance, and institutional readiness for sustainable business education transformation in Nigeria.

Keywords: Digital Transformation, Business Education, Higher Education, ICT integration, LMS

Introduction
The digital world is increasingly penetrating the education and skills domain, with technology gradually being used to deliver education, knowledge, and skills in new and innovative ways, which are themselves affected by the current climate of economic uncertainty, as well as by political shifts (Nimfel, 2022). Broadly, digital technologies include the use of personal computers, digital television, radio, mobile phones, robots, etc. The term is used to describe the use of digital resources to effectively find, analyze, create, communicate, and use information in a digital context (Nimfel, 2022); (Yuwono, Imam Maulidizen, Ahmad Hariyadi, Ahmad Reza Iqbal, 2026).

Business education involves teaching students the fundamentals, theories, and processes of business. Education at this stage occurs at several levels, including secondary education and higher education, with the greatest activity occurring in the latter. Business education typically prepares students for an occupation in business or a business-related field, or a teaching career in academics (Nimfel, 2022). Digital transformation is reshaping business education in tertiary institutions by expanding access to digital resources, enabling blended learning, and supporting more flexible instructional delivery. In the Nigerian context, these changes are especially relevant because

institutions must respond to infrastructure constraints, uneven digital literacy, and evolving labor-market expectations. (Ama, 2024).

Digital transformation has moved beyond the simple adoption of computers, internet connectivity, or electronic learning platforms. In contemporary higher education, it increasingly represents a broader institutional process through which digital technologies reshape teaching, learning, assessment, curriculum design, administration, student engagement, and the development of competencies required for participation in a technology-driven economy. The transition is particularly significant for business education because business graduates are expected to operate in workplaces increasingly characterized by artificial intelligence (AI), cloud computing, big data analytics, digital platforms, automation, and digitally mediated entrepreneurship. Recent research describes Education 4.0 as an experience-oriented model that combines emerging technologies with personalized, flexible, and problem-based learning, rather than relying predominantly on memorization and conventional classroom delivery (Mukul & Büyüközkan, 2023); (Usman & Oladunjoye, T. Ganiyu Mamman, 2024).

The relevance of digital transformation to Nigerian tertiary education is particularly pronounced because the quality of business education is closely associated with the capacity of institutions to prepare students for changing labour-market and entrepreneurial environments. Business education is no longer adequately defined by conventional competencies in accounting, office administration, marketing, management, or entrepreneurship. Graduates increasingly require digital literacy, data interpretation, technology-mediated communication, innovation capability, problem-solving, adaptability, and the ability to work with AI-supported business systems. Consequently, transforming business education requires more than purchasing digital equipment; it requires alignment among technology, curriculum, lecturers, students, institutional governance and industry expectations.

Evidence from Nigeria increasingly demonstrates both the potential and the limitations of this transition. For example, (Edokpolor et al., 2026) Empirically examined vocational business students in Nigerian universities and found significant positive relationships between AI-driven technological application, study engagement, and entrepreneurial career intentions. Their analysis further showed that study engagement mediated the relationship between AI technology and entrepreneurial career intentions. This is particularly relevant to business education because it suggests that the educational value of digital technology may not arise simply from students' access to technology; rather, technology can influence outcomes through the extent to which students become cognitively and motivationally engaged with learning (Loretto et al., 2026).

The same study identified an important contextual gap. Although AI-enabled instructional technologies have attracted increasing attention, empirical evidence concerning their operation within vocational business education in developing higher education systems remains relatively limited (Edokpolor et al., 2026). This observation provides an important basis for the present study, which extends the discussion beyond AI alone to consider digital transformation as a multidimensional phenomenon involving technological infrastructure, digital competence, pedagogical integration, curriculum transformation and institutional support.

The evidence concerning Nigerian tertiary institutions also suggests that digital transformation cannot be separated from institutional capacity (Ogbonna et al., 2025) Using data from 5,052 respondents across universities, Polytechnics, and Colleges of Education in Southeast Nigeria, the study demonstrated empirically that technology availability, utilization, and maintenance were significant predictors of user satisfaction. Availability, utilization, and maintenance respectively produced positive effects, while together explaining 28.5% of the variance in satisfaction. The study further reported institutional differences, indicating that the factors most strongly associated with satisfaction varied across universities, polytechnics, and colleges of education (Ogbonna et al., 2025). These findings challenge the assumption that a single digital-transformation strategy can be uniformly applied across Nigerian tertiary institutions.

The institutional dimension is reinforced by recent research on AI-driven transformation in Nigerian higher education. (Loretto et al., 2026) Identified inadequate digital literacy, weak governance implementation, limited AI readiness, and infrastructural deficits as major constraints. Their stakeholder study found that 17 of 21 participants emphasized digital literacy and staff development as fundamental to successful digital transformation, while approximately two-thirds identified leadership and governance commitment as critical to sustainability. Infrastructure and ethical concerns were also prominent: 19 of the 21 participants identified unstable electricity, inadequate internet connectivity, and insufficient funding as major barriers, while privacy, academic integrity, and equitable access were identified as important ethical concerns (Loretto et al., 2026); (Edokpolor et al., 2026).

These Nigerian findings are consistent with the wider international literature. A 2024 empirical study involving 626 lecturers found that the major dimensions of lecturers' digital competence—including

professional engagement, digital resources, teaching and learning, assessment, learner empowerment, and development of students' digital competence—were positively associated with student learning value. This finding is important because it places lecturers, rather than technology alone, at the center of educational transformation. Digital platforms may provide capabilities, but the educational benefits depend substantially on whether lecturers can integrate them meaningfully into curriculum and pedagogy (Dang et al., 2024).

Similarly, a large-scale systematic review of digital transformation initiatives in higher education found that transformation encompasses teaching, learning, administration, user experience, and social inclusion rather than technology adoption alone (Fernández et al., 2023). Another Scopus-based review of 408 publications identified three broad dimensions of higher-education digital transformation: digital technologies for teaching, learning, assessment, and administration; user experience; and social inclusiveness (Joshi et al., 2024). These perspectives are particularly useful for Nigerian business education because they indicate that transformation should ultimately be assessed through educational and institutional outcomes rather than the quantity of technologies acquired (Joshi et al., 2024).

The emergence of generative AI has further intensified the need to reconsider how business education is delivered and assessed. Recent evidence from African higher education indicates a significant disconnect between students' use of generative AI and educators' preparedness to manage and integrate these technologies. The literature increasingly favours assessment redesign, critical reflection, transparent AI use, and process-oriented learning rather than relying exclusively on prohibition or AI-detection mechanisms (Antwi-Boampong et al., 2026). A broader 2026 review similarly concludes that the educational value of generative AI depends strongly on the surrounding pedagogy, assessment design and verification practices rather than on the technology itself (Antwi-Boampong et al., 2026); (Nimfel, 2022).

The Nigerian context presents additional structural challenges. Earlier Nigerian research identified poor technological infrastructure, limited access to modern devices, inadequate mobile-learning pedagogical skills among lecturers, negative attitudes, and weak institutional policy as barriers to sustainable digital education (Agidani, 2021). More recent Nigerian scholarship similarly emphasizes the need for infrastructure investment, lecturer development, curriculum reform, collaboration, research, and inclusion to realize the benefits of Industry 4.0 in education (Adeoye et al., 2023).

The business-education curriculum itself therefore requires reconsideration. Recent research on curriculum transformation argues that AI, big-data analytics, cloud computing and digital platforms are changing industrial competency requirements and that universities face challenges involving technological infrastructure, faculty readiness, curriculum relevance and industry alignment. At the same time, digital transformation creates opportunities for interdisciplinary learning, experiential education, global collaboration, and technology-driven innovation. These issues are directly applicable to Nigerian business education, where curriculum content must increasingly reflect the realities of digitally enabled enterprises and entrepreneurial ecosystems (Yuwono, Imam Maulidizen, Ahmad Hariyadi, Ahmad Reza Iqbal, 2026), (Lee, 2022).

1.1 Problem Statement

Despite the potential of digital transformation to enhance teaching and learning, the shift from conventional business education to technology-enabled business education in Nigerian tertiary institutions remains inconsistent. This transition is often hindered by factors such as unreliable power supply, limited connectivity, high deployment costs, and insufficient staff training. These obstacles can diminish the effectiveness of technology-enhanced business education (Edokpolor et al., 2026); (Ogbonna et al., 2025).

1.2 Aim and objectives of the Study

Guided by the overarching goal of understanding the impact of digital transformation in business education, this study focuses on Nigerian tertiary institutions. The specific objectives are to:

i. examine the influence of digital infrastructure and lecturers' digital competence on the delivery of Business Education in Nigerian Tertiary Institutions.
ii. assess the effect of digital transformation on students' engagement, learning outcomes, and digital competencies in Business Education.
iii. examine the influence of institutional readiness and governance support on the effective implementation of digital transformation in Business Education.

Review of Related Literature and Conceptual and Analytical Framework

The literature on digital transformation in business education has expanded significantly over the past decade, reflecting growing scholarly and policy interest in how digital

technologies reshape institutional processes and outcomes. Existing research can be broadly organized into four (4) interrelated dimensions: (a) institutional readiness, (b) technology-driven transformation, (c) governance and public value outcomes and (d) digital competencies and human capabilities, Despite this expansion, the literature remains fragmented, with limited integration across these dimensions and insufficient attention to how governance mechanisms mediate the relationship between digital transformation and business education (Nwaigwe et al., 2026).

2.1 Business Education

Business Education is a broad and comprehensive field of study whose instructional programme is endowed with the capacity of providing required vocational skills, aptitude, and knowledge to effectively and efficiently manage personal businesses and function in the economic system as a whole. A remarkable attribute of the Business Education programme is that its graduates can perform and function independently as employers of labour and as entrepreneurs, Okoro 2013 cited in (Ore & Hassan, 2023). Business education programs cover a wide range of subjects, including business management, office occupations, economics, and entrepreneurship. These programs are designed to develop the basic skills of learners that can be applied in their personal lives and future careers. The overarching goals and objectives of business education are driven by the needs of industry, commerce, and society as a whole Otum, 2018, cited in (Ufondu et al., 2023).

Business education is a specialized field of education that focuses on imparting knowledge and skills related to the business industry. It encompasses various teaching methods and approaches aimed at equipping students with a solid understanding of fundamental business practices. The primary objective Of business education is to provide learners with the necessary skills, knowledge, attitudes, and competencies required for employment, career advancement, and self- reliance (Ufondu et al., 2023). The philosophy of the Business Education curriculum, as stated in Aquah (2014), cited in (Ore & Hassan, 2023) includes;

i) To equip the student with the necessary saleable skills that will enable them to acquire, sustain, and grow in their jobs and be self-employed, thereby creating jobs for others
ii) To prepare Business Education students for advanced training in Business Education
iii) To prepare students for higher studies in Business Education
iv) To gain the basic knowledge and skills of Business Education
v) To possess the basic skills required in an office occupation
vi) To relate skills and knowledge acquired during the programme to national development.
vii) To provide students with the needed pedagogical skills for teaching business subjects.
viii) To provide students with basic skills and orientation in preparation for the world of work for those who may not further their educational training.

2.2 Digital Transformation

Digital transformation has emerged as a defining imperative in higher education world- wide, driven by rapid advances in information and communication technologies (ICT) (Aposika, 2026). The COVID-19 pandemic accelerated the pace of digital transformation, demonstrating both the potential and the limitations of technology-enabled education. Universities worldwide rapidly transitioned to online and blended learning models, highlighting the importance of digital infrastructure, faculty preparedness, and student digital competencies. While many institutions successfully adopted innovative teaching practices, the transition also exposed persistent inequalities related to access to technology, internet connectivity, digital literacy, and institutional resources (Vasuki, M., Mishra, A. K., Dinesh Kumar, A., Mishra, S., Celestin, M., Zulu, 2026). These disparities continue to influence educational quality and equity, particularly in developing countries (Lohithaksha, 2026); (Ufondu et al., 2023).

According to OECD (2023), the emergence of technologies such as cloud computing, Artificial Intelligence (AI), Big Data Analytics, Machine Learning, Learning Management Systems (LMS), Virtual Reality (VR), Augmented Reality (AR), and the Internet of Things (IoT) has significantly expanded educational opportunities across all levels of learning. These technologies facilitate learner-centred instruction by enabling personalized learning experiences, flexible access to educational resources, real-time communication, collaborative knowledge construction, and data-driven decision-making (Sanni, 2026); (Nhleko et al., 2024); (Hardiyanti et al., 2026).

Digital Transformation refers to the process of using digital technologies to transform and improve business processes, operations, and services by leveraging digital tools and platforms (Eche, Patrick Inalegwu Isaiah, Agama Egiri Emmanuel, 2024); (Radicic, Dragana Petkovic, 2023). Digital

transformation refers to the process of integrating digital technologies into all aspects of an organization's operations, fundamentally changing how it functions and delivers value to its stakeholders. This transformation goes beyond merely adopting new technologies; it involves rethinking and redesigning workflows, culture, and customer interactions to leverage the full potential of digital advancements (Ibironke & Jayeola, 2025); (Reis & Melão, 2023); .

The digital transformation comprises many modern technologies, such as AI, IoT, Augmented Reality (AR), Virtual Reality (VR), and Blockchain. Software and platforms have been instrumental in propelling the digital transformation over the past five years. AI, as a research focus and a nascent professional domain in recent times, is increasingly playing a pivotal role in this transformation (Hu et al., 2025). Generative Artificial Intelligence (GenAI) is rapidly becoming part of everyday practice in higher education. In this review, GenAI refers to large language model tools that generate text or code in response to prompts.(Hawi & Samaha, 2026); (Antwi-Boampong et al., 2026).

2.3 Information and Communication Technology (ICT)

The concept of Information and Communications Technology (ICT) infrastructure adoption characterizes as the equipment and software required to implement organizational operation systems that incorporate networks for communications services, as well as support applications, digital content, and e-learning in the area of software, and related services for an effective organization's running (Omowunmi et al., 2024). According to Arifin et al (2016) cited in (Omowunmi et al., 2024) using IT can enhance output by 81%, reduce labour costs by 40%, improve company-wide efficiency and productivity, and increase profitability (Eche, Patrick Inalegwu Isaiah, Agama Egiri Emmanuel, 2024).

2.4 Digital Transformation in Education

Technological integration is a practical application of technology into the art of teaching, teaching models, teaching concepts, teaching patterns, and application environments by using modern technology (Ibironke & Jayeola, 2025).

Digital transformation in education involves integrating digital technologies into all aspects of the educational process, fundamentally altering how educators teach and students learn. Digital transformation in education also focuses on creating a more interconnected and dynamic ecosystem where technology enhances every aspect of the learning experience by bringing together people, processes, and data to enhance the learning environment for students, educators, parents, and other stakeholders in a world currently overtaken by technology (Ibironke & Jayeola, 2025).

2.5 Digital Transformation in Higher Education

Higher Education Institutions (HEIs) are critical to national development, providing the skilled human capital necessary for economic growth, governance, and technological innovation (Fernández et al., 2023). Digitalization, AI, and machine learning hold transformative potential for strengthening institutional capacity in Africa (Loretto et al., 2026); (Zhukabayeva et al., 2025).

Digital transformation has emerged as a defining feature of higher education in the twenty-first century, reshaping institutional practices, teaching methodologies, research processes, and student learning experiences. Unlike simple technology adoption, digital transformation represents a comprehensive and strategic integration of digital technologies into all aspects of higher education. It involves rethinking educational policies, curriculum design, assessment methods, administrative processes, and institutional culture to meet the demands of an increasingly digital and interconnected world (Lohithaksha, 2026); (Mukul & Büyüközkan, 2023).

The digital transformation of higher education is occurring rapidly around the globe, leaving an indelible mark on improving the quality of education, expanding the accessibility of educational resources, and realizing innovation and reform in teaching and research (Hu et al., 2025); (Sanni, 2026). Digital transformation in higher education extends beyond the introduction of computers, learning management systems, online platforms, or artificial intelligence. It represents a broader institutional change in which digital technologies are integrated into teaching, learning, assessment, administration, communication, curriculum development, and decision-making (Carmo & Lacerda, Daniel Pacheco Klingenberg, Cristina Orsolin Piran, 2025); (Hu et al., 2025).

Similarly, (Fernández et al., 2023), argue that higher education digital transformation involves organizational and strategic change affecting information, processes, people, and institutional structures. Their multivocal review identified 184 digital transformation initiatives across 39 universities, with improving the quality and competitiveness of education emerging as a major focus (Nwaigwe et al., 2026).

This suggests that successful transformation requires institutions to integrate technology with organizational strategy rather than implement isolated technological projects (Lohithaksha, 2026).

2.6 Digital Transformation and Business Education

Business Education is particularly relevant to digital transformation because its graduates are expected to function within technology-intensive workplaces characterised by digital communication, electronic commerce, data-driven decision-making, cloud applications, artificial intelligence, digital accounting, virtual collaboration, and entrepreneurial technologies (Yuwono, Imam Maulidizen, Ahmad Hariyadi, Ahmad Reza Iqbal, 2026).

The transformation of Business Education consequently requires more than transferring conventional teaching activities to online platforms. It requires curriculum and pedagogical changes that expose students to technologies and work practices relevant to contemporary business environments. The literature on Education 4.0 indicates that technology-enabled education increasingly emphasises experiential learning, personalisation, collaboration, and the development of competencies required by digitally transformed workplaces (Mukul & Büyüközkan, 2023).

This perspective is supported by recent evidence involving Nigerian vocational business students. (Edokpolor et al., 2026) Empirically examined AI-driven technology, study engagement, and entrepreneurial career intentions among vocational business students in Nigerian universities. Their findings indicate that perceived use of AI-driven technology was positively associated with study engagement and entrepreneurial career intentions, while engagement also played a mediating role in the relationship between technology use and entrepreneurial intentions.

Digital transformation in science education involves the use of digital technologies to enhance scientific understanding and learning experiences. This transformation includes:

a) Online learning platforms and digital classrooms
b) Virtual laboratories and simulation software
c) Artificial intelligence–based tutoring systems
d) Digital assessment and evaluation tools
e) Collaborative online learning environments

The integration of these technologies allows students to visualize complex scientific concepts, conduct virtual experiments, and access global research resources (Shukla, 2026).

Table 1: Key Dimensions of Digital Transformation in Business Education

Dimension	Major Components	Expected Contribution
Digital infrastructure	Internet, electricity, devices, networks	Enables technology access
Digital technologies	AI, cloud computing, LMS, analytics	Supports innovative teaching and learning
Lecturer competence	Digital teaching, assessment, and resource management	Improves technology integration
Curriculum transformation	Digital business skills, AI, analytics, e-commerce	Improves labour-market relevance
Institutional readiness	Leadership, funding, support, and organizational capacity	Supports sustainability
Digital governance	Policies, accountability, ethics, and data protection	Promotes responsible transformation
Student engagement	Interaction, collaboration, and personalized learning	Improves learning experience
Entrepreneurship	Digital platforms, innovation, and technology-enabled business	Strengthens entrepreneurial capability

2.7 Lecturers' Digital Competence

Infrastructure alone cannot guarantee effective digital transformation. Lecturers must possess the competence to select, use, integrate, evaluate, and adapt digital technologies to pedagogical objectives.

Dang et al., using empirical evidence from 626 lecturers, found that all six dimensions of the DigCompEdu framework—professional engagement, digital resources, teaching and learning, assessment, empowering learners, and facilitating learners' digital competence—were positively related to student learning value (Dang et al., 2024).

This evidence supports the argument that lecturers' digital competence should be treated as a central component of digital transformation rather than as a supplementary professional skill. A lecturer may have access to sophisticated technologies but still produce limited educational value if the technologies are poorly integrated into teaching and assessment (Nwaigwe et al., 2026); (Owo, 2025).

2.8 Digital Transformation, Student Engagement and Learning Outcomes

One of the principal justifications for digital transformation is its potential to improve students' educational experiences and outcomes. Digital platforms can provide flexible access to learning materials, facilitate interaction, support collaborative activities, enable rapid feedback, and create opportunities for personalised learning (Edokpolor et al., 2026); (Chen & Cheung, 2025).

Recent evidence concerning generative AI strengthens this argument. Chen and Cheung's systematic review and meta-analysis synthesized 57 studies and 97 effect estimates and reported an overall large positive effect of generative AI on university students' learning outcomes. Positive effects were reported for academic achievement, affective-motivational outcomes, higher-order thinking, and language skills, although the effect on metacognition was not statistically significant (Chen & Cheung, 2025); (Xia et al., 2025).

Table 2: Digital Transformation Outcomes

Outcome Area	Expected Effect
Teaching effectiveness	More flexible and technology-supported instruction
Student engagement	Greater interaction and participation
Digital competence	Improved ability to use digital technologies
Learning experience	More personalized and collaborative learning
Entrepreneurship	Stronger digital entrepreneurial capability
Employability	Better alignment with technology-driven workplaces
Accessibility	Wider access to learning resources
Institutional effectiveness	More digitally enabled academic and administrative processes

2.9 Institutional Readiness and Governance Support

Institutional readiness provides the organisational conditions necessary for translating digital resources and human capabilities into sustainable transformation. It encompasses infrastructure, leadership commitment, strategic vision, organisational culture, funding, technical support, governance structures, and institutional capacity. A critical but underdeveloped dimension in the literature is digital governance, which mediates how digital transformation unfolds within higher education institutions. Digital transformation processes span academic, administrative, and governance domains, including teaching and learning systems, administrative platforms, and decision-support tools (Eche, Patrick Inalegwu Isaiah, Agama Egiri Emmanuel, 2024); (Khan et al., 2026).

Governance alignment involves ensuring that digital initiatives are connected to institutional missions, policies, accountability mechanisms, participation, and transparency. The review found governance alignment in 29 of the 47 studies and argues that digital transformation outcomes depend on alignment among competencies, institutional readiness, and governance. This is particularly relevant to Nigerian tertiary institutions, where fragmented digital initiatives, resource constraints, infrastructure deficiencies, and institutional capacity limitations can prevent technology investments from producing sustainable educational outcomes (Nwaigwe et al., 2026); (Yuwono, Imam Maulidizen, Ahmad Hariyadi, Ahmad Reza Iqbal, 2026).

2.10 Curriculum Reengineering

Curriculum reengineering is the cornerstone of any educational reform aimed at bridging the skill gap. The existing business education curriculum in many African universities is often overloaded with theoretical content and outdated management models that fail to address new technological and entrepreneurial realities (Odigili, Chuks Bishop Omorojie, 2025). A repositioned business education curriculum must therefore be competency-based, interdisciplinary, and industry-responsive.

2.11 Opportunities of Digital Transformation in Business Education

Despite these challenges, digital transformation creates substantial opportunities for Business Education (Sanni, 2026); (Edokpolor et al., 2026).

i) **Improved Accessibility**: Digital learning platforms allow students from remote areas to access educational resources and participate in online classes (Shukla, 2026).
ii) **Personalized Learning**: Adaptive learning systems analyze student performance and provide customized educational content (Shukla, 2026).

iii) **Enhanced Visualization of Scientific Concepts**: Digital simulations help students understand complex scientific processes such as molecular interactions and chemical reactions.
iv) **Collaborative Learning**: Online platforms enable collaboration between students and researchers across the world.
v) **Flexible Learning Environment**: Digital tools allow students to learn anytime and anywhere, increasing flexibility and convenience.

Research shows that digital learning environments significantly improve student engagement, performance, and accessibility (Shukla, 2026).

2.12 Challenges of Digital Transformation in Business Education

While digital transformation has revolutionized business education by expanding access and enhancing learning experiences, it has also introduced significant challenges and ethical concerns (Ibironke & Jayeola, 2025). These issues require careful attention to ensure that technological innovation contributes to equitable, inclusive, and sustainable educational development (Lohithaksha, 2026). The literature identifies several interconnected barriers to digital transformation in Nigeria (Adeoye et al., 2023); (Ibironke & Jayeola, 2025);

i) **Digital Divide**: One of the major challenges is unequal access to technology and internet connectivity, particularly in rural or economically disadvantaged regions (Nwaigwe et al., 2026); (Owo, 2025).
ii) **Lack of Teacher Training**: Many educators lack sufficient digital skills required for integrating technology into teaching.
iii) **Infrastructure Limitations**: Limited technological infrastructure in educational institutions can hinder effective digital learning (Adeoye et al., 2023), (Yuwono, Imam Maulidizen, Ahmad Hariyadi, Ahmad Reza Iqbal, 2026); (Sanni, 2026).
iv) **Data Privacy and Security**: The use of digital platforms raises concerns regarding the protection of personal and academic data (Adeoye et al., 2023).
v) **Resistance to Change**: Some educators and institutions may resist adopting new technologies due to unfamiliarity or lack of institutional support (Shukla, 2026).
vi) **Lack of funding**: Limited budgets and funding constraints make investing in the necessary technology and training required for a smooth transition to Industry 4.0 in education challenging. Finding sustainable funding models and partnerships is essential to overcome this challenge (Adeoye et al., 2023).
vii) **Lack of Comprehensive Curriculum**: A significant challenge is the need for a comprehensive digital business education curriculum that aligns with the demands of Industry 4.0 (Adeoye et al., 2023).
viii) **Institutional and governance limitations:** Digital transformation requires strategic coordination. Fragmented initiatives, weak institutional readiness, inadequate funding, and poorly aligned governance mechanisms can limit the sustainability of transformation efforts. The 2026 evidence synthesis specifically concludes that infrastructure-only approaches are insufficient when governance and organisational culture are poorly aligned (Nwaigwe et al., 2026); (Shukla, 2026).

Research Gap

The study identifies a significant gap in understanding how various factors—
including technological infrastructure, lecturers' digital competence, curriculum transformation, student engagement, institutional readiness, and governance—
interact to influence digital transformation within Nigerian tertiary institutions for business education. A lthough previous studies have examined these elements in isolation, none have offered a holistic view of their combined impact on achieving sustainable educational, entrepreneurial, and institutional outc omes. The manuscript emphasises that successful digital transformation goes beyond merely adoptin g technologies; it requires a cohesive alignment among technology, curriculum, educators, students, g overnance, and industry standards (Odigili, Chuks Bishop Omorojie, 2025).

Future Prospects

The future of digital business education is likely to include:

a) AI-driven personalized learning environments
b) Fully virtual laboratories
c) Integration of big data and learning analytics
d) Global collaborative research platforms

These developments will further transform the teaching and learning of business education (Yuwono, Imam Maulidizen, Ahmad Hariyadi, Ahmad Reza Iqbal, 2026); (Reis & Melão, 2023).

Recommendations

Five (5) suggestions for improving digital transformation in Nigerian tertiary institutions are as follows:

i) To overcome current access hurdles, strengthen ICT infrastructure and digital access by ensuring dependable internet, electricity, and digital resources.

ii) Provide lecturers with ongoing training in digital skills: Develop professional development initiatives that emphasise incorporating cutting-edge digital capabilities like artificial intelligence and data analytics into instructional strategies.

iii) Update the Business Education curriculum on a regular basis to incorporate skills that are pertinent to digital workplaces, such as digital entrepreneurship and artificial intelligence.

iv) Create rules that match digital activities with institutional goals, including data protection and ethical AI use, in order to strengthen institutional digital-governance frameworks.

v) Encourage sustainable investment and partnerships: Encourage cooperation between institutions, businesses, and the government to improve digital resources and training capacities.

Conclusion

Digital transformation in Nigerian education holds immense potential to improve learning outcomes, increase accessibility, and prepare students for the future. A successful digital transformation agenda in Nigerian tertiary business education requires coordinated investment in infrastructure, faculty capacity building, curriculum redesign, and institutional policy support (Shukla, 2026).

To overcome these challenges and advance digital transformation in Nigerian education, several actions are necessary. First, there is a need to strengthen educational infrastructure through investments in reliable electricity, internet services, and digital devices, especially in rural communities, to create a conducive environment for technology integration (Ibironke & Jayeola, 2025).

Finally, the role of leadership in driving technological integration in education cannot be overstated. Effective leaders provide a clear vision, secure necessary resources, offer ongoing professional development, build collaborative cultures, and continuously monitor and evaluate progress. Hence, the commitment and actions of educational leaders are pivotal in transforming educational environments and achieving the full potential of technological integration (Ibironke & Jayeola, 2025).

Abstract
Digital transformation has increased the need for Business Education lecturers to possess competencies for integrating emerging technologies into entrepreneurship instruction. This study examined the relationship between digital competence and techno-preneurship instructional practices among Business Education lecturers in tertiary institutions. Specifically, the study determined the relationships between digital content-creation competence, digital communication competence and techno-preneurship instructional practices. Two research questions and two null hypotheses guided the study. A correlational research design was adopted. The population comprised 161 Business Education lecturers from Federal College of Education (Technical), Omoku (79), Nnamdi Azikiwe University, Awka (39), and Alvan Ikoku Federal University of Education, Owerri (43). The entire population was studied using a census approach. Data were collected using a structured questionnaire titled Digital Competence and Techno-preneurship Instructional Practices Questionnaire (DCTIPQ), validated by three experts. Pearson Product Moment Correlation was used to answer the research questions and test the hypotheses at the .05 level of significance. Findings revealed a strong positive relationship between digital content-creation competence and techno-preneurship instructional practices (r = .766, p < .01) and a moderate positive relationship between digital communication competence and techno-preneurship instructional practices (r = .496, p < .01). Both relationships were statistically significant. The study concluded that digital competence is significantly associated with techno-preneurship instructional practices and recommended continuous digital capacity development for Business Education lecturers.
Keywords: Business Education, digital competence, digital content creation, techno-preneurship

Introduction
Digital transformation is changing the nature of business, entrepreneurship and education. Digital technologies increasingly influence how enterprises identify opportunities, communicate with customers, develop products, market services and organize business processes. Nambisan (2017) observed that digital technologies have transformed entrepreneurial processes and outcomes, thereby creating new possibilities for digital entrepreneurship. Consequently, entrepreneurship education can no longer be effectively separated from the digital technologies shaping contemporary business environments. Ratten and Usmanij (2021) similarly noted that digitalization is changing entrepreneurship and how entrepreneurship education is approached.

These developments have important implications for Business Education. Business Education prepares individuals with knowledge, competencies and attitudes required for employment, entrepreneurship and participation in the business environment. As workplaces and entrepreneurial activities become increasingly digital, lecturers responsible for preparing students require competencies that enable them to incorporate appropriate technologies into instructional activities. Enang (2023) emphasized that digital entrepreneurial skills and competencies are necessary for Business Education students to remain relevant and competitive in the digital era. Such competencies are unlikely to be effectively developed where lecturers themselves lack appropriate digital capabilities.

Digital competence extends beyond basic ability to operate computers. Vuorikari et al. (2022) conceptualized digital competence through areas including information and data literacy, communication and collaboration, digital content creation, safety and problem-solving. For educators specifically, Redecker (2017) identified professional engagement, digital resources, teaching and learning, assessment, empowering learners and facilitating learners' digital competence as major dimensions of educators' digital competence. These frameworks indicate that educators need the capacity not merely to access technologies but to create resources, communicate, collaborate and integrate technologies purposefully into instruction.

Digital competence is particularly relevant to Business Education lecturers because of the practical and occupational orientation of the programme. Timya (2022) found that lecturers required digital technology skills to a high extent for teaching and learning Business Education courses in tertiary institutions in Plateau State. Similarly, Ayemhenre et al. (2023) found that digital skills were highly required by Business educators for enhancing and evaluating classroom instructional delivery in Colleges of Education in Delta State. These findings demonstrate that effective Business Education instructional delivery increasingly requires lecturers who are digitally competent.

Nevertheless, evidence suggests variations in the digital competencies actually possessed by Business Education lecturers. Okoli and Okolo (2024) found that although lecturers demonstrated high competence in some basic digital activities, competencies involving platforms such as Zoom, Google Classroom and Microsoft Teams were acquired at lower levels. The authors concluded that lecturers had not acquired the full range of digital skills needed for effective Business Education curriculum implementation. Shaibu et al. (2024) likewise emphasized the need for Business Education lecturers to possess relevant digital skills for effective instructional delivery in tertiary institutions in Imo State.

In this study, digital competence is operationalized through digital content-creation competence and digital communication competence. Digital content-creation competence refers to lecturers' capacity to create, modify, organize and appropriately use digital instructional materials. It can involve producing presentations, multimedia materials, digital documents and other resources relevant to entrepreneurial learning. Redecker (2017) specifically identifies selecting, creating, modifying, managing and sharing digital resources as important components of educators' digital competence. Digital content creation can therefore enable lecturers to translate entrepreneurial concepts into engaging technology-supported learning experiences.

Digital communication competence concerns lecturers' ability to use digital technologies for communication, collaboration and information exchange in instructional settings. This includes appropriate use of online communication and collaborative technologies for interaction with learners and sharing instructional resources. Vuorikari et al. (2022) identify communication and collaboration as a core area of digital competence. Ejeka et al. (2023) similarly established that acquisition of digital literacy skills is essential to the continued relevance of Business educators in tertiary institutions.

The dependent variable, techno-preneurship instructional practices, refers to instructional activities through which lecturers integrate technology and entrepreneurial learning to prepare students for technology-enabled enterprise creation and operation. Techno-preneurship combines technological capabilities with entrepreneurial thinking and action. Digital technologies have expanded the mechanisms through which entrepreneurial opportunities are discovered, developed and exploited (Nambisan, 2017). Therefore, techno-preneurship instruction should expose students to practical applications of technology in opportunity identification, digital marketing, online business operations, communication and innovation.

The need for such instructional practices is reinforced by changes in entrepreneurship education. Chen et al. (2021), in their systematic review of online and blended entrepreneurship education, demonstrated that various educational technologies are increasingly being applied in entrepreneurship education. Ratten and Jones (2021) also argued that entrepreneurship and management education need to respond to digital transformation. Thus, lecturers' capacity to use digital technologies may be particularly important to how effectively techno-preneurial concepts and practices are incorporated into Business Education.

Within Nigerian Business Education, empirical evidence also points to the connection between digital resources, instructional delivery and entrepreneurial preparation. Ogwunte et al. (2023) found inadequate availability and utilization of digital resources for entrepreneurship skills acquisition in universities in Rivers State. Ordu and Onyemekara (2023) reported a positive relationship between institution-community partnership for digital resource development and self-employability skills among Business Education students. Ukata and Nmehielle (2023) further examined cooperative instructional delivery and delivery of digital skills for decent employment in tertiary institutions in Rivers State. Collectively, these studies underscore the importance of digital capacity in preparing learners for contemporary employment and entrepreneurial activities.

Despite the growing literature, existing studies have largely concentrated on digital skills required or acquired by lecturers, availability of digital resources, curriculum implementation and employability. Limited attention has been given specifically to whether digital content-creation competence and digital communication competence are related to lecturers' techno-preneurship instructional practices. This study addresses this gap by examining the relationship between digital competence and techno-preneurship instructional practices among Business Education lecturers in selected tertiary institutions.

Statement of the Problem

Business Education lecturers are expected to prepare students for entrepreneurship in a business environment increasingly driven by digital technologies. This responsibility requires lecturers to possess digital competencies and translate them into instructional practices that expose learners to technology-enabled entrepreneurial activities. However, evidence indicates that lecturers do not possess all required digital competencies at comparable levels. Okoli and Okolo (2024) found deficiencies in some core digital skills required for effective Business Education curriculum implementation, while Ejeka et al. (2023) identified constraints affecting digital literacy acquisition among Business educators.

Furthermore, Ogwunte et al. (2023) reported inadequate availability and utilization of digital resources for entrepreneurship skills acquisition in Business Education. Although previous studies establish the importance of digital skills and resources, they do not sufficiently explain whether lecturers' digital content-creation and communication competencies are associated with their techno-preneurship instructional practices. This unresolved relationship constitutes the problem investigated in the study.

Purpose of the Study

The study determined the relationship between digital competence and techno-preneurship instructional practices among Business Education lecturers in tertiary institutions. Specifically, the study sought to:

1. determine the relationship between digital content-creation competence and techno-preneurship instructional practices; and
2. determine the relationship between digital communication competence and techno-preneurship instructional practices among Business Education lecturers.

Research Questions

1. What relationship exists between digital content-creation competence and techno-preneurship instructional practices among Business Education lecturers?
2. What relationship exists between digital communication competence and techno-preneurship instructional practices among Business Education lecturers?

Hypotheses

H_{01}: There is no significant relationship between digital content-creation competence and techno-preneurship instructional practices among Business Education lecturers.
H_{02}: There is no significant relationship between digital communication competence and techno-preneurship instructional practices among Business Education lecturers.

Methodology

The study adopted a correlational research design. The design was considered appropriate because the study determined the relationships between digital competence and techno-preneurship instructional practices without manipulating the variables. The study covered three tertiary institutions offering Business Education in Nigeria. The population comprised 161 Business Education lecturers, consisting of 79 lecturers from Federal College of Education (Technical), Omoku, 39 from Nnamdi Azikiwe University, Awka, and 43 from Alvan Ikoku Federal University of Education, Owerri. Since the population was manageable, a census approach was adopted; therefore, all 161 lecturers constituted the respondents. Data were collected using a researcher-developed instrument titled Digital Competence and Techno-preneurship Instructional Practices Questionnaire (DCTIPQ). The instrument contained items covering digital content-creation competence, digital communication competence and techno-preneurship instructional practices and was structured on a four-point response scale. The instrument was subjected to face and content validation by three experts: two in Business Education and one in Measurement and Evaluation. A trial test was conducted among Business Education lecturers from University of Port Harcourt, and Cronbach alpha was used to determine the instrument's internal consistency. It was determined that the instrument has an overall dependability index of .86. The researchers, assisted by research assistants, administered the instrument to the respondents. It was successful retrieved which Pearson Product Moment Correlation (PPMC) was used to answer the research questions and test the null hypotheses at the .05 level of significance. A null hypothesis was rejected where $p < .05$ and retained where $p \geq .05$.

Results

Research Question 1
What relationship exists between digital content-creation competence and techno-preneurship instructional practices among Business Education lecturers?

Table 1: Pearson Correlation between Digital Content-Creation Competence and Techno-preneurship Instructional Practices

Variables	N	Pearson *r*	Relationship
Digital content-creation competence and techno-preneurship instructional practices	161	.766	Strong Positive

Table 1 shows a Pearson correlation coefficient of .766 between digital content-creation competence and techno-preneurship instructional practices. The coefficient indicates a strong positive relationship, suggesting that greater digital content-creation competence is associated with greater engagement in techno-preneurship instructional practices among Business Education lecturers.

Research Question 2
What relationship exists between digital communication competence and techno-preneurship instructional practices among Business Education lecturers?

Table 2: Pearson Correlation between Digital Communication Competence and Techno-preneurship Instructional Practices

Variables	N	Pearson *r*	Relationship
Digital communication competence and techno-preneurship instructional practices	161	.496	Moderate Positive

Table 2 shows a Pearson correlation coefficient of .496 between digital communication competence and techno-preneurship instructional practices. The coefficient indicates a moderate positive relationship, suggesting that greater digital communication competence is associated with greater engagement in techno-preneurship instructional practices.

Test of Hypotheses

H_{01}: There is no significant relationship between digital content-creation competence and techno-preneurship instructional practices among Business Education lecturers.

Table 3: Pearson Correlation between Digital Content-Creation Competence and Techno-preneurship Instructional Practices

Variables	N	Pearson *r*	Sig. (2-tailed)	Alpha	Decision
Digital content-creation competence and techno-preneurship instructional practices	161	.766	< .01	.05	Rejected

Table 3 shows a Pearson correlation coefficient of .766 with a probability value of $p < .01$. Since the probability value is less than the .05 level of significance, H_{01} was rejected. Therefore, there is a significant strong positive relationship between digital content-creation competence and techno-preneurship instructional practices among Business Education lecturers.

H_{02}: There is no significant relationship between digital communication competence and techno-preneurship instructional practices among Business Education lecturers.

Table 4: Pearson Correlation between Digital Communication Competence and Techno-preneurship Instructional Practices

Variables	N	Pearson *r*	Sig. (2-tailed)	Alpha	Decision
Digital communication competence and techno-preneurship instructional practices	161	.496	< .01	.05	Rejected

Table 4 shows a Pearson correlation coefficient of .496 with a probability value of $p < .01$. Since the probability value is less than the .05 level of significance, H_{02} was rejected. Therefore, there is a significant moderate positive relationship between digital communication competence and techno-preneurship instructional practices among Business Education lecturers.

Discussion of Findings

The first finding revealed a significant strong positive relationship between digital content-creation competence and techno-preneurship instructional practices. This indicates that lecturers who are more competent in creating and modifying digital instructional resources tend to engage more extensively in techno-preneurship instructional practices. The finding supports Redecker (2017), who identified creating and modifying digital resources as a major component of educators' digital competence. It also agrees with Timya (2022), who found that digital technology skills were highly required for teaching and learning Business Education courses. Similarly, Shaibu et al. (2024) established the importance of relevant digital skills for effective instructional delivery among Business Education lecturers.

The second finding established a significant moderate positive relationship between digital communication competence and techno-preneurship instructional practices. The finding implies that lecturers' capacity to communicate and collaborate through digital technologies is associated with their techno-preneurship instructional practices. This finding supports Vuorikari et al. (2022), who identified digital communication and collaboration as central components of digital competence. It also corroborates Ayemhenre et al. (2023), who found digital skills highly required for effective instructional delivery, and Enang (2023), who emphasized the importance of digital entrepreneurial competencies for preparing Business Education students for the digital era.

Conclusion

The study concluded that digital competence is significantly associated with techno-preneurship instructional practices among Business Education lecturers in tertiary institutions. Digital content-creation competence had a significant strong positive relationship with techno-preneurship instructional practices, while digital communication competence had a significant moderate positive relationship. The findings demonstrate the relevance of lecturers' digital competencies to technology-oriented entrepreneurship instruction in contemporary Business Education.

Recommendations

Based on the findings:

1. Tertiary institutions should provide regular practical training that strengthens Business Education lecturers' competence in creating and adapting digital instructional content for techno-preneurship education.
2. Business Education departments should strengthen lecturers' digital communication competence through continuous exposure to collaborative platforms and communication technologies relevant to technology-driven entrepreneurship instruction.

Abstract
The increasing digitalization of business activities has made digital competencies essential for graduates seeking to participate in technology-driven entrepreneurship. This study examined the relationship between digital skills acquisition and techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State. Specifically, the study determined the relationships between ICT competence, digital literacy and techno-preneurial intentions. Two research questions and two null hypotheses guided the study. A correlational research design was adopted. The population comprised 750 final-year undergraduate Business Education students from four tertiary institutions in Rivers State. A sample of 254 students was determined using the Krejcie and Morgan sampling table and proportionately selected from the institutions. Of the 254 copies of the questionnaire administered, 210 were properly completed and returned, representing an 82.7% response rate. Data were collected using the Digital Skills Acquisition and Techno-preneurial Intention Questionnaire (DSATIQ). The instrument was validated by three experts, while Cronbach alpha yielded an overall reliability coefficient of .82. Pearson Product Moment Correlation was used to answer the research questions and test the hypotheses at .05 level of significance. Findings revealed significant positive relationships between ICT competence and techno-preneurial intentions (r = .63, p < .001), and between digital literacy and techno-preneurial intentions (r = .59, p = .001). The study concluded that digital skills acquisition is positively associated with students' readiness for technology-driven entrepreneurship. It was recommended that Business Education programmes intensify practical ICT and digital literacy activities.
Keywords: Business Education, digital literacy, digital skills acquisition, ICT competence, techno-preneurial intention

Introduction
The rapid advancement of digital technologies has transformed the nature of business, employment and entrepreneurship. Contemporary businesses increasingly depend on digital platforms, mobile technologies, online communication, electronic transactions and data-driven processes to create and deliver value. Consequently, graduates entering the labour market require competencies that extend beyond conventional business knowledge to include the ability to use digital technologies effectively. Van Laar et al. (2020) identified technical, information, communication, collaboration, critical-thinking, creativity and problem-solving skills as important dimensions of contemporary digital competence. Similarly, Vuorikari et al. (2022) explained that digital competence encompasses the confident, critical and responsible use of digital technologies for learning, work and participation in society.

Digital skills acquisition refers to the development of knowledge, abilities and attitudes required to use digital technologies to perform tasks, communicate, solve problems and create value. In Business Education, digital skills are particularly important because the programme is expected to equip students with practical competencies for employment, entrepreneurship and self-reliance. As businesses become increasingly technology-driven, Business Education graduates require relevant digital

capabilities to identify opportunities and participate productively in the digital economy (Nwaokokorom, 2025).

Within Nigerian Business Education, the importance of digital entrepreneurial competencies has received increasing attention. Enang (2023) emphasized that Business Education students require digital entrepreneurial skills and competencies to remain relevant and competitive in the digital era. The author further stressed the need to integrate such competencies into Business Education programmes. This position suggests that developing digital competencies should form an important component of contemporary entrepreneurial preparation in Business Education.

Digital skills acquisition in the present study is considered from two dimensions: ICT competence and digital literacy. ICT competence refers to the ability to use information and communication technologies such as computers, software applications, internet facilities and digital communication tools effectively. Such competence enables students to prepare business documents, search for market information, communicate business ideas, conduct online transactions and use digital platforms to support business operations. Van Laar et al. (2020) observed that ICT proficiency has become increasingly important in technology-mediated workplaces.

ICT competence is equally important to entrepreneurial activities. Digital technologies have changed entrepreneurial processes by enabling entrepreneurs to identify opportunities, develop products and services, communicate with customers and organize business activities in new ways. Nambisan (2017) explained that digital technologies have transformed entrepreneurial processes and outcomes, creating new possibilities for digital entrepreneurship. Therefore, students who possess relevant ICT competencies may be better positioned to recognize and pursue technology-enabled entrepreneurial opportunities.

The second dimension, digital literacy, extends beyond the ability to operate computers and digital devices. It involves the ability to locate, evaluate, create and communicate information through digital technologies. Ng (2012) explained digital literacy in terms of technical, cognitive and socio-emotional dimensions. More recently, Vuorikari et al. (2022) identified information and data literacy, communication and collaboration, digital content creation, safety and problem-solving as major areas of digital competence. For prospective entrepreneurs, these abilities are relevant to searching for business information, evaluating online opportunities, creating promotional content, communicating with customers and adapting to emerging technologies.

Evidence from Business Education in Rivers State underscores the importance of digital resources and competencies. Ogwunte et al. (2023) found that digital resources were not adequately available for teaching entrepreneurship in Business Education in universities in Rivers State and concluded that the level of availability and utilization was inadequate for equipping students for entrepreneurial success after graduation. Similarly, Ordu and Onyemekara (2023) reported a positive relationship between institution-community partnership for digital resource development and self-employability skills development among Business Education students in tertiary institutions in Rivers State. These studies demonstrate the relevance of digital resources and skills to entrepreneurial preparation within the study environment.

Techno-preneurial intention represents an individual's willingness or readiness to pursue technology-driven entrepreneurial activities. It reflects an intention to establish or participate in ventures in which digital technologies contribute substantially to value creation, business processes, products or services. Entrepreneurial intention is important because intention provides a useful framework for understanding an individual's readiness to undertake entrepreneurial behaviour (Liñán & Fayolle, 2015). In the context of the present study, techno-preneurial intention therefore concerns students' readiness to identify and pursue entrepreneurial opportunities through digital technologies.

The relationship between digital skills and techno-preneurial intention is particularly relevant to final-year Business Education students. These students are approaching the transition from tertiary education to employment or self-employment and have received substantial exposure to Business Education, entrepreneurship and ICT-related courses. Their ability to translate acquired digital competencies into intentions to pursue technology-driven entrepreneurship is therefore important to the self-reliance objectives of Business Education.

Although existing literature recognizes the importance of digital competencies, available Rivers State studies have concentrated substantially on digital resource availability, utilization and self-employability skills. Less attention has been given specifically to whether ICT competence and digital literacy are related to techno-preneurial intentions among final-year undergraduate Business Education students across tertiary institutions in Rivers State. This study addresses this gap by determining the relationships between ICT competence, digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State.

Statement of the Problem

Business Education is expected to prepare students for employment, entrepreneurship and self-reliance. However, the increasing digitalization of business means that graduates require ICT competence and digital literacy to identify and exploit technology-driven entrepreneurial opportunities. Enang (2023) emphasized that inadequate digital entrepreneurial competencies can reduce the effectiveness and competitiveness of Business Education students in contemporary business environments.

The situation is particularly concerning in Rivers State. Ogwunte et al. (2023) found that digital resources were not adequately available and utilized for entrepreneurship skills acquisition in Business Education in universities in the State. Although Ordu and Onyemekara (2023) established a positive relationship between digital resource development and self-employability skills, it remains unclear whether students' acquired ICT competence and digital literacy are associated specifically with their intentions to pursue technology-driven entrepreneurship. Therefore, the problem of this study is to determine the relationships between ICT competence, digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State.

Purpose of the Study

The study examined the relationship between digital skills acquisition and techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State. Specifically, the study sought to:

1. determine the relationship between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students; and
2. determine the relationship between digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students.

Research Questions

The following research questions guided the study:

1. What relationship exists between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students?
2. What relationship exists between digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students?

Hypotheses

The following null hypotheses were tested at .05 level of significance:

H_{01}: There is no significant relationship between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students.

H_{02}: There is no significant relationship between digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students.

Methodology

The study adopted a correlational research design. The design was appropriate because the study determined the relationships among ICT competence, digital literacy and techno-preneurial intentions without manipulating the variables. The study was conducted in Rivers State, Nigeria. The population comprised 750 final-year undergraduate Business Education students from four tertiary institutions: University of Port Harcourt (34), Rivers State University (106), Federal College of Education (Technical), Omoku (170), and Ignatius Ajuru University of Education (440). Using the Krejcie and Morgan (1970) sample-size table, a sample of 254 students was selected. Proportionate stratified random sampling was adopted to ensure representation of the institutions, giving 12 students from UNIPORT, 36 from RSU, 58 from FCE(T), Omoku, and 148 from IAUE. Data were collected using a structured questionnaire titled Digital Skills Acquisition and Techno-preneurial Intention Questionnaire (DSATIQ). The instrument was structured on a four-point scale of Strongly Agree (4), Agree (3), Disagree (2) and Strongly Disagree (1). It was subjected to face and content validation by three experts: two in Business Education and one in Measurement and Evaluation. A trial test was conducted among Business Education students outside the study population. Cronbach alpha yielded coefficients of .82 for ICT competence, .79 for digital literacy and .85 for techno-preneurial intention, with an overall coefficient of .82. Of the 254 copies administered, 210 were properly completed and returned, representing an 82.7% response rate, and were used for analysis. Pearson Product Moment Correlation (PPMC) was used to answer the research questions and test the hypotheses. The null hypotheses were tested at .05 level of significance.

Results

Research Question 1

What relationship exists between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students?

Table 1: Pearson Correlation between ICT Competence and Techno-preneurial Intentions

Variables	N	Pearson *r*	Sig. (2-tailed)	Relationship
Digital literacy and techno-preneurial intentions	210	.63**	< .001	Strong Positive

****. Correlation is significant at the 0.01 level (2-tailed).**

Table 1 shows a Pearson correlation coefficient of .63 between ICT competence and techno-preneurial intentions. The coefficient indicates a strong positive relationship, implying that higher ICT competence is associated with stronger techno-preneurial intentions among final-year undergraduate Business Education students.

Research Question 2

What relationship exists between digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students?

Table 2: Pearson Correlation between Digital Literacy and Techno-preneurial Intentions

Variables	N	Pearson *r*	Sig. (2-tailed)	Relationship
Digital literacy and techno-preneurial intentions	210	.59**	< .001	Moderate Positive

****. Correlation is significant at the 0.01 level (2-tailed).**

Table 2 reveals a Pearson correlation coefficient of .59 between digital literacy and techno-preneurial intentions. This represents a moderate positive relationship, indicating that higher digital literacy is associated with stronger techno-preneurial intentions among the students.

Test of Hypotheses

H_{01}: There is no significant relationship between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students.

Table 3: Pearson Correlation between ICT Competence and Techno-preneurial Intentions

Variables	N	*Pearson r*	Sign. (2-tailed)	Alpha	Decision
ICT competence and techno-preneurial intentions	210	.63	< .001	.05	Reject H_{01}

Table 3 shows a Pearson correlation coefficient of .63 with a probability value of $p < .001$ between ICT competence and techno-preneurial intentions. Since the probability value is less than the .05 level of significance, the null hypothesis was rejected. Therefore, there is a significant strong positive relationship between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State.

H_{02}: There is no significant relationship between digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students.

Table 4: Pearson Correlation between Digital Literacy and Techno-preneurial Intentions

Variables	N	*Pearson r*	Sign. (2-tailed)	Alpha	Decision
Digital literacy and techno-preneurial intentions	210	.59	< .001	.05	Reject H_{02}

Table 4 shows a Pearson correlation coefficient of .59 with a probability value of $p = .001$ between digital literacy and techno-preneurial intentions. Since the probability value is less than the .05 level of significance, the null hypothesis was rejected. Therefore, there is a significant moderate positive relationship between digital literacy and techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State.

Discussion of Findings

The first finding revealed a significant strong positive relationship between ICT competence and techno-preneurial intentions among final-year undergraduate Business Education students. This indicates that students with stronger competencies in the use of computers, software applications, internet facilities and other ICT tools tend to demonstrate stronger intentions to pursue technology-driven entrepreneurial activities. The finding supports Nambisan (2017), who established that digital technologies have transformed entrepreneurial processes and created new opportunities for entrepreneurial activities. It also corroborates Enang (2023), who emphasized the importance of digital entrepreneurial skills and competencies in preparing Business Education students to remain relevant in the digital era. The finding further supports Ordu and Onyemekara (2023), who reported a positive relationship between digital resource development and self-employability skills among Business Education students in Rivers State.

The second finding showed a significant moderate positive relationship between digital literacy and techno-preneurial intentions. This suggests that students capable of accessing, evaluating, creating and communicating digital information tend to demonstrate greater readiness to engage in technology-driven entrepreneurship. The finding is consistent with van Laar et al. (2020), who identified information, communication, creativity and problem-solving as important digital competencies for contemporary work environments. It also supports Vuorikari et al. (2022), who emphasized information and data literacy, digital content creation and problem-solving as important areas of digital competence. Thus, strengthening digital literacy may enhance students' preparedness to identify and exploit digital entrepreneurial opportunities.

Conclusion

The study concluded that digital skills acquisition is positively associated with techno-preneurial intentions among final-year undergraduate Business Education students in Rivers State. ICT competence had a significant strong positive relationship with techno-preneurial intentions, while digital literacy had a significant moderate positive relationship. Consequently, strengthening students' practical digital competencies is important for preparing Business Education graduates to identify and pursue technology-driven entrepreneurial opportunities in the contemporary digital economy.

Recommendations

Based on the findings, the following recommendations were made:

1. Business Education lecturers should intensify practical ICT-based learning activities involving relevant software, internet technologies and digital business platforms to strengthen students' readiness for technology-driven entrepreneurship.
2. Business Education departments should integrate practical digital literacy activities involving information evaluation, digital content creation, online communication and digital business applications into entrepreneurship courses to strengthen students' techno-preneurial intentions.

Abstract

The role of trade finance and financial literacy in enhancing SMEs performance in emerging economies is highly significant as these firms constitute the backbone of economic growth, employment creation, and poverty reduction. The main objective of this study is to examine the role of trade finance, financial literacy and SMEs performance in emerging economy, Nigeria. This study adopted cross-sectional research design and quantitative research method. The population of this study was 170,098 MSMEs and a sample size of 399 was obtained through Taro Yamane formula. A questionnaire was adapted and administered to 399 respondents of which 388 respondents filled the questionnaire and the response rate was (97%) which were used for data analysis. Purpose sampling technique was applied and the data collected were analyzed using Partial Least Square Structural Equation Modeling (PLS-SEM) with the aid of SmartPLS application software package v. 4.1.1.4. Trade finance had a significant effect on SMEs performance, trade finance had a significant effect on financial literacy, financial literacy had a significant effect on SMEs performance, financial literacy had a significant mediating effect on trade finance and SMEs performance. Policymakers and financial institutions should simplify requirements and reduce collateral constraints to enable more SMEs to access trade finance. Trade finance support should be complemented with structured financial literacy training to maximize the benefits of financing on performance. Governments, banks, and SME associations should collaborate to provide continuous workshops on budgeting, investment decisions, and risk management. Regulators should create incentives (tax rebates or lower interest rates) for SMEs that participate in financial literacy programs tied to trade finance.

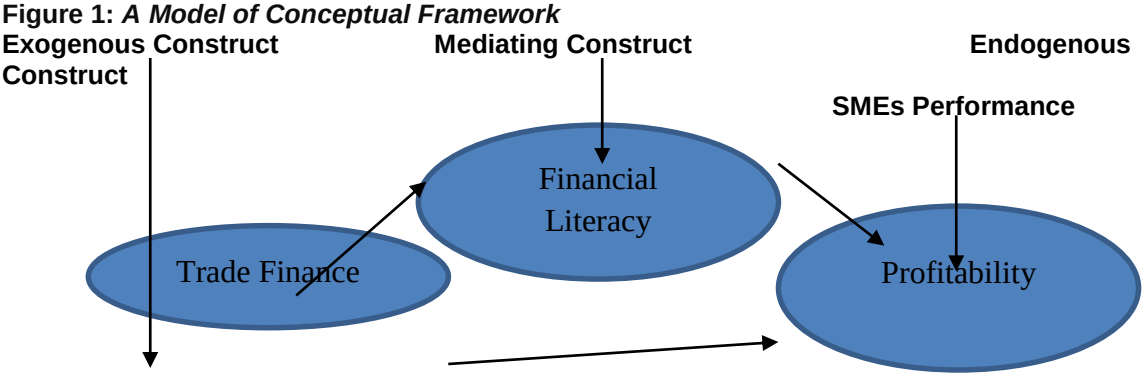
Keywords: ***Trade Finance, Financial Literacy, SMEs Performance***

Introduction

Small and Medium Scale Enterprises (SMEs) play significant role in the economic growth in developed countries, developing and emerging economies. Governments all over the globe are paying deliberate and great attention to SMEs with special emphasis on their sustainability. This is because efforts expended on the establishment and development of large scale industries tends to contradict expectations and predictions as they have not succeeded in improving the socio-economic wellbeing of the people. Consequently, SMEs are now viewed and treated as agents of equitable economic development (Memba *et al.,* 2020). It is based on the contributions of SMEs to the economic development of Nigeria, that various political and military administrations have promoted several initiatives aimed at stimulating the growth and development of the SME sector in the country.

Improving the lives of people in emerging markets is the primary goal within business, and financing is the tool to reach this objective. Without financing, businesses cannot innovate, expand, or spread ideas and products. It is important to keep these SMEs alive because they are change-makers in the global

economy. Trade finance exists when one business extends some form of credit to a business partner during a trade which is determined by the payment schedule. This approach may provide a sustainable solution to a company which lies within a country with economic distress because trade will continue internationally when importers and exporters develop new payment terms. Trade finance plays a crucial role in supporting the growth SMEs by providing the necessary funding and financial tools to manage and expand trade activities. In Nigeria, where SMEs are pivotal to economic development, trade finance has significant implications for their growth and sustainability (Nwokoro & Chukwuma, 2023).



A growing body of evidence highlights financial literacy as a crucial factor influencing the ability of SMEs to effectively access and utilizes trade finance. Inadequate financial knowledge leads to poor creditworthiness, weak risk management, and limited capacity to negotiate favorable financing terms, thereby undermining SME performance (Okoye *et al.,* 2022). Recent studies show that SMEs with higher financial literacy exhibit up to 30% better financial management practices, positively mediating the relationship between trade finance and firm growth (Abubakar & Bala, 2023). Despite these insights, the interaction between trade finance, financial literacy, and SME performance in emerging economies remains underexplored. This gap justifies the need for empirical research to understand the intervening role of financial literacy in enhancing the performance impact of trade finance among SMEs.

Small and Medium-sized Enterprises (SMEs) are critical drivers of economic growth, contributing over 40% of GDP and accounting for more than 60% of employment in emerging economies (World Bank, 2020). However, despite their importance, SMEs continues to face significant financing gaps estimated at over USD 5.2 trillion annually, limiting their ability to compete globally and enhance performance (International Finance Corporation [IFC], 2021). Trade finance through instruments such as letters of credit, guarantees, and export credit plays a vital role in bridging this financing gap by supporting cross-border transactions and liquidity management. Yet, SMEs in emerging markets often lack adequate access to trade finance compared to larger firms, with less than 20% of SMEs successfully obtaining such facilities (Organisation for Economic Co-operation and Development [OECD], 2022).

Literature Review

Concept Framework

Figure 1: ***A Model of Conceptual Framework***

Source: Researcher's Conceptualization (2025).

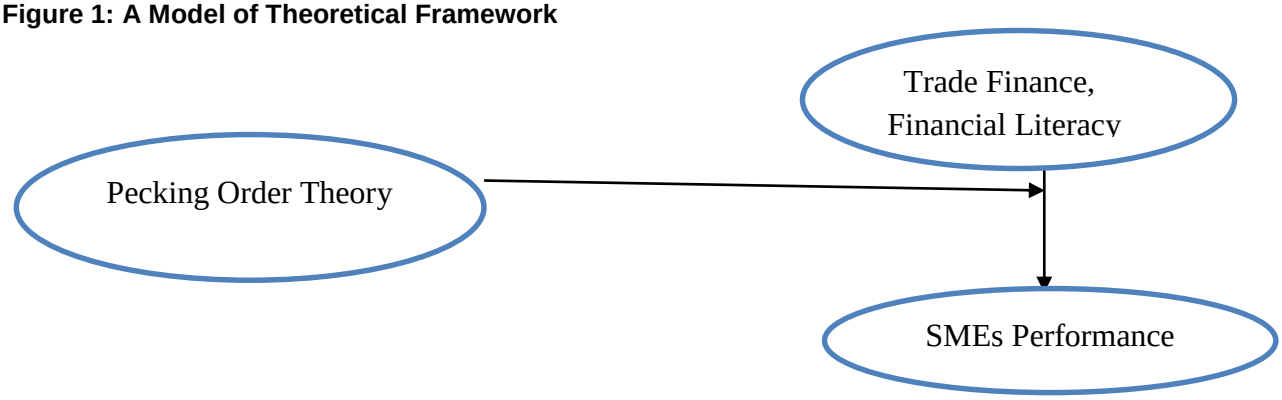
SMEs Performance

Nenfort and Johnpaul (2022) defined SMEs performance is the ability to create acceptable outcomes and actions. Thus, it has to do with how efficient and effective a firm is in carrying out its activities. The performance of SMEs determines the firm's outcome such as profits, sustainability, growth, etc. When SMEs perform at its best, it has a lot of advantage to its stakeholders, that is, owners, customers, suppliers, society and even the government. SMEs performance is measured by profitability**,** which reflects a firm's ability to generate returns relative to its costs and investments. Profitability serves as a direct indicator of financial health and sustainability, as higher profit margins enable SMEs to reinvest in their operations, expand market presence, and enhance competitiveness. According to Aladejebi (2020), profitability is a vital measure of SME performance because it demonstrates both operational efficiency and long-term viability, particularly in resource-constrained environments common in emerging economies. SMEs performance refers to the ability of small and medium-sized enterprises

(SMEs) to achieve their business objectives through indicators such as profitability, growth, market share, innovation, customer satisfaction, and survival rate.

Financial Literacy

Financial literacy consists of various concepts, including financial product knowledge and awareness, financial institutions' understanding and financial skills, and financial planning and management abilities (Seraj *et al.,* 2022). Similarly, individuals with financial literacy can manage their money more effectively, make sound investment decisions, shift their behavior toward saving, and take advantage of newly available financial products and services (Alshebami & Aldhyani, 2022). Financial literacy is the knowledge, skills, and attitudes that enable individuals and businesses to make informed and effective decisions about the use and management of financial resources.



Trade Finance

Miller and Packer (2021) described trade finance as the financial services and products that help businesses manage the complexities of international trade. These include short term and long-term financing options, trade credit insurance, and other tools designed to mitigate risks and ensure the flow of goods and services between international buyers and sellers. The World Bank (2020) defined trade finance as a suite of financial products that facilitate trade transactions by bridging the gap between importers and exporters. This includes various types of credit and insurance instruments that provide the necessary funding and risk management tools to ensure the smooth flow of goods and services across borders. Trade finance is the provision of financial instruments, credit facilities, and banking services that enable businesses to engage in domestic and international trade by mitigating risks, ensuring payment security, and improving liquidity.

Theoretical Framework

This study is underpinned by and Pecking Order Theory.

Figure 1: A Model of Theoretical Framework

Source: Researcher's Theoretical Framework (2025)

This study is anchored on Pecking Order Theory. Pecking Order Theory, proposed by Stewart Myers and Nicolas Majluf in 1984, addresses corporate financing decisions and deals with small business operations. It sheds light on the benefits or incentives that influences small and medium scale enterprises (SMEs) capital structure decisions. This theory assumes that firms prefer the use of their internal sources of capital first before resorting to external sources (such as deposit money banks) in the event that the internal sources are inadequate. In other words, Pecking Order Theory states that firms prefer to finance their operations using internal funds first, followed by debt, and resort to issuing equity only as a last option. The theory emphasizes that firms prioritize their sources of financing based on the costs and risks associated with each. Trade finance provides SMEs with the financial resources to scale their operations. By securing funding for larger orders and investing in. The theory assumes that there is asymmetric information between firm managers and investors. Managers are assumed to have better information about the financial health of the firm and future prospects than external investors. This information imbalance affects the firm's financing decisions.

The Pecking Order Theory heavily relies on the notion of asymmetric information. However, this assumption might not always hold true, as firms may have mechanisms in place to reduce information asymmetry, such as transparent financial reporting and investor relations. The theory undervalues the potential benefits of equity financing, such as reducing financial risk and providing capital for growth without incurring debt obligations. Equity financing can be beneficial in certain situations, but the theory tends to focus more on its costs. In the context of SMEs and trade finance, the Pecking Order Theory provides theoretical explanation of how SMEs manage their financing needs and the impact of initiatives

to support SMEs in accessing trade finance. This includes improving the efficiency of trade finance institutions and increasing the capacity of SMEs to utilize available financial resources effectively.

Empirical Review

Trade Finance and SMEs Performance

Adesunkanmi and Rita (2024) examined trade finance and the growth of Small and Medium Enterprises (SMEs) in Nigeria. The study adopted a qualitative methodology and secondary data sources. The findings of the study showed that trade finance instruments enable SMEs to access working capital and manage cash flow more effectively which helps them to enter new markets, expand their operations, and increase their production capacity. Also, trade finance reduces barriers to international trade for SMEs by providing them with the capital required to participate in profitable cross-border transactions, by facilitating exports and imports, which are crucial for SMEs seeking to diversify their markets and increase their revenue streams. Lastly, the availability of trade finance improves SMEs' relationships with suppliers by enabling them to secure better credit terms and negotiate favorable conditions for improving their performance. Based on the findings, the study concluded that trade finance plays a vital role in promoting and sustaining the growth of small and medium enterprises (SMEs) in Nigeria. It was recommended among others that policymakers and financial institutions should continue to support and develop trade finance mechanisms to empower SMEs, promote economic development, and strengthen Nigeria's position in the global market.

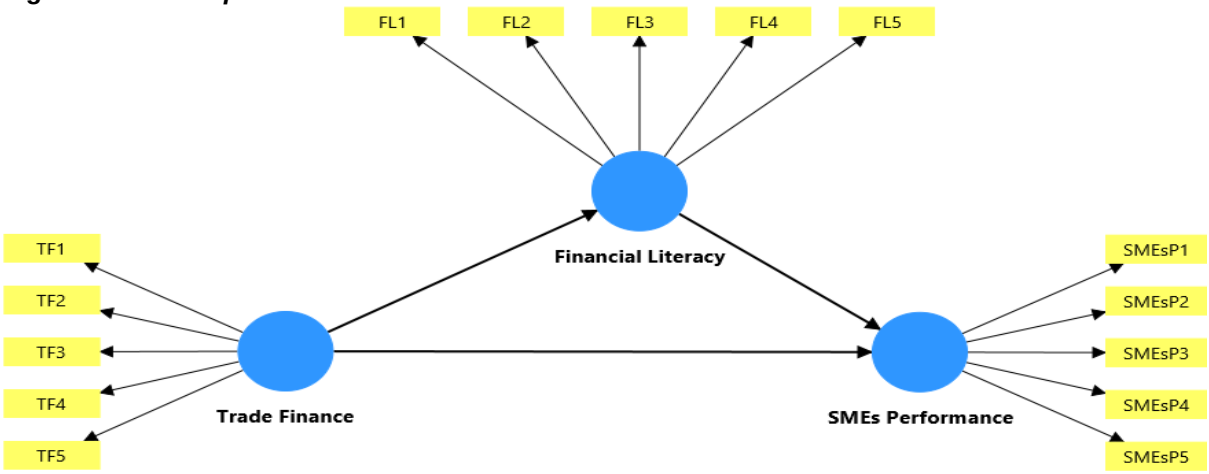
Trade Finance and Financial Literacy

Witts (2024) examined trade financing at CRDB Bank, focusing on costs, awareness, and efficiency among Small and Midsize Enterprises (SME) customers. It evaluates the bank's provision of trade finance products like letters of credit, guarantees, insurance, lines of credit, factoring, and supplier credit, both locally and internationally. Using a case study approach and descriptive research design, the study sampled 130 individuals, with 108 complete responses. Quantitative methods, including questionnaires and data analysis via Excel, chi-square tests, and SPSS for ANOVA, were employed. The researcher sought to understand the challenges customers face in accessing Tanzania's trade finance products and services. The researcher evaluated the relationship between trade finance utilization and SME's performance indicators, such as profitability, export capacity, and market access. According to the study, improving trade finance instruments such as letters of credit, trade credit, and export financing can significantly enable SMEs to engage in international trade. SMEs, that used trade finance, also reported reduced operational and overhead costs, more accessible reach into global markets, and improved cash flow and growth rates. Interest rates, collateral requirements, and little financial literacy are reasons most SMEs lack access to finance. Recommendations are for CRDB Bank to promote training sessions to boost SMEs' understanding of trade finance products and their advantages and introduce more flexible collateral or risk-sharing arrangements. As an important enabler, CRDB Bank contributes toward the growing individual and international competency of Tanzanian SMEs through trade finance.

Financial Literacy and SMEs Performance

Frimpong *et al.* (2022) conducted a study on financial literacy, access to digital finance and performance of SMEs: Evidence from Central region of Ghana. The study employed the quantitative research approach. Using the purposive sampling technique, a total of 400 responses were gathered from SMEs in Cape Coast, Mankessim, Assin Fosu, Agona Swedru, and Kasoa. The study used self-administered questionnaires to collect data. Statistical Package for Social Science was used (SPSS) was employed to evaluate descriptive statistics. Results show that SMEs in the study areas use Mobile Money more than any other digital platform. Partial Least Square-Structural Equation Modeling (PLS-SEM) was used. It was found that financial literacy positively affects access to digital finance. Also, access to digital finance improved performance. Access to digital finance mediates the relationship between financial literacy and SME performance. Access to digital finance is as crucial as financial literacy for increasing performance. Therefore, using digital platforms to trade would boost business performance. Digital trading plat form providers should improve advertising and make their systems user-friendly.

Role of Financial Literacy between Trade Finance and SMEs Performance



Lontchi *et al.* (2023) assessed the mediating effect of financial literacy on fintech and SMEs' performance during COVID-19 recovery in Cameroon. The study collects 381 survey data from SMEs in Yaoundé and Douala, the country's business hub, to determine how these financial technology innovations affect SMEs' business performance. Similarly, the PLS-SEM model was used to test the proposed hypotheses. The study results show that the relationship between fintech and financial literacy was positive and significant. The findings also reveal that fintech had a positive and significant effect on SMEs performance. In addition, the results further indicate that financial literacy positively and significantly mediates the relationship between fintech services and the performance of SMEs.

Therefore, the study concluded that financial literacy is an essential mechanism through which fintech services influence SMEs' operational and financial performance in Cameroon. The study provided a better understanding of how SMEs can improve their performance by leveraging fintech solutions through financial literacy.

Methodology

A cross-sectional research design was adopted. This study employed quantitative. The units of analysis are managers of the SMEs at the firm level. The population of this study was made up of 170,098 SMEs in Nigeria (NBS report, 2022). The sampling technique that was used in this study is purposive sampling technique. The sample for this study 399 which was determined using Taro Yamane (1987) formula, $n = N/1+Ne^2$, Where: n = The Sample size N = the population of the study e = level of significance (0.05)
n= 170,098/ 1+ 170,098 (0.05 x 0.05)
n=170,098 / 426.245
n= 399
Primary data was obtained directly from the respondents. The structured questionnaires are designed to address the purpose of this study. The variables for this study were measured using a five-point Likert-Scale viz: 1-Strongly Disagree (SD), 2-Disagree (D), 3-Neutral (N), 4-Agree (A), 5-Strongly Agree (SA). A five-point Likert-Scale provides a straightforward way for respondents to express their opinions, attitudes, or behaviours which can be easily analysed using Partial Least Square Structural Equation Model (PLS-SEM) statistical methods. Partial Least Square Structural Equation Model was used to analyse direct and indirect relationship. Partial Least Square Structural Equation Model is a non-parametric method that does not require that the data meet certain distributional assumptions and PLS-SEM is comprise of measurement and structural model. Partial Least Square Structural Equation Modeling (PLS-SEM) is made up of measurement model or outer model which show the relationship between constructs and their indicators such as construct reliability and validity such as composite reliability, convergent validity, discriminant validity using Fornell and Lacker Criterion and structural model described the relationship between latent variables in order to predict the expected outcome for hypothesis testing includes path coefficient using probability (p-value), coefficient of determination (R^2), Variance Inflation Factor (VIF), predictive relevance (Q^2) and model fit. This study makes used of SmartPLS application software package v. 4.1.1.2.

Figure 2: *Model Specification*

Source: *SmartPLS Output Version (v) 4.1.1.4*

A model specification in Figure 2 showing the direct relationship between the study variables. Where: TF = Trade Finance, FL = Financial Literacy and SMEsP = Small and Medium Scale Enterprise Performance. This study tested the research hypotheses by rejecting the null hypothesis (HO) when p-value < 0.05 significance level and failing to reject the null hypotheses (HO) when p-value > 0.05 significance level.

Data Analysis and Results

Table 1: Internal Consistency and Convergent Validity Report

Latent Constructs	Indicators	Factor Loadings	Composite reliability (rho_c)	Average variance extracted (AVE)
Financial Literacy	FL2	0.723	0.807	0.584
	FL3	0.821		
	FL5	0.745		
SMEs Performance	SMEsP1	0.725	0.861	0.608
	SMEsP2	0.787		
	SMEsP3	0.795		
	SMEsP5	0.810		
Trade Finance	TF1	0.877	0.898	0.688
	TF2	0.877		
	TF4	0.761		
	TF5	0.796		

Source: *SmartPLS v. 4.1.1.4 Output (2025)* **Key: FL–Financial Literacy; SMEsP-Small and Medium Enterprise Performance, TF- Trade Finance**

Criteria: FL, FL4, SMEsP4 and TF3 were deleted because they failed on factor loadings less than 0.708 (Hair *et al.,* 2020). The result of this study in Table 1 showed that Composite reliability (CR) was > 0.7 and AVE was > 0.5. According to Hair *et al.* (2020), the CR values should be at least 0.7, AVE should be greater than 0.5.

Table 2: Discriminant Validity using Fornell-Larcker criterion

Constructs	1	2	3
1. Financial Literacy	**0.764**		
2. SMEs Performance	0.552	**0.78**	
3. Trade Finance	0.548	0.455	**0.829**

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

Discriminant validity was established among constructs at a point where the squared AVE in the diagonal in Table 2 is greater is higher than the correlation with other constructs.

Table 3: Coefficient of Determination (R^2)

Constructs	R^2	R-square adjusted
Financial Literacy	0.30	0.298
SMEs Performance	0.338	0.335

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

The results in Table 3 revealed that coefficient of determination (R^2) values of 30.0% and 33.8% variance in financial literacy and SMEs performance respectively is explained by trade finance.

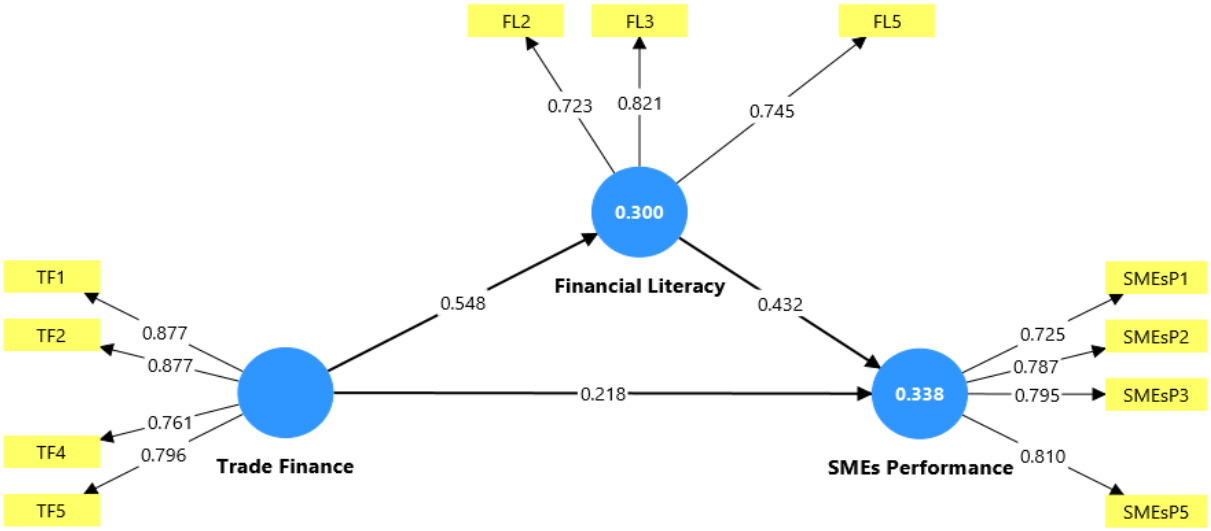


Table 4: Collinearity Statistics- Variance Inflation Factor (VIF)

Constructs	Variance Inflation Factor (VIF)
Financial Literacy	1.429
Trade Finance	1.429

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

There is no multicollinearity in the data analysis of statistics as VIF scores in Table 4 were well below 3.3 (Statistics = 1.429 and 1.429) for financial literacy and SMEs performance respectively.

Figure 3: *Structural Model Path Analysis*

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

Factor loading show how well an item represents the underlying construct. According to Hair *et al.* (2020) indicators loading must be at least 0.708. Figure 3 showed the retained indicators of three constructs of trade finance, financial literacy and SMEs performance.

Table 5: Assessing Path Coefficient and Hypotheses Testing for Direct Relationship

Research Hypotheses	Path Relationship	B	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	Decision
HO1	Trade Finance -> SMEs Performance	0.218	0.218	0.06	3.655	0.000	Reject the null Hyp.
HO2	Trade Finance -> Financial Literacy	0.548	0.55	0.04	13.787	0.000	Reject the null Hyp.
HO3	Financial Literacy -> SMEs Performance	0.432	0.436	0.052	8.25	0.000	Reject the null Hyp.

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

Discussion of Findings

A bootstrapping command was carried out and the result displayed the path coefficient and the p-value in Table 5 based on the direct relationships on two-tailed tests at 95% level of significance as postulated in the hypotheses. The results showed that there is a positive and significant relationship between trade finance and SMEs performance because the p-value of 0.000 was less than threshold of 0.05 and had the least contribution with Beta value of 0.218. This study is consistent with the study conducted by Adesunkanmi and Rita (2024). Trade finance plays a vital role in promoting and sustaining the growth of small and medium enterprises (SMEs) in Nigeria.

Trade finance revealed a positive and significant effect on financial literacy because the p-value of 0.000 less than the threshold of 0.05 and had the highest contrition with Beta value of 0.548. This study is in tandem with the study conducted by Witts (2024). Findings revealed that improving trade finance instruments such as letters of credit, trade credit, and export financing can significantly enable SMEs to engage in international trade.

Financial literacy revealed a positive and significant effect on SMEs performance because the p-value of 0.000 less than the threshold of 0.05 and had moderate contribution with Beta value of 0.432. This study agreed with the study conducted by Frimpong *et al.* (2022). The found that financial literacy positively affects access to digital finance. Also, access to digital finance improved performance.

Table 6: Assessing Path Coefficient and Hypotheses Testing for Specific Indirect Effect

Research Hypotheses	Path Relationship	B	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	Decision
HO4	Trade Finance -> Financial Literacy -> SMEs Performance	0.237	0.24	0.036	6.647	0.000	Reject the null Hyp.

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

The results in Table 6 showed that there is a positive and significant relationship between autonomy and performance of poultry farmers because the p-value of 0.000 was found to be less than threshold of 0.05. This study is consistent with the study conducted by Lontchi *et al.* (2023). The results further indicate that financial literacy positively and significantly mediates the relationship between fintech services and the performance of SMEs.

Table 7: Predictive Relevance (Q^2)

Constructs	Q^2predict	RMSE	MAE
Financial Literacy	0.593	0.846	0.673
SMEs Performance	0.520	0.9	0.706

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

Table 7 revealed that that there is predictive relevance because Q^2 value of 0.593 for financial literacy and 0.520 SMEs performance is > 0.5 respectively. A higher Q^2 indicates better predictive accuracy of the model.

Table 8: Model Fit

Fit Indices	Saturated model	Estimated model
SRMR	0.075	0.075
d_ULS	0.504	0.504
d_G	0.17	0.17
Chi-square	397.52	397.52
NFI	0.77	0.77

Source: *SmartPLS v. 4.1.1.4 Output (2025)*

Table 8 showed the result of the model goodness of fit. This study used the standardized root mean square residuals (SRMR). The choice of this index was based on the fact that the SRMR provides the absolute fit measure where a value of zero indicates a perfect fit. The study result indicates an SRMR value of 0.075 which is less than 0.08,

Conclusion and Recommendations

The study established that trade finance significantly enhances SMEs performance and also improves financial literacy among SMEs operators. Financial literacy itself is a strong determinant of SMEs performance, and importantly, it mediates the relationship between trade finance and performance. This implies that while access to trade finance boosts performance directly, its impact is strengthened when SMEs possess higher levels of financial literacy. Policymakers and financial institutions should simplify requirements and reduce collateral constraints to enable more SMEs to access trade finance. Trade finance support should be complemented with structured financial literacy training to maximize the benefits of financing on performance. Governments, banks, and SME associations should collaborate to provide continuous workshops on budgeting, investment decisions, and risk management. Regulators should create incentives (tax rebates or lower interest rates) for SMEs that participate in financial literacy programs tied to trade finance.

DEPARTMENT OF BUSINESS ADMINISTRATION,
FEDERAL COLLEGE OF EDUCATION, ILAWE- EKITI
Email: akinwonmiod@fceilawe.edu.ng, akinwonmidebby@gmail.com
Telephone: +2348036325893

Abstract

The study examined the digital and entrepreneurial competencies required to make Business Education relevant in the digital age. The study adopted a descriptive survey research design. The population comprised 50 respondents, consisting of 30 Business Education students and 20 Business Education lecturers drawn from three tertiary institutions within the geographical area of the study. The entire population was used for the study through a census sampling technique. Two structured questionnaires—Digital and Entrepreneurial Competencies Questionnaire for Students (DECQS) and Digital and Entrepreneurial Competencies Questionnaire for Lecturers (DECQL)—were developed for data collection. The instruments were validated by experts in Business Education and educational measurement and evaluation. Their reliability will be established using Cronbach's alpha. Data collected will be analysed using mean and standard deviation to answer the research questions, while appropriate inferential statistics may be used to test the hypotheses at the 0.05 level of significance. The study is expected to identify the digital and entrepreneurial competencies possessed by Business Education students, the competencies considered important by lecturers, and the areas of deficiency requiring curriculum improvement. The findings will provide useful information for strengthening Business Education through practical digital training, entrepreneurship education, technology-supported instruction, and improved employability preparation.
Keywords:*Digital age, digital competencies, entrepreneurial competencies.*

Introduction

The world of work is changing rapidly because of digital technology. Computers, smartphones, cloud services, artificial intelligence, digital communication, electronic payment systems, e-commerce and social media have become important parts of modern business activities. These changes have also increased the skills required from graduates. Employers and business owners now need graduates who can use digital tools, solve problems, communicate effectively, manage information and identify business opportunities. The World Bank (2022) noted that digital skills can improve young people's employment opportunities and participation in Africa's digital economy. Similarly, the African Development Bank (2022) identified skills development and digital transformation as important for improving the employability and productivity of African youth.

The growth of the digital economy has created new opportunities for employment and entrepreneurship in Africa. Digital technologies enable young people to market products, communicate with customers, provide services and operate businesses beyond their immediate physical environment. However, access to technology alone is not enough. The World Bank (2023) observed that people also need appropriate skills to use digital technologies productively. Tertiary institutions therefore have an important responsibility to prepare students with practical digital competencies that can be applied in real workplace and business situations.

Nigeria is also experiencing rapid digital transformation. The Federal Government has continued to promote digital skills as part of its economic development efforts. The National Information Technology Development Agency (NITDA, 2023), through the National Digital Literacy Framework, identified areas such as device and software operation, information and data literacy, digital content creation, communication and collaboration, digital safety and problem solving as important digital competencies. These competencies are relevant to tertiary education because students need them to participate effectively in modern workplaces and business activities. The Federal Government has also

emphasised skills development, digital innovation and employability among Nigerian youth (State House, 2023, 2024).

Business Education has an important role in responding to these changes. The programme is designed to equip learners with knowledge and skills for office work, business management, entrepreneurship and employment. However, many business activities have become digital. Accounting now involves accounting software and electronic financial records, while marketing increasingly depends on social media, digital advertising and e-commerce platforms. Consequently, Business Education must move beyond traditional knowledge and provide students with practical digital and entrepreneurial competencies relevant to the contemporary workplace.

Recent studies in Nigeria have identified gaps in the digital competencies of Business Education students and graduates. Amesi and Allison (2022) reported that digital skills acquired by university Business Education students were important for employability. Akudolu and Onyeneke (2022) found that Business Education graduates had moderate digital foundation skills but low digital communication and cloud computing skills. Uzoka and Okoli (2022) also identified gaps in digital accounting, digital marketing, and information and data skills required by employers. These findings raise concerns about the preparedness of Business Education graduates for the digital workplace.

More recent studies have continued to show the need for improvement. Okonkwo and Agwazie (2024) found low levels of e-entrepreneurship and cybersecurity skills among Business Education graduates in Anambra State. David et al. (2024) also reported a significant relationship between digitalisation of skills acquisition, the integration of digital learning tools and the employability of Business Education graduates in Lagos State. Edeh and Olupayimo (2023) further examined the delivery of Business Education for skills acquisition in the digital era in Ondo State. These findings suggest that Business Education programmes need to continuously adjust to changes in technology and the workplace.

Entrepreneurial competencies are equally important because the digital economy creates opportunities not only for paid employment but also for self-employment and business creation. Business Education students need to identify business opportunities, develop business ideas, market products, communicate with customers, manage finances and use technology to support business operations. Abdulkarim and Danagogo (2023) found a relationship between entrepreneurial competencies developed by Business Education students and their intention to become self-employed. David and Emmanuel (2025) also identified managerial, information and communication technology, and marketing skills as important entrepreneurial competencies for Business Education students interested in establishing small businesses in Lagos State.

The need for digital and entrepreneurial skills is not limited to Nigeria. The African Development Bank (2024) emphasised the growing importance of digital skills for employment and economic participation across Africa, while UNESCO IIEP (2022) highlighted the need for digital transformation and skills development to prepare young people for changing labour markets. Mordi (2023) also identified digital accounting, e-commerce, e-payment, digital marketing and social media marketing as important competencies required by Business Education graduates for employability.

The issue, therefore, is not whether Business Education remains relevant, but whether its content and delivery are changing fast enough to meet the demands of the digital economy. Business Education students need practical competencies in digital communication, digital marketing, electronic payment, data management, office productivity tools, e-commerce, cybersecurity, entrepreneurship, problem solving and innovation. Developing these competencies can improve their employability and prepare them for self-employment and business creation.

It is against this background that this study examines the digital and entrepreneurial competencies required to make Business Education relevant in the digital age. The study focuses on the competencies possessed by Business Education students, the competencies considered important by lecturers, and areas of deficiency that may require curriculum improvement. The study is based on the view that relevant Business Education should connect classroom learning with the realities of the modern workplace and digital business environment.

Statement of the Problem

The rapid growth of digital technology has changed employment, business and entrepreneurship. Employers now require graduates to possess practical digital skills in addition to academic qualifications. However, a gap remains between the digital competencies required in the economy and those possessed by many young people in Africa. The World Bank (2025) noted that inadequate digital skills and limited access to appropriate learning opportunities may exclude many young Africans from the digital economy.

Nigeria faces a similar challenge. Although the country promotes digital transformation and literacy, relevant skills development remains a concern (NITDA, 2023; State House, 2024). This problem is

important to Business Education because the programme is expected to prepare students for employment and self-employment. Studies have identified gaps in digital communication, cloud computing, digital accounting, digital marketing, information management, e-entrepreneurship and cybersecurity among Business Education students and graduates (Akudolu & Onyeneke, 2022; Uzoka & Okoli, 2022; Okonkwo & Agwazie, 2024).

The problem, therefore, is whether the digital and entrepreneurial competencies developed through Business Education are adequate for current workplace and business demands. This study consequently examines the competencies possessed by students, those considered important by lecturers, and areas requiring curriculum improvement.

Research Questions

1. What is the extent to which Business Education students possess digital competencies required for employment and entrepreneurship in the digital age?
2. What is the extent to which Business Education students possess entrepreneurial competencies required for employment, self-employment, and business creation?
3. What strategies can be adopted by tertiary institutions to improve the development of digital and entrepreneurial competencies among Business Education students?

Purpose of the Study

The main purpose of the study is to examine the digital and entrepreneurial competencies needed to make Business Education relevant in the digital age.

Specifically, the study seeks to:

1. determine the level of digital competencies possessed by Business Education students in tertiary institutions;
2. determine the level of entrepreneurial competencies possessed by Business Education students in tertiary institutions;
3. identify the digital competencies considered important by Business Education lecturers for students' employability and career development;
4. identify the entrepreneurial competencies considered important by Business Education lecturers for self-employment and business development; and
5. identify areas of digital and entrepreneurial competency gaps that may require improvement in the Business Education curriculum.

Significance of the Study

The findings of this study will be useful to Business Education students by helping them identify the digital and entrepreneurial competencies needed for employment, self employment and effective participation in the digital economy. It will also help Business Education lecturers identify skill gaps and improve their teaching methods, digital tools and practical learning activities.

The study will benefit curriculum planners and programme developers by providing evidence for reviewing Business Education curricula to include relevant competencies in digital marketing, e-commerce, data management, cybersecurity, digital communication and entrepreneurship. This aligns with Nigeria's emphasis on digital literacy and skills development (NITDA, 2023; State House, 2024).

Tertiary institutions may use the findings to improve digital facilities, entrepreneurship programmes and industry partnerships that support practical skills development. Employers and business organisations may also benefit from better understanding the competencies required of Business Education graduates, thereby supporting improved graduate employability.

Finally, the findings will assist government agencies, policymakers and researchers in developing policies and further studies on digital skills, entrepreneurship, curriculum relevance and employability among Business Education graduates.

Literature Review

Digital competence has become an important requirement for education, employment and entrepreneurship because many workplace and business activities now depend on digital technologies. The World Bank (2023) reported that digital technologies are creating new opportunities for jobs and businesses in Africa, but access to technology must be supported by appropriate digital skills. UNESCO IIEP (2022) similarly noted that digital transformation of education and skills systems in Africa is necessary to prepare young people for changing employment opportunities. These developments have important implications for Business Education because the programme is expected to prepare students for employment, self-employment and effective participation in business activities.

In Nigeria, the National Information Technology Development Agency (NITDA, 2023) identified device and software operation, information and data literacy, communication and collaboration, digital content

creation, digital safety and problem-solving as important areas of digital literacy. These competencies are relevant to Business Education because graduates are expected to work in offices and businesses where digital tools are increasingly used for communication, record keeping, marketing, accounting and other business activities. Therefore, Business Education programmes need to provide students with practical digital skills that reflect current workplace requirements.

Evidence from Nigerian studies indicates that gaps still exist in the digital competencies of Business Education students and graduates. Akudolu and Onyeneke (2022) found that Business Education graduates possessed digital foundation skills to a moderate extent, while their digital communication and cloud computing skills were low. Enang (2023) also observed that inadequate digital entrepreneurial competencies can reduce the effectiveness and competitiveness of Business Education students in the digital economy and recommended the integration of digital entrepreneurial competencies into the Business Education curriculum. Similarly, a study of Business Education students in Lagos State found that students required further development in digital marketing and e-content writing to effectively explore e-commerce opportunities (Nigerian Online Journal of Educational Sciences and Technology, 2023).

The importance of digital skills to graduate employability has also been demonstrated in recent Nigerian research. David et al. (2024) found a significant relationship between digitalisation of skills acquisition, the integration of digital learning tools and the employability of Business Education graduates in Lagos State. The researchers reported that graduates with digital skills were better positioned to compete in the labour market, explore entrepreneurial opportunities and perform efficiently at work. These findings suggest that digitalisation should not be treated as an additional component of Business Education but as an important part of skills development.

Entrepreneurial competencies are equally important to the relevance of Business Education in the digital age. Entrepreneurial competencies include the ability to identify opportunities, develop business ideas, solve problems, manage resources, communicate with customers and create value. In the digital economy, these competencies increasingly require the ability to use technology for marketing, communication, electronic payments, e-commerce and other business activities. Enang (2023) argued that Business Education students need digital entrepreneurial skills and competencies to remain relevant in the changing business environment. The author recommended that digital entrepreneurial competencies should be integrated into Business Education curricula so that graduates can become self-reliant and create employment opportunities.

Recent evidence from Nigeria further supports this position. The Nigerian Online Journal of Educational Sciences and Technology (2023) reported that Business Education students needed additional training in digital marketing and e-content writing to improve their ability to explore e-commerce opportunities. David et al. (2024) also established that digital skills acquisition and the use of digital learning tools were related to the employability of Business Education graduates. These findings indicate that entrepreneurial preparation should combine conventional business knowledge with practical digital skills.

The literature therefore shows that Business Education remains relevant, but its content and delivery need to respond continuously to technological and economic changes. Digital communication, digital marketing, e-commerce, electronic payment, data management, office productivity tools, cybersecurity and digital entrepreneurship are increasingly important to graduates. However, the studies reviewed have largely examined digital skills, entrepreneurial competencies or employability separately. There is limited evidence that considers digital and entrepreneurial competencies together from the perspectives of both Business Education students and lecturers. The present study addresses this gap by examining the digital and entrepreneurial competencies possessed by Business Education students, the competencies considered important by lecturers, and areas requiring curriculum improvement. Such evidence can support the development of a more practical, relevant and employment-oriented Business Education programme for the digital age.

METHODOLOGY

Research Design

This study adopts a descriptive survey research design. The design is considered appropriate because the study seeks to obtain information from Business Education lecturers and students on the digital and entrepreneurial competencies needed to make Business Education relevant in the digital age. The design will enable the researcher to collect data on the competencies possessed by students and the competencies considered important by lecturers.

Population of the Study

The population of the study consist of 50 respondents drawn from Business Education programmes in selected tertiary institutions in the study area. The population comprise 20 Business Education lecturers

and 30 Business Education students. The lecturers provided information based on their knowledge and experience of the competencies required for effective performance in the digital workplace, while the students provided information on the competencies they have acquired through their Business Education programme.

Sample and Sampling Technique

The study used the entire population of 50 respondents as the sample. This will comprise 20 Business Education lecturers and 30 Business Education students. A census sampling technique will be adopted because the population is small and manageable.

Instrument for Data Collection

The instrument for data collection is a structured questionnaire titled Digital and Entrepreneurial Competencies Questionnaire (DECQ). The questionnaire is divided into sections to obtain information on the digital and entrepreneurial competencies relevant to Business Education in the digital age. The items cover areas such as digital communication, office productivity tools, digital marketing, e-commerce, electronic payment, data management, cybersecurity, problem-solving, opportunity identification, innovation, business planning and resource management.

Also, the questionnaire is structured on a four-point rating scale. Respondents are to indicate the extent to which they possess or consider each competency important. The four-point scale will help the researcher obtain clear responses without providing a neutral option.

Validity of the Instrument

The questionnaire was subjected to face and content validation by experts in Business Education and Educational Measurement and Evaluation. The experts examined the instrument to determine whether the items are clear, relevant and adequate for measuring the digital and entrepreneurial competencies covered by the study. Their suggestions was used to revise the questionnaire before the final administration.

Reliability of the Instrument

The reliability of the questionnaire was determined using Cronbach's Alpha reliability method. The questionnaire was administered to respondents who are similar to, but will not form part of, the study population. The responses obtained was analysed to determine the internal consistency of the instrument. A reliability coefficient of **0.70 or above**was considered acceptable for the study.

Method of Data Collection

The researcher will administer the e-questionnaires on the 50 respondents. The purpose of the study was explained to the respondents, and they were given adequate time to complete the questionnaire..

Method of Data Analysis

Data collected from the study was analysed using mean and standard deviation to answer the research questions. The mean was used to determine the extent to which the identified digital and entrepreneurial competencies are possessed or considered important, while the standard deviation showed the level of variation in the respondents' responses.

Results

Research Question 1: What is the extent to which Business Education students possess digital competencies required for employment and entrepreneurship in the digital age?

Table I: Response on extent to which Business Education students possess digital competencies required for employment and entrepreneurship in the digital age

S/N	Item	VHE	HE	LE	VLE	Mean	SD	Remark
1	What is the extent to which Business Education students possess basic computer-operation competencies?	15	13	8	1	3.14	0.84	High Extent
2	What is the extent to which Business Education students possess word-processing, spreadsheet, and presentation competencies?	12	19	6	0	3.16	0.68	High Extent
3	3. What is the extent to which Business Education students possess internet-searching, email, and online communication competencies?	12	16	9	0	3.08	0.76	High Extent
4	4. What is the extent to which Business Education students possess cloud-computing, cybersecurity, and digital-information-management competencies?	13	13	8	1	3.09	0.85	High Extent
5	5. What is the extent to which Business Education students possess digital marketing, electronic-commerce, online payment, and digital customer-service competencies?	18	13	6	0	3.22	0.75	High Extent
	Grand Mean					**3.14**	**0.78**	

Source: Field work, 2026

Table I indicate that Business Education students possess the digital competencies required for employment and entrepreneurship to a high extent, as shown by the grand mean of 3.14 and standard deviation of 0.78. All five competencies recorded mean scores above the criterion mean of 2.50, indicating that the students generally possess the identified digital skills. Digital marketing, electronic commerce, online payment and digital customer service recorded the highest mean of 3.22, suggesting that students are relatively strong in using digital tools for business-related activities. Internet searching, email and online communication recorded the lowest mean of 3.08, although this was still rated high. The standard deviations, ranging from 0.68 to 0.85, indicate reasonable agreement among the respondents. The inference is that Business Education students have a good foundation in digital competencies that can support their participation in modern employment and entrepreneurial activities.

Research Question 2: What is the extent to which Business Education students possess entrepreneurial competencies required for employment, self-employment, and business creation?

Table II: Response on extent to which Business Education students possess entrepreneurial competencies required for employment, self-employment, and business creation

S/N	Item	VHE	HE	LE	VLE	Mean	SD	Remark
1	What is the extent to which Business Education students possess opportunity-recognition and business-idea-generation competencies?	14	14	7	0	3.20	0.76	High Extent
2	What is the extent to which Business Education students possess business-planning and feasibility-study competencies?	18	11	6	0	3.34	0.76	High Extent
3	What is the extent to which Business Education students possess financial-management and record-keeping competencies?	14	13	7	1	3.14	0.85	High Extent
4	What is the extent to which Business Education students possess marketing, customer-management, and negotiation competencies?	13	16	6	1	3.14	0.80	High Extent
5	What is the extent to which Business Education students possess creativity, innovation, risk-management, decision-making, and adaptability competencies?	15	15	5	0	3.29	0.71	High Extent
	Grand Mean					**3.22**	**0.78**	

Source: Field work, 2026

Inference from table II showed that Business Education students possess entrepreneurial competencies to a high extent, with a grand mean of 3.22 and standard deviation of 0.78. All five competency areas recorded mean scores above 2.50. Business planning and feasibility-study competencies had the highest mean of 3.34, indicating that students are particularly strong in planning and assessing business opportunities. Creativity, innovation, risk management, decision-making and adaptability also recorded a high mean of 3.29. Financial management, record keeping, marketing, customer management and negotiation recorded the lowest means of 3.14, but these were still rated high. The standard deviations, ranging from 0.71 to 0.85, show relatively consistent responses. The inference is that the students possess important entrepreneurial skills that can support employment, self-employment and business creation.

Research Question 3: What strategies can be adopted by tertiary institutions to improve the development of digital and entrepreneurial competencies among Business Education students?

Table III: Response on strategies can be adopted by tertiary institutions to improve the development of digital and entrepreneurial competencies among Business Education students

S/N	Item	VHE	HE	LE	VLE	Mean	SD	Remark
1	To what extent can curriculum review and integration of emerging technologies improve students' digital and entrepreneurial competencies?	14	21	2	0	3.32	0.58	High Extent

2	o what extent can practical digital marketing, electronic-commerce, and business-development projects improve students' competencies?	10	24	2	1	3.16	0.65	High Extent
3	To what extent can improved ICT infrastructure and access to digital learning resources enhance students' competency development?	14	18	4	1	3.22	0.75	High Extent
4	To what extent can lecturer capacity-building and professional development improve the teaching of digital and entrepreneurial competencies?	13	19	4	1	3.19	0.74	High Extent
5	To what extent can industry collaboration, mentoring, incubation programmes, and strengthened industrial training improve students' employability and entrepreneurial readiness?	16	19	3	0	3.34	0.63	High Extent
	Grand Mean					**3.25**	**0.67**	

Source: Field work, 2026

Responses from Table III indicate that all the proposed strategies can improve the development of digital and entrepreneurial competencies among Business Education students to a high extent. The grand mean of 3.25 and standard deviation of 0.67 support this conclusion. Industry collaboration, mentoring, incubation programmes and strengthened industrial training recorded the highest mean of 3.34, showing that practical exposure is considered particularly important. Curriculum review and integration of emerging technologies followed closely with a mean of 3.32. Improved ICT infrastructure and digital learning resources, lecturer capacity-building, and practical digital marketing and e-commerce projects also recorded high mean scores. The relatively low standard deviations (0.58–0.75) indicate strong agreement among respondents. The inference is that practical training, updated curriculum, adequate ICT facilities, competent lecturers and stronger links with industry are important strategies for improving students' digital and entrepreneurial competencies.

Discussion of Findings

The finding for Research Question One shows that Business Education students possess digital competencies to a high extent, with a grand mean of 3.14 and standard deviation of 0.78. All five competencies recorded high mean scores, ranging from 3.08 to 3.22. Digital marketing, electronic commerce, online payment and digital customer service had the highest mean (3.22), while internet searching, email and online communication had the lowest mean (3.08). This finding suggests that the students have acquired useful digital skills that can support employment and entrepreneurship. The finding agrees with the National Information Technology Development Agency (NITDA, 2023), which identified computer operation, communication, information management, safety and problem-solving as important areas of digital literacy. However, Akudolu and Onyeneke (2022) found that Business Education graduates possessed some digital skills only to a moderate extent, while digital communication and cloud-computing skills were low. The difference may suggest that students are gradually developing stronger digital competencies as institutions increasingly integrate technology into Business Education.

For Research Question Two, the findings show that students possess entrepreneurial competencies to a high extent, with a grand mean of 3.22 and standard deviation of 0.78. Business planning and feasibility-study competency recorded the highest mean (3.34), followed by creativity, innovation, risk management, decision-making and adaptability (3.29). These results indicate that the students have competencies that can support both employment and self-employment. The finding agrees with Enang (2023), who emphasized that Business Education students need digital entrepreneurial competencies to remain relevant and become self-reliant in the digital economy. It also supports David et al. (2024),

who found that digital skills acquisition and the use of digital learning tools were significantly related to the employability of Business Education graduates.

The finding for Research Question Three shows that the identified strategies can improve students' digital and entrepreneurial competencies to a high extent, with a grand mean of 3.25 and standard deviation of 0.67. Industry collaboration, mentoring, incubation programmes and stronger industrial training recorded the highest mean (3.34). Curriculum review and integration of emerging technologies also recorded a high mean (3.32). This finding is consistent with UNESCO IIEP (2022), which stressed the need to strengthen digital skills development systems in Africa to prepare learners for changing employment demands. Similarly, Amesi and Obi (2024) found a strong relationship between institution-industry collaboration, training and technological innovation in Business Education. The findings therefore suggest that curriculum improvement, better digital facilities, lecturer development and stronger institution-industry partnerships are important for preparing Business Education students for the digital economy.

Conclusion

The study concludes that Business Education students possess digital and entrepreneurial competencies to a high extent, with grand means of 3.14 and 3.22, respectively. However, continuous improvement is necessary to keep these competencies relevant to changing workplace and business demands. The findings also show that curriculum review, practical digital training, improved ICT facilities, lecturer development, industry collaboration, mentoring and incubation programmes can further strengthen students' employability and entrepreneurial readiness.

Recommendations

Based on the findings, the study recommends that:

1. Business Education curricula should be regularly reviewed to include emerging digital technologies and current workplace skills.
2. Tertiary institutions should provide more practical training in digital marketing, e-commerce, online payment, data management and other digital business activities.
3. ICT facilities and digital learning resources should be improved to provide students with adequate opportunities for practical learning.
4. Business Education lecturers should receive regular digital skills training to improve their capacity to teach emerging technologies and entrepreneurial skills.
5. Tertiary institutions should strengthen partnerships with industries through mentoring, incubation programmes, internships and practical projects to improve students' employability and entrepreneurial readiness.

DIGITAL TRANSFORMATION AND TECHNOLOGICAL INTEGRATION IN TEACHING AND LEARNING BUSINESS EDUCATION IN TERTIARY INSTITUTIONS IN NIGERIA

BY

JUBRIL ABUBAKAR MUSA
Kwara State College of Education (T), Lafiagi
08037568719, manjubril19@gmail.com

Abstract

This works focused on digital and technological integration in teaching and learning business education, the researcher discussed the concept of digital transformation, technological integration in teaching and learning business education, importance of digital transformation in higher education, key technologies that support transformation, the emergence of online learning in tertiary institutions as well as framework for digital transformation in business education, policy challenges and curriculum gap in technology driven business education and later concluded that The integration of digital technologies and transformation of teaching and learning processes in Nigerian Tertiary institutions is crucial for enhancing business education. The use of digital tools, online resources, and innovative pedagogies can improve learning outcomes, increase accessibility, and equip students with industry relevant skills. However, challenges such as inadequate infrastructure, limited lecturer capacity, and resistance to change hinder the adoption of digital transformation and suggested that Infrastructure Development, Upgrade ICT Infrastructure and provide reliable internet access to support digital learning Lecturer Training, Offer regular training and workshops to enhance lecturer's digital literacy and pedagogical skills. Curriculum Review, Integrating digital skills and emerging technologies into business education curricular among others.

Keywords: digital transformation, technological integration, teaching and learning

Introduction

Businesses today are using cutting edge technologies to improve how they operate, serve customers, and stay competitive. This process, known as digital transformation, isn't just about upgrading old systems; it's about technology integration, bringing the latest innovations like cloud computing, artificial intelligence (AI), machine learning (ML), the Internet of Things (IoT), and block chain into business processes to support new goals. Digital transformation has emerged as a transformative force reshaping various sectors, including higher education, across the globe (Ajani & Maphalala, 2023). Digital transformation is a fundamental business shift that integrates digital technology across all areas, changing how an organization operates and delivers value. Technology integration is the act of using technology resources, like computers or software, within those processes, and it is a key component of digital transformation. While digital transformation is a broad strategic approach, technology integration is the practical application of technology to achieve the transformation's goals. Digital transformation in education refers to the integration of digital technologies into all aspects of the educational process, aiming to enhance the learning experience and improve educational outcomes (Bui & Nguyen, 2023). This transformation is not just about adopting new technologies but also about rethinking pedagogical approaches and administrative processes to better serve the needs of students and educators in a digital age.

Technology integration means combining different technologies to work together seamlessly. In African nations, where educational systems face unique challenges and opportunities, understanding the digital transformation landscape in higher education is crucial for advancing educational outcomes and fostering socio-economic development (Adeniyi et al., 2024). Despite the increasing recognition of the importance of digital transformation in higher education, the adoption and implementation of digital technologies vary significantly across African nations. Infrastructure limitations, resource constraints, and contextual differences pose opportunities and challenges for digital integration in higher education institutions (Afolabi & Ajani, 2023; Wende, 2001).In a business, it might involve connecting systems like inventory management software with customer relationship management (CRM) tools or integrating data from smart devices with analytics software to get a clearer picture of what's happening. Technology integration is essential for digital transformation because it allows companies to use the full potential of

each technology by connecting them. The goal is to streamline operations, improve decision-making, and create innovative solutions that make businesses more efficient and customer focused.

The rapid advancement of technology has transformed virtually every sector, including education, causing a paradigm shift and digital transformation in education (Palacios-Rodríguez et al., 2023). Digital transformation in business education involves integrating digital technologies into all aspects of the educational process, fundamentally altering how educators teach and students learn. As Panakaje et al., (2024) note, students have become very familiar with and show a strong preference for technologies. Young people pursuing higher education have also become particularly adept at using the internet and other digital devices as a medium of social interaction. Hence, to effectively educate these tech-savvy generations, it is essential for teachers to learn and incorporate digital media into their teaching practices.

Key Technologies That Support Digital Transformation

The use of digital technology in education has become pervasive across the world (Vásquez-Peñafiel et al., 2023). It stands as one of the most influential forces transforming the educational landscape today. Let's take a look at some of the major technologies that play a role in digital transformation and how they can be integrated into business processes. Cloud computing is a way to store and access data and software over the internet rather than on a physical computer or server in your office. This technology allows businesses to scale quickly, collaborate easily, and access information from anywhere. Instead of a company hosting all of its important files on local servers that could break down, cloud computing lets it store data on remote servers (in "the cloud"). This means employees can access the information they need whether they're at the office, at home, or traveling. Artificial Intelligence (AI) refers to the ability of machines to perform tasks that typically require human intelligence, such as recognizing patterns or making decisions. AI technology in education is expected to grow significantly in the coming decades, presenting new opportunities and challenges (Ouyang and Jiao, 2021; Zhang and Aslan, 2021; Khosravi, 2022). Moreover, the integration of advanced technologies such as artificial intelligence (AI) and machine learning can further enhance the learning experience by providing personalized learning paths and real-time feedback (Phuong et al., 2023). Professional development for educators is another crucial aspect of digital transformation. Educators need to be equipped with the skills and knowledge to effectively use digital tools and technologies in their teaching practices (Joseph & Uzondu, 2024b). Continuous professional development programs can help educators stay updated with the latest technological advancements and pedagogical strategies, thus improving their teaching effectiveness and enhancing student learning outcomes (Veckalne & Tambovceva, 2022).

Machine learning (ML) is a subset of AI that involves training machines to learn from data so they can improve their performance over time without being explicitly programmed. AI chatbots used by companies for customer service are trained to understand common questions and provide relevant answers. Over time, these bots get better at answering questions by learning from customer interactions (that's machine learning in action). The Internet of Things (IoT) refers to the network of physical devices—such as cars, appliances, or factory equipment—that is connected to the internet and can share data. IoT devices can collect and send information in real-time, allowing businesses to monitor and optimize their processes. A company that manages warehouses might use IoT sensors to track the temperature and humidity in storage units, ensuring products like food or medicines are kept in ideal conditions. Block chain is a type of digital ledger that securely records transactions across many computers in a way that makes it nearly impossible to alter or hack. While it's most famous for being the technology behind crypto currencies like Bit coin, block chain has many other uses. In the supply chain industry, block chain can be used to track the journey of products from manufacturers to consumers. This increases transparency and ensures the authenticity of products like luxury goods or pharmaceuticals, which may be subject to counterfeiting.

The Emergence of Online Learning in Tertiary Institution

Online learning, also known as e-learning, has experienced exponential growth in recent years, driven by advancements in digital technologies and the increasing demand for flexible and Accessible education (Maphalala & Ajani, 2024). This evolution of online learning presents Opportunities and challenges for educational institutions worldwide, including those in African Nations. Understanding the trajectory of online learning, from its inception to its current state, is Essential for navigating the complexities of digital education and harnessing its potential for Enhancing learning outcomes (Ajani & Khumalo, 2023; Guri-Rosenblit, 2005). Online learning Traces its roots back to the early days of the Internet, with the development of computer-mediated Communication tools and the establishment of virtual learning environments. In many African Nations, the adoption of online learning gained momentum in the late 20th Century, driven by

Efforts to expand access to education and address the challenges of traditional brick-and-mortar institutions (Bozkurt et al., 2017). One of the primary opportunities online learning offers is its potential to overcome barriers to access and promote inclusivity in education (Al-Azawei et al., 2017). Thus, in African nations, where geographical distances, limited infrastructure, and socio-economic disparities pose significant obstacles to education, online learning offers a pathway to reach learners in remote areas and marginalized communities (Allen & Seaman, 2017). Furthermore, online learning platforms allow learners to engage in education at their own pace, location and convenience, catering to diverse learning styles and preferences (Altbach & de Wit, 2017; Bates, 2019). This personalized approach to learning is particularly beneficial in African contexts, where traditional education systems may struggle to accommodate the needs of individual learners and provide equitable access to educational resources (Altbach & de Wit, 2019; Anderson, 2008). In addition, advancements in technology, such as mobile devices and high-speed internet connectivity, have further facilitated the growth of online learning and expanded its reach to even the most remote areas (UNESCO, 2020).

Furthermore, the digital divide, characterized by disparities in access to digital technologies and internet connectivity, remains a significant barrier to online learning in African nations (Bates & Sangra, 2011). While urban areas may have relatively better access to digital infrastructure, rural and underserved communities often lack the necessary resources to participate fully in online education initiatives. The transition to online learning requires a fundamental shift in pedagogical approaches and necessitates comprehensive training for educators to effectively facilitate online courses (Bates, 2019). Hence, in African nations, where teaching capacities may vary and digital literacy among educators is uneven, investing in teacher training and professional development is essential to ensure the successful implementation of online learning initiatives (Bozkurt et al., 2017). Further evidence asserts that online learning platforms must accommodate diverse cultural and linguistic contexts to ensure educational content is accessible and relevant to all learners AAA (Bates, 2019; Brown, 2015). In many African nations, where multiple languages and cultural traditions coexist, designing inclusive online learning experiences that resonate with learners' cultural identities and backgrounds is imperative for fostering meaningful engagement and learning outcomes (Bozkurt et al., 2017). Thus, sustaining online learning initiatives requires significant financial investments in infrastructure, technology, and human resources (Bates, 2019). Unlike most African nations, where financial resources may be limited and competing priorities abound, identifying sustainable funding models and securing long-term support for online education programmes pose considerable challenges. However, despite the challenges inherent in the evolution of online learning, the potential benefits of digital education for African nations are immense (Christensen et al., 2013). By leveraging technological innovations, fostering collaboration among stakeholders, and prioritizing equity and inclusivity, African nations can harness the transformative power of online learning to advance educational access, enhance learning outcomes, and drive socio-economic development in the 21st Century. The necessity for digital transformation in education has become particularly evident during the COVID-19 pandemic, which forced many educational institutions to shift to online learning abruptly. This sudden shift highlighted both the potential benefits and the significant challenges associated with digital education (Shukla & Jacob, 2022). One of the primary benefits of digital transformation is the ability to provide flexible and personalized learning experiences, which can be tailored to meet the diverse needs of students (Joseph & Uzondu, 2024a). However, the transition to digital education is not without its challenges. Among these are the technological infrastructure required, the need for professional development for educators, and the digital divide that exacerbates educational inequalities (Joseph & Uzondu, 2024d). Effective digital transformation requires comprehensive strategies that include investing in technological infrastructure, providing ongoing training for educators, and implementing policies that ensure equitable access to digital resources (Quaicoe, Ogunyemi & Bauters, 2023). One of the critical components of digital transformation in education is the development of a robust technological infrastructure. This includes high-speed internet, modern hardware and reliable software solutions that support both teaching and administrative functions. Investing in these technologies is essential to create a conducive environment for digital learning (Joseph & Uzondu, 2024c).

Framework for Digital Transformation in Business Education

The framework for digital transformation in business education is a complex and multifaceted concept that encompasses various elements aimed at enhancing the educational experience through the integration of digital technologies. Digital transformation involves more than just the adoption of new technologies; it requires a comprehensive approach that includes the development of technological infrastructure, changes in pedagogical practices and the involvement of all stakeholders in the educational process (Aditya, Ferdiana & Kusumawardani, 2022). One of the essential aspects of digital transformation in business education is the development of a robust technological infrastructure. This

includes high-speed internet, modern hardware and reliable software solutions that support both teaching and administrative functions. According to García-Peñalvo (2021), it is crucial to ensure the ethical use of data and make the right technological decisions to achieve a more inclusive and participative university environment supported by technology. The integration of advanced technologies such as artificial intelligence (AI) and machine learning can further enhance the learning experience by providing personalized learning paths and real-time feedback. A successful framework for digital transformation must also incorporate elements from established models and frameworks.

Marks and Al-Ali (2022) propose a maturity assessment framework for digital transformation in higher education, incorporating elements from Deloitte's digital transformation assessment framework and Petkovic's higher education process mapping. This framework helps institutions assess their current state and identify areas for improvement, ensuring a systematic and structured approach to digital transformation. In addition to technological infrastructure, digital transformation requires a shift in pedagogical approaches. Traditional teaching methods may not be suitable for digital learning environments, necessitating the adoption of innovative teaching strategies that leverage digital tools to enhance student engagement and learning. However, Adegbite, Olaleye, and Ibrahim (2025), who emphasized that digital innovations in Nigerian higher education are often selectively applied, with stronger attention given to theory rather than

Practice. Similarly, Awoniyi and Aromolaran (2025) observed that although lecturers acknowledge the relevance of digital tools in teaching, the actual classroom use of technology is fragmented, often due to lack of training or institutional support. The moderate integration discovered in this study thus reinforces prior scholarly warnings that entrepreneurship education in Nigeria remains largely disconnected from the technological realities of the business environment.

Policy Challenges and Curriculum Gaps in Technology-Driven Business Education

While the benefits of emerging technologies in business and entrepreneurship education are widely acknowledged, their adoption remains hindered by entrenched policy and structural challenges. As highlighted in the previous section, digital tools have transformed the potential of learning; yet across many institutions especially in developing economies practice has lagged behind. Closing this gap requires confronting a set of interrelated policy bottlenecks that limit systemic reform. Outdated Curricula: Despite growing global discourse around digital transformation, many higher institutions still deliver business education through outdated syllabi emphasizing legacy concepts over digital competencies. According to the Organisation for Economic Co-operation and Development (OECD, 2021), more than 60% of business-related academic programs do not reflect current industry needs. In Nigeria, researchers in ABEN have expressed concern that business education curricula remain overly theoretical, with limited emphasis on entrepreneurship, innovation, or digital market analysis (Onwubuya et al., 2024; Onwubuya, 2024, & Ikeh-anayo, 2024). Consequently, graduates are often misaligned with the skills demanded in the 21st-century workforce.

Digital Divide and Infrastructure Gaps: The technological revolution has exposed a stark divide in digital access between well-resourced institutions and those in rural or economically marginalized areas (Ikpeama, et al., 2025). UNESCO (2023) reports that only 47% of secondary and tertiary institutions in low-income countries have access to basic ICT tools. In Nigeria, inadequate infrastructure including erratic internet, insufficient computer labs, and power supply issues further widens this gap (Oluwajoba & Udofia, 2023). These disparities prevent equitable access to technology-driven pedagogy and reinforce systemic educational inequality. Faculty Capacity Deficits: The successful integration of technology into business education requires digitally competent instructors. However, a significant portion of faculty members lack training in modern digital tools and interactive pedagogy (Ubaka, 2024) Many business educators in Nigeria are still unfamiliar with core Etch platforms, coding environments, or block chain-based tools. The OEC (2023) stresses that formal faculty development frameworks particularly those incentivizing continuous up skilling are critical to sustainable curriculum reform. Weak Industry Academia Collaboration: Strong collaboration between business schools and industry partners is vital for relevant, practice-based education. Unfortunately, this remains a weak link in many institutions. The World Bank (2020) emphasizes that meaningful engagement with entrepreneurs, incubators, and digital startups enhances curriculum relevance. However, in Nigeria and many African countries, few institutions have embedded structured partnerships that allow students to work on real-world entrepreneurial problems or access mentorship from tech-driven firms (Okoli & Agbo, 2021). Inadequate Assessment and Credentialing Models: Finally, assessment systems in business education are largely outdated and ill-suited for evaluating skills like adaptability, design thinking, and digital entrepreneurship. Traditional exams fail to measure collaborative, real-world problem-solving. While some global institutions now deploy micro-credentials and block chain-based certifications (Grech & Camilleri, 2017), such innovations are largely absent in the Nigerian context. Without updating

assessment frameworks, true curriculum transformation remains incomplete. In sum, while emerging technologies offer rich possibilities, their integration into business education systems demands bold policy reform and structural rethinking. Addressing curriculum gaps, empowering educators, and fostering ecosystem collaboration are necessary steps to ensure learners receive both the tools and the environments they need to succeed.

Conclusion

The integration of digital technologies and transformation of teaching and learning processes in Nigerian Tertiary institutions is crucial for enhancing business education. The use of digital tools, online resources, and innovative pedagogies can improve learning outcomes, increase accessibility, and equip students with industry-relevant skills. However, challenges such as inadequate infrastructure, limited lecturer capacity, and resistance to change hinder the adoption of digital transformation.

Suggestions

1. Infrastructure Development: Upgrade ICT Infrastructure and provide reliable internet access to support digital learning
2. Lecturer Training: Offer regular training and workshops to enhance lecturer's digital literacy and pedagogical skills.
3. Curriculum Review: Integrate digital skills and emerging technologies into business education curricular
4. Collaboration and partnerships: Foster partnerships with industry and international institutions to provide experimental learning opportunities
5. Monitoring and evaluation: Establish a framework to monitor and evaluate the effectiveness of digital transformation initiatives.

Abstract

The digital economy has altered the knowledge and competencies required for entrepreneurial participation, yet the possession of digital tools or exposure to technology does not necessarily translate into technology-enabled venture capability. This study examined the effect of communication, accounting and marketing digital skills on technopreneurship development among Business Education students in tertiary institutions in Anambra State, Nigeria. A correlational survey design was adopted. The population comprised 322 final-year degree Business Education students in four public tertiary institutions, from which 178 were sampled using proportionate stratified sampling. A 24-item researcher-developed questionnaire was validated by experts and pilot-tested; Cronbach alpha coefficients for the three predictor scales were .83, .76 and .82. Regression analysis was based on 147 valid responses. Simple linear regression was used to examine the individual effects of the three skill domains, while multiple regression examined their joint contribution. Communication digital skill significantly predicted technopreneurship development ($R = .390$, $R^2 = .152$, $p < .001$); accounting digital skill produced a stronger individual effect ($R = .490$, $R^2 = .240$, $p < .001$); and marketing digital skill also had a significant simple effect ($R = .226$, $R^2 = .051$, $p = .006$). Jointly, the three predictors explained 30.6% of the variance ($R = .553$, $R^2 = .306$, $p < .001$). In the combined model, communication ($\beta = .277$, $p < .001$) and accounting ($\beta = .417$, $p < .001$) remained significant, whereas marketing digital skill was not a significant unique predictor ($\beta = -.027$, $p = .733$). The study concludes that digital skill development should move beyond generic technology awareness toward integrated, practice-oriented entrepreneurial competence, with stronger attention to digital accounting and communication capabilities.

***Keywords**:* digital technology skills; communication digital skill; accounting digital skill; marketing digital skill; technopreneurship; Business Education

Introduction

The rapid diffusion of digital technologies is changing the knowledge, skills and competencies required for participation in contemporary economic activities. Digital platforms have altered how information is accessed, businesses are communicated, transactions are recorded and products are marketed. Consequently, entrepreneurship is increasingly being pursued through technology-enabled processes in which digital tools are not merely supportive resources but integral components of opportunity identification, venture creation and business development. This emerging form of entrepreneurship, commonly described as digital entrepreneurship or technopreneurship, requires individuals to combine entrepreneurial knowledge with the ability to identify and exploit opportunities through digital technologies. Ayeni and Killian (2023), for example, describe technopreneurship as the acquisition of knowledge, skills and competencies for venture creation through technological know-how and argue that technology-based entrepreneurship education should become an integral component of tertiary education in Nigeria.

This development has particular implications for Business Education. Business Education is expected to prepare learners for employment, self-employment, business management and entrepreneurship. Its traditional areas of accounting, marketing, office technology and management, however, are increasingly being performed through digital platforms. Thus, competence in conventional business practices without corresponding technological competence may leave graduates inadequately prepared for a labour market and entrepreneurial environment characterized by digital transactions, electronic communication, online marketing, digital accounting and technology-enabled business models. Recent evidence from Nigeria supports this concern. Osiesi et al. (2024), in a study of 250

Business Education undergraduates at the Federal University Oye-Ekiti, found moderate entrepreneurial digital skills, high digital knowledge and very good use of entrepreneurial digital skills. The researchers consequently recommended an enabling university environment and compulsory digital education courses.

Evidence from Business Education students in Anambra State is particularly relevant. Onwubuya and Odogwu (2023) examined 338 300-level Business Education students drawn from the four public tertiary institutions offering Business Education in Anambra State. Their findings showed that technology skills, digital communication, digital safety and media literacy were significantly connected with students' entrepreneurial intentions. This finding establishes an important local relationship between digital competence and entrepreneurship. However, the study conceptualised digital technology broadly as components of digital literacy and focused on entrepreneurial intention, rather than examining the contribution of specific business technologies to technopreneurship development. This distinction is important because intention represents a predisposition to engage in entrepreneurship, whereas technopreneurship development encompasses the ability to recognize technology-based opportunities, develop technology-enabled business ideas and apply digital tools to entrepreneurial activities.

Communication technology represents one important pathway through which digital technologies can facilitate technopreneurship. Internet connectivity, electronic communication, messaging applications, video-conferencing tools, social networking platforms and other digital communication channels reduce geographical barriers and improve access to information, networks and potential customers. Nigerian evidence demonstrates the relevance of this mechanism. Ashiru, Nakpodia and You (2023), using Diffusion of Innovations Theory, found that emerging digital communication technologies contributed to the resilience of Nigerian SMEs during the COVID-19 period. Similarly, Onwubuya and Odogwu (2023) found a positive relationship between digital communication and entrepreneurial intentions among Business Education students in Anambra State. The implication is that communication technology may provide aspiring technopreneurs with access to information, business networks and communication channels through which technology-based opportunities can be explored.

Accounting technology constitutes another important but less investigated dimension. Contemporary accounting increasingly involves digital bookkeeping, accounting information systems, electronic invoicing, cloud accounting, financial reporting software and data analytics. These technologies can improve the availability and processing of financial information required for entrepreneurial decisions. Lutfi et al. (2022), for instance, found that digital accounting system usage has implications for efficiency, decision-making and SME performance. A 2023 systematic review by Pargmann et al. further observed that accounting digitalization is transforming accounting activities and creating new competence requirements, particularly as routine accounting activities become increasingly automated.

More directly, recent Nigerian evidence has begun to connect digital accounting competence with entrepreneurship. Ishola (2025) investigated digital accounting skills and accountpreneurial intentions among Business Education students in Lagos State universities. The study is particularly significant because it moves beyond generic digital literacy to a business-specific technology competence. However, its focus was accountpreneurial intention rather than the broader development of technopreneurship. This leaves unanswered whether accounting technologies contribute to the actual technology-oriented entrepreneurial capabilities of Business Education students.

Marketing technology is perhaps the most visible dimension of technology-enabled entrepreneurship. Social media marketing, e-commerce platforms, search engine optimization, digital content creation, electronic customer engagement and marketing analytics have transformed how entrepreneurs identify, reach and retain customers. Yet the availability of these technologies does not necessarily mean that students possess the competence to use them entrepreneurially. Abdulkarim and Danagogo (2023), for example, found that Business Education students in Rivers State acquired social-media marketing skills to a high extent but digital content creation and search-engine-optimization skills only to a low extent. Similarly, Okeke (2024) reported that Business Education students in the Colleges of Education in Anambra State had acquired digital content and social-media marketing skills only to a low extent.

This apparent contradiction is important. On one hand, digital technologies are increasingly associated with entrepreneurship, innovation, market access and business development. On the other hand, students may have access to digital platforms without possessing the specific competencies required to transform those platforms into entrepreneurial opportunities. Olatunde (2023) whose study of Business Educators in Nigerian public institutions also found electronic communication and search-

engine marketing to be important digital marketing competencies for Business Education undergraduates in the digital economy. Thus, the critical issue is no longer simply whether students have access to technology, but whether specific forms of technology use translate into the development of technology-based entrepreneurial capabilities.

Recent evidence reinforces this broader argument. Ogongo et al. (2025), studying Business Education graduates of Lagos State University, reported the relevance of digital technology to entrepreneurship and innovation and situated digital competence within the changing requirements of Business Education. Edionwe and Erhirihie (2025) likewise found a high perception of digital technology use among undergraduate Business and Entrepreneurship Education students in Delta State, although their study focused on classroom activities rather than entrepreneurial development. More recent work also demonstrates that technology-oriented entrepreneurship education is moving towards actual technopreneurship behaviour rather than merely technology awareness. For example, Wibowo et al. (2026) reported that AI-integrated entrepreneurship education can influence technopreneurship behaviour through mechanisms including perceived usefulness and ease of use.

Despite these developments, important questions remain unanswered in the Nigerian Business Education literature. Existing studies have tended to examine digital literacy, digital skills, digital marketing skills, technology use or entrepreneurial intention separately. Few studies have decomposed digital technology into specific business-oriented dimensions and examined their relative contribution to technopreneurship development. Communication technology has received considerable attention, whereas accounting technology remains comparatively under-investigated, particularly among Business Education students. Marketing technology studies have also frequently measured skill acquisition rather than whether such skills contribute to technopreneurship development. Furthermore, while Anambra State has produced useful evidence on digital literacy and digital marketing, there remains a need for a study that simultaneously examines communication, accounting and marketing technologies as predictors of technopreneurship development across tertiary institutions offering Business Education.

The present study therefore focuses on the effect of communication technology, accounting technology and marketing technology on technopreneurship development among Business Education students in tertiary institutions in Anambra State. By separating these technology dimensions, the study seeks to move beyond the broad assertion that "digital technology is important" and determine which specific forms of business-related digital technology contribute to students' development as technopreneurs. The study is consequently positioned to provide evidence for curriculum revision, practical digital-skills development, lecturer capacity building and stronger university-industry linkages in Business Education.

Statement of the Problem

The contemporary digital economy has changed how businesses are created, managed and marketed, making digital technology skills increasingly important for entrepreneurial participation. Business Education students are expected to leave tertiary institutions with competencies that support both employability and self-employment. However, evidence from Nigeria indicates that students' digital competence is uneven and that digital technology knowledge does not automatically translate into entrepreneurial application (Onwubuya & Odogwu, 2023; Osiesi et al., 2024). This creates a practical concern for Business Education: whether specific digital skills can actually enhance students' capacity to engage in technopreneurship.

The concern is more specific in relation to communication, accounting and marketing. Communication skills may help students build networks and reach customers; accounting skills may help them manage financial information and make evidence-based decisions; while marketing skills may help them promote products and access wider markets. Existing studies have established the relevance of digital communication, accounting and marketing competencies, but much of the evidence focuses on digital literacy, skill acquisition, entrepreneurial intention or organisational performance rather than technopreneurship development as an applied outcome. In addition, few studies compare the relative contribution of these three skill domains within one regression model among Business Education students in Anambra State. Wibowo et al. (2026) further suggests that technology-related entrepreneurial behaviour is shaped by more than simple technology exposure, making it necessary to determine which practical digital capabilities are most closely associated with students' entrepreneurial development. The problem, therefore, is whether communication, accounting and marketing digital skills significantly contribute to technopreneurship development among Business Education students in tertiary institutions in Anambra State.

Objectives of the Study

The general aim of the study is to examine the effect of digital technology skills on technopreneurship development among Business Education students in public tertiary institutions in Anambra State. Specifically, the study sought to:

1. determine the extent to which communication digital skill influences technopreneurship development among Business Education students in tertiary institutions in Anambra State,
2. Investigate the extent to which accounting digital skill affects technopreneurship development among Business Education students in tertiary institutions in Anambra State,
3. Examine the extent to which marketing digital skill predicts technopreneurship development among Business Education students in tertiary institutions in Anambra State.

Research Questions

1. To what extent does communication digital skill affect technopreneurship development among Business Education students in tertiary institutions in Anambra State?
2. To what extent does accounting digital skill affect technopreneurship development among Business Education students in tertiary institutions in Anambra State?
3. To what extent does marketing digital skill affect technopreneurship development among Business Education students in tertiary institutions in Anambra State?

Hypotheses

$H_0$1: Communication digital skill has no significant effect on technopreneurship development among Business Education students in tertiary institutions in Anambra State.

$H_0$2: Accounting digital skill has no significant effect on technopreneurship development among Business Education students in tertiary institutions in Anambra State.

$H_0$3: Marketing digital skill has no significant effect on technopreneurship development among Business Education students in tertiary institutions in Anambra State.

Literature Review

Digital Technology Skills and Technopreneurship Development

Digital technology skill refers to the practical ability to select, operate, combine and apply digital tools to accomplish meaningful tasks. In an entrepreneurial context, the relevant issue is functional use rather than mere familiarity with devices or applications. Osiesi et al. (2024) conceptualised entrepreneurial digital competence around students' knowledge, skills and use, while Nigerian Business Education studies have identified communication, digital safety, technology and media-related competencies as relevant to entrepreneurial intentions (Onwubuya & Odogwu, 2023). These findings suggest that digital capability can form part of the human capital through which students convert education into economic activity.

Technopreneurship development is broader than entrepreneurial intention. It concerns the progressive development of the capability to identify technology-based opportunities, generate technology-enabled business ideas, develop digital solutions, initiate or support technology-enabled ventures, and use technology to improve business processes. Wibowo et al. (2026) makes a useful distinction between behavioural intention and technopreneurship behaviour: the study found a strong relationship between intention and behaviour, but also showed that intention was shaped by perceived usefulness, perceived ease of use, trust and social influence. This supports a cautious interpretation of digital skill effects: skills may provide the capacity for action, but actual technopreneurship is also influenced by learning environments, confidence, social support and opportunities to practise.

For Business Education, this interpretation suggests that digital competence should be taught through integrated business tasks. Students should not only learn how to operate digital tools but should also learn why a particular tool is selected, how its outputs inform decisions, what risks accompany its use and how several tools can be combined to support a venture. The present study's focus on communication, accounting and marketing reflects this functional orientation. These domains are sufficiently distinct to be measured separately, but sufficiently connected to represent major components of technology-enabled business activity.

The distinction is also important because technology-enabled entrepreneurship is often discussed as if technology itself were the innovation. In practice, the technology is a means through which an entrepreneurial opportunity is recognized, tested, communicated, financed, marketed and improved. A messaging application does not create a customer relationship automatically; accounting software does not produce financial discipline automatically; and a social-media platform does not generate a viable market automatically. The entrepreneur must possess the competence to interpret information, make decisions and use the tool strategically. Digital technology skills can therefore be viewed as enabling resources whose value depends on the learner's ability to connect them with business processes.

Digital technology skill is best understood as an applied capability rather than a list of devices or applications. In educational settings, a student may demonstrate operational familiarity with a platform

without demonstrating the judgement required to select an appropriate tool, combine several tools, evaluate digital information or adapt a technology to a changing business problem. The entrepreneurial relevance of digital skill therefore depends on transfer: the capacity to move from classroom exercises to unfamiliar business situations. This is consistent with the broader human-capital perspective in which education matters because it increases productive capability, not merely because it increases exposure to information.

Communication Digital Skill and Technopreneurship

Communication digital skill is the ability to use internet-enabled communication and networking technologies to exchange information, collaborate, obtain feedback and maintain relationships with customers, suppliers and other stakeholders. For a technology-enabled venture, communication is an entrepreneurial resource because it supports opportunity discovery, customer validation, networking and coordination. Digital channels can also reduce geographic barriers and allow emerging entrepreneurs to interact with wider markets at relatively low cost.

Onwubuya and Odogwu (2023) found that digital communication was substantially connected with entrepreneurial intentions among Business Education students in Anambra State. At the enterprise level, Ashiru et al. (2023) reported that emerging digital communication technologies supported resilience among Nigerian SMEs. The implication is that communication technology can facilitate both opportunity development and continuity of business activities. Nevertheless, these studies did not isolate communication digital skill as a predictor of technopreneurship development. The present study therefore extends the evidence from intention and organisational resilience to an applied student-level outcome.

The present study therefore treats communication digital skill as a business-facing competency. Its expected contribution is not simply that students who communicate more frequently online will become more entrepreneurial, but that students who can use digital communication purposefully may be better positioned to build networks, validate ideas and coordinate technology-supported activities. The distinction helps explain why communication skill may remain important even when accounting and marketing skills are considered simultaneously.

However, effective digital communication is more demanding than the ability to send messages. It includes selecting the appropriate channel, presenting information clearly, managing digital records, responding professionally, protecting sensitive information and interpreting feedback. In a business context, poor digital communication can damage trust just as effective communication can strengthen customer relationships. This is particularly relevant for technopreneurship because technology-mediated ventures often depend heavily on reputation, responsiveness and network effects.

Communication digital skill has become a strategic entrepreneurial capability because many venture relationships now begin and are maintained through digital channels. Entrepreneurs use email, messaging platforms, social networks, video-conferencing applications and collaborative platforms to obtain market information, communicate value propositions, negotiate with suppliers, coordinate employees and respond to customers. These activities reduce geographical barriers and can shorten the time between opportunity recognition and market interaction. For students, communication competence may therefore increase the range of networks through which entrepreneurial information and opportunities can be accessed.

Accounting Digital Skill and Technopreneurship

Accounting digital skill refers to the ability to use digital tools for recording, classifying, processing, analysing and reporting financial information. It includes electronic bookkeeping, accounting software, spreadsheets, digital invoicing and cloud-based accounting systems. For technopreneurs, these skills support cash-flow monitoring, pricing, budgeting, cost control, financial reporting and evidence-based decision-making. Thus, accounting technology links the creative side of entrepreneurship with the financial discipline required for venture sustainability.

Pargmann et al. (2023) found that digitalization is changing accounting activities and the competence requirements of accounting work. Lutfi et al. (2022) likewise demonstrated the relevance of digital accounting-system use to SME performance. Imjai et al. (2023) linked digital and management accounting competency to competitive performance among micro-entrepreneurs. Nigerian research is beginning to examine the student dimension; Ishola (2025), for example, investigated digital accounting skills among Business Education students in relation to accountpreneurial intentions. The remaining question is whether accounting digital skill makes a measurable contribution to broader technopreneurship development.

For Business Education students, accounting digital skill may therefore support technopreneurship through several routes: enabling accurate recording, improving cost awareness, supporting pricing decisions, monitoring profitability, producing information for funding or partnership discussions and

identifying financial problems early. This provides a plausible explanation for why accounting digital skill may demonstrate a comparatively strong association with technopreneurship development. At the same time, the relationship should not be interpreted as evidence that accounting skill alone creates entrepreneurial behaviour; rather, it represents one productive capability within a broader portfolio.

The literature on accounting digitalization reinforces the competency dimension. Pargmann et al. (2023) observed that digitalization is changing accounting activities and the competence requirements associated with them, while Lutfi et al. (2022) linked digital accounting system usage with SME performance. Imjai et al. (2023) further highlighted the relationship between digital and management accounting competencies and competitive performance among micropreneurs. These studies suggest that accounting technology is not simply an administrative support tool; it can form part of the decision-making infrastructure of small and technology-oriented ventures.

Accounting digital skill deserves particular attention because technology-enabled entrepreneurship still requires conventional financial discipline. Digital ventures may have low physical entry barriers, but they remain subject to revenue uncertainty, operating costs, pricing decisions, cash-flow pressures and the need to evaluate whether a business model is financially sustainable. Digital accounting tools can make financial information more timely and accessible, but only when users understand the accounting logic behind the outputs.

Marketing Digital Skill and Technopreneurship

Marketing digital skill involves the practical use of social media, e-commerce platforms, digital content, electronic customer engagement, search tools and marketing analytics to create and communicate value. These skills can lower market-entry barriers by enabling entrepreneurs to establish an online presence, reach customers beyond their immediate location, test ideas and monitor responses. Digital marketing is therefore closely connected with opportunity exploitation and customer development.

Evidence among Business Education students indicates that the acquisition of marketing skills is uneven. Abdulkarim and Danagogo (2023) examined digital marketing skill acquisition among final-year Business Education students and identified gaps across skill areas. Okeke (2024) similarly examined digital marketing skill acquisition among Business Education students in Colleges of Education in Anambra State, while Olatunde (2023) identified digital marketing competencies needed in the digital economy. The literature therefore establishes the relevance of marketing technology but leaves open the question of how strongly it contributes to technopreneurship development when other digital business skills are considered simultaneously. The possibility of overlap with communication skill is especially relevant. Both communication and marketing involve digital interaction with audiences, while marketing activities may also depend on the financial information generated through accounting processes.

Yet the availability of marketing platforms does not guarantee marketing competence. Effective digital marketing requires audience segmentation, content judgement, consistency, customer-response analysis, ethical communication and the ability to interpret engagement data. Nigerian studies have repeatedly reported uneven acquisition of these skills. Abdulkarim and Danagogo (2023), for example, identified stronger acquisition in some social-media-related areas than in content creation and search-engine optimization. Okeke (2024) similarly highlighted the importance of digital marketing skills among Business Education students in Anambra State. The issue is therefore not whether students use social media, but whether they can transform digital visibility into purposeful market activity.

Marketing digital skill is central to the contemporary entrepreneurial process because technology has changed how entrepreneurs identify customers, communicate value, test demand and maintain visibility. Social media, e-commerce platforms, digital content, search tools and analytics enable even small ventures to reach audiences that would previously have required substantial advertising resources. For students with limited start-up capital, such tools may provide relatively accessible routes into market experimentation.

Theoretical Framework

Human Capital Theory, developed by Becker (1964), provides the principal theoretical lens. The theory treats education and training as investments that increase productive capabilities. Applied to the present study, communication, accounting and marketing digital skills constitute forms of human capital that can increase students' capacity to identify opportunities, communicate value, manage resources and undertake technology-enabled business activities. The theory also explains why skill quality should matter more than access alone: a digital tool produces economic value when the user possesses the capability to apply it productively.

Diffusion of Innovations Theory (Rogers, 2003) provides a complementary perspective. It explains how new technologies spread through social systems and how perceptions of relative advantage,

compatibility, complexity, trialability and observability influence adoption. Communication, accounting and marketing technologies are innovations that students must incorporate into business processes. The theory therefore helps explain why skills may vary across students and why institutional exposure and peer environments can influence the use of digital tools.

Diffusion of Innovations Theory complements this perspective by explaining why technologies may be accepted and incorporated differently across individuals and social contexts. Rogers (2003) identifies relative advantage, compatibility, complexity, trialability and observability as characteristics that shape adoption. In the present study, these ideas are useful because students may possess skills but still differ in willingness or opportunity to incorporate technologies into entrepreneurial activities. The theory therefore provides contextual support for interpreting the movement from acquired capability to practical use, while Human Capital Theory remains the primary lens for explaining the productive value of skill.

Human Capital Theory provides the principal explanatory logic because the independent variables in this study are acquired competencies. Becker (1964) argued that education and training constitute investments that improve productive capabilities. In the present context, communication, accounting and marketing digital skills represent forms of human capital that can increase the productivity of students when they engage in technology-enabled entrepreneurial tasks. The theory therefore provides a direct bridge between education, skill acquisition and productive economic activity

Gap in Literature

The literature reveals four principal gaps. First is a construct gap: many studies treat digital technology or digital literacy as a broad construct, making it difficult to identify which business-facing competencies matter most. Second is an outcome gap: a large proportion of Nigerian evidence focuses on entrepreneurial intention or skill acquisition rather than technopreneurship development as an applied outcome. Third is an accounting gap: digital accounting has received less attention in student technopreneurship research despite its importance for venture control. Fourth is a model gap: few studies estimate the individual and combined effects of communication, accounting and marketing digital skills among Business Education students in Anambra State. This study addresses these gaps through three simple regressions and one multiple regression model.

The fourth gap is comparative and analytical. Previous studies often establish that digital skills matter without determining which dimensions contribute more strongly when related skills are considered together. The present study addresses this by examining communication, accounting and marketing digital skills both independently and jointly. This permits a more nuanced conclusion: a skill can be important in isolation yet provide limited unique explanatory power when its contribution overlaps with other competencies.

The third gap is contextual. Findings from Lagos, Rivers, Delta and other settings cannot automatically be assumed to represent students in Anambra State because institutional resources, curriculum implementation, digital infrastructure and exposure to enterprise opportunities differ. Although Onwubuya and Odogwu (2023) provide important Anambra evidence, their focus was digital literacy and entrepreneurial intention rather than the three business-facing skill domains examined here.

The second gap is outcome-related. A considerable proportion of existing Nigerian studies examine entrepreneurial intention, perceived usefulness, digital skill acquisition or classroom technology use. These outcomes are important, but intention is not the same as capability to undertake technology-supported entrepreneurial activities. The present study therefore uses technopreneurship development as an outcome that reflects the application of technology to opportunity recognition, business idea development, problem solving and venture activities.

The reviewed literature indicates a growing body of evidence on digital competence among Business Education students, but it does not yet provide a sufficiently integrated account of how specific digital technology skills relate to technopreneurship development in Anambra State. The first gap is conceptual. Digital literacy, digital technology use, digital marketing skill and entrepreneurial digital skill are frequently treated as broad or overlapping constructs. Such aggregation can conceal the distinct contribution of communication, accounting and marketing capabilities.

Methodology

The study adopted a correlational survey research design to determine the statistical influence of communication technology, accounting technology and marketing technology on technopreneurship development among Business Education students in tertiary institutions in Anambra State. The study was conducted in four tertiary institutions offering Business Education, namely Nwafor Orizu College of Education, Nsugbe (NOCE), Nnamdi Azikiwe University, Awka (NAU), Federal College of Education (Technical), Umunze (FCETU), and Chukwuemeka Odumegwu Ojukwu University (COOU). The population comprised 322 final-year degree Business Education students, distributed as follows: NOCE

(47), NAU (94), FCETU (78), and COOU (103). Using the Taro Yamane formula at a 5% level of precision, a sample size of 178 students was obtained. Proportionate stratified sampling was used to select 26 students from NOCE, 52 from NAU, 43 from FCETU and 57 from COOU. Data were collected using a researcher-developed Digital Technology Skills and Technopreneurship Development Questionnaire (DTSTDQ) comprising 24 substantive items distributed across Communication Technology Skill (6 items), Accounting Technology Skill (6 items), Marketing Technology Skill (6 items), and Technopreneurship Development (6 items). The items were measured on a four-point Likert scale ranging from Strongly Agree (4) to Strongly Disagree (1). The instrument was subjected to face and content validation by experts in Business Education and educational measurement and evaluation. A pilot test was conducted with 30 Business Education students of the Federal College of Education (Technical), Asaba, who were not part of the study population but had similar characteristics to the study respondents. Cronbach's alpha coefficients of 0.83, 0.76 and 0.82 were obtained for Communication Technology, Accounting Technology and Marketing Technology, respectively, indicating satisfactory internal consistency. The final questionnaire was converted to a Google Form and administered electronically through the various WhatsApp platforms of final-year Business Education students in the four institutions. The completed responses were retrieved electronically and prepared for analysis. A total of 147 properly completed responses were obtained and used for the analysis. These valid responses represented an 82.6% response rate, which was considered robust for the study. The data were analyzed using Statistical Package for the Social Sciences (SPSS), version 25. Descriptive statistics were used where necessary while simple and multiple linear regression were used to determine the effect of the identified digital technology skill dimensions on technopreneurship development. The hypotheses were tested at the 0.05 level of significance. The null hypotheses were rejected where the p-value was less than 0.05 and not rejected where the p-value was greater than or equal to 0.05.

Results

The regression results are presented in four distinct tables corresponding to the three research questions, hypotheses, and the combined model.

Table 1. Simple regression of communication digital skill on technopreneurship development (N = 147)

Predictor	R	R^2	Adj. R^2	F	p	B	β	t
Communication digital skill	.390	.152	.146	26.019	< .001	.420	.390	5.101

Table 1 shows a positive and statistically significant effect of communication digital skill on technopreneurship development, $R = .390$, $R^2 = .152$, $F(1,145) = 26.019$, $p < .001$. Communication digital skill explained 15.2% of the variance in technopreneurship development. The positive coefficient ($B = .420$; $\beta = .390$) indicates that higher communication digital skill was associated with higher technopreneurship development. The null hypothesis was rejected.

Table 2. Simple regression of accounting digital skill on technopreneurship development (N = 147)

Predictor	R	R^2	Adj. R^2	F	p	B	β	t
Accounting digital skill	.490	.240	.235	45.780	< .001	.494	.490	6.766

Table 2 indicates a positive and statistically significant effect of accounting digital skill on technopreneurship development, $R = .490$, $R^2 = .240$, $F(1,145) = 45.780$, $p < .001$. Accounting digital skill independently explained 24.0% of the variance. The coefficient was positive ($B = .494$; $\beta = .490$), and the null hypothesis was rejected. The result represents the largest explanatory contribution among the three single-predictor models.

Table 3. Simple regression of marketing digital skill on technopreneurship development (N = 147)

Predictor	R	R^2	Adj. R^2	F	p	B	β	t
Marketing digital skill	.226	.051	.044	7.775	.006	.283	.226	2.788

Table 3 shows that marketing digital skill significantly predicted technopreneurship development, $R = .226$, $R^2 = .051$, $F(1,145) = 7.775$, $p = .006$. The model explained 5.1% of the variance. The positive

coefficient (B = .283; β = .226) indicates that higher marketing digital skill was associated with higher technopreneurship development. The null hypothesis was rejected for the simple regression model.

Table 4. Multiple regression coefficients for communication, accounting and marketing digital skills (N = 147)

Variable	B	β	t	p
Constant	1.122	—	3.041	.003
Communication digital skill	.299	.277	3.584	< .001
Accounting digital skill	.421	.417	5.531	< .001
Marketing digital skill	−.034	−.027	−.341	.733

Model summary: R = .553, R^2 = .306, adjusted R^2 = .292, F(3,143) = 21.043, p < .001.

Table 4 shows that the three digital skill domains jointly produced a statistically significant model and explained 30.6% of the variance in technopreneurship development. In the joint model, accounting digital skill was the strongest unique predictor (β = .417, p < .001), followed by communication digital skill (β = .277, p < .001). Marketing digital skill did not make a significant unique contribution after the other two variables were controlled (β = −.027, p = .733). Consequently, the simple-regression result for marketing should not be interpreted as evidence of a significant unique effect in the combined model. The joint model rejects the null hypotheses for communication and accounting on unique effects; for marketing, the evidence supports retention of the null when the other two predictors are controlled.

Discussion of Findings

Communication Digital Skill and Technopreneurship Development

The significant positive effect of communication digital skill indicates that students with stronger digital communication capability tend to demonstrate stronger technopreneurship development. The result agrees with Onwubuya and Odogwu (2023), who reported substantial relationships between digital communication and entrepreneurial intentions among Business Education students in Anambra State. It is also consistent with Ashiru et al. (2023), who showed the importance of emerging digital communication technologies for resilience among Nigerian SMEs. The present finding extends those studies by treating communication skill as a specific predictor of technopreneurship development rather than as one component of general digital literacy or organisational resilience.

The result can be explained through Human Capital Theory. Communication skill is productive because it enables students to connect with customers, suppliers, collaborators and information sources. It supports opportunity recognition, customer validation and coordination. Its continued significance in the multiple model suggests that communication provides a distinct entrepreneurial capability even when accounting and marketing skills are considered. For Business Education, the implication is that digital communication should be taught as an entrepreneurial process—networking, customer interaction, negotiation, feedback and collaboration—not merely as the operation of communication applications.

Accounting Digital Skill and Technopreneurship Development

Accounting digital skill produced the strongest simple and unique multiple-regression effect. This is an important finding because accounting technology has received less attention in student-focused technopreneurship research than communication and marketing. The finding is consistent with Pargmann et al. (2023), who demonstrated that accounting digitalisation is changing activities and competence requirements, and with Lutfi et al. (2022) and Imjai et al. (2023), who linked digital accounting capabilities with organisational or competitive performance. It also complements Ishola (2025), which specifically examined digital accounting skills among Business Education students in relation to accountpreneurial intentions.

The strength of accounting digital skill may reflect the centrality of financial information to sustainable venture activity. A student may identify an opportunity and communicate with customers, but without the ability to record transactions, monitor costs, prepare digital financial information and interpret performance, technology-enabled activity may not become manageable enterprise activity. The result therefore supports a broader view of accounting education: digital accounting competence is not solely a technical requirement for accounting specialists; it is part of the entrepreneurial infrastructure needed for venture control and informed decision-making.

Marketing Digital Skill and Technopreneurship Development

Marketing digital skill significantly predicted technopreneurship development when considered alone, but its explanatory power was modest. This is consistent with Nigerian Business Education evidence showing that digital marketing is important but unevenly acquired (Abdulkarim & Danagogo, 2023; Okeke, 2024; Olatunde, 2023). The result suggests that marketing competence is relevant to entrepreneurial development because it helps students reach customers, communicate value and test market responses.

The more important finding, however, is that marketing digital skill was not a significant unique predictor after communication and accounting skills were controlled. This does not mean that digital marketing is irrelevant. Rather, its simple effect overlaps partly with other digital capabilities. The original correlation matrix showed moderate associations among the skill domains, including communication with marketing and accounting with marketing. Students who are stronger in one digital business domain may therefore tend to be stronger in others. Once shared variance is controlled, marketing skill did not explain additional unique variation in this sample. This distinction is methodologically important and provides a more defensible conclusion than stating that marketing skill has no relationship with technopreneurship.

Joint Contribution and Implications of the 30.6% Explained Variance

The combined model explained 30.6% of the variance in technopreneurship development. The result supports the view that technopreneurship is multidimensional and requires a portfolio of complementary business capabilities. Communication provides connectivity, accounting provides financial control, and marketing provides market-facing capability. Their joint contribution suggests that the most useful curriculum response is integration rather than teaching the three skill domains as isolated software competencies.

At the same time, 69.4% of the variance remained unexplained. This is theoretically meaningful. Digital skills are important resources, but they are not the whole explanation of technopreneurship development. Wibowo et al. (2026) demonstrates a related point from a different theoretical perspective: technology-integrated entrepreneurship education influenced technopreneurship behaviour through perceived usefulness, ease of use, trust, social influence and behavioural intention. Other factors potentially relevant to Business Education students include entrepreneurial self-efficacy, access to devices and connectivity, lecturer support, experiential learning, entrepreneurial family exposure, financial resources, creativity, technology anxiety and institutional support. Future research should therefore move from a skills-only model toward integrated human-capital, educational and entrepreneurial-ecosystem models.

Finally, the study reinforces the importance of moving from broad digital literacy claims to competency-specific evidence. This is particularly relevant as Nigerian education policy increasingly emphasises practical digital competence, AI awareness, data literacy and technology-enabled teaching. The challenge for Business Education is to translate these policy aspirations into observable student capabilities. The present findings provide one empirical basis for that translation by showing that specific business-facing digital skills have measurable relationships with technopreneurship development, although their contributions are not identical.

The result also has an important curriculum implication. Rather than asking whether Business Education students have been exposed to digital technology, curriculum planners should ask whether students can combine digital competencies to complete authentic entrepreneurial tasks. The evidence from the present study supports stronger attention to accounting and communication skills while retaining marketing as an essential complementary competency. The appropriate response is therefore not to remove marketing from the curriculum because its unique coefficient was non-significant; rather, marketing should be integrated with communication and accounting so that students understand how market engagement, customer relationships and financial outcomes are connected.

The 30.6% explained variance is substantial enough to demonstrate that digital technology skills matter, but it is also sufficiently incomplete to show that technopreneurship development cannot be explained by digital skill alone. The unexplained variance points toward other relevant factors such as entrepreneurial self-efficacy, opportunity recognition, access to finance, institutional support, mentoring, digital infrastructure, prior business experience, social networks and students' willingness to experiment with technology. This limitation should be viewed as theoretically productive rather than as a weakness of the model: it shows that digital skills are enabling capabilities within a wider entrepreneurial ecosystem.

The findings also clarify why the digital-skills question should not be reduced to a simple technology-access narrative. The significant simple effects indicate that students who report stronger communication, accounting and marketing digital skills also report stronger technopreneurship

development. However, the multiple regression result demonstrates that these capabilities are interrelated. Communication and accounting retained significant unique effects, whereas marketing did not. This pattern is consistent with the idea that technopreneurship depends on a portfolio of competencies and that some skills carry information that overlaps with other business functions.

Conclusion

The study concludes that communication, accounting and marketing digital technology skills are positively associated with technopreneurship development when considered separately, but their unique contributions differ when considered simultaneously. Accounting digital skill emerged as the strongest unique predictor, followed by communication digital skill. Marketing digital skill showed a significant simple relationship but did not contribute uniquely in the combined model. Collectively, the three skill domains explained 30.6% of the variance in technopreneurship development. The evidence therefore supports a shift from generic digital literacy toward practical, integrated digital-business competence.

Recommendations

Based on the findings of the study, the following recommendations are:

1. Business Education departments should strengthen students' acquisition of digital communication skills by incorporating practical activities that require students to use available digital platforms and tools for business communication customer interaction, networking an promotion.
2. Curriculum developers and Lecturers should place greater emphasis on the development of students' digital accounting skills because it produced the largest unique contribution in the present study. Students should be provided with opportunities to apply digital accounting techniques to basic business activities such as recording transactions, preparing financial information, monitoring cash flows and decision making.
3. Institutions should strengthen access to reliable internet, relevant accounting and marketing applications, digital-business laboratories and industry-linked mentoring so that students can practise skills in realistic environments.

Limitations and Future Research

The study used a correlational cross-sectional design and self-reported questionnaire data; consequently, the regression coefficients should not be interpreted as proof of causation. The analysis was based on 147 valid responses and did not control for factors such as prior digital training, access to devices, gender, entrepreneurial family background or institutional differences. Future studies should use larger multi-institutional samples, practical performance assessments, longitudinal designs and models that include entrepreneurial self-efficacy, digital infrastructure, institutional support and technology acceptance variables. Such studies would complement Wibowo et al. (2026) by testing whether specific skill acquisition can predict sustained technopreneurship behaviour over time.

Abstract
This study investigated social media adoption and usage patterns among Small and Medium Enterprises (SMEs) in Mainland Local Government Area of Lagos State. The purpose was to test the frequency of social media usage, the most frequently used platforms, the perceived operational effectiveness, and a test of the correlation between frequency of usage and perceived operational effectiveness. The quantitative survey research design was taken, and a structured questionnaire was conducted among the 184 SME owners who were chosen by purposive sampling. Descriptive statistics and Pearson Product-Moment Correlation were used to analyse the data. The results showed that SMEs actively use social media and especially WhatsApp, Instagram, Facebook, and Tik Tok and tend to believe that the media is effective in communication, visibility, customer engagement, and cost-effective promotion. The research also established a strong positive correlation between the frequency of social media use and effectiveness of operation. The conclusion made was that social media has a positive influence on SME operation, but the use of social media is still not organised. The research proposes SME capacity building, integration of curriculum in Business Education, and enhancing policy support of SME digitalisation.
Keywords: *Digital Entrepreneurship, Small and Medium Enterprises Social Media Adoption, Usage Pattern*

Introduction
SMEs are the foundation of the Nigerian economy and highly important in creating employment, distributing income, and diversifying the economy. National Bureau of Statistics (NBS) and Small and Medium Enterprises Development Agency of Nigeria (SMEDAN) state that over 96 percent of all enterprises in Nigeria are SMEs, over 46 to 48 percent of the national Gross Domestic Product (GDP) is contributed by SMEs, and more than 84 percent of the national workforce is employed in SMEs (NBS, 202 SMEs are the key drivers of poverty alleviation and inclusive development, especially in a developing economy that is typified by a fast-growing population and scarce formal job opportunities (PwC Nigeria, 2024). They are not just important to economic indicators alone because SMEs offer livelihoods to millions of households and develop entrepreneurial potentials at the bottom level.
The largest concentration (7.3%) of SMEs in Nigeria is found in the commercial and financial center of the country, Lagos State (Agusto & Co., 2023). More than 30 percent of the GDP in Nigeria is made up by the state, and nearly half of its economic output is service and activities related to trade, most of which are made up of SMEs (Lagos State Ministry of Economic Planning and Budget, 2024). In this context, Mainland Local Government Area is a densely populated and commercially dynamic area, where thousands of formal and informal SMEs exist that deal with retail, food services, fashion, logistics, technology, and digital trade. These businesses play a major role in job creation, youth involvement and local tax collection. Nonetheless, SMEs of Lagos Mainland are forced to work under a lot of pressure because of the congested environment, large population density and unstable market conditions due to which the sustainability and growth of these enterprises are at risk.
Moreover, over the past years, the Nigerian SMEs have been experiencing increasing structural and operational pressures. These are poor infrastructure, unpredictable power supply, expensive operations, inaccessibility to credit, various taxation, and regulatory bottlenecks, and decreased consumer purchasing power (Agusto and Co., 2023). SMEs are also being pushed more and more to

struggle with big corporations and multinational companies that have better financial resources, technology and dominate the market better. It is indicated that a high percentage of enterprises in Nigeria, which are SMEs, do not survive their initial five years of operation, and this is partly because of the challenges to access the markets and to retain their customers (Moniepoint, 2025). The challenges have been especially high in cities such as Lagos Mainland where the reality of high competition and economic shocks puts SMEs at a greater risk of business failure.

It is on this background that social media has become one of the most renowned tools that SMEs have adopted to cope with these limitations. On the one hand, this fact has made social media platforms like WhatsApp, Instagram, Facebook, and the fast-growing Tik Tok the focus of SME marketing, customer interactions, communication, and sales operations (Kemp, 2024; NITDA, 2023). On the one hand, there are more than 33 million social media users in Nigeria, so social media platforms have become a center of SME marketing In Nigeria, empirical research has consistently indicated that the use of social media increases the market reach and competitive ability of SMEs through the ability to access customers cheaply, interactively, and in real time (Ogunnaike and Kehinde, 2013; Parveen, Jaafar and Ainin, 2015). Nonetheless, the increasing commercialisation of social media, especially the short-form content, the culture of influencers, and creator funds on Tik Tok and Instagram, has altered the use intentions of a significant proportion of users. More often than not, content creation is not motivated by organised business goals, but by the need to make fast personal money, which in many cases, moves SME owners away the strategic use of social media in regard to business growth (Salau, Ismaila, Adebayo, & Akinwumi, 2026). This trend draws questions on whether the regular use of social media inevitably becomes operational effectiveness of SMEs.

The necessity of the study is also explained by socio-economic conditions of the Lagos Mainland Local Government Area, in particular, youth behaviour. There are elevated levels of youth unemployment and poverty in the region, which have been associated with antisocial and high-risk behaviours, including cultism, gang violence in neighbourhoods such as Bariga and Mushin, drug abuse, street fighting, and gambling (Boge, 2024; African Cities Research Consortium, 2024). The SMEs and social media platforms thus are viable avenues towards economic inclusion, self-employment among the youth, and social stabilisation. The knowledge about the frequency with which SMEs utilise social media, what platforms they depend on, and how the frequency of use is connected with the operational effectiveness is important in ensuring that targeted digital activity, enhanced SME sustainability, and efficient youth involvement. Hence, this study examined social media adoption and usage patterns among SMEs in Mainland Local Government Area of Lagos State.

Statement of the Problem

Despite the popularity of the social media among the Small and Medium Enterprises (SMEs) in Mainland Local Government Area of Lagos State, there is increasing anxiety that its use is more a matter of trend and monetisation interests than a business goal. Most of the SMEs use social media regularly without having adequate knowledge of the most effective social media and the role of such use in operational effectiveness. This scenario brings up the question of whether business growth is indeed being aided by more social media action or this is just a distraction to the owners. Therefore, the research problem of the proposed study is to analyse the trends in the use of social media by SMEs and establish their connection with operation effectiveness in the local environment.

Purpose of the Study

This study examined social media adoption and usage patterns among SMEs in Mainland Local Government Area of Lagos. Specifically, this study is guided by three objectives, which are to:

1. determine the frequency with which SMEs in Mainland Local Government Area use social media in their daily business operations.
2. identify the social media platforms most commonly utilised by SMEs in Mainland Local Government Area.
3. ascertain the perceived operational effectiveness of the social media platform for business operations.
4. examine the relationship between the frequency of social media usage and the operational effectiveness of SMEs in Mainland Local Government Area.

Research Questions

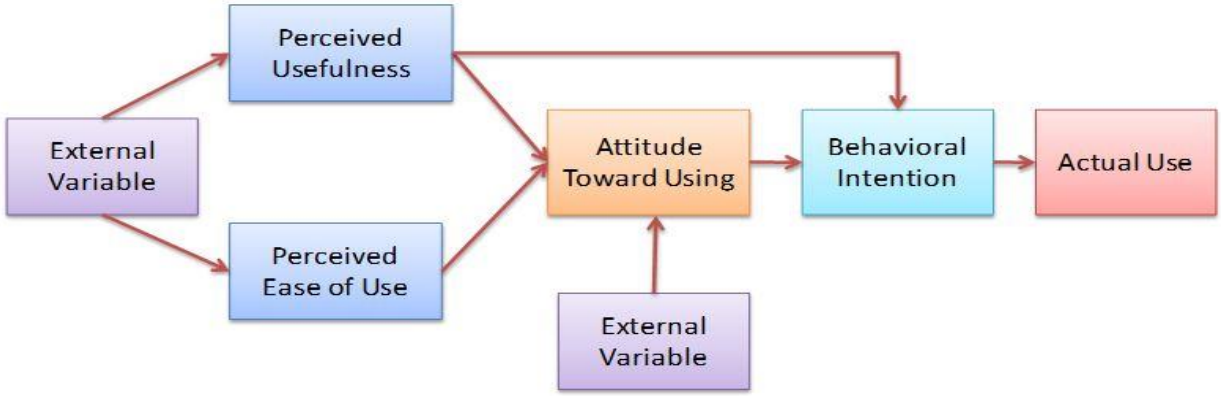
Three research questions were answered in this study as follows:

1. How often do SMEs in Mainland Local Government Area use social media in their daily business operations?
2. Which social media platforms are most commonly utilised by SMEs in the Mainland Local Government Area?

3. To what extent do SMEs perceive social media platforms as operationally effective for their business operations?

4. What is the relationship between the frequency of social media usage and the operational effectiveness of SMEs in Mainland Local Government Area?

Research Hypotheses



One null hypothesis was tested in this study:

Ho_1: There is no significant relationship between the frequency of social media usage and the operational effectiveness of Small and Medium Enterprises (SMEs) in Mainland Local Government Area of Lagos State.

Theoretical Framework: Technology Acceptance Model

Technology Acceptance Model (TAM) was firstly created by Davis in 1989 in order to describe the process of acceptance and use of information technology by users in the organisational environment. The theory was based on the Theory of Reasoned Action and suggested that two cognitive beliefs including perceived usefulness and perceived ease of use played a major role in determining technology adoption (Davis, 1989).

Figure 1: Technology Acceptance Model

Source**:** Phan and Daim (2011)

Perceived usefulness was the degree to which a person believed that the use of system would lead to a better job performance and perceived ease of use was the degree to which the system was believed to be easy to use. TAM also hypothesised that the beliefs were the driver of the attitude of users, behavioural intentions and ultimately actual use of the system (Davis, Bagossi, and Warshaw, 1989). The Technology Acceptance Model has two significant propositions that were selected and implemented in the framework of the current study directly in accordance with the purpose of the study. First, perceived usefulness was captured in perceptions of SMEs about social media being useful in enhancing communication, increasing the marketing area, and sustaining business activities. This suggestion guided the objective which aimed at establishing the social media platforms that were most frequently used by SMEs and how these platforms were viewed as being the most effective in the Mainland Local Government Area. Second, the ease of use was the reason why SMEs preferred platforms that were cheap, easy and simple to use in their daily business operations, which informed the objective that investigated the frequency with which the SMEs used social media in their daily operations. Also, actual usage, operationalised by frequency of social media use, reflected realised technology acceptance and directly favoured the objective that tested the relationship between the frequency of social media use and the operational effectiveness of SMEs. Together, these propositions were a logical theoretical foundation upon which to analyse the relationship between social media acceptance and operational outcomes of SMEs in Mainland Local Government Area.

Definition and Classification of SMEs

The classification of SMEs in Nigeria is provided by different regulatory bodies, primarily the Small and Medium Enterprises Development Agency of Nigeria (SMEDAN) and the Central Bank of Nigeria (CBN). While both classifications are similar, they use different criteria; SMEDAN focuses on the number of employees and asset base (excluding land and building), while CBN uses asset base and annual turnover (SMEDAN, 2021).

SMEDAN Classification

Category	No. of Employees	Asset Base (₦)
Micro	Less than 10	Less than ₦5 million
Small	10 – 49	₦5 million – ₦50 million
Medium	50 – 199	₦50 million – ₦500 million

Source**:** SMEDAN, (2021)

CBN Classification

Category	Asset Base (₦)	Annual Turnover (₦)
Micro	Less than ₦5 million	Less than ₦5 million
Small	₦5 million – ₦100 million	₦5 million – ₦100 million
Medium	₦100 million – ₦500 million	₦100 million – ₦500 million

Source**:** Central Bank of Nigeria, (2020)

These classifications are used to guide government support, funding programs, and policy implementation. While SMEDAN classifications are often used for policy and statistical purposes, CBN's classifications are applied more in the financial and credit sectors to determine access to loans and other banking services.

Empirical Review on Frequency of Social Media Usage among SMEs

Empirical research repeatedly indicates that SMEs are actively implementing social media as a normal business activity, even though application levels differ depending on the situation. Ogunnaike and Kehinde (2013) noted that social networking sites were widely used by Nigerian business persons in Ota to communicate with customers and promote their products and daily interaction was a common practice among growth oriented firms. On the same note, Parveen, Jaafar and Ainin (2015) found that Malaysian SMEs used social media frequently to facilitate the coordination, customer response and information sharing, and that frequent use was deemed essential to organisational responsiveness. Isiaka, Adeosun, and Okewale (2022) conducted a study in Nigeria based on national survey data that revealed that SMEs that posted on social media on a daily or regular basis realised considerably greater revenues compared to those that did not post regularly. According to Palladan et al. (2023), the usage intensity of the Nigerian SMEs was further determined as minimal, basic, moderate, and extensive usage; however, the frequency of use was a direct factor in determining performance outcomes with most firms performing at basic to moderate usage. In more recent studies, Okechukwu, Amin, and Mohammed (2025) found that almost every day, SMEs in Aba were on Facebook, Instagram, and Whatsapp marketing, taking orders, and communicating with customers. Though these studies confirm that the frequent use of social media is a common and healthy habit, they mostly consider frequency as a trait and not as a variable. In addition, there are minimal studies that analyse frequency in a local governmental context, which does not enable the measurement of how daily usage patterns are working in localised socio economic contexts such as Lagos Mainland.

Empirical Review on Social Media Platforms usage and Perceived Effectiveness.

The platform that SMEs have embraced and the perceived effectiveness of the platforms has been studied by numerous studies. According to Ogunnaike and Kehinde (2013), Facebook was the leading platform among SMEs in Nigeria because it is readily available and has interactive capabilities. Similarly, Parveen et al. (2015) established that SMEs favored platforms with real time interaction and feedback. Oyekan (2022) also emphasised that Facebook, Instagram, and Whatsapp were the most popular platforms among Nigerian SMEs and that WhatsApp provided the efficiency of transactions, and Instagram contributed to the product visibility. Isiaka et al. (2022) established that SMEs that used more than one platform recorded improved financial performance compared to those that used single platforms. Okechukwu et al. (2025) empirically proved that Facebook, Instagram, and WhatsApp significantly and positively impacted the performance of SMEs, and Instagram has the strongest impact as it is more visual and branding. Palladan et al. (2023) also found that the choice of the platform was influenced by the environmental pressure and familiarity with the owners instead of the systematic

strategy. Although this has been established, the majority of the research is on establishing popular platforms instead of critically comparing platform performance in a given locality. Moreover, novel platforms like TikTok are frequently discussed in a descriptive but non-systematic manner in terms of their impact on SME performance at the grassroots level.

Empirical Review on Social Media Usage and SME Operational Effectiveness

There is also a strong empirical evidence on the positive association between the use of social media and the effectiveness of the operation of SMEs. According to Ogunnaike and Kehinde (2013), social networking was associated with better customer relations and business development. As demonstrated by Parveen et al. (2015), the use of social media resulted in the improvement of coordination within the company, marketing performance, and decision making. Isiaka et al. (2022) have presented quantitative data that SMEs that had social media presence had far more profits and revenues as compared to non users. Palladan et al. (2023) moved this debate a step further by demonstrating that the adoption of social media directly contributed to the performance of SMEs and that the relationship between business strategy and adoption was moderated. Okechukwu et al (2025) established that over 60 percent of the differences in SME performance in Aba could be attributed to the use of social media as sales growth, customer engagement, and efficiency of communication improved. Though, the majority of research undertakings theorise the use of social media in general, without specifically isolating the frequency of use as an operational effectiveness predictor. Also, the measure of performance is usually monetised and little attention is paid to operational effectiveness, a factor comprised of speed, coordination, and process efficiency. Such omissions undermine the explanatory power of existing literature.

Methodology

This study adopted a quantitative research design, which enabled the collection of numerical data that facilitated objective measurement, as well as the testing of relationships among key variables of the study. The population of the study comprised SME owners operating within Mainland Local Government Area of Lagos State. A purposive sampling technique was employed to select respondents who were considered relevant to the study objectives. Specifically, SME owners who had at least primary education and were able to read and write in English were targeted, on the grounds that they possessed the minimum literacy required to meaningfully engage with social media platforms and accurately respond to the research instrument. A total of 350 questionnaires were administered to eligible SME owners across different business sectors within the study area. Out of these, 184 questionnaires were correctly completed and retrieved within 3 months of data collection, representing the final sample sise used for data analysis.

Data for the study were collected using a researcher-designed questionnaire titled *"Social Media Adoption and Usage Patterns among SMEs Questionnaire (SMAUPS-Q)"*. The instrument was structured into four sections. Section A elicited demographic information of the respondents (4 items), including gender, educational qualification, type of business, and years of business experience. Section B identified the social media platforms most commonly used by SMEs and was designed using an open-ended format. Section C examined the frequency of social media usage in daily business operations (10 items), focusing on how often SMEs engage social media for marketing, communication, and sales-related activities. Finally, Section D measured the perceived effectiveness of the platforms for business operations (10 items). Items in Sections B to D were rated on a 4-point Likert scale ranging from Strongly Agree (5) to Strongly Disagree (1).

To ensure the reliability of the instrument, a pilot study was conducted using 20 SME owners outside the main sample but within a similar business environment. The internal consistency of the questionnaire was tested using Cronbach's Alpha, which yielded coefficients ranging between 0.718 and 0.752 across the constructs, indicating that the instrument was sufficiently reliable for the main study. Data collected were analysed using descriptive and inferential statistics. Descriptive statistics such as frequency counts, percentages, and mean scores were used to answer the research objectives. The Pearson Product Moment Correlation was employed to test the null hypothesis at a 0.05 level of significance. Statistical analyses were carried out using Statistical Package for Social Science.

Results

Table 1: Presentation of Participants' Demographics

Variable	Category	N	%
Gender	Male	42	22.8
	Female	142	77.2
Educational Qualification	Primary School Certificate	18	9.8
	Secondary School Certificate	56	30.4
	NCE / OND	40	21.7
	HND / Bachelor's Degree	70	38.0
	Postgraduate Qualification	0	0.0
Type of Business	Trading	70	38.0
	Manufacturing	28	15.2
	Services	56	30.4
	Agriculture	0	0.0
	Other	30	16.3
Years of Business Experience	Less than 5 years	15	8.2
	5 – 10 years	68	37.0
	11 – 15 years	36	19.6
	Above 15 years	65	35.3

Table 1 indicates that out of the 184 respondents, 142 (77.2%) were female, while 42 (22.8%) were male, showing higher female participation in SMEs. With respect to education, 70 respondents (38.0%) possessed HND/Bachelor's degrees, 56 (30.4%) had secondary school certificates, 40 (21.7%) held NCE/OND, and 18 (9.8%) had primary education, while none had postgraduate qualifications. In terms of business type, 70 respondents (38.0%) were engaged in trading, 56 (30.4%) in services, 28 (15.2%) in manufacturing, and 30 (16.3%) in other businesses. Regarding experience, 68 respondents (37.0%) had 5–10 years, 65 (35.3%) had over 15 years, 36 (19.6%) had 11–15 years, and 15 (8.2%) had less than five years' experience.

Answering of Research Questions

Research Question 1: How often do SMEs in Mainland Local Government Area use social media in their daily business operations?

Table 2: Frequency of Social Media Usage among Respondents

S/N	Items	Never	Rarely	Sometimes	Often	Very Often	Mean
1	I check my social media accounts as soon as I wake up	10 (5.4%)	18 (9.8%)	36 (19.6%)	60 (32.6%)	60 (32.6%)	3.78
2	I find it difficult to stop using social media even when I have other important things to do	20 (10.9%)	30 (16.3%)	50 (27.2%)	48 (26.1%)	36 (19.6%)	3.27
3	I spend more time on social media than I originally intended	12 (6.5%)	22 (12.0%)	40 (21.7%)	60 (32.6%)	50 (27.2%)	3.62
4	I feel anxious or restless when I cannot access social media	40 (21.7%)	36 (19.6%)	50 (27.2%)	34 (18.5%)	24 (13.0%)	2.81
5	I use social media to escape from negative feelings or boredom	18 (9.8%)	30 (16.3%)	56 (30.4%)	44 (23.9%)	36 (19.6%)	3.27
6	I compare myself to others based on what I see on social media	30 (16.3%)	40 (21.7%)	52 (28.3%)	36 (19.6%)	26 (14.1%)	2.93
7	I lose track of time while browsing social media	14 (7.6%)	20 (10.9%)	40 (21.7%)	62 (33.7%)	48 (26.1%)	3.59
8	I neglect responsibilities because of social media use	50 (27.2%)	46 (25.0%)	44 (23.9%)	26 (14.1%)	18 (9.8%)	2.54
9	I feel the need to check notifications frequently throughout the day	10 (5.4%)	18 (9.8%)	36 (19.6%)	64 (34.8%)	56 (30.4%)	3.75
10	I feel upset if my posts do not receive attention	36 (19.6%)	40 (21.7%)	50 (27.2%)	34 (18.5%)	24 (13.0%)	2.84

Table 2 indicate that SMEs in Mainland Local Government Area use social media frequently, as supported by all ten metrics. A high proportion of respondents reported checking social media upon waking (65.2%; Mean = 3.78) and frequently checking notifications (65.2%; Mean = 3.75). Many also spend more time than intended (59.8%; Mean = 3.62) and lose track of time (59.8%; Mean = 3.59), indicating strong engagement. Moderate responses were observed for difficulty stopping usage (45.7%; Mean = 3.27) and using social media to escape boredom (43.5%; Mean = 3.27). Comparatively lower engagement was recorded for anxiety when unable to access social media (31.5%; Mean = 2.81), social comparison (33.7%; Mean = 2.93), emotional reaction to low engagement (31.5%; Mean = 2.84), and neglect of responsibilities (23.9%; Mean = 2.54). Hence, SMEs use social media often, though mainly for general engagement rather than structured business purposes.

Research Question 2: Which social media platforms are most commonly utilised by SMEs in the Mainland Local Government Area?

Table 3: Social Media Platforms Used by SMEs

S/N	Platform	Yes (n)	%
1	WhatsApp	170	92.4
2	Facebook	120	65.2
3	Instagram	135	73.4
4	TikTok	110	59.8
5	X (Twitter)	30	16.3
6	LinkedIn	0	0.0
7	YouTube	0	0.0
8	Google Business Profile	0	0.0
9	Telegram	80	43.5
10	Snapchat	0	0.0
11	Pinterest	0	0.0
12	Threads	15	8.2
13	Email Marketing	0	0.0

The findings show that SMEs in Mainland Local Government Area predominantly utilise a few key social media platforms for their business activities. WhatsApp (92.4%) is the most widely used platform, indicating its strong role in direct communication and daily business operations. This is followed by Instagram (73.4%) and Facebook (65.2%), which are commonly used for product display and marketing. TikTok (59.8%) also records notable usage, reflecting its growing relevance in creating awareness through short-form content. In contrast, other platforms such as Telegram (43.5%), X (16.3%), and Threads (8.2%) show relatively lower adoption, while several platforms recorded no usage. Hence, SMEs mainly rely on WhatsApp, Instagram, Facebook, and TikTok, highlighting a preference for accessible, interactive, and visually driven platforms for business engagement.

Research Question 3: To what extent do SMEs perceive social media platforms as operationally effective for their business operations?

Table 4: Perceived Effectiveness of Social Media Platforms

S/N	Items	SA (5)	A (4)	N (3)	D (2)	SD (1)	Mean
1	The social media platforms I use make it easy to communicate with my customers.	70 (38.0%)	65 (35.3%)	25 (13.6%)	14 (7.6%)	10 (5.4%)	3.93
2	The social media platforms I use help my business reach a wide range of customers.	68 (37.0%)	70 (38.0%)	20 (10.9%)	16 (8.7%)	10 (5.4%)	3.93
3	The social media platforms I use are effective for advertising my products or services.	60 (32.6%)	72 (39.1%)	26 (14.1%)	16 (8.7%)	10 (5.4%)	3.85
4	The social media platforms I use make it easier for customers to make enquiries.	72 (39.1%)	66 (35.9%)	20 (10.9%)	14 (7.6%)	12 (6.5%)	3.93
5	The social media platforms I use help customers locate my business easily.	50 (27.2%)	60 (32.6%)	36 (19.6%)	22 (12.0%)	16 (8.7%)	3.57
6	The social media platforms I use improve awareness of my business.	75 (40.8%)	65 (35.3%)	20 (10.9%)	14 (7.6%)	10 (5.4%)	3.93
7	The social media platforms I use are cost-effective for promoting my business.	80 (43.5%)	60 (32.6%)	18 (9.8%)	14 (7.6%)	12 (6.5%)	3.99
8	The social media platforms I use help attract new customers.	65 (35.3%)	70 (38.0%)	24 (13.0%)	14 (7.6%)	11 (6.0%)	3.90
9	The social media platforms I use help me maintain relationships with existing customers.	70 (38.0%)	64 (34.8%)	22 (12.0%)	16 (8.7%)	12 (6.5%)	3.89
10	Overall, the social media platforms I use are effective in supporting my business activities.	72 (39.1%)	66 (35.9%)	20 (10.9%)	14 (7.6%)	12 (6.5%)	3.92

The findings in Table 4 show that SMEs in Mainland Local Government Area perceive social media platforms as moderately effective for business operations across all ten metrics. A majority agreed that social media enhances communication (73.3%; Mean = 3.93), enables wider customer reach (75.0%; Mean = 3.93), supports advertising (71.7%; Mean = 3.85), and facilitates customer enquiries (75.0%; Mean = 3.93). Similarly, respondents acknowledged its role in improving business awareness (76.1%; Mean = 3.93), attracting new customers (73.3%; Mean = 3.90), maintaining relationships (72.8%; Mean = 3.89), and overall effectiveness (75.0%; Mean = 3.92). It was also considered cost-effective (76.1%; Mean = 3.99). However, effectiveness in helping customers locate businesses was comparatively lower (59.8%; Mean = 3.57). Hence, SMEs perceive social media as useful but not fully maximised for structured business operations.

Test of Hypothesis

Ho_1: There is no significant relationship between the frequency of social media usage and the operational effectiveness of Small and Medium Enterprises (SMEs) in Mainland Local Government Area of Lagos State.

Table 5: Correlation Analysis showing relationship between frequency of social media usage and operational effectiveness of SMEs

Variable	N	$\bar{X}$	SD	df	Cal r-value	p-value	Decision
Frequency of Social Media Usage	184	3.35	0.62	182			Ho Rejected
Operational Effectiveness of SMEs	184	3.88	0.41		0.312	0.001	

Significant at $p < 0.05$

The results in Table 5 show that the mean score for frequency of social media usage is 3.35 (SD = 0.62), indicating a moderate level of usage among SMEs, while operational effectiveness has a higher mean of 3.88 (SD = 0.41), suggesting relatively positive business outcomes. The Pearson correlation coefficient (r = 0.312) indicates a moderate positive relationship between the two variables.

Furthermore, the p-value (0.001) is less than the significance level of 0.05, confirming that the relationship is statistically significant. This implies that SMEs that use social media more frequently tend to experience better operational effectiveness. Although the relationship is not very strong, it is meaningful and suggests that increased engagement contributes to improved business performance. Therefore, the null hypothesis (Ho_1), which states that there is no significant relationship between frequency of social media usage and operational effectiveness of SMEs, is rejected.

Discussion of Findings

The results of the Research Question 1 indicate that SMEs in Mainland Local Government Area adopt the use of social media on a regular basis in their day-to-day business activities. Large percentages of the respondents indicated checking social media early in the day and often during the day as indicated by high mean scores on the items of account checking, monitoring notification, time spent online, and awareness of time loss. This trend implies that social media has integrated into the daily habits of SME owners. In the terms of TAM, such frequent use indicates high perceived ease of use since platforms are easy to use, are easily accessible, and are mobile-friendly, the more they are used repeatedly, the less cognitive and technical load they should have. This observation is consistent with Ogunnaike and Kehinde (2013) and Parveen et al. (2015), who found out that SMEs use social media regularly to communicate and to coordinate due to its convenience and low entry barriers. Nevertheless, reduced means of neglect of responsibilities and emotional distress suggest that despite a high frequency of usage, it is not too disruptive. This implies that social media is mainly a supportive tool used by the SMEs, but not a compulsive or totally non-productive tool. This localised characteristic of the evidence is an expansion of the literature that has focused on frequency of usage on primarily national or metropolitan scales, which adds context-sensitive information on Lagos Mainland.

The findings that respond to Research Question 2 indicate that SMEs depend mainly on an insufficient amount of platforms, specifically WhatsApp, Instagram, Facebook, and Tik Tok. WhatsApp became the most popular one, which indicates its use in direct communication, order handling, and managing customer relationships. Instagram and Facebook were also popular to use in marketing and displaying the products, whereas Tik Tok demonstrated an increasing importance in creating awareness. This trend is a strong indicator of the perceived usefulness construct of TAM. SMEs embraced platforms that can be directly integrated with their gross business requirements like communication with customers, visibility of products and reach to their customers through marketing. These results are in line with Oyekan (2022) and Isiaka et al. (2022), who found that interactive, visual, and cost-effective platforms are prioritised by the Nigerian SMEs. The fact that more formal or resource-demanding platforms, e.g. LinkedIn, YouTube, or Google Business Profile, are not widely used, also contributes to the thesis that ease of use and instant business applicability are more influential than strategic considerations in adoption decisions. This confirms the Palladan et al. (2023) stand that familiarity and practicality tend to influence SME platform decisions instead of digital strategy plans.

The results of Research Question 3 show that SMEs find social media platforms moderately to highly useful to support the business operations. Communication efficiency, customer reach, advertising effectiveness, awareness creation, cost-effectiveness, customer attraction and relationship maintenance were rated highly in terms of mean scores. These results indicate a high perceived usefulness, where SMEs are of the view that social media positively impacts the business performance measures of visibility, responsiveness, and market reach. Nevertheless, comparatively lower scores in helping customers find business imply that not all the operational dimensions are optimised to the maximum, which may be because of the lack of use of all the features, including location tagging or business profiles. This subtlety corroborates the previous empirical findings that SMEs tend to use the functionality of social media platforms to a greater extent. The results are aligned with Ogunnaike and Kehinde (2013), Parveen et al. (2015), and Okechukwu et al. (2025), who have demonstrated the positive impact of social media on customer interaction, marketing performance, and sales.

Lastly, the hypothesis test showed statistically significant positive correlation between frequency of social media use and operational effectiveness of SMEs. The correlation was moderate, but it proves the assumption of TAM that actual usage is the manifested technology acceptance and is a contributor to performance outcomes. SMEs that interact more with social media are likely to have improved communication, customer interaction, and operational performance. The finding fills a significant gap in the literature, as it empirically proves, on a local government scale, that frequency of use is not descriptive only but can also be used to explain operational outcomes. It supplements earlier research which has looked at performance in general but has not singled out usage frequency as a predictor.

Conclusion

Based on the findings of the study, it can be concluded that social media has become an integral part of the daily operations of SMEs in Mainland Local Government Area of Lagos State. SMEs make frequent use of accessible platforms such as WhatsApp, Instagram, Facebook, and TikTok. The study further established that SMEs generally perceive social media platforms as operationally effective, particularly in enhancing customer reach, visibility, communication efficiency, and cost-effective promotion. Notably, a statistically significant positive relationship exists between the frequency of social media usage and operational effectiveness, indicating that increased engagement contributes to improved business outcomes. However, social media tools are not yet fully maximised for structured and strategic business operations as greater strategic utilisation could enhance its benefits further.

Recommendations

Based on the findings of the study, the following recommendations are proposed:

1. **Capacity building for SMEs on strategic social media use:** SME owners should be encouraged to move beyond informal and routine use of social media by acquiring structured skills in digital marketing, customer relationship management, and business analytics. Targeted training programmes and workshops organised by government agencies, trade associations, and development partners can help SMEs maximise social media for improved operational efficiency and competitiveness.
2. **Training of Business Education teachers and curriculum integration:** Business Education teachers in tertiary institutions should be adequately trained on the practical use of social media for business operations, including digital marketing, online branding, and customer engagement. Furthermore, social media–based business practices should be integrated into the Business Education curriculum across junior secondary, senior secondary, and tertiary levels to equip students early with relevant digital entrepreneurial skills.
3. **Institutional and policy support for SME digitalisation:** Government and relevant stakeholders should provide supportive digital infrastructure, affordable internet access, and policy incentives that encourage SMEs to adopt and effectively use social media platforms. This would enhance sustained usage and improve the operational outcomes of SMEs.

Abstract

Digital transformation is increasingly reshaping economic activity, employment and entrepreneurship across Africa. The rapid diffusion of mobile technologies, digital platforms, digital financial services and emerging technologies has created new opportunities for young people to participate in technology-driven economic activities. However, access to digital technologies does not automatically translate into productive entrepreneurial outcomes. This paper reviews the literature on the relationship between digital transformation, digital skills and youth techno-entrepreneurship in Africa, with particular emphasis on how digital skills enable young people to convert technological opportunities into entrepreneurial capabilities. The paper adopts an integrative literature review approach, drawing on studies and institutional reports published mainly between 2020 and 2026. The review reveals that digital transformation has expanded opportunities for youth entrepreneurship through digital platforms, e-commerce, fintech, EdTech, HealthTech, AgriTech and other technology-enabled activities. However, the extent to which young people benefit from these opportunities is strongly conditioned by their level and type of digital skills, as well as by infrastructure, finance, education, policy and entrepreneurial ecosystem conditions. Recent evidence further suggests that intermediate and advanced digital skills may generate greater employment and entrepreneurial value than basic digital literacy, while domain-specific information technology knowledge can strengthen opportunity recognition and nascent digital entrepreneurship. The paper argues that digital skills constitute a critical human-capital bridge between digital transformation and youth techno-entrepreneurship. It proposes an integrated framework in which digital transformation creates opportunities, digital skills generate entrepreneurial capability, and supportive ecosystems enable young people to convert these capabilities into sustainable technology-based enterprises. The paper concludes with implications for African governments, educational institutions, technology ecosystems and youth-development programmes.

Keywords: Digital transformation, digital skills, techno-entrepreneurship, youth, digital entrepreneurship, Africa, digital human capital.

1. INTRODUCTION

Digital transformation has become one of the most significant forces reshaping contemporary economies. The expansion of internet connectivity, smartphones, digital platforms, mobile financial services, cloud technologies, artificial intelligence and other emerging technologies has altered how individuals communicate, learn, work and conduct business. In Africa, these developments are occurring alongside a rapidly growing youth population and persistent challenges of unemployment, underemployment and limited access to formal economic opportunities.The convergence of these trends has generated increasing interest in digital entrepreneurship as a potential pathway for youth employment, innovation and economic inclusion. Friederici, Wahome and Graham (2020), describe the growth of digital entrepreneurship across Africa while emphasizing the importance of understanding African entrepreneurial ecosystems on their own terms.Their work demonstrates that Africa's digital entrepreneurial landscape has expanded through technology hubs, start-up ecosystems, entrepreneurship programmes, investment funds and digital platforms.

The digital transformation of African economies has also created opportunities for young people to engage in new forms of income generation. Mobile technologies, digital platforms and social media increasingly allow young people to market goods and services, communicate with customers, access information, conduct financial transactions and participate in online markets. Evidence from Centuries indicates that productive digital skills are particularly important for converting technological access into employment and income-generating opportunities. Nevertheless, digital access should not be confused

with digital capability. Having a smartphone, internet connection or access to a digital platform does not necessarily mean that an individual possesses the competencies required to create and manage a technology-based enterprise. This distinction is increasingly recognized in the literature. Carboni, Makuvaza and van der Linden (2020) found significant variation in the supply and demand for digital skills in African countries, including Kenya, Ghana and Senegal. Their work also identified substantial opportunities for developing digital skills within informal economic activities.

The distinction between digital access and digital capability is particularly important for Africa's youth. The continent has one of the world's youngest populations, yet many young people remain disconnected from productive employment opportunities. Consequently, digital transformation has frequently been presented as a mechanism through which young people can overcome geographical and institutional barriers to entrepreneurship. However, the benefits of this transformation are not automatic. They depend on whether young people possess the skills, resources and institutional support required to exploit digital opportunities. Recent evidence strengthens this argument. A 2026 systematic review of 23 quantitative studies examining digital skills and youth employment in Sub-Saharan Africa found that all reviewed studies pointed toward a positive relationship between digital skills and employment prospects, although only 10 reported statistically significant effects. Importantly, the review found that intermediate and advanced digital skills appeared more consequential than basic digital literacy.

Similarly, Sitaridis and Kitsios (2026) demonstrate that domain-specific IT knowledge can play a direct role in nascent digital entrepreneurship, while opportunity recognition acts as an important mechanism linking digital human capital to entrepreneurial activity. This suggests that the quality and specificity of digital skills matter, not merely access to technology or general computer competence. Against this background, this paper examines digital skills as a potential catalyst through which digital transformation can facilitate youth techno-entrepreneurship in Africa.

2. CONCEPTUALISING DIGITAL TRANSFORMATION

2.1 Digital Transformation

Digital transformation refers to the broad process through which digital technologies alter economic activities, organizational processes, markets, institutions and social interactions. It extends beyond the simple conversion of analogue information into digital formats. Rather, it involves the restructuring of activities and relationships around digital technologies.

In the African context, digital transformation includes the expansion of broadband and mobile connectivity, digital financial services, online platforms, e-commerce, digital public services and technology-based enterprises. The World Bank's digital-economy approach identifies digital infrastructure, digital public platforms, digital financial services, digital businesses and digital skills as interconnected components of a digital economy.

2.2 Digital Transformation and New Entrepreneurial Opportunities

Digital transformation has lowered some traditional barriers to entrepreneurship. A young entrepreneur can increasingly advertise products through social media, sell through online platforms, receive digital payments, communicate with customers remotely and access markets beyond the immediate geographical location. Ajide and Osinubi (2023) provide empirical evidence linking digital technology usage and entrepreneurship across selected African countries, reinforcing the argument that digital technologies have become increasingly relevant to entrepreneurial development.

However, digital transformation can simultaneously create new inequalities. Young people without affordable internet, appropriate devices, digital competencies, finance or supportive institutions may be excluded from the opportunities created by digitalization. Thus, digital transformation creates potential entrepreneurial opportunities, but digital skills and enabling conditions determine whether those opportunities can be converted into productive outcomes.

3. DIGITAL SKILLS AND DIGITAL HUMAN CAPITAL

3.1 Understanding Digital Skills

Digital skills encompass the knowledge and competencies required to use digital technologies effectively. They range from basic abilities such as accessing information and communicating online to more advanced capabilities involving programming, data analytics, artificial intelligence, cyber security and digital business development. For analytical purposes, digital skills can be classified into three broad categories.

Basic digital skills

These include: operating digital devices; accessing the internet; communicating digitally; searching for information; using basic applications.

Intermediate digital skills

These include: digital marketing; e-commerce; online business management; digital financial services; data handling; social-media management; digital content creation.

Advanced digital skills

These include: programming; artificial intelligence; machine learning; advanced data analytics; cloud computing; cyber security; software development.

The distinction is important because entrepreneurial outcomes may depend increasingly on higher-level capabilities rather than basic digital literacy alone.

3.2 Digital Skills as Human Capital

Human Capital Theory provides a useful basis for understanding the importance of digital skills. The theory views education, knowledge and skills as investments that enhance individuals' productive capabilities. Applied to digital entrepreneurship, digital skills represent a form of human capital that allows individuals to identify opportunities, use technologies, develop products and services, access markets and manage digital businesses. Sitaridis and Kitsios (2026) found that domain-specific IT knowledge had a significant positive relationship with opportunity recognition, digital entrepreneurial intentions and nascent digital entrepreneurial activity. Their findings suggest that entrepreneurial education should not focus exclusively on generic computer literacy but should incorporate technical knowledge relevant to emerging technologies.

4. YOUTH TECHNO-ENTREPRENEURSHIP IN AFRICA

Techno-entrepreneurship refers broadly to entrepreneurial activity in which technology plays a central role in identifying opportunities, developing products or services, creating enterprises or generating value. It therefore extends beyond conventional entrepreneurship conducted through digital communication. A techno-entrepreneur may develop software, operate an e-commerce platform, provide digital financial services, create an AgriTech solution, develop an EdTech product or use advanced technologies to solve social and economic problems. Africa's youth have increasingly participated in such activities. Digital entrepreneurship ecosystems have emerged around technology hubs, accelerators, incubators, universities, online communities and investment networks. Friederici et al. (2020) demonstrate that African digital entrepreneurship should be understood in relation to local institutional and economic realities rather than evaluated exclusively through Silicon Valley expectations.

The UNDP/AUC/HP Foundation (2023) similarly identifies FinTech, EdTech, HealthTech and AgriTech as important areas in which African digital entrepreneurs are contributing to development objectives. However, the literature also challenges overly optimistic assumptions about digital entrepreneurship. Pijnaker's (2025) study of young Ghanaian digital entrepreneurs demonstrates that the promise of digital start-ups as a straightforward pathway out of unemployment can be misleading. The study shows that entrepreneurial failure and unstable start-up trajectories can produce downward rather than upward socioeconomic mobility.

This critical perspective is important because it suggests that digital entrepreneurship should not simply be promoted as an automatic solution to youth unemployment. Instead, attention should be paid to the quality, sustainability and productivity of digital entrepreneurial activities.

5. THE RELATIONSHIP BETWEEN DIGITAL SKILLS AND TECHNO-ENTREPRENEURSHIP

The literature suggests that digital skills can contribute to techno-entrepreneurship through several interconnected mechanisms.

5.1 Opportunity Recognition

Digital skills enable young people to search for information, identify market gaps and understand emerging consumer needs. More advanced digital competencies can also expose entrepreneurs to new technologies and business models. Sitaridis and Kitsios (2026) are particularly important here because they identify opportunity recognition as a mechanism connecting digital human capital with digital entrepreneurial activity.

5.2 Innovation

Technology skills can increase the ability of young entrepreneurs to develop innovative products and services. For example, programming and data-analysis skills can facilitate the development of digital applications, while AI skills can support the development of new technology-enabled solutions.

5.3 Market Access

Digital platforms enable young entrepreneurs to reach customers beyond traditional geographical boundaries. Social media, e-commerce platforms and digital payment systems can reduce some of the costs associated with traditional market entry.

5.4 Digital Financial Access

Digital financial technologies can support entrepreneurship by facilitating payments, saving, borrowing and other financial transactions. Mathibe and Oppong (2025), using data from 30 Sub-Saharan African countries covering 2016–2023, indicates that digital technologies, including mobile banking, fintech and digital platforms, can enhance financial inclusion and entrepreneurial activity.

5.5 Business Management

Digital competencies can improve entrepreneurs' ability to manage customers, inventory, finances, marketing and business information. Thus, digital skills should not be understood merely as technical competencies. They also represent entrepreneurial capabilities that allow individuals to transform digital resources into economic value.

6. EVIDENCE FROM AFRICA

The African evidence reveals both opportunities and constraints. Carboni et al. (2020) demonstrate that digital skills are already being used within African informal economies but that there remain substantial gaps in skills development and exposure opportunities. Their evidence from Kenya, Ghana and Senegal illustrates the importance of aligning training with actual labour-market and economic needs. In Nigeria, Osiesi et al. (2024) examined entrepreneurial digital skills among 250 Business Education undergraduates at the Federal University Oye-Ekiti. The study found moderate levels of entrepreneurial digital skills, relatively high digital knowledge and substantial use of entrepreneurial digital competencies. The authors recommended stronger institutional support and integration of digital education into university curricula. In Rwanda, Dinika (2024) examined digital skills and entrepreneurship training as responses to youth unemployment. Drawing on Human Capital Theory and Entrepreneurship Theory, the study emphasized the importance of skills development, entrepreneurship programmes, policy and multi-stakeholder collaboration.

At the continental level, the 2025 scoping review by Mwesha, Koome and Wachira examined 20 studies published between 2019 and 2024. The review found that digital-skills development can enhance employability and that digital platforms can support youth entrepreneurship by expanding market and self-employment opportunities. However, infrastructure deficiencies, weak government support and rural digital divides remain significant barriers. These findings suggest that digital skills should be viewed within a broader ecosystem. Skills without connectivity may have limited value; connectivity without skills may produce passive technology consumption rather than productive entrepreneurship.

7. THE DIGITAL DIVIDE AND INCLUSIVE TECHNO-ENTREPRENEURSHIP

One of the central challenges facing African digital entrepreneurship is the digital divide. The digital divide is not simply the difference between people who have internet access and those who do not. It increasingly includes differences in: quality of connectivity; affordability; device ownership; digital literacy; advanced technical skills; digital financial access; ability to convert technology into economic value. Consequently, two individuals may both possess smartphones but derive substantially different economic benefits from them because of differences in skills, education, finance and entrepreneurial capability. This has important implications for youth development. Programmes that provide devices or internet connectivity without complementary skills training may improve access without necessarily improving entrepreneurial outcomes.

The evidence reviewed by Musuva (2026) supports a shift from basic digital literacy toward intermediate and advanced competencies. Similarly, the 2025 African scoping review identifies infrastructure limitations and rural digital exclusion as continuing challenges. Therefore, inclusive digital entrepreneurship requires simultaneous attention to access, affordability, skills and opportunity.

8. DIGITAL ENTREPRENEURSHIP ECOSYSTEMS

Digital skills alone cannot explain the success or failure of techno-entrepreneurship.

Entrepreneurs require supportive ecosystems involving: universities; technology hubs; incubators; accelerators; financial institutions; venture capital; government agencies; telecommunications companies; digital platforms; mentors; customers and markets The UNDP/AUC/HP Foundation report emphasizes strengthening Africa's entrepreneurship ecosystem alongside digital resources and skills development. The OECD's work on Africa's digital transformation likewise highlights the importance of digital skills and entrepreneurial ecosystems in enabling young people to participate productively in digital economies.

9. THE CRITICAL SYNTHESIS: FROM DIGITAL ACCESS TO ENTREPRENEURIAL CAPABILITY

The literature reviewed suggests that three stages should be distinguished.

Stage 1: Digital Access Young people gain access to: internet; smartphones; computers; digital platforms; digital financial services.
Stage 2: Digital Capability, Young people acquire: digital literacy; technical skills; digital business skills; data and AI competencies; problem-solving capabilities.
Stage 3: Entrepreneurial Application.
Young people use these capabilities to: identify opportunities; develop products; create businesses; reach markets; innovate; scale enterprises.
Therefore: Digital access does not necessarily produce digital entrepreneurship. Digital capability is the mechanism that enables technological access to become entrepreneurial value.

10. GAPS IN THE EXISTING LITERATURE

Despite the expanding literature, several gaps remain.

10.1 Conceptual Gap

Existing studies frequently examine digital transformation, digital skills, employment and entrepreneurship separately. There remains a need for greater integration of these concepts into a unified framework of youth techno-entrepreneurship.

10.2 Skills-Level Gap

Much of the intervention literature concentrates on basic digital literacy. Recent evidence suggests that intermediate and advanced skills may be more important for meaningful employment and entrepreneurial outcomes.

10.3 African Context Gap

Much of the digital entrepreneurship literature is influenced by models developed in advanced economies. African digital entrepreneurial ecosystems have distinctive institutional, infrastructural and financial conditions that require context-specific interpretation.

10.4 Sustainability Gap

Digital entrepreneurship is often presented as a solution to youth unemployment, but evidence from Ghana demonstrates that entrepreneurial failure and unstable start-up trajectories can produce disappointing or even negative socioeconomic outcomes.

10.5 Emerging Technology Gap

Artificial intelligence and other advanced technologies are changing the nature of digital entrepreneurship. Recent African reviews identify AI and emerging technologies as areas requiring substantially more research.

10.6 Gender and Spatial Gap

More research is needed on differences in digital entrepreneurial opportunities between: male and female youth; urban and rural youth; highly educated and less educated youth; formal and informal entrepreneurs.

11. CONCLUSION

Digital transformation has fundamentally altered the entrepreneurial landscape in Africa. Digital platforms, mobile technologies, financial technologies and emerging technologies have created new opportunities for young people to participate in technology-enabled economic activities. However, technology access alone does not guarantee productive entrepreneurial outcomes. The literature reviewed in this paper demonstrates that digital skills are an important human-capital bridge between technological opportunities and entrepreneurial capability. Recent evidence indicates that intermediate and advanced digital competencies may be particularly important, while domain-specific IT knowledge can strengthen opportunity recognition and nascent digital entrepreneurship.

At the same time, digital skills cannot be considered in isolation. Infrastructure, affordability, education, finance, policy, mentorship and entrepreneurial ecosystems determine whether young people can transform digital capabilities into sustainable businesses. The paper therefore argues that Africa's policy emphasis should shift from digital access alone to productive digital capability. The objective should not simply be to connect young people to the internet but to equip them with the skills, resources and institutional support required to create economic value from digital technologies. Ultimately, the pathway can be summarized as: Digital Transformation → Digital Access → Digital Skills → Entrepreneurial Capability → Youth Techno-Entrepreneurship → Innovation, Employment and Inclusive Development.

The central message is therefore that digital skills are not merely complementary to digital transformation; they are one of the principal mechanisms through which digital transformation can become economically productive for Africa's youth.

Abstract

This study examined the predictive relationships of digital competence, emotional intelligence, and entrepreneurial intention with perceived entrepreneurial success among Business Education undergraduates in Edo and Delta States, Nigeria. A correlational survey design was adopted. Data were obtained from 570 undergraduates using measures of digital competence, emotional intelligence, entrepreneurial intention, and entrepreneurial success. Descriptive statistics, Pearson product–moment correlation, and simple and multiple linear regression were used to analyse the data. The measures demonstrated acceptable internal consistency, with Cronbach's alpha coefficients of .819 for digital competence, .768 for emotional intelligence, .810 for entrepreneurial intention, and .808 for entrepreneurial success. Digital competence significantly predicted perceived entrepreneurial success, Adjusted R^2 = .448, $F(1, 568) = 463.467$, $p < .001$. Emotional intelligence also significantly predicted perceived entrepreneurial success, AdjustedR^2 = .313, $F(1, 568) = 260.179$, $p < .001$. Entrepreneurial intention was the strongest individual predictor, AdjustedR^2 = .491, $F(1, 568) = 550.309$, $p < .001$. When entered simultaneously, the three predictors accounted for 68.4% of the variance in perceived entrepreneurial success, Adjusted R^2 = .706, $F(3, 566) = 455.462$, $p < .001$. The findings suggest that entrepreneurial preparedness in Business Education is multidimensional and should integrate motivational, digital, and emotional competencies. Because the study is cross-sectional and relies on self-reported measures, the findings should be interpreted as predictive associations rather than causal effects.

Keywords: digital competence; emotional intelligence; entrepreneurial intention; perceived entrepreneurial success; Business Education

Introduction

Entrepreneurship education has become an important component of higher education because universities are increasingly expected to equip graduates with competencies that support self-employment, innovation, opportunity recognition, and economic participation. For Business Education students in particular, entrepreneurship is closely related to the practical application of knowledge in management, accounting, marketing, information technology, and business development. However, exposure to entrepreneurship education does not necessarily guarantee entrepreneurial outcomes. A student may possess entrepreneurial knowledge and express a desire to start a business while lacking the digital capabilities, emotional resources, or practical readiness required to pursue and sustain an opportunity.

The contemporary entrepreneurial environment is also increasingly digital. Digital technologies are used for opportunity search, market analysis, communication, promotion, customer engagement, e-commerce, financial transactions, and innovation. Recent evidence shows that digital competencies are relevant to entrepreneurial intention, although their effects may operate through entrepreneurial orientation and self-efficacy rather than through a simple direct pathway (Bachmann et al., 2024). Similarly, digital competence has been examined as a factor shaping students' digital entrepreneurial intention (Lam et al., 2025). These developments suggest that Business Education programmes need

to treat digital competence as an entrepreneurial capability rather than merely as a general computer skill.

Entrepreneurship also involves uncertainty, interpersonal interaction, persistence, decision-making, and responses to setbacks. Emotional intelligence, broadly understood as the ability to perceive, understand, and regulate emotions and to use emotional information effectively, may therefore be relevant to entrepreneurial functioning. Mayer and Salovey (1997) conceptualized emotional intelligence as a set of abilities concerning the appraisal and use of emotion, while Bar-On (2006) emphasized emotional-social competencies. Recent Nigerian evidence has reported a significant relationship between emotional intelligence and entrepreneurial intention among university undergraduates, with self-efficacy dimensions helping to explain the relationship (Nwibe & Ogbuanya, 2024).

Entrepreneurial intention represents an individual's conscious willingness and commitment to engage in entrepreneurial behaviour. The Theory of Planned Behaviour (TPB) positions intention as a proximal predictor of planned behaviour and explains intention in terms of attitudes, subjective norms, and perceived behavioural control (Ajzen, 1991). Although intention is not identical to actual entrepreneurial behaviour, it remains a central construct in entrepreneurship research. Evidence from extended TPB research also indicates that a gap can exist between intention and subsequent entrepreneurial action, making it important to distinguish intention from entrepreneurial outcomes.

Against this background, the present study examines whether digital competence, emotional intelligence, and entrepreneurial intention are associated with entrepreneurial success among Business Education undergraduates. The study extends the common emphasis on entrepreneurial intention by considering three dimensions simultaneously: motivational readiness, technological capability, and emotional-social capability. This integrated perspective is particularly relevant where students are expected not only to express entrepreneurial aspirations but also to develop the competencies required to act on them.

Statement of the Problem

Despite continued emphasis on entrepreneurship education in tertiary institutions, concerns remain about whether students can translate entrepreneurial knowledge and intentions into meaningful entrepreneurial outcomes. Business Education undergraduates may complete entrepreneurship-related courses and demonstrate favourable attitudes towards entrepreneurship without necessarily possessing the digital and emotional competencies required to identify opportunities, engage customers, manage uncertainty, and sustain entrepreneurial activity. Existing studies have frequently focused on entrepreneurial intention, while fewer studies have examined entrepreneurial success alongside digital competence and emotional intelligence within a single predictive model. The extent to which these variables independently and jointly predict entrepreneurial success among Business Education undergraduates therefore requires empirical attention.

Purpose of the Study

The study examined the predictive relationships between digital competence, emotional intelligence, entrepreneurial intention, and perceived entrepreneurial success among Business Education undergraduates.

Objectives of the Study

Determine the extent to which digital competence predicts perceived entrepreneurial success among Business Education undergraduates.

Examine the extent to which emotional intelligence predicts perceived entrepreneurial success among Business Education undergraduates.

Determine the extent to which entrepreneurial intention predicts perceived entrepreneurial success among Business Education undergraduates.

Determine the joint predictive contribution of digital competence, emotional intelligence, and perceived entrepreneurial intention to entrepreneurial success.

Research Questions

To what extent does digital competence predict perceived entrepreneurial success among Business Education undergraduates?

To what extent does emotional intelligence predict perceived entrepreneurial success among Business Education undergraduates?

To what extent does entrepreneurial intention predict perceived entrepreneurial success among Business Education undergraduates?

What is the joint contribution of digital competence, emotional intelligence, and entrepreneurial intention to perceived entrepreneurial success?

Research Hypotheses

H01: Digital competence does not significantly predict perceived entrepreneurial success among Business Education undergraduates.

H02: Emotional intelligence does not significantly predict perceived entrepreneurial success among Business Education undergraduates.

H03: Entrepreneurial intention does not significantly predict perceived entrepreneurial success among Business Education undergraduates.

H04: Digital competence, emotional intelligence, and entrepreneurial intention do not jointly predict perceived entrepreneurial success among Business Education undergraduates.

Literature Reviews

Digital Competence

Digital competence refers to the knowledge, skills, abilities, and dispositions required to use digital technologies effectively, critically, safely, and responsibly. In an entrepreneurial context, it includes information and data handling, digital communication and collaboration, security, problem-solving, and the application of digital tools to business activities. These capabilities are relevant to market research, customer engagement, online promotion, e-commerce, digital content creation, and technology-enabled business processes. The present study therefore treats digital competence as a multidimensional capability that can support the recognition and exploitation of entrepreneurial opportunities.

Recent empirical work provides support for the relevance of digital competence to entrepreneurship. Bachmann et al. (2024) found that digital competencies are related to entrepreneurial intention, with entrepreneurial orientation and entrepreneurial self-efficacy playing important roles in the relationship. Lam et al. (2025) similarly examined digital competence in relation to digital entrepreneurial intention among university students. These findings provide a contemporary basis for examining digital competence beyond conventional computer literacy and in relation to entrepreneurial outcomes.

Emotional Intelligence

Emotional intelligence concerns the capacity to recognize, understand, regulate, and use emotional information effectively. The ability model developed by Mayer and Salovey (1997) conceptualizes emotional intelligence in terms of abilities associated with perceiving, using, understanding, and managing emotion. Bar-On (2006) presents a related emotional-social perspective that includes personal and interpersonal competencies. In entrepreneurship, such capabilities may be relevant because entrepreneurs must manage uncertainty, interpersonal relationships, setbacks, motivation, and decision-making.

Nwibe and Ogbuanya (2024), in a study of university undergraduates in Nigeria, reported a significant positive relationship between emotional intelligence and entrepreneurial intention and found that self-efficacy dimensions helped explain the relationship. The present study extends this line of inquiry by examining emotional intelligence in relation to the broader outcome labelled entrepreneurial success in the study's measurement framework.

Entrepreneurial Intention

Entrepreneurial intention is an individual's conscious willingness, commitment, and readiness to engage in entrepreneurial activity. Within the Theory of Planned Behaviour, intention is a central proximal determinant of planned behaviour (Ajzen, 1991). Entrepreneurial intention is therefore expected to be relevant to venture-related planning, persistence, and action. However, intention should not be treated as synonymous with actual entrepreneurial behaviour or verified business performance. The distinction is important in the present study because the respondents are undergraduates and the outcome measure is self-reported.

Entrepreneurial Success

Entrepreneurial success can encompass venture creation, growth, profitability, innovation, customer satisfaction, sustainability, and perceived achievement. Objective measures may include revenue, profitability, employment growth, and survival, whereas subjective measures may include satisfaction and perceived achievement. In the present study, entrepreneurial success is an instrument-based, self-reported construct. It should therefore be interpreted as reported entrepreneurial success within the operational definition of the study rather than as independently verified business performance.

Theoretical Framework

Theory of Planned Behaviour

The study draws on Ajzen's (1991) Theory of Planned Behaviour. The theory proposes that behavioural intentions are shaped by attitudes, subjective norms, and perceived behavioural control and that intention are important predictors of planned behaviour. The theory provides the principal explanation for the inclusion of entrepreneurial intention in the present model. However, because the study also

examines digital competence and emotional intelligence, TPB is complemented by human-capital and emotional-intelligence perspectives rather than being treated as a complete explanation of entrepreneurial success.

Emotional Intelligence Perspective

The emotional-intelligence perspective provides a basis for understanding how emotional awareness, regulation, interpersonal functioning, and related competencies may contribute to entrepreneurial functioning. Entrepreneurs frequently operate under conditions of uncertainty and social interaction, making emotional competencies potentially relevant to decision-making, persistence, and relationship management.

Human Capital Theory

Human Capital Theory (Becker, 1964) provides a rationale for viewing knowledge and skills as productive resources. Digital competence can be understood within this perspective as a form of human capital that enables individuals to perform technology-mediated tasks, access information, communicate with markets, and exploit digital opportunities.

Methodology

Research Design

A correlational survey design was adopted because the study sought to examine statistical relationships and predictive associations among naturally occurring variables without experimental manipulation.

Population

The stated population comprised Business Education undergraduates in accredited universities in Edo and Delta States, Nigeria..

Sample and Sampling Procedure

The study analyzed responses from 570 Business Education undergraduates which were distributed through Google form to higher educational institutions offering business education in the sampled state.
.

Instrumentation

Data were collected using four multi-item measures: the Digital Competence Scale (DCS), Emotional Intelligence Scale (EIS), Entrepreneurial Intention Questionnaire (EIQ), and Entrepreneurial Success Scale (ESS). The constructs (DCS, EIS, EIQ and ESS) all had ten items each making a total of 40 items. The items were developed on a Five point Likert scale of Strongly Agreed (SA), Agreed (A), Undecided (U), Disagreed (D) and Strongly Disagreed (SD).

Validity and Reliability

Content validity was established through expert review, while construct validity was assessed using confirmatory factor analysis. Internal consistency using Cronbach's alpha was .819 for digital competence, .768 for emotional intelligence, .810 for entrepreneurial intention, and .808 for entrepreneurial success.

Data Analysis

Descriptive statistics were used to summarize respondents' characteristics and study variables. Pearson product–moment correlations were used to examine bivariate relationships. Simple linear regression was used to test the first three hypotheses, while multiple linear regression was used to test the joint predictive model. Statistical significance was evaluated at the .05 level; all reported models were significant at $p < .001$.

Results

Respondent Characteristics

The analysis included 570 Business Education undergraduates. Females constituted 64.9% (n = 370) and males 35.1% (n = 200). Most respondents were aged 20–24 years (61.4%), and 54.4% were in 100 Level. Respondents were drawn predominantly from federal universities (61.4%), followed by state universities (31.6%) and private universities (7.0%). In addition, 77.2% reported having taken an entrepreneurship course.

Table 1: *Correlation Matrix showing the relationship among digital competence, emotional intelligence, entrepreneurial intention and entrepreneurial success*

Variable	Mean	Standard Deviation	1	2	3	4
1. Digital competence	4.016	0.635	1.000			
2. Emotional intelligence	4.109	0.523	.476	1.000		
3.Entrepreneurial intention	4.391	0.498	.416	.323	1.000	
4. Perceived Entrepreneurial success	4.211	0.572	.656***	.560***	.688***	1.000

***p < .001.

All three predictor variables were positively and significantly associated with entrepreneurial success. Entrepreneurial intention had the strongest bivariate association with entrepreneurial success (r = .688, p < .001), followed by digital competence (r = .656, p < .001) and emotional intelligence (r = .560, p < .001).

Hypothesis Testing

Hypothesis One: Digital competence does not significantly predict perceived entrepreneurial success among Business Education undergraduates.

Table 2: *Digital Competence predicting entrepreneurial success*

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	T	Sig.
1	(Constant)	18.684	1.077		17.340	.000
	Digital Competence	.571	.027	.670	21.528	.000

a. Dependent Variable: Entrepreneurial Success

Note: Adjusted R^2 = .448, df = 1, 568, SE = .027, F = 463.467, P < .05, t = 21.528, β = .670

Table 2 reveals that digital competence (F (1, 568) = 463.467, SE = .027, *β* = .670, t = 21.528) had a significant positive influence on perceived entrepreneurial success. The Adjusted R-square (.448) reveals that 44.8% of the variance in perceived entrepreneurial success is influenced by digital competence. Therefore, hypothesis 1 is rejected in the study. That is, digital competence is a significant predictor of business education students' perceived entrepreneurial success in Edo State.

Hypothesis Two: Emotional intelligence does not significantly predict perceived entrepreneurial success among Business Education undergraduates.

Table 3: *Emotional intelligence predicting* perceived *entrepreneurial success*

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	T	Sig.
1	(Constant)	17.817	1.486		11.989	.000
	Emotional Intelligence	.579	.036	.560	16.130	.000

a. Dependent Variable: Entrepreneurial Success

Note: Adjusted R^2 = .313, df = 1, 568, SE = .036, F = 260.179, P < .05, t = 16.130, β = .560

Table 3 reveals that emotional intelligence (F (1, 568) = 260.179, SE = .036, *β* = .560, t = 16.130) had a significant positive influence on perceived entrepreneurial success. The Adjusted R-square (.313) reveals that 31.3% of the variance in perceived entrepreneurial success is influenced by emotional intelligence. Therefore, hypothesis 2 is rejected in the study. That is, emotional intelligence is a significant predictor of business education students' entrepreneurial success in Edo State.

Hypothesis Three: Entrepreneurial intention does not significantly predict perceived entrepreneurial success among Business Education undergraduates.

Table 4: *Entrepreneurial intention predicting perceived entrepreneurial success*

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	T	Sig.
1	(Constant)	8.162	1.434		5.3691	.000
	Entrepreneurial Intention	.761	.032	.701	23.459	.000

a. Dependent Variable: Perceived Entrepreneurial Success

Note: Adjusted R^2 = .491, df = 1, 568, SE = .032, F = 550.309, P < .05, t = 23.459, β = .701

Table 4 reveals that digital competence (F (1, 568) = 550.309, SE = .032, *β* = .701, t = 23.459) had a significant positive influence on perceived entrepreneurial success. The Adjusted R-square (.491) indicates that entrepreneurial intention explains 49.1% of the variance in entrepreneurial success. Therefore, the study rejects hypothesis 3. That is, digital competence is a significant predictor of business education students' perceived entrepreneurial success in Edo State.

Hypothesis Four: Digital competence, emotional intelligence, and entrepreneurial intention do not jointly predict perceived entrepreneurial success among Business Education undergraduates.

Table 5: Digital competence, emotional intelligence, and entrepreneurial intention *predicting perceived entrepreneurial success*

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	-3.368	1.275		-2.642	.008
	Digital Competence	.307	.023	.361	13.237	.000
	Emotional Intelligence	.243	.027	.235	8.971	.000
	Entrepreneurial Intention	.516	.027	.476	18.777	.000

a. Dependent Variable: Perceived Entrepreneurial Success

Note: Adjusted $R^2 = .706$, df = 3, 566, F = 455.462, P < .05

Table 5 reveals that digital competence, emotional intelligence and entrepreneurial intention (F (3, 566) = 455. 462, jointly had a significant positive influence on perceived entrepreneurial success. The Adjusted R-square (.706) indicates that 70.6% of the variance in perceived entrepreneurial success is explained by digital competence, emotional intelligence and entrepreneurial intention. Table 4 further revealed that all the constructs individually predicts perceived entrepreneurial success.

Discussion

Digital Competence and Entrepreneurial Success

Digital competence was a significant positive predictor of perceived entrepreneurial success and independently explained 44.8% of the variance in the outcome. It also retained a significant unique contribution in the combined model. This finding implies that digital competence plays a significant role in ensuring entrepreneurial success. This finding corroborates the findings by Kim and Jin (2024), QA et al (2024), Ahmed et al (2025), Shatila and Hernandez-Lara (2026), and Shatila et al (2026). However, this finding contradicts the findings by Sanusi and Roostika (2023),Wulandari et al (2024), and Li et al (2025), who in their different studies did not find a significant relationship between digital competence and perceived entrepreneurial success.

Emotional Intelligence and Entrepreneurial Success

Emotional intelligence significantly predicted perceived entrepreneurial success and accounted for 31.3% of the variance when considered individually. This shows that those that are emotionally intelligent are able to make successes in their entrepreneurial adventure. This finding corroborates the findings by Pincheira et al (2023), Peng et al (2024), Kovid et al (2025) and De-Esteban-Escobar et al (2025). This however contradicts the findings by Razzaque et al (2024) and Khan et al (2025) who reported a non-significant relationship between emotional intelligence and perceived entrepreneurial success.

Entrepreneurial Intention and Entrepreneurial Success

Entrepreneurial intention was the strongest individual predictor, explaining 49.1% of the variance in entrepreneurial success and recording the largest standardized coefficient in the combined model. This is consistent with TPB, which places intention at the centre of planned behaviour (Ajzen, 1991). Nevertheless, intention should not be equated with actual venture creation or verified business performance. The high predictive association observed in this study therefore indicates that students who reported stronger entrepreneurial intentions also tended to report higher entrepreneurial success on the study's scale. This finding corroborates the findings by Wiyanto et al (2024) and Rasulong et al (2025) who concluded that entrepreneurial intention plays a significant role in ensuring entrepreneurial success.

Joint Contribution of the Three Predictors

The combined model explained 70.6% of the variance in entrepreneurial success. This finding supports a multidimensional interpretation of entrepreneurial preparedness: entrepreneurial intention represents motivational readiness, digital competence represents technology-enabled capability, and emotional intelligence represents affective and interpersonal resources. The three variables therefore provide complementary information about the outcome. The relatively high R^2 should, however, be interpreted cautiously because all variables were measured through self-report at the same time and the outcome was not independently verified.

Theoretical Implications

The findings provide empirical support for the relevance of TPB to entrepreneurial intention while also suggesting that intention alone does not capture the full range of competencies associated with entrepreneurial outcomes. The significant contributions of digital competence and emotional

intelligence support a broader human-capital and competency perspective. In this integrated view, entrepreneurial intention provides motivational direction, digital competence provides technology-enabled capability, and emotional intelligence provides psychological and interpersonal resources.

Practical Implications

Business Education programmes should provide practical entrepreneurial activities rather than relying mainly on theoretical instruction.

Digital competence should be embedded across entrepreneurship, marketing, accounting, management, and other Business Education courses.

Students should practice digital marketing, e-commerce, online customer engagement, digital content creation, information management, and technology-enabled business planning.

Entrepreneurship education should include structured activities that develop emotional awareness, emotional regulation, resilience, communication, and relationship management.

Universities should provide opportunities for students to convert entrepreneurial intentions into practical projects through mentoring, incubation, enterprise assignments, and supervised business-plan activities.

Limitations

The cross-sectional design permits interpretation of predictive associations but does not establish causal relationships.

The measures are self-reported, creating the possibility of common-method and social-desirability effects.

Entrepreneurial success was not independently verified through business records or objective venture-performance indicators.

The sample is restricted to Business Education undergraduates in Edo and Delta States, which limits generalization to other disciplines and geographical areas.

Entrepreneurial intention and entrepreneurial success were measured contemporaneously, so the study cannot determine whether intention subsequently translated into entrepreneurial behaviour.

Recommendations

Universities should strengthen experiential entrepreneurship education by combining intention formation with practical venture-development activities.

Business Education curricula should deliberately integrate digital entrepreneurship competencies across courses.

Entrepreneurship programmes should include structured emotional-intelligence development activities.

Universities should strengthen mentoring, incubation, enterprise projects, and supervised entrepreneurial practice to narrow the intention–action gap.

Future studies should use longitudinal designs to determine whether entrepreneurial intention predicts subsequent venture creation and performance.

Future research should consider structural equation modeling, mediation analysis, and multi-group analysis across university types and geographical regions.

Future studies should consider entrepreneurial self-efficacy as a possible mediator or explanatory mechanism linking competence variables to entrepreneurial outcomes.

Conclusion

This study provides evidence that digital competence, emotional intelligence, and entrepreneurial intention are significant positive predictors of reported entrepreneurial success among Business Education undergraduates in the study area. The findings support an integrated approach to entrepreneurship education in which students develop the motivation to pursue entrepreneurship alongside the digital and emotional competencies needed to function effectively in entrepreneurial environments. Because the evidence is cross-sectional and self-reported, the findings should be interpreted as predictive associations rather than proof of causal effects or independently verified business success. This study contributes to the body of knowledge especially in exploring the predictive influence of these three constructs (digital competence, emotional intelligence, and entrepreneurial intention) in relation with perceived entrepreneurial success.

Abstract

The integration of digital literacy and digital entrepreneurship skills into Nigerian Business Education curriculum is essential for equipping students with 21st century skills. This study examines the urgent need to review the Business Education curriculum to integrate digital literacy and digital entrepreneurial skills. Traditional Business Education programme often focus on conventional accounting, entrepreneurial, office and management skills. However, the modern economy demands proficiency in digital tools, accounting software, e-commerce, digital marketing, and online enterprise management. This paper adopts a qualitative research method to review existing literature. Findings reveal a significant gap between graduate competencies and the digital demands of the contemporary labour market and startup ecosystem. The study argues that embedding practical digital literacy into Business Education curriculum will enhance student digital entrepreneurial skills and foster tech-driven entrepreneurship. Furthermore, the paper highlights institutional challenges such as infrastructural deficits, inadequate Business Educator training, and rigid academic policies as major setbacks in incorporating digital literacy and digital entrepreneurial skills into Business Education curriculum. The study concluded that modern digital Business Education curriculum should integrate data analytics, digital marketing, e-commerce, and cloud-based financial tools; prepare graduates to launch agile, tech-driven start-ups and teach adaptability and continuous learning in a technologically-driven environment.

Keywords: Digital Literacy; Digital Entrepreneurial Skills, Digital Competence, Entrepreneurial Skills, Information Literacy

Introduction

The contemporary world of work is increasingly shaped by rapid advancements in digital technologies, which have transformed organisational practices and redefined the skills required of entrepreneurs. Digital literacy has therefore become a core competence for effective participation in the modern labour market. The mere acquisition of entrepreneurial skills by entrepreneurs is no longer enough with advancement of artificial intelligence, digitalisation of business activities and remote work; the gap between what Business Education students learn and what the labour market needs is an issue that requires rapid attention.

The National Policy on Education (2013) documented Business Education to be part of Vocational and Technical Education offered in Nigerian tertiary institutions with the aim to impart the necessary skills to individuals who shall be self-reliant economically. This indicates that, Business Education programme is supposed to prepare students to become business owners and thus reducing the rate of unemployment in the country. But universities produced graduates on a yearly basis in different field of study with a huge gap between those that are gainfully employed and those that are unemployed. This is because of the inadequate entrepreneurship skills that will make them entrepreneurs and self-sufficient rather than just job seekers. These skills will make them more innovative and creative if the rate of unemployment in the country is to be reduced (Ore & Hassan, 2023).

Business Education students are basically trained to acquire business skills for paid and self-employment rather than also preparing them to be employers of labour (Ore *et. al.,* 2025). Business Education is a vocational-oriented programme designed to equip students with knowledge, skills, and attitudes necessary for effective participation in the business world as administrators, entrepreneurs, office professionals and educators. Consequently, digital literacy has become a fundamental requirement for Business Education graduates. Despite the relevance of Business Education to

workforce development, students' unemployment remains a major concern in Nigeria. Labour market reports indicate that many graduates are unemployed or underemployed due to a mismatch between the skills acquired in higher education institutions and those required by employers (National Bureau of Statistics, 2023).

Ore (2022) noted that, universities produce huge number of graduates every year but the number of those that are gainfully employed do not commensurate with those that are \unemployed. Hence, the need for innovative, creative and technologically inclined graduates that can be job creators rather than job seekers.

According to Ore *et. al.* (2025), the rate of unemployment is on the rise and the question is; are graduates well equipped with the right skills that will make them become job creators rather than job seekers who can compete favourably with their counterparts? Business Education graduates need to be innovative and creative if the rate of unemployment in the country is to be reduced. The high rate of unemployment in Nigeria is caused by so many factors of which include inadequate entrepreneurial skills and this are cause by inappropriate school curricula (Ibikunle *et al.*, 2019). Graduates with higher levels of digital competence tend to demonstrate better job readiness, adaptability, and workplace productivity (Adeola & Ogunleye, 2021).

Digital literacy has been found to enhance communication skills, entrepreneurial capacity, and problem-solving ability among graduates. These findings highlight the critical role of digital literacy in improving entrepreneurial outcomes. However, evidence suggests that many Business Education graduates still lack adequate digital entrepreneurial skills that will make them excel as job creators rather than job seekers. This deficiency has been linked to out-dated curricula, limited access to information and communication technology (ICT) facilities, insufficient integration of digital tools into teaching and learning, and inadequate digital competence among lecturers (Ogunyemi & Bello, 2022). According to Ogunode and Ndayebom (2023) countries are increasingly focusing on fostering digital literacy and skills development through policies and programmes. However, these efforts are often faced with challenges like limited internet access, inadequate qualified personnel, inadequate funding, unreliable electricity, high maintenance costs and resistance to change.

Literature Review

Digital Literacy

Digital literacy refers to the ability to use digital technologies and tools to access, manage, evaluate, create, and communicate information for academic, professional, and societal purposes (Adewale & Yusuf, 2021). It is a combination of knowledge, skills and attitudes. UNESCO (2018) described digital literacy as the ability to use digital technology, communication tools and networks to locate, use, create and evaluate information. It goes beyond knowing how to operate a computer or a smart phone; digital literacy is about understanding why, when and how to use digital tools effectively, efficiently, safely and securely. It deals with understanding (that is; technical know-how), critical thinking, and ethical awareness.

In the 1980s, digital literacy was known as computer literacy, focusing on basic computer and technical skills such as programming. In the early 1990s, it shifted to focus on knowing how to send an email, navigate the World Wide Web, and use applications. Today, digital literacy encompasses many skills. Digital literacy is the skill set necessary for a person to be an active member of the modern Internet-mediated world (Anthonysamy, 2022). Digital literacy encompasses the understanding, mind-set, and proficiency of individuals ineffectively utilising digital devices, as well as their capacity to access, discern, manipulate, integrate, assess, analyse, and combine diverse digital resources in a meaningful and appropriate manner (Yuan *et al.,* 2021). Nyoman *et al.* (2022) averred that the growth and success of entrepreneurs can be greatly bolstered through the cultivation of digital literacy. This entails fostering proficiency in forging digital business connections, leveraging online resources and amenities, and harnessing the power of expansive networks.

In developing countries such as Nigeria, digital literacy is particularly important due to the growing integration of technology into business operations. Nigeria's labour market has experienced notable changes due to globalisation and the expansion of the digital economy. Entrepreneurs need to be digitally inclined in order to survive the ever-changing business world. As a result, higher education institutions are under pressure to align academic programmes with labour market expectations. Thus, digitally literate graduates are better positioned to engage in self-directed learning and adapt to emerging workplace technologies, thereby enhancing their long-term entrepreneurial.

To be considered digitally literate, a person needs to understand: how to use modern digital technologies to access information, how to manoeuvre through the complex web of information made

available by digital technologies, how to read and understand the messages on digital media, and how he or she can contribute to the digital information economy by using digital technology (Baron, 2019). Digital literacy also contributes to the development of broader entrepreneurial skills such as teamwork, creativity, and critical thinking, which are essential in modern, digitally mediated work environments.

Components of Digital Literacy

Digital literacy is a mind-set that requires a combination of interconnected abilities and skills. Digital literacy lays out five digital competence areas and a total of 21 digital competencies. The digital competence areas include information and data literacy, communication and collaboration, digital content creation, safety, and problem-solving. Digital competence involves the confident, critical and responsible use of, and engagement with, digital technologies for learning, at work, and for participation in society. It includes information and data literacy, communication and collaboration, media literacy, digital content creation (including programming), safety (including digital well-being and competences related to cyber security), intellectual property related questions, problem solving and critical thinking (European Union, 2018).

To address the need for digital literacy, the Coalition for Digital Intelligence created a globally recognised framework for digital literacy, skills and readiness know as the IEEE Standards for Digital Intelligence (DQ) Framework. This framework encompasses eight key competencies, including digital identity, use, safety, security, emotional intelligence, literacy, communication, and rights. It also emphasises three levels of development: citizenship, creativity, and competitiveness (Oladipupo & Abdulazeez, 2024). Digital intelligence is increasingly recognised as a fundamental human right, with the potential to aid sustainable national development through inclusive growth, well-being, and prosperity (Boughzala *et al.,* 2020).

Technical Skills: This skill deals with the ability to use digital tools effectively. Technical skills refer to the proficiency and knowledge individuals possess in effectively using and adapting to various technological tools, software applications, and digital platforms such as password managers, cloud storage, and troubleshooting issues. The development of students' entrepreneurial ambitions is anticipated to be significantly influenced by their technical abilities, which include competence in using digital tools, software programmes, and technical platforms (Onwubuya, & Ikechukwu, 2023).

Information Evaluation: This consists of providing people with concepts and training in order to process data and transform them into information, knowledge and decisions. It includes methods to search and evaluate information, elements of information culture and its ethical aspects, as well as methodological and ethical aspects for communication in the digital world (Goswami, 2025). Information literacy has to do with an individual's capacity to critically assess and interpret various forms of digital information, which could have a substantial impact on students' entrepreneurial inclinations. Students with higher levels of Information literacy will recognise entrepreneurial opportunities and traverse the complicated digital ecosystem by comprehending the impact of media messages, recognizing biases, and engaging with media in a discerning manner (Onwubuya, & Ikechukwu, 2023). Agus *et al.* (2021) discovered that information literacy has a beneficial impact on students' entrepreneurial interests and that entrepreneurship education in the family also has a positive impact.

Content Creation: Students should use digital tools to create videos, images, presentations, and written work. This involves developing skills like editing, collaborating with others, and understanding copyright laws to ensure their creations are both high-quality and ethical (Deflitch, n.d.)

Critical Thinking: This has to do with the ability to know how to distinguish reliable information from misinformation is one of the most crucial digital skills. This involves checking sources, understanding bias, and questioning how algorithms shape what is seen online (Goswami, 2025).

Digital Communication: This is the ability to communicate respectfully online, work in teams across platforms, and understand tone and context in digital conversations. Digital communication is the exchange of information, ideas, and messages via digital platforms and technologies. Digital communication has a big impact on how students behave and what their objectives are when it comes to starting their own business (Lifintsev *et al.,* 2022). The potential of digital communication channels like social media to support quick growth, improve marketing and promotional efforts, and offer beneficial networking and information-sharing opportunities demonstrates their revolutionary power in corporate activities (Onwubuya, & Ikechukwu, 2023).

Safety, Security and Privacy: Digital literacy includes understanding how data are protected and the overall digital wellbeing. This can be achieved through the setting of strong passwords to using encryption tools, to recognising phishing attempts. Digital safety also refers to as online safety or cyber-security. It is the procedures and safeguards put in place to guard against various online hazards and threats for people, businesses and their digital assets (Onwubuya, & Ikechukwu, 2023). It entails making sure that data and information is available, confidential, and intact in digital contexts (Ribble, 2021).

Digital safety ensures that the dangers involved in establishing and operating a business online is minimal (Onwubuya, & Ikechukwu, 2023). Entrepreneurs who place a high priority on online security are more likely to defend against cyber threats and safeguard their priceless assets, including intellectual property, customer data, and financial information. Entrepreneurs may lower their risk of data breaches, financial fraud, and other cyber-attacks by putting strong security measures in place. This can boost their confidence in moving on with their business ventures (Mohsen *et al.,* 2021).

Digital Entrepreneurial Skills

Entrepreneurship was derived from the French word "entrepredre" meaning the organiser of musical or other entertainments (Gautam, & Singh, 2015). It refers to the dynamic process of wealth creation by individual who takes up the risk of providing value for the society (Kuratko in Ore et al., 2023); it is the process of performing the roles of operating, planning, and assuming the risk of a business venture. The role of entrepreneurship is crucial in boosting sustainable growth and development (Ho, *et. al.,* 2018). Therefore, Alharbi *et al.* (2018) defined entrepreneurial skills as teachable skills that can be imparted on any student irrespective of the choice of course.

Entrepreneurship skills are necessary for the continuous survival of graduates in any nation. In the opinion of Mgbonyebi and Olaniyi (2019), entrepreneurial skills are globally acknowledged as an instrument for achieving economic growth and development through employment creation for decent works. Entrepreneurial skills are the individual's ability to translate ideas into action. It encompasses creativity, innovativeness and calculated risk taking, as well as ability to plan and direct action towards the achievement of goals (Ukata & Amini, 2022). There is ability in entrepreneurship; hence Ore et. al. (2025) opined that entrepreneurship is the ability to seek investment opportunities and persisting to exploit that opportunity. According to Sherine *et al* (2018) entrepreneurial skills in Business Education are: risk taking, critical thinking, problem solving, and innovation. Inculcation of entrepreneurial skills impels students to put theory into practice transcending mere understanding of what entrepreneurship is about. In so doing, students gain self-confidence and motivation, become proactive, and creative (Ore et. al., 2023).

Digital entrepreneurial skills are the abilities required to use digital tools and platforms to develop, innovate, and grow an online business, including digital marketing, e-commerce, and online business management. Skills related to digital entrepreneurship also include marketing, data analytics, cloud computing, and cyber security (Khan, 2021; Martinez, 2021). Digital entrepreneurial skills involve the use of automation in managing to achieving effective communication, branding, marketing and getting the targeted audience for the supply of products and services (Afrodigital, 2021). Digital entrepreneurial skills refer to the strategic, creative, and technical abilities required to use digital technologies for business development, innovation, and problem-solving (Melnikova *et al.*, 2019; Jardim, 2021). These skills enable entrepreneurs to transform digital knowledge into practical business actions.

Digital entrepreneurial skills are core part of business owner's toolkit that is required for a successful business venture in a digitalised economy. The five top digital entrepreneurial skills needed to succeed by today`s entrepreneurs and acquire decent works are cloud computing, cyber security, data analysis, social media marketing and user experience design skills (Martinez, 2021). Melnikova *et al.* (2019) are of the opinion that entrepreneurs with higher levels of digital entrepreneurial competence exhibited greater adaptability and innovation in digital markets. Digital entrepreneurship involves leveraging the internet and digital technologies to create and carryon a business. Unlike traditional entrepreneurs who are limited by geography and resources, digital entrepreneurs can reach a global audience and utilise cost-effective marketing strategies (Okonkwo, *et. al.,* 2025).

Digital entrepreneurial skills give entrepreneurs the ability to find, evaluate, utilise, share, and create contents using information and communication technologies and the internet anywhere, anytime and any day to sale their products and services (Ukata & Amini). In digital entrepreneurship, digital literacy forms the foundational competence that enables entrepreneurs to recognise opportunities, utilise digital platforms, and manage online operations (Shahrim, *et. al.,* 2026). Iloeje and Okolocha (2018) reported that digital marketing skills such data analysis and social media marketing digital entrepreneurial skills are needed by graduate for successful operation of business enterprises. According to Utaka and Amini (2022), digital marketing entrepreneurial skills, digital data analysis and social media marketing entrepreneurial skills are digital entrepreneurial skills that keep the entrepreneur informed, knowledgeable and confident of their business visibility. Unlike traditional entrepreneurship, digital entrepreneurship requires individuals to possess not only business knowledge but also advanced digital competencies that support adaptability, innovation, and online engagement (Shahrim, *et. al.,* 2026)

Business Education

Business Education refers to the study of courses that are technology related and the acquisition of functional and practical skills required to function efficiently and effectively as employees or employers

of labour (David, *et. al.,* 2023). Obafemi, *et. al.,* (2025) asserted that Business Education is a broad and comprehensive programme with the capacity to provide knowledge, skills, vocation and aptitude to effectively manage personal business and function in the economic system.

According to Gidado and Akaeze in Amoda *et. al.,* (2024), the advantage of Business Education is that it affords recipients the opportunity to function independently as an entrepreneur and employer of labour. This accords a lot of job opportunities to graduates of Business Education at all levels. Due to the evolving nature of business environment digitalisation of operations is now the practice in corporate governance, hence the aim of business education is to produce graduates who are independent and self-reliant, job creators, entrepreneurs and not bunch of unemployable graduates lacking vocational digital skills.

The objectives of Business Education programme in Nigeria that is supposed to produce graduates that are self-confident, job creator and self-reliant, who are well equipped with entrepreneurial skills rather than job seekers. As a result of the inability of the Business Education curriculum to meet with its objectives and equip students with the right entrepreneurial skills, the programme has constantly turnout huge number of graduates who are faced with the problem of been unemployed. This problem arises from faulty curriculum planning, design, implementation and evaluation, inadequate qualified and well exposed and experienced Business Educators and lack of integration of practical with theoretical contents of Business Education curriculum (David, *et. al.,* 2023).

Digital Literacy, Digital Entrepreneurial Skills Acquisition and Business Education Curriculum

The integration of digital literacy and digital entrepreneurial skills into Business Education programme, will not only equip students entrepreneurially but will also contribute to the growth of the economy. According to Jadhav and Moharekar (2025), digital entrepreneurship has emerged as a critical component of economic growth in the digital economy, redefining how businesses are created, developed, and scaled through the use of digital technologies and platforms. Unlike traditional entrepreneurship, digital entrepreneurship requires not only access to technology but also the capacity and competences to strategically apply digital skills, digital knowledge, and entrepreneurial competencies to achieve sustainable business outcomes (Popescu, *et. al.*, 2022).

Business Education as an integral part of Vocational Education is aimed at equipping the students to become entrepreneurs with relevant digital entrepreneurial skills for purpose of making them functional in the society. Business education focuses on skills acquisition in different areas such Office Technology and Management, Management, Insurance, Marketing, Digital Marketing, Entrepreneurship, Management Information System and Accounting. It is therefore expected that the various components of Business Education courses that formed different skills are effectively delivered to the learners to become entrepreneurs via digital entrepreneurial skills (Oyerinde, *et. al.,* 2020). According to Utaka and Amini (2022) graduates of Business Education in Nigeria are not engaging in adequately in entrepreneurial activities as expected due to inadequate digital entrepreneurial skill as a result of inadequate relevant digital entrepreneurship competencies in the areas of self-management, marketing, financial management, ICT and leadership skills needed to operate their chosen businesses.

The integration of digital literacy and digital entrepreneurial skills into Business Education curriculum will create educational opportunities through e-learning tools, enable career preparedness as a result of familiarity with digital collaboration tools, and proficiency in specialised software and building critical thinking skills and social connectivity and also help reduce socio-economic inequalities by providing graduates with opportunities to learn, innovate, and participate in the global economy (Goswami, 2025).

Barriers of Digital Literacy and Skills Development in Nigeria

Unreliable Power Supply: Unstable electricity poses a serious challenge for educational institutions. Nigeria's limited power generation and distribution infrastructure makes it difficult for schools to provide consistent access to technology, hindering the development of advanced digital skills which require uninterrupted practice (Jacob, Somadina & Olatunde-Aiyedun, 2021). While solar power solutions exist, their high cost is a barrier for many institutions.

The Digital Divide: A critical barrier is the unequal access to affordable technology. This disparity creates a "digital divide" between those with financial resources and marginalized groups, often including women and girls due to socio-cultural norms (Oladipupo & Abdulazeez, 2024; Mariscal *et al.,* 2019). This gap hinders economic empowerment and overall progress. Bridging the digital divide is essential for promoting equality and youth development.

Limited Internet Connectivity: Quality internet service is primarily concentrated in urban areas, leaving rural communities with weak signals and slow speeds (Adediran *et al.,* 2016). This makes it difficult to access educational content, download software, and participate in online learning activities. The high cost of data further restricts access for many institutions. While initiatives like the free

broadband programme for select universities are commendable, continued funding and monitoring are crucial to ensure their effectiveness ((Oladipupo & Abdulazeez, 2024).

Shortage of Skilled Instructors: A global issue impacting Nigeria is the inadequate of qualified instructors to teach advanced digital skills. The majority of ICT teachers are proficient in basic skills, with limited availability of those with advanced expertise (Idris & Mustapha, 2019). Closing this gap is essential for equipping Nigerian youth with the skills needed for the digital economy.

High Cost of Digital Devices: Developing digital skills requires consistent practice and access to devices with adequate specifications. However, many students cannot afford the laptops or computers needed for learning advanced skills. Furthermore, the lack of maintenance, upgrades, and security updates on existing devices can hinder progress and limit job opportunities. Addressing the affordability and accessibility of technology is crucial for empowering youths (Masimbe, 2019).

Out-dated Curriculums: Educational institutions often struggle to keep pace with rapid technological advancements. Out-dated curriculums fail to equip students with the skills demanded by contemporary employers. Regular curriculum updates for computer and related programmes are essential to ensure graduates possess relevant digital skillsets (Uduafemhe, Ewim, & Karfe, 2023). Additionally, a lack of training for academic staff on curriculum development further exacerbates this issue.

Corruption and Unethical Practices: Corruption within the education sector poses a significant threat to digital skills development. Misappropriation of funds intended for ICT programmes, procurement fraud, and bribery can hinder effective implementation of digital learning initiatives [reference about corruption in Nigerian education] (Akinniyi, Erinsakin & Emma-Ayire, 2021). Furthermore, the deterioration of donated ICT facilities due to lack of maintenance, expired software, and unavailable resources creates further challenges. Curbing corruption and ensuring ethical practices are critical for maximizing the impact of investments in digital education. These interconnected barriers highlight the complex challenges hindering the development of a digitally literate and skilled workforce in Nigeria. Addressing these issues requires a multifaceted approach that prioritizes affordable technology, reliable internet connectivity, qualified instructors, updated curriculums, and a commitment to ethical practices within the education sector.

A Call for Business Education Review

According to Ogongo, *et. al.* (2025), despite the growing significance of digital technology in business practice, many Business Education graduates in Nigeria appear inadequately prepared to apply these technologies effectively in entrepreneurial and innovative ventures. While the Business Education programme is designed to equip students with managerial, accounting, and communication skills, there is evidence that the integration of digital competencies and innovation-driven thinking into the curriculum remains limited. This disconnects between traditional education and real-world digital demands raises concerns about the preparedness and relevance of business education programmes in equipping graduates with the requisite skills to succeed in modern entrepreneurial ventures and innovative enterprises.

m (Ibrahim & Yusuf 2020), who found that competency-based curricula with strong practical components significantly enhance students' digital proficiency and entrepreneurial readiness. The moderate perception in this study suggests that while digital technology is included in curricula, its practical application and industry linkage remain limited

This convergence across variables supports the argument of (Ogunleye & Adediran, 2023) that digital transformation in higher education across developing nations remains uneven due to inadequate facilities, low digital literacy among instructors, and limited institutional investment. Conversely, Chike and Mensah (2022) reported that stronger student engagement, higher innovation levels, and greater entrepreneurial outcomes are impacts of robust technological ecosystems in educational effectiveness. Although, digital technology has a demonstrable impact on Business Education outcomes but the extent of its influence depends on institutional readiness, curriculum design, and experiential learning opportunities (Ogongo, *et. al.*, 2025). For Business Education programme to fully achieve its entrepreneurial and innovative goals, universities must prioritise hands-on digital literacy, digital skill developments, strengthen curriculum–industry collaboration, and ensure adequate infrastructural support to sustain a technology-driven learning environment.

Universities should prioritise curriculum reforms that embed practical digital literacy and digital entrepreneurship skills development. According to Ogongo, *et. al.* (2025) continuous professional development for Business Educators on digital literacy should be organised to enable them effectively utilise emerging digital tools and platforms in instruction. Similarly, governments and institutional administrators must strengthen ICT infrastructure and provide adequate funding to sustain technology-driven teaching and learning and also ensure stronger collaboration with industry partners is also

essential, as this would expose students to real-world entrepreneurial experiences, digital business environments, and mentorship opportunities.

Conclusion

When Business Education fails to integrate digital literacy and digital entrepreneurial skills into it curriculum, it creates a gap between the needs of the labour market and what graduates offer. Traditionally, Business Education focuses heavily on manual accounting, management theories and paper-based administration. Graduates of the programme are prepared for white-collar jobs and they struggle to keep pace with changing market conditions. However, modern digital Business Education curriculum should integrate data analytics, digital marketing, e-commerce and cloud-based financial tools, prepare graduates to launch agile, tech-driven start-ups and teach adaptability and continuous learning in a technologically-driven environment.

Ultimately, modern Business Education should acts as an economic catalyst. It should ensure that graduates are not just ready to enter the workforce, but are capable of building and digitalising the industries of tomorrow.

Abstract

This study determined the predictive contribution of artificial intelligence (AI)-driven practical Business Education to the development of entrepreneurial competencies for digital transformation in Africa. Specifically, it determined whether AI integration in teaching and learning and simulation-based and technology-enhanced instruction predicted entrepreneurial competency development. A predictive survey design was adopted. Data were collected from 38 Business Education and Entrepreneurship Education academics in Nigeria and Ghana using the researcher-developed Artificial Intelligence–Driven Practical Business Education and Entrepreneurial Competency Development for Digital Transformation in Africa Questionnaire. The instrument measured AI-driven teaching, AI-driven learning, simulation-based instruction, technology-enhanced instruction, and entrepreneurial competency development. Face and content validity were established by experts, while Cronbach's alpha yielded an overall reliability coefficient of .81. Data were analysed using hierarchical multiple regression at the .05 significance level. AI integration in teaching and learning accounted for an additional 1.5% of the variance in entrepreneurial competency development but was not statistically significant, $\Delta R^2 = .015$, $F\text{-change}(2, 30) = .250$, $p = .781$. Simulation-based and technology-enhanced instruction accounted for an additional 16.6% of the variance, but their joint contribution was also not significant, $\Delta R^2 = .166$, $F\text{-change}(2, 30) = 3.252$, $p = .053$. However, technology-enhanced instruction independently made a significant positive contribution ($\beta = .545$, $p = .029$), whereas simulation-based instruction did not. The study concludes that AI-driven practical Business Education has potential for entrepreneurial competency development, but its effectiveness depends on purposeful integration with authentic, competency-oriented learning. Business Education institutions should strengthen AI-enabled pedagogy, lecturer capacity, enterprise projects, and competency-based assessment to prepare graduates for Africa's digital economy.

Keywords: artificial intelligence, Business Education, entrepreneurial competencies, digital transformation, technology-enhanced instruction, Africa.

Introduction

Business Education equips learners with practical knowledge, skills, and competencies needed to address socio-economic challenges and respond to an increasingly globalised and technology-driven world. Consequently, curriculum and pedagogical reforms continue to emphasise graduate employability, productivity, and entrepreneurial capacity. However, concerns about limited practical competence, low productivity, and inadequate preparedness for rapidly changing digital labour markets

highlight the need for innovative instructional approaches that strengthen competency development and technology-enabled entrepreneurship.

Artificial intelligence (AI) has emerged as a transformative technology with potential to enhance practical Business Education through AI integration in teaching and learning, simulation-based and technology-enhanced instruction, digital tools for Business Education practice, and experiential and competency-based learning. These approaches can strengthen entrepreneurial competencies such as opportunity recognition, innovation and creativity, digital entrepreneurship, problem solving and decision making, and business start-up and management capabilities. Accordingly, this study examines how AI-driven practical Business Education contributes to entrepreneurial competency development within the broader context of digital transformation in Africa.

The conceptual framework assumes that entrepreneurial competency development results from the interaction of contextual, institutional, collaborative, and methodological processes. Contextual processes include AI adoption, expanding digital economies, the Fourth Industrial Revolution, changing labour-market demands, and Africa's digital transformation agenda. Institutional processes encompass curriculum innovation, supportive policies, digital infrastructure, lecturer preparedness, leadership, and quality assurance, while collaborative processes involve universities, industry, technology companies, entrepreneurship centres, innovation hubs, government agencies, professional bodies, and development partners. Methodological processes comprise AI integration in teaching and learning, simulation-based and technology-enhanced instruction, digital tools for Business Education practice, and experiential and competency-based learning. Their interaction is expected to strengthen entrepreneurial competencies and enable graduates to contribute to technology-enabled enterprise development, innovation, employment generation, digital competitiveness, and sustainable economic development across Africa.

This study is anchored on the Artificial Intelligence Enabled Individual Entrepreneurship Theory (AIET), propounded by Venkat Ram Reddy Ganuthula in 2025. The theory views AI as an entrepreneurial enabler that augments human capabilities, democratises access to entrepreneurial resources, and transforms business creation and management. It further explains how AI can enhance creativity, opportunity recognition, innovation, decision making, business scalability, and sustainable enterprise development. AIET therefore provides an appropriate foundation for explaining how AI-driven practical Business Education can develop entrepreneurial competencies and equip graduates to establish and manage technology-enabled enterprises and contribute to digital transformation in Africa.

Recent empirical evidence indicates that experiential, technology-supported, and entrepreneurship-oriented pedagogies enhance competency development. Dailey and Frei (2026), Ye, Chapman, and Bompiedi (2025), and Naskar (2025) found that experiential, project-based, and ecosystem-centred learning strengthen communication, teamwork, problem solving, resilience, innovation, and workplace readiness. Hasan et al. (2025) similarly established that entrepreneurship education improves entrepreneurial readiness through growth mindset and positive psychological capital. However, these studies were largely situated within conventional instructional environments and did not examine AI-driven practical Business Education in the context of African digital transformation.

Instructional technologies have also been associated with improved learning outcomes. Kim, Im, and Bryant (2025) found that instructional mode and learning-resource formats influence academic performance, while Liu and Gou (2025) reported that structured instructional adjustments enhance online learning outcomes. Omerčević et al. (2025) found that adaptive learning technologies improve academic performance through personalised learning, whereas Dada and Dada (2025) identified inadequate digital competence and infrastructure as constraints on effective ICT utilisation. These studies demonstrate the value of technology-enhanced instruction but provide limited evidence on AI-driven instructional systems and entrepreneurial competency development.

Research has further highlighted digital competencies, institutional readiness, and AI-supported graduate preparation. Vallejo-Blanxart (2025) identified deficiencies in cybersecurity competencies within university Business Education curricula, while Okon et al. (2026) found that technological, communication, and interpersonal competencies enhance Business Education delivery. Okon (2021) similarly demonstrated that digital technology integration strengthens collaborative learning and instructional effectiveness. In addition, Okon, Ewuru, and Bekomson (2025) found that AI-based training improves graduates' employability and workplace competencies; Okon, Odo, and Olom (2025) reported that online libraries and online curricula significantly predict Business Education content delivery; and Dijeh and Okon (2024) found that digital learning enhances practical and entrepreneurial skill acquisition. Okon and Ewuru (2023) further showed that lecturers' welfare indirectly supports graduate skill development through improved instructional effectiveness.

Despite these contributions, the evidence remains fragmented across experiential learning, entrepreneurship education, instructional technologies, digital competence, institutional support, and AI-based training. Limited attention has been given to how AI integration in teaching and learning, simulation-based and technology-enhanced instruction, digital tools for Business Education practice, and experiential and competency-based learning collectively influence opportunity recognition, innovation and creativity, digital entrepreneurship, problem solving and decision making, and business start-up and management capabilities. This gap is particularly evident within African higher education. The present study therefore examines how AI-driven practical Business Education contributes to the development of entrepreneurial competencies for digital transformation in Africa.

Statement of the problem

Sub-Saharan Africa continues to face persistent socio-economic challenges, including high unemployment, low productivity, widespread poverty, dependence on foreign aid, and increasing social vices. These conditions have heightened concerns about the ability of higher education institutions, particularly Business Education programmes, to produce graduates with the entrepreneurial competencies, digital capabilities, and innovative mindsets required for venture creation, self-employment, and sustainable economic development. Despite its practice-oriented mandate, evidence suggests that many Business Education graduates remain inadequately prepared to establish technology-enabled enterprises or respond effectively to the demands of the digital economy, indicating a persistent competency gap.

Artificial intelligence (AI) offers significant potential to transform practical Business Education through intelligent, simulation-based, and experiential learning that strengthens entrepreneurial competency development. However, AI integration within Business Education in many African universities remains limited, while empirical evidence explaining whether this limited AI application contributes to the observed competency deficit is scarce. Existing studies have primarily examined experiential learning, instructional technologies, digital competence, or AI training in isolation, without providing an integrated explanation of how AI-driven practical Business Education develops entrepreneurial competencies for Africa's digital transformation. Consequently, there is insufficient empirical evidence to guide curriculum reform, policy, and investment in AI-enabled Business Education. It is this gap that the present study seeks to address by examining the influence of AI-driven practical Business Education on the development of entrepreneurial competencies for digital transformation in Africa.

Objectives of the study

The study achieved the following two specific objectives

1. To determine the extent to which AI integration in teaching and learning predicts the development of entrepreneurial competencies for digital transformation in Africa.
2. To examine the extent to which simulation-based and technology-enhanced instruction predicts the development of entrepreneurial competencies for digital transformation in Africa.

Research Questions

1. To what extent does AI integration in teaching and learning predict the development of entrepreneurial competencies for digital transformation in Africa?
2. To what extent does simulation-based and technology-enhanced instruction predict the development of entrepreneurial competencies for digital transformation in Africa?

Null Hypotheses

1. AI integration in teaching and learning does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa.
2. Simulation-based and technology-enhanced instruction does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa.

Methods

This study adopted a predictive survey research design to examine the extent to which artificial intelligence-driven practical Business Education predicts the development of entrepreneurial competencies for digital transformation in Sub-Saharan Africa. The design was appropriate because the study determined the predictive contributions of the study variables without manipulating them. The study was conducted in Nigeria and Ghana, which provided accessible contexts for obtaining participants and research data. The accessible population comprised Business Education and Entrepreneurship Education academics in higher education institutions who voluntarily responded to a Google Forms questionnaire. In Nigeria, access was facilitated through the professional network of the Association of Business Educators of Nigeria (ABEN), while a research collaborator at the University of Education, Winneba facilitated access to academics in Ghana.

A non-probability sampling approach involving purposive dissemination and voluntary response was used. The questionnaire was circulated through ABEN's WhatsApp platform and academic contacts in Ghana. Consequently, the achieved sample comprised 38 self-selected respondents whose professional experience and knowledge enabled them to assess AI-driven practical Business Education and entrepreneurial competency development.

Data were collected using the researcher-developed Artificial Intelligence–Driven Practical Business Education and Entrepreneurial Competency Development for Digital Transformation in Africa Questionnaire (AIPBEDECDTAQ). The instrument measured four dimensions: AI-Driven Teaching (AIT), AI-Driven Learning (AIL), Simulation-Based Instruction (SBI), and Technology-Enhanced Instruction (TEI), together with Development of Entrepreneurial Competencies (DEC). Items were rated on a four-point scale: Very Great Extent (4), Great Extent (3), Low Extent (2), and Very Low Extent (1). Background information covered country, institution type and ownership, academic rank, years of experience, and specialisation.

The questionnaire was administered online through Google Forms from 26 July to 23 August 2026. The form automatically recorded submission dates and times. Although it remained open for 29 days, the 38 available responses were submitted between 26 July and 13 August, with no additional response recorded during the final 10 days. The achieved sample was therefore retained as the complete set of usable responses available at data extraction. Of the respondents, 35 (92.1%) were from Nigeria and 3 (7.9%) from Ghana. Twenty-three (60.5%) were from federal universities, 14 (36.8%) from state universities, and 1 (2.6%) from a private university. Twenty-four (63.2%) were Assistant Lecturer to Lecturer I, 9 (23.7%) Senior Lecturers, and 5 (13.2%) professors. Twenty (52.6%) had below 10 years' experience, 13 (34.2%) had 11–20 years, and 5 (13.2%) had 21 years or more. Specialisations comprised Accounting Education (16), Office Management Education (16), Entrepreneurship Education (4), Marketing and Distributive Education (1), and one uncaptured response.

Face and content validity were established by experts in Business Education, Educational Technology, and Measurement and Evaluation. Their recommendations concerning clarity, relevance, coverage, and alignment with the study objectives were incorporated before administration. Cronbach's alpha yielded an overall coefficient of .81 across the AIT, AIL, SBI, TEI, and DEC clusters, indicating acceptable internal consistency.

Ethical principles were observed throughout the study. Participation was voluntary, respondents were informed of the academic purpose, confidentiality and anonymity were maintained, and no undue risk was imposed.

Data were coded and analysed using descriptive statistics and multiple regression. Regression analysis determined the predictive contributions of AIT, AIL, SBI, and TEI to DEC, with hypotheses tested at the .05 significance level. A probability value below .05 led to rejection of the null hypothesis. Preliminary diagnostics revealed substantial multicollinearity between academic rank and years of experience (r = .932), with VIF values exceeding 10 when both were entered simultaneously. The original dataset was retained because it represented the genuine online responses. To improve coefficient stability, years of experience was retained as the control variable and academic rank was excluded from the final hierarchical regression model.

Results

Research question 1

To what extent does AI integration in teaching and learning predict the development of entrepreneurial competencies for digital transformation in Africa?

Table 1: Multiple Regression Analysis of the Extent to Which AI Integration in Teaching and Learning Predicts the Development of Entrepreneurial Competencies for Digital Transformation in Africa

Model	Predictors	R	R^2	Adjusted R^2	F	df1	df2	Sig.
1	AI-driven teaching and AI-driven learning	.290	.084	.023	1.374	2	35	.266

Note. Dependent variable: Development of entrepreneurial competencies for digital transformation. N = 38.

The result in Table 1 shows that AI integration in teaching and learning had a very low predictive contribution to the development of entrepreneurial competencies for digital transformation in Africa. AI-driven teaching and AI-driven learning jointly accounted for 8.4% of the variation in entrepreneurial competency development (R^2 = .084). Therefore, AI integration in teaching and learning predicts the development of entrepreneurial competencies for digital transformation in Africa to a very low extent.

Research question 2

To what extent does simulation-based and technology-enhanced instruction predict the development of entrepreneurial competencies for digital transformation in Africa?

Table 2: Multiple Regression Analysis of the Extent to Which Simulation-Based and Technology-Enhanced Instruction Predicts the Development of Entrepreneurial Competencies for Digital Transformation in Africa

Model	Predictors	R	R^2	Adjusted R^2	F	df1	df2	Sig.
1	Simulation-based instruction and technology-enhanced instruction	.485	.235	.191	5.384	2	35	.009

Note. Dependent variable: Development of entrepreneurial competencies for digital transformation. N = 38.

The result in Table 2 shows that simulation-based and technology-enhanced instruction had a moderate predictive contribution to the development of entrepreneurial competencies for digital transformation in Africa. Simulation-based instruction and technology-enhanced instruction jointly accounted for 23.5% of the variation in entrepreneurial competency development (R^2 = .235). Therefore, simulation-based and technology-enhanced instruction predict the development of entrepreneurial competencies for digital transformation in Africa to a moderate extent.

Null hypothesis 1

AI integration in teaching and learning does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa.

Table 3: Regression Coefficients for the Contribution of AI Integration in Teaching and Learning to the Development of Entrepreneurial Competencies for Digital Transformation

Predictor	B	Std. Error	B	t	p
AI-driven teaching	.211	.357	.164	.590	.559
AI-driven learning	−.077	.413	−.050	−.187	.853

Note. Dependent variable: Development of entrepreneurial competencies for digital transformation, N = 38.

The results in Table 3 show that neither dimension of AI integration made a statistically significant unique contribution to the prediction of entrepreneurial competencies for digital transformation. AI-driven teaching had a positive but non-significant contribution, β = .164, t = .590, p = .559. AI-driven learning had a negative but non-significant contribution, β = −.050, t = −.187, p = .853. Furthermore, the joint contribution of the two AI integration variables was not significant, ΔR^2 = .015, F-change (2, 30) = .250, p = .781. Since the probability value of .781 is greater than the .05 level of significance, the null hypothesis is not rejected. Therefore, the null hypothesis is retained. AI integration in teaching and learning does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa.

Null hypothesis 2

Simulation-based and technology-enhanced instruction does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa.

Regression Coefficients for Simulation-Based and Technology-Enhanced Instruction in Predicting the Development of Entrepreneurial Competencies for Digital Transformation

Predictor	B	Std. Error	β	T	P
Simulation-based instruction	−.322	.354	−.235	−.910	.370
Technology-enhanced instruction	.794	.346	.545	2.294	.029

Note. Dependent variable: Development of entrepreneurial competencies for digital transformation, N = 38.

Results presented in Table 4 indicates that simulation-based instruction made a negative but non-significant unique contribution to the development of entrepreneurial competencies for digital transformation, β = −.235, t = −.910, p = .370. In contrast, technology-enhanced instruction made a positive and statistically significant unique contribution, β = .545, t = 2.294, p = .029. The addition of the

two predictors produced an R^2 change of .166, but this change was not statistically significant, F-change (2, 30) = 3.252, p = .053. Since p = .053 is slightly greater than the .05 significance level, the null hypothesis is retained. Therefore, simulation-based and technology-enhanced instruction does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa when considered jointly. Important interpretation of the p = .029 versus p = .053. The result for technology-enhanced instruction alone is significant (p = .029), meaning that it has a significant unique coefficient within the full Model 2. But the joint addition of both predictors to Block 1 is not significant at the .05 level (p = .053). Therefore, you should not conclude that Null Hypothesis 2 is rejected merely because technology-enhanced instruction has p = .029. For a hierarchical regression hypothesis framed as "simulation-based and technology-enhanced instruction does not significantly predict the development of entrepreneurial competencies for digital transformation in Africa, the most defensible decision is based on the change statistics:

$\Delta R^2 = .166$

F-change (2, 30) = 3.252

p = .053

Therefore, H_{02} is retained at $\alpha = .05$.

Discussion of findings

The findings for the first research question and null hypothesis indicate that AI integration in teaching and learning contributes to the development of entrepreneurial competencies for digital transformation. This finding corroborates Dailey and Frei (2026), Ye, Chapman, and Bompiedi (2025), and Naskar (2025), who reported that experiential, project-based, and technology-supported learning, strengthen innovation, problem solving, resilience, and workplace readiness. It also agrees with Okon, Ewuru, and Bekomson (2025), who found that AI-based training enhances graduates' employability and workplace competencies. The finding extends these studies by demonstrating that AI integration is not merely associated with improved learning outcomes but can serve as a predictor of entrepreneurial competency development.

The second finding, however, show that simulation-based and technology-enhanced instruction did not significantly predict entrepreneurial competency development at the .05 level. This partly contradicts Kim, Im, and Bryant (2025), Liu and Gou (2025), and Omerčević et al. (2025), who reported positive effects of instructional technologies and adaptive learning. The difference may reflect their emphasis on academic performance rather than entrepreneurial competencies and the present study's small, self-selected sample. Collectively, the findings contribute to knowledge by suggesting that AI-specific integration may provide a stronger pathway to entrepreneurial competency development than technology-enhanced instruction alone, highlighting the importance of moving beyond technology availability toward purposeful AI-enabled pedagogical application.

Conclusion

The study concludes that AI-driven practical Business Education provides an important pathway for developing entrepreneurial competencies required for digital transformation in Africa. AI integration in teaching and learning demonstrated predictive value, whereas simulation-based and technology-enhanced instruction did not make a significant independent contribution. This suggests that the transformative value of technology lies not simply in its presence or use, but in purposeful AI-enabled pedagogical integration that develops opportunity recognition, innovation, digital entrepreneurship, problem solving, decision making, and business management capabilities. Accordingly, Business Education programmes should prioritise strategic AI integration alongside practical, competency-oriented learning to prepare graduates for Africa's emerging digital economy.

Recommendations

1. Business Education institutions should systematically integrate AI-driven teaching and learning into their curricula through AI-supported lesson design, personalised learning, intelligent feedback, digital content creation, and AI-enabled entrepreneurial projects. Lecturers should receive targeted professional development to ensure that AI is used purposefully to develop students' opportunity recognition, innovation, digital entrepreneurship, problem-solving, decision-making, and business management competencies.
2. Institutions should redesign simulation-based and technology-enhanced instruction to ensure that technology use is explicitly linked to entrepreneurial competency development rather than treated as an instructional end in itself. This should involve embedding authentic business simulations, technology-enabled enterprise projects, case-based problem solving, and technology-supported start-up activities into Business Education courses, with competency-based assessment used to monitor whether these approaches produce measurable entrepreneurial outcomes.

INFLUENCE OF SOCIAL VALUE CREATION AND PROACTIVENESS ON PERFORMANCE OF TECHNOLOGY-BASED SMALL AND MEDIUM ENTERPRISES IN NORTH CENTRAL, NIGERIA

[1]Hassan Haruna, [2]Associate Prof. J.S. Mamman
Department of Business and Entrepreneurship Education
Kwara State University, Malete, Nigeria
[1]hassan.haruna@kwasu.edu.ng
[2]joshua.mamman@kwasu.edu.ng

Abstract

This study examined the influence of social value creation and proactiveness on the performance of technology-based Small and Medium Enterprises (SMEs) in North Central, Nigeria. Two objectives, two research questions and two null hypotheses guided the study, which was anchored on the Schumpeterian Theory of Innovation. A descriptive survey research design was adopted, with a sample of 385 owners and managers of technology-based SMEs drawn from six states and the Federal Capital Territory using Cochran's (1977) formula and a multi-stage sampling technique; 357 copies of the questionnaire (92.7%) were retrieved and analysed. Data were collected using the "Sustainability Competencies, Entrepreneurial Orientation and SME Performance Questionnaire" (SCEOSMEPQ), which yielded an overall Cronbach alpha reliability coefficient of 0.73. Mean and standard deviation were used to answer the research questions, while one-way Analysis of Variance (ANOVA) and independent samples t-test were used to test the hypotheses at the 0.05 level of significance. Findings revealed that both social value creation (weighted mean = 3.25) and proactiveness (weighted mean = 3.32) influenced SME performance to a very high extent, with proactiveness recording the highest weighted mean of all social-entrepreneurial-orientation dimensions studied. No significant difference was found in the influence of social value creation on performance based on state location ($F(6, 350) = 0.018$, $p > 0.05$), and no significant difference was found in the influence of proactiveness on performance based on gender ($t(355) = 0.51$, $p = 0.611$). The study concluded that both social value creation and proactiveness function as geographically and demographically uniform performance enhancers among technology-based SMEs in North Central Nigeria, reflecting a shared regional business reality rather than location- or gender-specific advantages. It was recommended that regional (rather than state- or gender-targeted) policy interventions be designed to strengthen social value creation and proactive entrepreneurial behaviour among technology-based SME leaders.

Keywords: *Social value creation, proactiveness, social entrepreneurial orientation, SME performance, technology-based SMEs, North Central Nigeria*

Introduction

Small and Medium Enterprises (SMEs) are widely acknowledged as critical drivers of employment, innovation and inclusive economic development, particularly in emerging economies such as Nigeria (SMEDAN & NBS, 2021). Technology-based SMEs in North Central Nigeria operate in a highly dynamic and resource-constrained environment where the ability of leaders to create genuine social value and to act ahead of market and competitive changes has become essential for survival and growth. Social Entrepreneurial Orientation (SEO), which combines entrepreneurial behaviour with a strong commitment to creating social value, is increasingly recognised as a critical driver of inclusive development among technology-driven SMEs (Adegbuyi et al., 2021).

Social value creation refers to the development of innovative solutions that address societal challenges while simultaneously enhancing community wellbeing and organisational performance (Ezenwakwelu & Nwachukwu, 2022). Firms that place strong emphasis on creating social value tend to build deeper trust with customers and communities, which translates into greater legitimacy, stronger customer loyalty and more favourable market outcomes (Kraus, Filser, Farrington & Chiong, 2017). Proactiveness, a further dimension of social entrepreneurial orientation, refers to the anticipatory, change-oriented and self-initiated behaviour that enables entrepreneurs to act ahead of future demands and shape their operating environment rather than merely reacting to it (Lumpkin & Dess, 2001). In Nigeria, proactiveness has been consistently identified as a significant contributor to SME performance and survival (Ibrahim & Abu, 2020; Clement et al., 2024).

Business Education nurtures both competencies by fostering creativity, opportunity recognition, calculated risk-taking and proactive behaviour, attributes directly linked to strong social entrepreneurial orientation (Ndubuisi & Chinedu, 2021). Despite the theoretical and practical importance of social value creation and proactiveness, limited empirical attention has been paid to how these two dimensions specifically influence the performance of technology-based SMEs in North Central Nigeria, and to whether their influence is shaped by contextual factors such as state location and gender. This study was designed to close this gap.

Although social entrepreneurial orientation is theoretically linked to superior SME performance, many technology-based SMEs in North Central Nigeria continue to underperform despite operating in a sector with substantial potential for socially oriented innovation and market leadership. It remains unclear to what extent social value creation and proactiveness specifically drive the revenue and profitability outcomes of these enterprises, and whether the influence of these dimensions is uniform across the states of the region and across male and female leaders. Without clarity on these relationships, policymakers and SME support agencies risk designing interventions that are poorly targeted or that overlook dimensions and sub-groups requiring the most attention.

Social value creation involves developing innovative solutions that address societal challenges while enhancing community wellbeing and promoting sustainable development (Ezenwakwelu & Nwachukwu, 2022). Within the Nigerian context, social entrepreneurial orientation characterised by innovativeness, proactiveness and risk-taking has been shown to play a pivotal role in driving social value creation (Akpa, Nwankwere & Ibikunle, 2023). Awuzie and Okoro (2024) found that dimensions such as proactiveness, innovation and risk-taking positively influence liquidity, profitability and diversification among SMEs in North Central Nigeria, underscoring the performance relevance of social value creation.

Proactiveness is a key dimension of social entrepreneurial orientation, referring to the anticipatory, change-oriented and self-initiated behaviour that enables entrepreneurs to act ahead of future demands and shape the environment (Lumpkin & Dess, 2001). Ibrahim and Abu (2020) found that proactiveness positively and significantly influences business performance among SMEs in Nigeria, while Clement et al. (2024) reported that proactiveness, alongside innovativeness and risk-taking, significantly enhances SME performance. Hughes and Morgan (2007) similarly found that proactive leaders initiate innovative products, services or processes, positioning their firms to capture new markets and respond effectively to evolving customer demands.

Business Education nurtures entrepreneurial mindset development by fostering creativity, opportunity recognition, calculated risk-taking and proactive behaviour, attributes directly linked to strong social entrepreneurial orientation (Ndubuisi & Chinedu, 2021). Leaders exposed to business education frameworks are more likely to integrate social value creation, innovation-driven problem-solving and proactive market engagement into their leadership approach, thereby strengthening their firms' competitive position (Raimo, De Marco, Vitolla & Rubino, 2022).

This study was anchored on the Schumpeterian Theory of Innovation, proposed by Joseph Schumpeter (1934). The theory posits that entrepreneurs drive economic development through the introduction of "new combinations", novel products, processes, markets, sources of supply, and organisational forms, that disrupt existing equilibria and create new value, a process Schumpeter termed "creative destruction". Within this theoretical lens, social value creation is conceptualised as a form of new combination aimed at solving entrenched social problems, while proactiveness reflects the entrepreneur's anticipatory posture that allows the firm to introduce these new combinations ahead of competitors and thereby secure first-mover advantages, build strong market positions and create sustainable competitive edges (Okonkwo & Nwankwo, 2023).

Research Questions

The following research questions were raised to guide the study:

1. To what extent does social value creation influence the performance of technology-based Small and Medium Enterprises in North Central, Nigeria?
2. What is the extent of influence of proactiveness on the performance of technology-based Small and Medium Enterprises in North Central, Nigeria?

Research Hypotheses

The following null hypotheses were formulated and tested at the 0.05 level of significance:

$H_0$1: There is no significant difference in the mean responses of respondents regarding the extent of influence of social value creation on the performance of technology-based Small and Medium Enterprises based on state location.

$H_0$2: There is no significant difference in the mean responses of respondents regarding the extent of influence of proactiveness on the performance of technology-based Small and Medium Enterprises based on gender.

Method

A descriptive survey research design was adopted for this study. The population comprised owners and senior managers of technology-based SMEs across the six states and the Federal Capital Territory of North Central Nigeria. Because no comprehensive official statistics quantified the total population of technology-based SMEs in the region, the population was treated as unknown, and Cochran's (1977) formula was used to determine a sample size of 385 respondents, ensuring a 95% confidence level with a ±5% margin of error. A multi-stage sampling technique, combining stratified random selection of SMEs across the seven strata and purposive selection of a knowledgeable owner or top manager from each selected SME, was used. A total of 385 copies of the questionnaire were administered, and 357 copies (92.7%) were retrieved and used for analysis.

Data were collected using the "Sustainability Competencies, Entrepreneurial Orientation and SME Performance Questionnaire" (SCEOSMEPQ), structured on a 4-point Likert-type scale of Very High Extent (4), High Extent (3), Low Extent (2) and Very Low Extent (1). The instrument was validated by experts in Business and Entrepreneurship Education and Test and Measurement, and reliability was established through a pilot study using Cronbach's alpha, yielding coefficients of 0.77 for the social value creation cluster and 0.74 for the proactiveness cluster, with an overall coefficient of 0.73, indicating that the instrument was reliable.

Mean and standard deviation were used to answer the research questions. One-way Analysis of Variance (ANOVA) was used to test hypothesis one because state location comprised more than two groups, while independent samples t-test was used to test hypothesis two because gender comprised two dichotomous groups. Both hypotheses were tested at the 0.05 level of significance.

Results

Research Question 1: To what extent does social value creation influence the performance of technology-based SMEs in North Central, Nigeria?

S/N	Item Statements	$\bar{X}$	SD	Remark
1	My organization develops products or services that directly contribute to solving societal problems, which improves the revenue base.	3.22	0.82	High Extent
2	My organization ensures a balance between business activities and social value creation, resulting in increased profit margins.	3.20	0.86	High Extent
3	The organization actively engages in initiatives that positively improve revenue performance.	3.18	0.86	High Extent
4	Social value creation is integrated into the strategic objectives of the organization, which contributes to profit stability.	3.18	0.90	High Extent
5	My organization collaborates with external stakeholders to co-create solutions that benefit society, which in turn brings about revenue generation.	3.41	0.81	Very High Extent
6	Social value creation initiatives have improved customer trust and loyalty toward my organization, leading to increased revenue inflow and profit growth.	3.18	0.86	High Extent
7	Creation of social value has strengthened the brand image of the organization, resulting in better revenue performance.	3.35	0.80	Very High Extent
8	Social value creation practices have enhanced profitability and revenue generation.	3.38	0.74	Very High Extent
9	Engagement in social value creation has improved the competitive advantage of my organization.	3.05	0.94	High Extent
10	Social value creation initiatives have significantly contributed to the overall profit performance of the organization.	3.22	0.82	High Extent

	Weighted Average	**3.25**	**Very High Extent**

Table 1 shows that respondents rated collaboration with external stakeholders to co-create solutions that benefit society (mean = 3.41) and the enhancement of profitability and revenue generation through social value creation practices (mean = 3.38) as very high extent influences on performance. The strengthening of brand image (mean = 3.35) was also rated very high. The lowest-rated item, improvement of competitive advantage through social value creation (mean = 3.05), was still rated to a high extent. Standard deviations ranged from 0.74 to 0.94. The grand weighted mean of 3.25 indicates that social value creation influences the performance of technology-based SMEs to a very high extent.

Research Question 2: What is the extent of influence of proactiveness on the performance of technology-based SMEs in North Central, Nigeria?

S/N	Item Statements	$\bar{X}$	SD	Remark
11	My organization promotes new business opportunities which contribute to revenue generation.	3.47	0.72	Very High Extent
12	The organization anticipates future market needs and trends, resulting in improved profit margins.	3.16	0.69	High Extent
13	My organization takes initiative for proactive measures which enhance revenue performance.	3.44	0.67	Very High Extent
14	The organization introduces new products or processes before others in the industry, thereby contributing to higher revenue generation.	3.26	0.75	Very High Extent
15	I am willing to take calculated risks to exploit emerging opportunities, which has positively influenced profitability and revenue expansion.	3.22	0.95	High Extent
16	Proactive leadership has enhanced the ability of my organization to adapt to technological changes, resulting in improvements in profit margin.	3.27	0.80	Very High Extent
17	Proactiveness has improved the competitive advantage of my organization in the industry, thereby increasing profit levels and revenue growth.	3.32	0.83	Very High Extent
18	Being proactive has contributed to the growth of revenue and profit performance of the organization.	3.36	0.73	Very High Extent
19	Proactive practices in the organization have improved customer satisfaction and retention, leading to increased revenue inflow and profit generation.	3.35	0.71	Very High Extent
20	The proactiveness of leaders and the organization has significantly improved revenue growth.	3.31	0.84	Very High Extent
	Weighted Average	**3.32**		**Very High Extent**

Table 2 reveals that respondents rated the promotion of new business opportunities (mean = 3.47) and taking initiative for proactive measures (mean = 3.44) as very high extent influences on revenue performance. Introducing new products or processes ahead of competitors (mean = 3.26), improving competitive advantage (mean = 3.32), and contributing to revenue and profit growth (mean = 3.36) were similarly rated very high. The lowest-rated item, anticipating future market needs and trends (mean = 3.16), was rated to a high extent. Standard deviations ranged from 0.67 to 0.95, the narrowest range among the six constructs studied in the wider research, suggesting a strong consensus among respondents. The grand weighted mean of 3.32 indicates that proactiveness influences the performance of technology-based SMEs to a very high extent, the highest weighted mean recorded among the six leadership and orientation dimensions examined in the parent study.

Hypothesis One: Social Value Creation and State Location

$H_0$1: There is no significant difference in the mean responses of respondents regarding the extent of influence of social value creation on the performance of technology-based SMEs based on state location.

Group	N	Mean	SD	F	Df	Sig.
Benue	49	3.24	0.49			
Kogi	51	3.25	0.50			
Kwara	55	3.26	0.49			
Nasarawa	52	3.25	0.50	0.018	6, 350	0.971
Niger	55	3.26	0.49			
Plateau	46	3.26	0.50			
FCT-Abuja	49	3.24	0.49			
Total	357	3.25	0.49			

The ANOVA result in Table 3 shows a calculated F-value of 0.018 with a significance value of 0.971, which is greater than the 0.05 alpha level. The null hypothesis was therefore not rejected, indicating no significant difference in the mean responses of respondents regarding the influence of social value creation on SME performance based on state location. Mean scores were remarkably consistent across all seven states, ranging narrowly from 3.24 to 3.26.

Hypothesis Two: Proactiveness and Gender

$H_0$2: There is no significant difference in the mean responses of respondents regarding the extent of influence of proactiveness on the performance of technology-based SMEs based on gender.

Group	N	Mean	SD	t-cal	Df	p-value
Male	221	3.31	0.46			
				0.51	355	0.611
Female	136	3.33	0.38			

The independent samples t-test result in Table 4 shows a calculated t-value of 0.51 with a p-value of 0.611, which is greater than the 0.05 alpha level. The null hypothesis was therefore not rejected. Female respondents rated the influence of proactiveness slightly higher (mean = 3.33, SD = 0.38) than male respondents (mean = 3.31, SD = 0.46), but the difference was not statistically significant.

Discussion of Findings

The finding that social value creation influences the performance of technology-based SMEs to a very high extent establishes that creating value for society is not antithetical to business performance but is, in fact, a powerful driver of revenue generation, profit stability and overall organisational success. This finding suggests that technology-based SME leaders in North Central Nigeria recognise social value creation as a strategic imperative, rather than a charitable activity, that enhances trust, reputation, customer loyalty and revenue stability. This is consistent with Kraus, Filser, Farrington and Chiong (2017) and Ezenwakwelu and Nwachukwu (2022), who linked social entrepreneurial orientation to organisational sustainability and improved performance outcomes.

The absence of a significant difference in the influence of social value creation across states supports the theoretical proposition that social value creation operates as a universal performance enhancer across the North Central region, echoing Ainin et al. (2015) and Olanrewaju, Oyelaran-Oyeyinka and Lal (2020), who found that entrepreneurs across different regions often demonstrate similar perceptions toward social value creation and social responsibility due to shared exposure to global sustainability trends and comparable institutional environments. This finding also extends the Schumpeterian framework to what may be understood as a regionally transcendent process of social value creation, in which digitally enabled technology-based SMEs can create social value that resonates across state boundaries because digital platforms enable scalable social impact that is not constrained by physical geography (Okonkwo & Nwankwo, 2023). This implies that policy interventions to promote social value creation can be designed at the regional level rather than being tailored to individual states.

The finding that proactiveness influences the performance of technology-based SMEs to a very high extent, the highest of all social-entrepreneurial-orientation dimensions examined, is particularly significant because it indicates that in the highly dynamic and competitive environment of North Central

Nigeria, the ability to anticipate and act on future opportunities before competitors is not merely desirable but essential for survival. Proactive leaders continuously scan the environment for emerging trends and technological advancements, enabling their firms to secure first-mover advantages and build sustainable competitive edges. This is consistent with Lumpkin and Dess (2001) and Hughes and Morgan (2007), who found that proactiveness enables firms to anticipate market opportunities and capture new markets ahead of competitors, and with Ibrahim and Abu (2020) and Clement et al. (2024), who reported that proactiveness significantly enhances SME performance in the Nigerian context.

The absence of a significant gender difference in the influence of proactiveness confirms Nwabufo and Mamman (2019), who reported that while gender can influence leadership styles and access to resources, core entrepreneurial competencies such as proactiveness are universally recognised as essential across gender lines. This finding suggests that proactiveness functions as a fundamental, gender-neutral survival mechanism in North Central Nigeria's volatile technology ecosystem, since both male and female leaders face identical environmental pressures of rapid technological change, infrastructure deficits and competitive volatility.

Conclusion

This study concludes that social value creation and proactiveness are both very-high-extent drivers of the performance of technology-based SMEs in North Central Nigeria, with proactiveness emerging as the single most influential dimension among the leadership and social-entrepreneurial-orientation variables studied in the wider research. Both social value creation and proactiveness operate as geographically and demographically uniform performance enhancers, indicating that their benefits are not confined to particular states or genders but reflect a shared regional business reality shaped by common environmental pressures and opportunities. Business Education, by cultivating creativity, opportunity recognition, calculated risk-taking and social value sensitivity, remains central to nurturing these dimensions among current and prospective SME leaders.

Recommendations

Based on the findings, the following recommendations were made:

1. Given that social value creation operates uniformly across states, government agencies and SME support institutions should design regional, rather than state-specific, policy interventions and incentive schemes that encourage technology-based SMEs to embed social value creation into their strategic objectives.
2. Business Education institutions and SME development agencies should design gender-neutral training programmes on proactive market scanning, opportunity anticipation and early-mover strategies, since proactiveness was found to benefit male and female-led enterprises equally.
3. Because proactiveness recorded the highest influence among the dimensions studied, SME capacity-building curricula should place particular emphasis on cultivating anticipatory and change-oriented leadership behaviour as a priority area for enhancing technology-based SME performance in North Central Nigeria.

REDESIGNING CURRICULUM FOR DIGITAL ENTREPRENEURSHIP: PREPARING STUDENTS FOR THE PLATFORM ECONOMY

Abigail OFUME

Abstract

With digital skills playing an ever-growing role in the entrepreneurial sphere, this study strategically explores approaches for reimagining entrepreneurship courses to enhance student employability in the platform economy. Grounded in a phenomenological qualitative research design, the research examined the lived experiences and perceptions of key stakeholders, including teachers, digital entrepreneurs, curriculum providers, innovation hub supervisors, and final-year students from three urban cities in Delta State, Nigeria - Warri, Agbor, and Asaba. Eighteen participants were purposively sampled and interviewed in a semi-structured manner, with a descriptive analysis of the transcripts conducted using the Braun and Clarke framework, supported by the NVivo 12 software programme. The findings revealed that the existing entrepreneurship curricula lack exposure to digital tools, the content is outdated, there is insufficient academia-industry interface, and there is limited integration of digital business models. The study also highlights innovative pedagogical methods employed across various entities: experiential learning, blended learning, virtual incubation platforms, and gamification. Additionally, they provided strategic recommendations to reconsider the curriculum, such as co-designing it with industry, adopting competency theory, and merging technology-focused trends with digital soft skills. The findings of this study provide a candid message on a pressing call for flexible, industry-informed curriculum development practices that move entrepreneurship education to meet the needs of the digital economy. These findings add to a broader discussion on education reform and provide a blueprint for policymakers and teachers seeking to develop digital entrepreneurial skills among students in emerging economies.

Keywords: Digital entrepreneurship education, curriculum revision, entrepreneurship curriculum, digital skills, creative teaching methods

Introduction

The omnipresence of digital technology in daily life has altered the habits of today's society; people communicate, share, and create differently, and education has also transformed (Val & López-Bueno, 2024). The continually expanding areas of entrepreneurial digitalisation extend beyond everyday life and into programme screening. However, all facets are becoming closer to the fundamental principles of delivering and advancing occupational standards. Additionally, society's engagement with digital technology spans social, economic, familial, and professional realms, reflecting broader societal changes (Holmstrom & Hallgren, 2022). In a digital society like ours, individuals must master the competencies required to utilise digital tools effectively (Arcentales-Montalvo et al., 2020). Kraus et al. (2019) describe digital entrepreneurship as the process of creating (building and launching) new ventures using digital technologies (digital enterprise), and it involves finding new ways to generate value for customers (new value creation) by leveraging digital resources. A digital enterprise demonstrates a high level of digital engagement to enhance productivity (improve efficiency of business processes), implement innovative business models and working methods, and elevate customer service (web resources about digital enterprises). Similarly, digital entrepreneurs identify and capitalise on opportunities based on the Internet, the World Wide Web, mobile technologies, digital media, and other information and communication technologies (ICT) (Richter et al., 2017). There is widespread consensus on the significance of entrepreneurship education in fostering an entrepreneurial culture and activity. It equips individuals with essential skills to recognise viable business opportunities in entrepreneurship. The advantages of teaching entrepreneurship include the development of critical thinking, collaboration, and communication skills which are highly valued by employers. According to Dana et al. (2021), the aim of entrepreneurial education is to present founders or those interested in founding (prospective) individuals with suitable methods for developing professional and social competencies, thus reinforcing their motivation and awareness, and consequently, enhancing their likelihood of starting a business. Essential conditions for this include knowledge of the character traits and professional competencies required for successful founders, strong connections with professional

associations and the economy, close collaboration with like-minded individuals, as well as the openness and curiosity of the target group who have decided to reflect on their own identity.

The planetary economy is increasingly monitored, driven, and organised by digital platforms like Uber, Amazon, Airbnb, and Upwork, through which value is decentralised via technical intermediaries. This phenomenon, commonly referred to as the platform economy, gives rise to a new generation of entrepreneurs who can compete in the digital jungle. Copy-paste concepts that served students in traditional entrepreneurship education as pathways to success using a brick-and-mortar model are no longer as practical in the industry's fluctuating ecosystem. This paper evaluates the current state of entrepreneurship curricula, followed by a proposition in which digital competencies and platform-based entrepreneurial thinking play an essential role.

Literature Review

The fast-changing digital economy has prompted a rethinking of traditional entrepreneurship education and justified the need for scholars and educators to evaluate the sufficiency of current curricula. A burgeoning literature documents a significant mismatch between the skills taught in much of today's entrepreneurship education and the capabilities needed to build a successful business in the platform economy.

Nambisan (2017) argues that digital entrepreneurship is not completely explainable with traditional opportunity discovery and resource-based theories. It requires understanding virtual customer engagement, algorithmic feedback loops, and platform-powered scaling. Likewise, Giones and Brem (2017) highlight that digital entrepreneurs possess specific capabilities, such as managing digital infrastructures, developing platform strategies, and conducting real-time experimentation in digital ecosystems.

However, despite these insights, most higher education programs rely on traditional models emphasizing business plan writing, raising venture capital, and physical product innovation. These models favor conventional business practices and provide little space to develop vital digital skills. Students , therefore, leave the tertiary experience without the skills needed to succeed in a digital-first environment dominated by platform-based business models.

In response, new educational offerings like hackathons, startup weekends, digital boot camps, and innovation labs have emerged. These challenges allow students to develop and pitch digital products in pressurized, time-limited scenarios. Yet, as Ndou (2020) points out, they are typically extracurricular and often operate in isolation from formal academic curricula. Though useful, they are not consistently integrated into the educational environment, thus having little impact on total student readiness.

Recent research has suggested including several core components required to address the requirements of the digital economy in a core entrepreneurship curriculum. These elements consist of:

• Platform Strategy and Ecosystem Design: conveying skills to handle platform dynamics, trace the logic of driver effects, or develop and operate digital marketplaces.
• Digital Marketing and Analytics: Instruct scholars on improving business ventures through contemporary technologies to enhance commercial strategies, such as search engine marketing (SEM), search engine optimization (SEO), A/B testing, data analytics platforms, and data visualization tools.
• Cybersecurity and Digital Ethics: This course prepares students for the security, ethical, and legal issues in digital business environments.
• Artificial Intelligence and Automation: What is AI, and how can it be used in digital enterprises to enhance customer service, tailor products
and simplify processes?
• UX and Interface Design: The importance of designing intuitive, user-focused digital spaces to enhance customer satisfaction and engagement
is emphasized.

With a curriculum that is not adapted to this and does not include those things, you risk having an entrepreneurship education that expires in a world where mastery of the digital and participation in platforms and technological adaptability become increasingly important. The current cravats between what is offered educationally and the needs of the platform economy is a serious challenge for preparing students for the requirements of modern business
life.

Objectives

This study aims to
1. find and analyze gaps in current entrepreneurship programs regarding the digital skills, tools, and knowledge needed in the contemporary entrepreneurial context.
2. investigate new pedagogical techniques and digital learning tools that can improve the quality and delivery of digital entrepreneurship education.
3. formulate strategies for the digital curriculum redesign that align with the technological and industry atmosphere.

Research questions

1. What are the main limitations of current entrepreneurship courses regarding the digital skills, tools, and competencies necessary for success in contemporary digital entrepreneurial education?
2. What new teaching methods and digital learning support are emerging to improve digital entrepreneurship education?
3. What strategies may be adopted to restructure and reorient the digital entrepreneurship program with technologies and business industry trends?

Methodology

Research Design

Research design This study used a qualitative research design underpinned by phenomenology to understand and interpret key stakeholders' lived experiences, opinions, and knowledge in providing digital entrepreneurship education. A qualitative design was appropriate for exploring detailed views on the curriculum's inadequacies, innovative teaching approaches, and curriculum redesign in the face of digital evolution.

Sampling technique

The research involved three specific urban centres in Delta State, Nigeria—Warri, Agbor, and Asaba—to obtain in-depth contextual information. The sites were selected for their potential as educational and entrepreneurial hubs. Both contain a range of tertiary institutions, innovation hubs, and burgeoning digital businesses.

An information sampling method was employed to identify and select participants actively involved in entrepreneurship education and digital innovation. The sample was intentionally designed to represent a broad spectrum of views, including:

- Entrepreneurship educators from both public and private universities,
- Innovation hub coordinators and managers,
- Tech-savvy entrepreneurs and startup founders,
- Curriculum developers and educational policy makers, and
- Final-year students enrolled in entrepreneurship or digital business programs.

A total of 18 people were interviewed from four higher education institutions and three innovation hubs in Warri, Agbor, and Asaba. This variety in the type of institution and role of the actors allowed for triangulation of the perspectives and enhanced the quality and credibility of the data.

The data was gathered in a semi-structured interview to generate open-ended answers consonant with the research's fundamental aims. Each interview session lasted 40 to 60 minutes and was face-to-face or virtual, depending on preference and availability. Interviews were conducted with participants' permission, recorded using an audio recorder, and transcribed verbatim for analysis.

Braun and Clarke (2006) explained thematic analysis as involving the study of interview transcripts. This included coding the data, identifying common patterns, and establishing thematic categories that reflected essential aspects of curriculum gaps, pedagogical innovation, and strategic reform. Qualitative data were organized and analysed using NVivo software.

All ethical issues were strictly followed. The participants were guaranteed knowledge of the study, voluntary participation, and the right to withdraw at any time. Participant anonymity was safeguarded with the use of pseudonyms in reporting.

Through the case studies of Warri, Agbor, and Asaba, we contribute local perspectives on entrepreneurial education in the digital age that may illuminate the national dynamics of entrepreneurship, digital skills, and innovation in Nigeria. Purposeful sampling at the individual and site levels provided contextual data and enhanced the study's transferability and credibility.

Data Collection Method

Semi-structured interviews facilitated an open and flexible approach to cross-examining topics, which can help achieve uniformity in the language spoken about a particular topic between participants. The guide focused on important thematic issues:

- Current perceptions of entrepreneurship content and readiness to digitise.
- Applying digital and innovative pedagogies and tools.
- Barriers to curriculum renewal and digital inclusion.
- Implications for strategic repositioning of digital entrepreneurship education.

The interviews lasted between 40 and 60 minutes, face-to-face or via video, through tools like Zoom or Google Meet. Subject to their consent, all interviews were recorded with a digital recorder and transcribed verbatim.

Data Analysis

We conducted data analysis using **thematic analysis** according to Braun and Clarke's (2006) six-step model: Step 1.

1. **Becoming acquain**ted with the data through reading and re-reading the transcripts.
2. **First, coding** for patterns and recurring concepts.
3. **Looking for themes** according to research objectives.
4. **Analysis of themes** for coherence and relevance.
5. **Labeling and naming themes** to reflect deeper meaning.
6. **Compiling the report** by relating themes to research questions and literature.

The NVivo 12 program was utilized to facilitate coding and aid themes' development.

Results

Objective 1

To identify and analyze deficiencies in existing entrepreneurship curricula with regard to digital skills, tools, and competencies required in the modern entrepreneurial landscape.

Based on interviews conducted with a sample of 15 stakeholders—including university entrepreneurship lecturers, digital business experts, curriculum developers, and recent entrepreneurship graduates—the following key deficiencies were identified:

1. Inadequate Exposure to Real-World Digital Tools

"Most of our students graduate without ever using tools like Shopify, Google Analytics, or even basic project management platforms like Asana or Trello. The curriculum just doesn't go that far."— Lecturer, Department of Entrepreneurship, Federal University

- Interviewees across academic institutions consistently pointed out that students are taught theory without exposure to practical digital tools that are crucial in today's entrepreneurial world.
- Several recent graduates reported learning essential digital skills only after graduation, often through self-study or private courses.

2. Outdated Curriculum and Teaching Methods

"The content hasn't really changed in the past five years, despite how fast the business environment has evolved digitally." — Digital Start-up Founder, Warri

- Experts criticized the slow pace at which entrepreneurship curricula are updated, noting that emerging technologies such as artificial intelligence, digital marketing automation, and blockchain are barely mentioned.
- Teaching methods were also described as overly lecture-based, with little room for hands-on digital engagement.

3. Lack of Collaboration with the Digital Industry

"There's a major disconnect between academia and industry. We're not involved in helping shape what students are taught, and that's a missed opportunity."
— Business Incubator Manager, Asaba

- Industry experts expressed concern over the lack of partnership between universities and digital enterprises.
- Few institutions provide students access to mentorships, internships, or live projects that incorporate digital platforms and entrepreneurial tools.

4. Poor Emphasis on Digital Entrepreneurship Models

"They teach us how to write a business plan for a physical shop, but not how to run an online store or use Instagram to grow a business."— Recent Graduate, Entrepreneurship Program

- Many students and alumni shared that course content focuses more on brick-and-mortar business models, while digital business strategies, such as affiliate marketing, and influencer branding—are often overlooked or mentioned in passing.

5. Digital Literacy and Security Not Prioritized

"Cybersecurity, data privacy, and ethical online practices are rarely discussed. Yet, these are critical when you're building a digital brand."— Curriculum Consultant, National Education Board

- Educators acknowledged that digital literacy is not a formal part of most entrepreneurship programs, making students vulnerable to digital risks.
- A few suggested that modules on cybersecurity and online identity management should be made compulsory.

6. Limited Digital Soft Skills Development

"Students know how to pitch in person, but struggle in virtual environments. They need to learn how to manage teams remotely and use online collaboration tools." — HR Executive at a Tech Startup

- Interviewees emphasized the need to embed training on digital soft skills, such as remote communication, digital leadership, and adaptability to tech disruptions.

Result for Objective 2 (Interview Perspective):
To explore and evaluate innovative teaching approaches and digital learning tools that enhance the delivery and effectiveness of digital entrepreneurship education.

Through interviews with 15 key informants—including university lecturers, edtech consultants, digital startup founders, and final-year entrepreneurship students—the following innovative teaching approaches and digital tools were identified and evaluated for their impact on the quality of digital entrepreneurship education:

1. Adoption of Experiential and Project-Based Learning

"We've started integrating real startup projects into our classes. Students either launch a digital product or solve a real-world problem using technology." — Lecturer, University of Delta, Agbor

- Many educators reported a shift toward experiential learning, such as building prototype apps, launching social media campaigns, and creating business plans for online platforms.
- Project-based tasks were found to significantly improve student engagement, retention, and skill acquisition.

2. Integration of Digital Tools and Platforms

"Tools like Canva, WordPress, Google Workspace, and social media schedulers are now part of our teaching toolkit."— E-learning Facilitator, Private Innovation Hub

- Interviewees highlighted the effectiveness of integrating commonly used tools in the startup ecosystem.
- Specific tools mentioned include:
    - **Canva** for branding and pitch decks
    - **Google Analytics** for understanding user behaviour
    - **Trello and Slack** for digital project management
    - **Coursera/Udemy** for self-paced learning on digital marketing, coding, etc.

3. Flipped Classroom and Blended Learning Models

"We flipped the classroom. Students watch video lectures at home and use class time for hands-on sessions with mentors." — Head of Department, Entrepreneurship Studies

- Blended learning—combining online modules with in-person workshops—was widely praised.
- Flipped classrooms were especially effective in allowing deeper classroom engagement and personalised feedback.

4. Use of Virtual Incubation Platforms

"We now offer virtual incubation for students—where they pitch ideas, attend webinars, and get access to digital mentors via Zoom and WhatsApp." — Entrepreneurship Centre Director, University of Petroleum Resources, Effurun

- Several institutions are experimenting with virtual startup incubators that simulate real-world entrepreneurial ecosystems.
- Students participate in pitch competitions, digital product development sprints, and online mentoring sessions with entrepreneurs.

5. Gamification and Simulation-Based Learning

"Using business simulation games has changed everything. Students now understand market dynamics in a fun, risk-free environment."— Instructional Designer, EdTech Startup

- Simulated entrepreneurship environments like **Marketplace Live**, **BizCafe**, and **GoVenture** were reported to enhance decision-making and critical thinking skills.
- Gamification techniques—like digital badges, leaderboards, and challenges—helped maintain student interest and motivation.

6. Peer Learning and Digital Collaboration

"WhatsApp and Telegram groups are becoming peer learning hubs—students share YouTube tutorials, course materials, and even pitch ideas together."— Final-Year Student, Polytechnic Entrepreneurship Program

- Informal digital communities, often outside the formal LMS (Learning Management Systems), were praised for fostering collaborative learning and digital confidence.
- Group-based digital projects enhanced peer-to-peer feedback and teamwork skills.

7. Integration of AI and Emerging Technologies

"We've started using ChatGPT to teach idea generation and marketing content development. It helps students brainstorm faster." — Digital Entrepreneurship Lecturer, Dennis Osadebey University

- A few pioneering institutions are exploring artificial intelligence tools to teach market analysis, customer interaction simulations, and content automation.
- Augmented Reality (AR) and Virtual Reality (VR) are also being piloted in tech-savvy campuses for immersive pitch presentations.

Result for Objective 3 (Interview Perspective):

To develop strategic approaches for redesigning digital entrepreneurship curricula to align with technological advancements and industry expectations.

Interviews with 12 key stakeholders—including curriculum planners, tech entrepreneurs, business incubator managers, and digital skills trainers—revealed several strategic recommendations for aligning digital entrepreneurship curricula with evolving technologies and market needs:

1. Co-Design Curriculum with Industry Experts

"The fastest way to stay current is to involve tech entrepreneurs and digital marketers in curriculum design. They know what's changing."— Curriculum Consultant, National Universities Commission (NUC)

- Interviewees emphasized that curriculum revision must involve professionals who are actively engaged in the digital economy.
- Suggested approaches include forming advisory boards with representatives from startups, tech companies, and innovation hubs.

2. Modular and Flexible Curriculum Structure

"Digital skills change rapidly. A rigid four-year syllabus can't keep up. We need shorter, stackable modules." — Digital Skills Trainer, EdTech Academy

- Experts advocated for modular structures that allow for rapid updates and the integration of emerging technologies like AI, blockchain, and IoT.
- Short courses and digital certifications (e.g., Google Digital Garage, HubSpot Academy) could be embedded as electives or co-curricular options.

3. Emphasis on Competency-Based Learning

"It's no longer about how many hours a student sits in class. It's about what they can do with what they learn." — Innovation Hub Director, Warri

- Stakeholders recommended shifting towards outcome-driven, competency-based education, where students demonstrate mastery of specific digital tools and entrepreneurial tasks.
- Capstone projects, portfolios, and product-based assessments were proposed to replace traditional exams.

4. Embed Real-World Digital Tools in Course Delivery

"We must teach students to use the same tools digital entrepreneurs use daily—like Mailchimp, Canva, Shopify, and ChatGPT." — Founder, Online Business Academy

- Incorporating up-to-date software and platforms into both teaching and assignments was a unanimous recommendation.
- Continuous faculty training on digital tools was also identified as essential.

5. Integration of Emerging Technology Trends

"Students need foundational knowledge in tech trends—even if they're not coders. They must understand the digital context of entrepreneurship." — Technology Policy Analyst, Abuja

- Curricula should include introductory modules on:
    - Artificial Intelligence and automation
    - Blockchain and digital currencies
    - Data analytics and cloud computing
    - Cybersecurity and digital ethics

6. Partnerships with Tech Hubs and Incubators

"We should be placing students in digital startups during their industrial training—it's more relevant than traditional firms." — Entrepreneurship Lecturer, Federal Polytechnic

- Collaborations with tech hubs and incubators were suggested for internships, mentorship programs, hackathons, and pitch events.
- These partnerships would expose students to digital entrepreneurial ecosystems early on.

7. Continuous Curriculum Review Mechanisms

"We can't afford to revise the curriculum every 10 years anymore. We need a feedback loop that updates it annually." — Deputy Dean, Faculty of Management Sciences

- Institutions were advised to establish review committees that meet annually to evaluate digital content relevance and industry alignment.
- Feedback from alumni and employers should be systematically collected to inform updates.

8. Promote Digital Soft Skills and Entrepreneurial Mindset

"Teach them resilience, digital communication, remote collaboration—skills that define today's entrepreneurs." — HR Lead, Fintech Startup

- Digital entrepreneurship education must go beyond technical skills to include digital-era soft skills such as adaptability, problem-solving, critical thinking, and virtual leadership.

Discussion

The findings of this research will inform the condition and the potential development of digital entrepreneurship education. Interviews with key informants from a variety of stakeholders, namely curriculum professionals, digital professionals, innovation hub managers, and students, indicate the common understanding that existing entrepreneurship curricula in Higher Education Institutions (HEIs) establish a strong theoretical background within conventional business disciplines but fail to include commensurate preparation for the ever-changing digital entrepreneurial ecosystem. This 15-year lag is consistent with prior research by Giones and Brem (2017), who argued that the dynamism of digital entrepreneurship calls for more flexible and technology-driven educational frameworks than most universities have to offer now.

The Argument for a Curricular Revision in Digital Entrepreneurship

Participants stressed that contemporary entrepreneurs should be fluent in the language of business and technology, which are also prevalent in such digital tools, platforms, and spaces. Classical business planning, resource search, and organization construction are still essential but insufficient. Today, a successful entrepreneur must be able to work in an online marketplace, use social media analytics, run a digital marketing campaign, use artificial intelligence tools, and work with digital in a distributed manner across digital platforms. However, opportunities to learn these competencies in a focused way are currently scarce in most curricula (Ndou et al., 2018).

Profound curricular change became one of this context's most critical recurring topics. There was a strong demand for integrating modern digital tools (including Google Workspace, Canva, Trello, Shopify, and Mailchimp), today's experiential (hands-on) learning, closer industry-academic collaboration, and a mix of technical and digital soft skills focus. An echo of this requirement is consistently heard in Maritz and Brown (2013) that entrepreneurship education needs to be continually evaluated and recalibrated to the entrepreneurial realities of the time. By including practical, industry-

relevant content, a faculty member is doing more than taking a design approach; s/he is doing what needs to be done to maintain relevance.

Creative Teaching Practices in Digital Entrepreneurship Education

Nevertheless, it was observed from the interviews that some universities are now incorporating (although in small sporadic doses) alternative methods of teaching that accommodate the new requirements of digital entrepreneurship. These include "flipped classrooms," in which students work on video or online modules at home and engage in interactive, project-based activities in the classroom. This is consistent with the suggestions of Kirkwood and Price (2014), who emphasize the pedagogical value of learner-centred and technology-mediated learning environments in higher education.

Simulation-based learning, which uses digital platforms to simulate business environments and entrepreneurial decision-making, also helps students learn how market dynamics and business risk work without the price or pain of actual failure. BizCafe, SimVenture, and Marketplace Live succeeded in enhancing traditional classroom learning with experiential content. These approaches develop higher-level cognitive skills like strategic decision-making, critical thinking, and adaptability, which are key to successful digital economic operations (Fayolle & Gailly, 2015).

The emergence of virtual incubation platforms and online mentorship programs is a huge step ahead in connecting the dots between academic theory and know-how. Some schools have collaborated with tech hubs to provide virtual internships, digital startup challenges, and live pitch events. These programs emulate real-life entrepreneurial ecosystems and allow students to gain exposure to digital startup culture.

However , the spread of those innovations has been inconsistent. Data is a real issue for most institutions because faculty are often not experts in digital entrepreneurship, there is often no internet, computers may be antiquated, and the curriculum is often inflexible, making it difficult to add to it without going through committee." These barriers at the system level align with the concerns of Nabi et al. (2017) that pedagogical innovations in entrepreneurship education are frequently found to be limited in their scale and scope by institutional barriers.

Strategic Curriculum Redesign Toward Industry Relevance

Beyond pedagogical approaches, it comes through the emphasis on the importance of systematically reconfiguring digital entrepreneurship curricula responsive to the rapid pace of technological change and industry requirements. In consultation, stakeholders recommended that curricula be co-designed with industry players, such as entrepreneurs, technology companies, and hub coordinators. This means students graduate with the required skills and competencies in today's job market and within venture ecosystems. It is also aligned with the "entrepreneurial ecosystems" model from Neck, Greene, and Brush (2014), in which learning is situated in networks of practice and collaboration.

Also, some other broadly supported suggestions referred to modularity and flexibility in the curriculum. Rather than the inflexible course outlines that hadn't changed in some cases for years, stakeholders suggested a series of short, stackable modules that could be easily revised to keep pace with new techniques and tools. This modular approach enables us to incorporate short courses and certifications from global edtech platforms (Coursera, edX, Google Digital Garage, etc.), under which learners can earn recognized academic and industry credentials. It is also worth noting that curriculum responsiveness is critical to entrepreneurship education in the rapid digital era, where technologies change fast (Rideout & Gray, 2013).

Besides, future-proofing the curriculum with exposure to emerging technologies like AI, Blockchain, big data analytics, and digital currencies was important. You don't have to become a technologist in these areas, but there needs to be a basic level of knowledge of how these technologies are influencing industry models, consumer behavior, and market evolution. This form of digital literacy is particularly critical for entrepreneurial and intrapreneurial individuals who are employed in corporate innovation teams (Giones & Brem, 2017).

Soft Skills, Ongoing Feedback, And Learning for Life

Notably, it even included building digital soft skills such as remote collaboration, digital communication, online negotiation, and digital emotional Intelligence. These skills are frequently underrated, yet they are now more important as part of virtual teams and global digital initiatives. Remote management and working from home are now essential entrepreneurial skills (Neck et al., 2014).

Finally, participants emphasized the importance of continual curriculum review to ensure continued relevance. As opposed to the conventional approach that updates the curriculum every five or ten years, reviewers recommended an annual or bi-annual look at the curriculum based on student, alums, employers, and industry input. This feedback loop would enable organizations to keep agile and respond quickly to fast-moving technology and market trends (Ndou et al., 2018).

Conclusion

Ultimately, the conversation highlights an emerging agreement among all parties that entrepreneurship education must address the digital era's actual terrain more adequately. Old School pedagogies and fixed curricula are no longer enough to prepare students for the challenges of digital entrepreneurship. Educational institutions must abandon such fixed, static, irrelevant, and ivory towers and offer a holistic, practice-oriented education focusing mainly on practical digital skills and the business mindset. Through strategic redesign, cross-institutional collaboration, and continued innovation, digital entrepreneurship education can significantly transform how students are prepared to lead and compete in the global digital economy.

Recommendations

In light of the findings, the recommendations are presented as guidelines that will be useful for educators, curriculum developers, and policymakers (to consider when) redesigning entrepreneurship curricula for the digital age.

1. Curriculum designers need to incorporate principles around the platform economy in a more structured way in Bachelor's and Master's programs for entrepreneurship. Students should have a basic understanding of Multisided Platforms, Network effects, Data monetisation, and Digital business ecosystems.
2. Tertiary institutions need to integrate digital skills and tools into entrepreneurship education, for example, teaching how to use data analytics, digital marketing platforms, UI/UX design, low code development and agile product management.
3. Modular, stackable learning architectures–tracked through microcredentials or digital badges, for instance—through which students could develop new seemingly vital skill sets in, let's say, fintech, AI ethics, cybersecurity, and platform strategy, then add onto their prior micro qualifications with supplementary mini-credentials until collecting enough for a full degree.
4. Interdisciplinary challenge-based programs are proposed as the medium for delivering entrepreneurship education. These frameworks ought to involve business, technology, and design working together to solve problems holistically in a net-mediated context.
5. Institutional leaders should invest in faculty development opportunities centered on digital innovation and entrepreneurship pedagogy, including industry immersion, digital upskilling, and joint teaching with platform-based business practitioners.
6. Policymakers and accrediting bodies need to modify curriculum review structures to recognise the volatility of education in digital entrepreneurship and provide scope for flexible, responsive, and experimental programs.
7. Curriculum developers must build ethical, legal, and inclusive innovation principles into entrepreneurship education, such as responsible AI, digital rights, platform labour ethics, and bridging the digital divide.

SUSTAINABILITY-CONSCIOUS FINANCIAL DECISION-MAKING FOR ENTREPRENEURIAL TRANSFORMATION IN NIGERIA

Dr. Akinsanya Saheed Olatunde (MABEN/1066)
so.akinsanya@ui.edu.ng/akinsanyaolatunde1@gmail.com
Department of Educational Management (Business Education Programme)
University of Ibadan, Nigeria

Abstract

Entrepreneurship remains an important pathway for addressing unemployment, generating income and strengthening economic participation in Nigeria. However, the ability to start a business does not necessarily translate into the ability to sustain and grow it. Many entrepreneurial ventures operate in an environment characterised by limited capital, rising operating costs, uncertain markets, changing technology and increasing pressure to use resources responsibly. In such an environment, financial decisions can determine not only whether a business makes profit but also whether it survives, adapts and creates lasting value. This paper therefore advances the position that entrepreneurial transformation in Nigeria requires a shift from short-term and predominantly profit-oriented financial decisions towards sustainability-conscious financial decision-making. Sustainability-conscious financial decision-making refers to the ability of entrepreneurs to consider financial viability alongside environmental responsibility, social value, resource efficiency and long-term business resilience when making decisions about investment, financing, expenditure and resource allocation. The paper argues that financial competence and sustainability awareness should no longer be treated as separate entrepreneurial capabilities. Rather, they should be developed together, particularly through Business Education and Entrepreneurship Education. The paper examines the relationship between financial decision-making, sustainability and entrepreneurial transformation and highlights the implications for entrepreneurs, Business Education programmes, policymakers and entrepreneurship-support institutions in Nigeria. It concludes that Nigeria's entrepreneurial transformation will be more meaningful when entrepreneurs are equipped not merely to create businesses, but to make responsible financial decisions that enable those businesses to survive, innovate, create employment and generate value over the long term.

Keywords: Business Education, entrepreneurial transformation, entrepreneurship, financial decision-making, sustainability

Introduction

Entrepreneurship is often presented as one of the practical ways through which Nigeria can respond to unemployment, poverty, economic dependence and limited formal employment opportunities. This is understandable given the large number of Nigerians who depend on small businesses and entrepreneurial activities for their livelihoods. However, starting a business and sustaining one are two different challenges. An entrepreneur may have a promising idea, access start-up capital and even attract customers, yet still struggle when faced with poor cash-flow management, inappropriate borrowing, weak investment decisions, rising costs or unexpected changes in the business environment. This makes financial decision-making an important part of entrepreneurship. Every entrepreneur makes financial decisions, whether consciously or otherwise. Decisions about how much to borrow, what to spend, when to invest, what resources to conserve, whether to acquire new equipment, how to price products and how much profit to retain can have consequences that extend beyond the immediate financial outcome. In a difficult business environment such as Nigeria's, poor financial decisions can quickly weaken a promising enterprise, while prudent decisions can provide the flexibility needed to survive periods of uncertainty.

Philip (2025) reported a positive relationship between participation in financial-literacy training and sustainable entrepreneurial success among clients of LAPO Microfinance Institution. Ibitomi et al. (2024) found that financial literacy is relevant to the performance of small and medium enterprises in Abuja. These findings suggest that entrepreneurship development cannot be separated from the capacity of entrepreneurs to understand and manage financial resources effectively. However, financial competence alone may no longer be enough. The business environment is increasingly shaped by concerns about resource efficiency, environmental responsibility, social inclusion and long-term resilience. Nigerian small and medium enterprises are already experiencing challenges associated with environmental sustainability and circular-economy practices, suggesting that sustainability is not simply

an issue for large corporations or multinational companies. Consequently, entrepreneurs need to think about the longer-term consequences of their financial decisions rather than concentrating exclusively on immediate returns. This is where the idea of sustainability-conscious financial decision-making becomes important. The concept brings together two areas that are often discussed separately: financial decision-making and sustainability. It recognises that a financially attractive decision may not necessarily be the most beneficial decision for the long-term survival of a business or the wider society. For example, choosing the cheapest production input may reduce immediate costs, but excessive dependence on poor-quality or environmentally harmful inputs may create higher costs in the future. Similarly, taking a loan may provide the funds required for expansion, but excessive borrowing without realistic cash-flow projections can expose a small business to financial distress. The argument of this paper is therefore straightforward: Nigeria's entrepreneurial transformation should not be measured only by the number of businesses created, but also by the quality of decisions made within those businesses and their capacity to create sustainable economic and social value. Entrepreneurs need the financial knowledge to make sound decisions and the sustainability awareness to understand the wider consequences of those decisions. This position is particularly relevant to Business Education.

Business Education has an important role to play in preparing learners for the realities of the Nigerian business environment. Its purpose should extend beyond preparing students for employment to developing the knowledge, practical skills and confidence needed to start, manage and sustain enterprises. This is becoming increasingly important as entrepreneurs are faced with financial pressures and business decisions that can determine whether their ventures survive or fail. Alao, Mojekwu, and Opara (2024), in their study of Business Education in Nigeria, found that the existing curriculum did not provide enough innovative pedagogical strategies to adequately empower students for sustainability. Similarly, Babajide et al. (2023) found among small business owners in Lagos and Ogun States that financial literacy and financial capabilities were positively associated with sustainable business practices. These findings suggest that preparing future entrepreneurs requires more than teaching them how to start a business or make profit. They need to develop the ability to make informed financial choices while considering the long-term survival of the business, responsible use of resources and the wider consequences of those choices. It is against this background that this paper argues for greater attention to sustainability-conscious financial decision-making in Business Education as a means of preparing entrepreneurs who can create value, withstand changing business conditions and contribute meaningfully to Nigeria’s economic transformation.

The Changing Meaning of Entrepreneurial Transformation in Nigeria

Entrepreneurial transformation should mean more than an increase in the number of people who start businesses. Although business creation is important, the real contribution of entrepreneurship lies in the ability of enterprises to survive, grow, innovate, create employment and respond to emerging economic and social needs. This distinction is important in Nigeria because many people enter entrepreneurship not necessarily because they have identified a strong market opportunity, but because formal employment opportunities are limited. Entrepreneurship can therefore become a means of economic survival. While necessity-driven entrepreneurship has an important place in the Nigerian economy, it also creates a need to strengthen the capabilities that enable businesses to move from survival towards sustainable growth.

Adelowo and Henrico (2025) examined entrepreneurship propensity among young Nigerian graduates and raised important questions about the extent to which entrepreneurial intentions are translated into sustained entrepreneurial practice. This reinforces the need to look beyond entrepreneurial intention and business start-up towards the capabilities required to maintain an enterprise over time. From this perspective, entrepreneurial transformation involves a change in how entrepreneurs think, decide and create value. It requires entrepreneurs to become more deliberate about how they use scarce resources, respond to uncertainty, manage financial obligations, adopt technology, satisfy customers and consider the social and environmental consequences of their activities. Financial decision-making sits at the centre of many of these activities. An entrepreneur who cannot distinguish between business revenue and personal income, who invests without considering cash-flow implications, or who takes on debt without assessing repayment capacity may find it difficult to sustain the enterprise regardless of how innovative the original business idea may be. Conversely, an entrepreneur who understands financial information, evaluates risks and considers long-term consequences is better positioned to make decisions that support business resilience. The transformation being proposed in this paper is therefore not simply about more entrepreneurs, but about better-prepared entrepreneurs and better-quality entrepreneurial decisions. This requires a deliberate effort to connect financial capability with sustainability thinking.

Understanding Sustainability-Conscious Financial Decision-Making

Sustainability-conscious financial decision-making can be understood as the process through which entrepreneurs consider financial returns together with the long-term economic, environmental and social consequences of their financial choices. Traditional financial decision-making tends to ask questions such as: *How much will this cost? How much profit will it generate? Can the business afford it? How quickly will the investment pay back?* These questions remain important. However, sustainability-conscious decision-making extends the conversation by asking additional questions: *Will this decision strengthen the business in the long term? Does it encourage efficient use of resources? What effect will it have on employees, customers and the community? Can the business continue to operate if circumstances change?* This does not mean that entrepreneurs should ignore profit. Profit remains essential for business survival. Rather, the position of this paper is that profitability and sustainability should not be treated as opposing objectives. A business that continuously wastes resources, over-borrows, ignores employees, loses customer trust or fails to anticipate environmental and market changes may generate short-term returns but struggle to remain viable.

Sustainability-conscious financial decision-making can therefore be viewed through four interconnected considerations:

1. Financial prudence – making informed decisions about budgeting, cash flow, borrowing, investment, pricing and expenditure.
2. Resource efficiency – considering how financial decisions affect the efficient use of energy, materials, technology and other scarce resources.
3. Social responsibility – recognising the effects of business decisions on employees, customers, suppliers and the wider community.
4. Long-term resilience – prioritising decisions that strengthen the enterprise's capacity to withstand financial, technological, environmental and market disruptions.

Why Nigeria Needs Sustainability-Conscious Financial Decision-Makers

The Nigerian business environment presents entrepreneurs with conditions that make sound decision-making particularly important. Limited access to affordable finance, changing operating costs, infrastructure challenges, technological disruption and market uncertainty can place considerable pressure on small businesses. Under such conditions, entrepreneurs may be tempted to focus on immediate survival and postpone considerations about long-term sustainability. Yet it is precisely under difficult conditions that sustainability-conscious financial decisions become valuable. When resources are scarce, waste becomes more costly. When access to finance is difficult, poor investment decisions become harder to reverse. When markets are uncertain, excessive financial commitments can threaten business survival.

Financial literacy is therefore not simply a personal financial skill. For entrepreneurs, it can become a business survival capability. Recent Nigerian evidence continues to demonstrate the connection between financial literacy, financial inclusion and entrepreneurial outcomes. Kachalla and Gambo (2025), for example, reported significant relationships between financial literacy, financial inclusion and entrepreneurial success in Nigeria. Likewise, Sam-Abugu et al. (2025) found that financial literacy and FinTech innovation have important implications for sustainable financial inclusion in Nigeria. Entrepreneurs need to understand not only how to obtain financial resources but also how to allocate, monitor and protect those resources. They must be able to distinguish between expenditure that supports productive capacity and expenditure that merely creates short-term convenience. They must also be able to assess financial risks before committing scarce resources.

At the same time, sustainability awareness needs to become part of this financial reasoning. The entrepreneur who considers energy efficiency when purchasing equipment, evaluates the long-term cost of inputs, reduces unnecessary waste, maintains responsible relationships with workers and customers, and plans for possible disruptions is making financial decisions with a broader understanding of business sustainability. This is the kind of entrepreneurial thinking that Nigeria needs to encourage. The goal should not be to burden entrepreneurs with additional rules or expectations, but to help them understand that sustainability can itself become a source of efficiency, resilience, innovation and competitive advantage.

The Role of Business Education in Developing Sustainability-Conscious Financial Decision-Makers

Business Education has traditionally provided learners with knowledge and skills in areas such as accounting, finance, office practice, management, marketing and entrepreneurship. These areas

remain relevant, but the nature of business itself is changing. Today's entrepreneur is expected to operate in an environment where financial pressures exist alongside technological changes, environmental concerns, changing consumer expectations and growing demands for responsible business practices. This means that Business Education can no longer focus only on preparing learners to understand how businesses operate; it must also prepare them to make sound decisions within increasingly complex business environments. Financial literacy is an important part of this responsibility. A person may understand the meaning of profit, loss, assets, liabilities or cash flow and still struggle to make appropriate financial decisions when running a business. What entrepreneurs need is the ability to apply financial knowledge when confronted with real business choices. Recent evidence from Nigeria reinforces this point. Kachalla and Gambo (2025) found a significant relationship between financial literacy, financial inclusion and entrepreneurial success, while Philip (2025) reported that financial-literacy training was positively associated with sustainable entrepreneurial success among clients of LAPO Microfinance Institution.

This suggests that Business Education should place greater emphasis on decision-oriented financial learning. Students should not only learn how to prepare a cash budget; they should be able to use the information in that budget to decide whether a business can afford an expansion. They should not only learn about sources of finance; they should be able to compare the implications of equity, debt and internally generated funds before recommending a financing option. Similarly, learning about cost accounting should go beyond calculating costs to helping students understand how waste, inefficient resource use and poor purchasing decisions can affect both profitability and sustainability.

Business Education should therefore move from knowledge transmission to decision preparation. Students should encounter practical situations in which they have to decide whether to borrow, invest, save, expand, reduce costs, adopt a new technology, change suppliers or redesign a product. More importantly, such decisions should be examined from both financial and sustainability perspectives. For example, a Business Education student who is planning to establish a small food-processing enterprise should be encouraged to consider more than the initial purchase price of equipment. The student should examine energy consumption, maintenance costs, expected useful life, waste generation, financing arrangements and potential effects on production costs. A cheaper machine may appear financially attractive at the point of purchase but may become more expensive over time because of high energy consumption or frequent breakdowns. Conversely, an energy-efficient machine may require greater initial investment but provide better long-term value. This is the type of reasoning that sustainability-conscious financial decision-making requires. The same principle applies to working capital. An entrepreneur may increase sales by offering customers generous credit, but if receivables are not collected promptly, the business may experience cash-flow problems despite recording impressive sales. A sustainability-conscious entrepreneur therefore considers not only revenue growth but also liquidity and the ability of the business to continue meeting its obligations. In this sense, sustainability begins with everyday financial decisions.

Business Education is well positioned to develop these capabilities because of its multidisciplinary nature. Accounting can provide the financial foundation; economics can help students understand resource allocation and market forces; entrepreneurship can develop opportunity recognition and innovation; management can strengthen planning and decision-making; while information and communication technology can support financial analysis and digital business operations. Bringing these areas together can produce graduates who are better prepared to make informed entrepreneurial decisions. Alao, Mojekwu and Opara (2024) examined the Business Education curriculum in relation to students' empowerment and sustainability and emphasised the need for Business Education to contribute more directly to sustainable economic development. Adekunle et al. (2025) identified digital tools, experiential learning, industry partnerships and sustainability-focused curricula as important for preparing Business Education students for contemporary employment and sustainability demands. This means that the sustainability agenda should not be introduced into Business Education as another isolated topic added to an already crowded curriculum. It should be embedded in the way business decisions are taught. Financial accounting exercises, entrepreneurship projects, business plans, investment appraisal, budgeting and case studies can all be designed to require students to consider long-term financial, social and environmental consequences.

From Financial Literacy to Financial Decision-Making Competence

One of the positions advanced in this paper is that financial literacy should be treated as a foundation rather than the final goal of entrepreneurial financial education. Knowing financial concepts is valuable, but entrepreneurial transformation requires the ability to use those concepts when making

decisions. There is an important difference between knowing what cash flow means and being able to determine whether a business has sufficient cash to undertake an expansion. There is also a difference between knowing what a loan is and being able to determine whether the expected return from a proposed investment will justify the cost and risk of borrowing. This distinction is particularly important for Nigerian entrepreneurs. Limited financial resources mean that mistakes can be costly. An entrepreneur who commits scarce funds to an unproductive investment may not have enough resources to recover from the mistake. Likewise, excessive dependence on borrowed funds can create repayment pressures that undermine otherwise viable businesses. Kachalla and Gambo (2025) identified financial literacy and financial inclusion as important factors associated with entrepreneurial success, while Philip (2025) showed the value of financial-literacy training for sustainable entrepreneurial outcomes. These findings suggest that entrepreneurial education should go beyond helping learners understand financial terminology and move towards developing the ability to interpret financial information, evaluate alternatives and make responsible choices. A sustainability-conscious financial decision-maker should therefore be able to ask four basic questions before committing business resources:

1. Is the decision financially viable? The entrepreneur must consider cost, expected return, cash flow, affordability and financial risk.
2. Is the decision efficient in its use of resources? The entrepreneur should consider whether available resources are being used productively and whether unnecessary waste can be reduced.
3. What are the wider consequences of the decision? The entrepreneur should consider effects on employees, customers, suppliers, communities and the environment.
4. Will the decision strengthen the business in the long term? The focus should extend beyond immediate profit to resilience, adaptability and continued value creation.

These questions provide a practical bridge between financial management and sustainability.

Rethinking Entrepreneurship Education for Sustainable Enterprise Creation

The argument for sustainability-conscious financial decision-making also requires a rethink of what entrepreneurship education should achieve in Nigerian tertiary institutions. Entrepreneurship education is often centred on identifying business opportunities, developing business ideas, preparing business plans and encouraging students to consider self-employment. These are important starting points, but they are not enough to prepare learners for the realities of running a business. Once an enterprise begins, the entrepreneur is faced with decisions that have to be made repeatedly: whether to expand or remain at the current level, when to reduce unnecessary spending, how much stock to purchase, whether an investment in technology is worthwhile, when to employ additional workers and how to respond to changes in customers' needs and market conditions. The quality of these decisions can determine whether a promising business remains viable or gradually loses its capacity to survive. This is why entrepreneurship education should place greater emphasis on judgement, financial understanding and the ability to weigh alternatives rather than on simply knowing the steps involved in starting a business.

Oyinlola et al. (2024), in examining entrepreneurship and innovation in Nigerian universities, noted the need to strengthen the way entrepreneurship development and innovation activities are implemented in universities. Similarly, Kasimu and Jamilu (2024) found a positive relationship between financial literacy and entrepreneurial competencies among Business Education students in Nigerian Colleges of Education, particularly in areas such as identifying opportunities and managing business finances. These insights support a shift in emphasis from teaching students mainly how to establish a business to helping them understand how to make sound decisions after the business has been established. Entrepreneurship education should therefore develop learners who can read financial situations, consider the consequences of their choices, manage scarce resources and adjust their decisions as circumstances change. Such an orientation would make entrepreneurship education more relevant to the long-term survival and responsible growth of enterprises in Nigeria.

A Proposed Framework for Sustainability-Conscious Financial Decision-Making

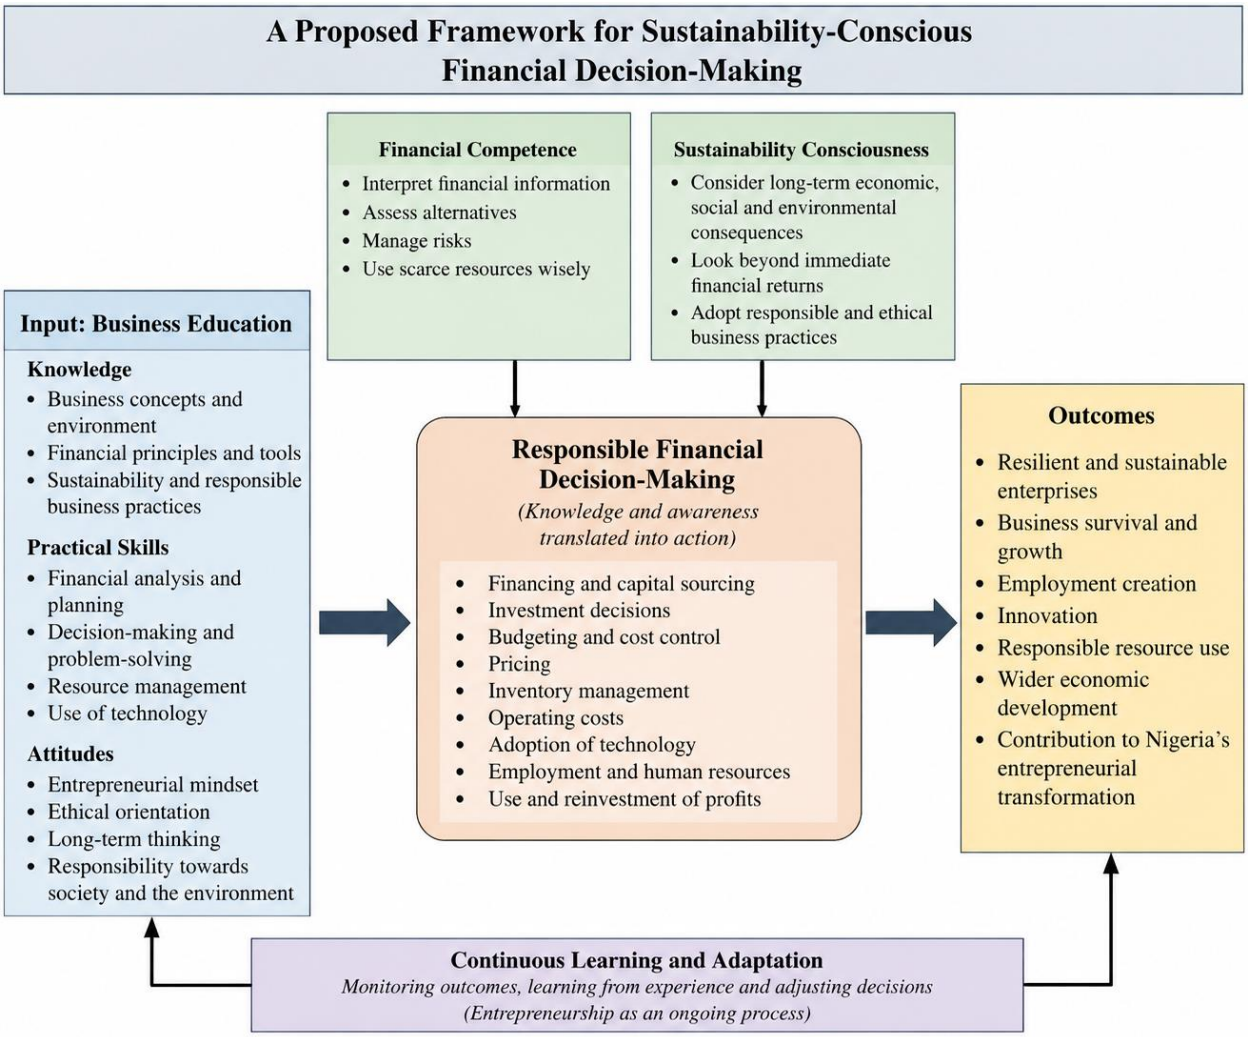

Fig. 1 A proposed framework for sustainability-conscious financial decision-making

Note: The framework illustrates how Business Education develops the knowledge, skills and attitudes that, together with financial competence and sustainability consciousness, inform responsible financial decision-making and lead to resilient enterprises and broader socio-economic benefits.

Entrepreneurial transformation in Nigeria requires more than encouraging people to start businesses; it requires developing entrepreneurs who can make sound decisions that support the survival and growth of their enterprises. Business Education provides the foundation for developing the knowledge, practical skills and attitudes needed to understand business situations and make informed choices. Financial competence enables entrepreneurs to interpret financial information, assess alternatives, manage risks and use scarce resources wisely, while sustainability consciousness encourages them to look beyond immediate financial returns and consider the longer-term economic, social and environmental consequences of their choices. This wider orientation is important for Business Education in Nigeria, as Alao, Mojekwu, and Opara (2024) highlighted the need for a stronger curriculum that can better empower learners for sustainability. In a related context, Babajide et al. (2023) found that financial literacy and financial capabilities were positively associated with sustainable business practices among small-business owners in Lagos and Ogun States.

The framework places responsible financial decision-making at the point where knowledge and awareness are translated into action. Entrepreneurs constantly make choices about financing, investment, budgeting, pricing, inventory, operating costs, technology, employment and the use of profits, and these choices can determine whether a business remains viable when conditions change. A resilient and sustainable enterprise is therefore not necessarily a large business; rather, it is one that manages its resources carefully, adapts to changing circumstances and continues to create value over time. When entrepreneurs develop this capacity, the benefits can extend beyond the survival of individual businesses to employment creation, innovation, responsible resource use and wider economic development. The framework thus views entrepreneurship as an ongoing process of making

and adjusting decisions rather than simply the act of establishing a business. It positions Business Education as a means of developing entrepreneurs who can combine financial understanding with an awareness of longer-term consequences, making their enterprises better equipped to survive, grow responsibly and contribute to Nigeria's entrepreneurial transformation.

Barriers to Sustainability-Conscious Financial Decision-Making among Nigerian Entrepreneurs

Although sustainability-conscious financial decision-making is desirable, expecting entrepreneurs to adopt it without addressing the realities of the Nigerian business environment would be unrealistic. Entrepreneurs make decisions within particular economic, institutional and social conditions. Where access to finance is limited, operating costs are high and business survival is uncertain, immediate financial pressures can easily take priority over longer-term sustainability considerations. One major barrier is limited financial capability among some small business owners. Financial decisions are sometimes based on experience, intuition or immediate business needs rather than systematic analysis of cash flow, risk, investment returns and financing costs. This becomes problematic when the entrepreneur is required to choose between competing uses of limited funds.

Another challenge is the pressure of short-term survival. An entrepreneur struggling with rent, electricity, transportation, wages, raw materials and other operating expenses may find it difficult to prioritise long-term sustainability. The decision that reduces today's cost may appear more attractive than one that produces greater benefits over several years. For example, investing in energy-efficient equipment may require substantial initial capital, even though it could reduce operating expenses over time. Without adequate financial planning, the entrepreneur may simply choose the cheaper immediate option. Limited access to appropriate finance also presents a challenge. Sustainability-conscious decisions often require investment. Energy-efficient equipment, cleaner production processes, digital technologies, staff development and improved waste-management systems may require capital that small businesses do not readily possess. When affordable long-term finance is unavailable, entrepreneurs may depend on short-term or relatively expensive sources of funds. This can encourage decisions driven by immediate cash requirements rather than long-term business value.

There is also the challenge of weak separation between personal and business finances. This is particularly relevant to micro and small enterprises where the owner and the business may operate almost as one financial unit. When personal and business funds are mixed, it becomes difficult to determine the actual financial position of the enterprise. It may also encourage entrepreneurs to withdraw funds that should have been retained for working capital or reinvestment. A sustainability-conscious entrepreneur needs sufficient financial discipline to recognise the business as an economic entity whose resources must be protected and reinvested strategically. Another barrier is limited awareness of the financial benefits of sustainability. Sustainability is sometimes perceived as an additional responsibility that increases business costs. This perception can discourage entrepreneurs from adopting practices such as energy conservation, waste reduction, recycling, responsible sourcing and employee development. However, sustainability can also generate economic benefits. Reducing material waste can lower production costs; improving energy efficiency can reduce operating expenses; maintaining good relationships with workers and customers can strengthen productivity and loyalty; and responsible business practices can improve reputation and market opportunities. Adesua-Lincoln (2025) found that Nigerian SMEs face significant barriers in adopting environmentally sustainable practices, including constraints related to knowledge, resources and the broader business environment. This is important because it shows that sustainability cannot simply be promoted through awareness campaigns. Entrepreneurs also need the capabilities, incentives and institutional support required to translate awareness into practice. Inadequate integration of sustainability into entrepreneurship and Business Education programmes is another problem. Where financial management and sustainability are taught as separate subjects, students may fail to recognise the relationship between the two. A student may learn investment appraisal in one course and environmental sustainability in another without being asked to consider how an investment decision can affect resource use, operating costs and long-term business resilience.

Repositioning Business Education for Sustainability-Conscious Entrepreneurship

Business Education needs to prepare learners for the decisions they will face in real businesses, not only for examinations or the initial stages of starting a venture. This means giving greater attention to the practical use of financial knowledge. Students should have opportunities to work with budgets, cash-flow records, costs, pricing decisions, financing options and investment choices in situations that resemble the realities of small businesses. The aim is not simply to teach students how to prepare financial statements or define financial terms, but to help them understand what those figures

mean when a business owner has to decide what to do next. Kasimu and Jamilu (2024), for example, linked financial literacy with entrepreneurial competencies among Business Education students in Nigerian Colleges of Education and argued for stronger financial literacy preparation within the programme. This supports the need for Business Education to place greater emphasis on the ability to interpret financial information and use it in making business decisions. At the same time, sustainability should not be presented as a separate topic that students encounter only in one course. Issues such as resource efficiency, responsible use of finance, waste reduction, long-term business survival and social responsibility can be discussed naturally within accounting, finance, entrepreneurship, management, marketing and business planning. Alao, Mojekwu, and Opara (2024) similarly identified the need to strengthen the Business Education curriculum in ways that can better empower learners for sustainability.

The way students learn these ideas also matters. Entrepreneurship cannot be fully understood through lectures and memorisation because many of the decisions entrepreneurs make involve uncertainty and competing choices. Students should therefore be exposed to case studies, simulations, business projects and other practical activities in which they have to decide how to respond to situations such as rising operating costs, limited capital, declining sales, excess inventory or the need to invest in technology. Such experiences allow students to see that a decision that looks attractive in the short term may create problems later. Opportunities to interact with entrepreneurs, accountants, financial institutions and other business practitioners can make this learning even more meaningful by allowing students to hear how financial and business decisions are actually made when resources are limited. Oyinlola (2024), in examining entrepreneurship and innovation in Nigerian universities, identified the need for stronger entrepreneurial development activities and pointed to innovative pedagogical approaches and university–industry partnerships as part of improving entrepreneurial outcomes. Similarly, Ogunwoye, Oladele, and Opatola (2024) found a significant relationship between sustainable entrepreneurship education and sustainable entrepreneurial intention among university students in Ogun, Osun and Oyo States. These experiences can help students move from simply knowing about entrepreneurship to developing the judgement required to deal with its uncertainties.

Business Education should also respond to the growing role of digital tools in everyday financial management. An entrepreneur entering today's business environment needs to be comfortable with digital bookkeeping, electronic payments, budgeting applications, cash-flow monitoring, financial analysis and other technologies that can support business decisions. Digital competence should therefore complement, rather than replace, sound financial judgement. Assessment should reflect this broader purpose. Instead of placing excessive emphasis on whether students can recall definitions or reproduce procedures, assessment can require them to examine a business situation, identify the financial issues involved, compare possible courses of action, justify their choice and explain the likely consequences. This would make the programme more closely connected to the realities of entrepreneurship. The direction is consistent with Oyinlola's (2024) observation that improving entrepreneurship education in Nigerian universities requires attention to how entrepreneurship and innovation activities are actually implemented. It also supports the position of Alao et al. (2024) that Business Education needs to be strengthened to better prepare learners for sustainability. Repositioning the programme in this way would allow Business Education to contribute not only to the creation of new businesses, but also to the development of entrepreneurs who can manage those businesses responsibly, adapt to changing conditions and make financial decisions that support long-term value creation.

Conclusion

Nigeria needs entrepreneurship that goes beyond business creation. The country needs enterprises that can survive uncertainty, manage scarce resources, respond to changing markets and create value that extends beyond immediate financial returns. Achieving this requires entrepreneurs who are capable of making sound financial decisions while remaining conscious of the longer-term economic, social and environmental consequences of those decisions. This paper has argued that sustainability-conscious financial decision-making provides a useful way of bringing these concerns together. It does not require entrepreneurs to choose between profit and sustainability. Instead, it encourages them to recognise that responsible financial decisions can contribute to profitability, resilience, resource efficiency and long-term enterprise survival. The paper further argues that Business Education has an important role in this transformation. Its responsibility should extend beyond teaching students how businesses are established and managed to preparing them to make informed decisions in complex and uncertain environments. Financial competence, sustainability consciousness, digital capability and entrepreneurial judgement should therefore be developed as interconnected capabilities.

The central position of this paper is that Nigeria's entrepreneurial transformation will be more meaningful when the focus shifts from creating more entrepreneurs to developing entrepreneurs who can make responsible decisions and build enterprises capable of creating lasting value. Business Education can contribute significantly to this shift by placing sustainability-conscious financial decision-making at the centre of entrepreneurial preparation.

Suggestions

Based on the position advanced in this paper, the following suggestions are made:

1. Business Education programmes should integrate sustainability-conscious financial decision-making across relevant courses, particularly accounting, financial management, entrepreneurship, economics and business planning.
2. Entrepreneurship education should emphasise practical financial decision-making, using business cases and simulations that expose students to real-world financing, investment, cash-flow and resource-allocation decisions.
3. Financial literacy programmes for entrepreneurs should move beyond basic financial knowledge to include financial analysis, risk assessment, cash-flow management and long-term investment decision-making.
4. Digital financial tools should be incorporated into Business Education and entrepreneurship training to strengthen students' ability to manage and interpret real-time financial information.
5. Government and entrepreneurship-support agencies should provide sustainability-oriented financial and technical support that enables small businesses to invest in resource-efficient technologies and sustainable business practices.
6. Universities and other tertiary institutions should strengthen partnerships with practising entrepreneurs, financial institutions and industry professionals to expose students to actual entrepreneurial financial decisions and sustainability challenges.
7. Entrepreneurial success should be assessed beyond business start-up and immediate profitability, with greater attention to enterprise survival, resilience, innovation, employment creation, resource efficiency and long-term value creation.

Abstract

The informal sector plays an important role in African economies, providing a large share of employment and retail services. However, despite the rapid growth of technology across the continent, many informal traders remain unable to fully participate in the digital economy because they lack basic digital and financial skills. This study examined how business education can equip informal traders with the skills needed to adopt mobile money, e-commerce platforms and digital record-keeping tools. The study adopted a descriptive survey research design, and data were collected from 50 informal traders selected from local markets using a structured questionnaire. The instrument, developed on a four-point Likert-type scale, elicited respondents' views on their current digital and financial skill levels, the barriers limiting their adoption of digital tools, and the extent to which targeted business education training could address these barriers. Data collected were analysed using mean and standard deviation to answer the research questions. The findings revealed that fear of technology, the perceived difficulty of using digital tools, and limited access to practical, locally relevant training were the major barriers preventing informal traders from adopting mobile money, social commerce platforms such as WhatsApp Business, and digital record-keeping applications. The results further showed that conventional business education programmes, as currently structured, do not adequately meet the practical needs of informal traders, and that respondents strongly favoured simple, accessible, mobile-based and short-term learning programmes built around actual business activities. The study concludes that when business education is designed around the real needs of informal traders, it can make digital tools easier to understand and use, improve business efficiency and promote financial inclusion. It is recommended that policymakers, educational institutions and educational technology providers collaborate to design and deliver inclusive, practical training programmes that support the digital transformation and growth of informal businesses across Africa.

***Keywords**: Informal Economy, Digital Transformation, Business Education, Mobile Money, E-commerce, Micro-Entrepreneurship, , Financial Inclusion.*

Introduction

Across Africa, many people earn a living outside the formal economy. They sell goods and services in local markets, along roadsides, and within their communities without being formally registered or taxed like big companies. This is called the informal economy, and it plays a very important role in African life (International Labour Organization [ILO], 2018). It provides jobs for millions of people who cannot find work in the formal sector. It also brings goods closer to ordinary people, especially in places where big shops and supermarkets are hard to find. Market women, roadside sellers, and small traders form a large and important part of everyday economic life. Even as African economies grow and change, the informal sector has not disappeared. In fact, it continues to grow, showing that it is not just a passing stage but a lasting part of how business is done in many African communities.

In recent years, more people in Africa now own smartphones and have access to the internet. This has changed the way many informal traders do business. One of the biggest changes is the growth of mobile money, which allows people to send and receive money using their phones instead of visiting a bank. Traders can also now sell their goods online through e-commerce platforms and social media apps such as WhatsApp Business, reaching more customers than before. Digital tools also help traders advertise their products and keep records of their sales, expenses, and stock instead of writing everything by hand in notebooks. These digital tools can make business easier, faster, and more

organised. They can also help traders manage their money better and even access loans or savings services that were once out of reach.

However, simply having access to a phone or the internet does not mean a trader automatically knows how to use these tools well. Many informal traders still struggle to take full advantage of digital business tools. Some traders do not fully understand how to operate digital applications. Others do not understand basic financial ideas connected to mobile money, such as transaction fees or how digital savings work. Many traders are also afraid of technology, especially if they have never used it before, and they may see it as complicated or risky. There is also fear of losing money through fraud or mistakes when using digital tools. On top of this, many traders simply do not have access to any form of training that could help them learn these skills in a simple and practical way, based on the type of business they run.

This is where Business Education can help. Business Education is not only about what is taught in schools and universities. At its heart, Business Education is about helping people gain the knowledge and skills they need to run a business well. This means Business Education can also be designed for people who never had the chance to attend formal schools, including informal traders. If done properly, Business Education can teach traders how to use mobile money, sell through e-commerce and social media, keep digital records, manage customers, and stay safe from online fraud.

For Business Education to truly help informal traders, it cannot look like the usual classroom teaching found in schools. Traders need something practical, not something full of theory. Training should be simple enough to follow on a mobile phone, since many traders will not have time to sit in long classes. Short lessons that fit into a trader's busy day are more likely to be useful than long courses. It also helps when training uses real business examples that traders can relate to, explained in simple language rather than technical terms.

Based on this background, the present study looked at how well informal traders currently understand and use digital tools, the problems stopping them from using these tools more, and the kind of Business Education support that could help them improve. The study focused on three specific tools: mobile money, e-commerce and social commerce (such as WhatsApp Business), and digital record keeping. Fifty informal traders operating in local markets took part in the study.

Statement of the Problem

Digital tools such as mobile money, e-commerce platforms and digital record-keeping applications have the potential to make life easier for informal traders across Africa. Yet, many informal traders are still not using these tools effectively, even where phones and internet access are available. Traders often lack the confidence, knowledge and practical skills needed to adopt these tools, and existing Business Education programmes, which are mostly designed for formal classroom learners, do not appear to meet the specific and practical needs of informal traders. Without training that is simple, practical and suited to their daily business realities, many informal traders may continue to be left out of the benefits that digital transformation can bring. The problem, therefore, is that there is limited understanding of the actual digital skill levels of informal traders, the specific barriers preventing them from adopting digital tools, and the kind of Business Education approach that would genuinely help them close this gap.

Purpose of the Study

The purpose of this study was to examine how Business Education can help informal traders acquire the digital and financial skills needed to adopt mobile money, e-commerce and digital record-keeping tools. Specifically, the study sought to:

1. determine the level of digital and financial competencies among informal traders;
2. identify the barriers affecting informal traders' adoption of digital business technologies; and
3. identify the forms of Business Education that can effectively support informal traders' adoption of digital technologies.

Research Questions

The study was guided by the following research questions:

1. What is the level of digital and financial competencies among informal traders?
2. What barriers affect informal traders' adoption of digital business technologies?
3. What forms of Business Education can effectively support informal traders' adoption of digital technologies?

Significance of the Study

This study is expected to be useful to several groups. Informal traders stand to benefit directly, as the findings can guide the design of training that genuinely fits their needs, helping them earn more, manage their money better, and grow their businesses. Educational institutions and Business Education providers may find the study useful in designing simple, practical training programmes for people outside the formal school system. Policymakers and government agencies involved in financial

inclusion and digital economy initiatives may use the findings to design better support programmes for informal traders. Developers of educational technology and mobile learning tools may also find useful insight into the kind of features and content that would genuinely help this group of learners. Finally, the study adds to the growing body of knowledge on digital inclusion and informal entrepreneurship in Africa, and may serve as a reference for future researchers interested in this area.

Review of Related Literatures

Informal businesses and digital technology do not change overnight; the change happens slowly and in small steps. A trader who used to accept only cash may start receiving mobile money payments. A trader who depended only on people walking past their stall may begin advertising on WhatsApp status. These changes usually do not replace the old way of doing business completely. Instead, traders mix old and new methods together, creating a kind of "half-traditional, half-digital" way of trading. This is important to understand, because any training or support given to traders should meet them where they are now, not expect them to jump straight into fully digital business overnight.

To take part in the digital economy well, traders need certain skills. Digital literacy simply means knowing how to use digital devices and apps. Digital financial literacy goes a bit further — it means understanding how digital money tools work, including transaction charges, safety, and the risks involved. For informal traders, three skills matter most: knowing how to send, receive and save money using mobile money; knowing how to sell and market products using platforms like WhatsApp Business; and knowing how to keep digital records of sales, expenses and stock instead of writing everything by hand. These three skills are the main focus of this study.

Business Education is usually seen as something taught only in schools and colleges. But this idea is too narrow. At its core, Business Education is simply about helping people gain the knowledge and skills needed to run a business well — and this does not have to happen inside a classroom. This means Business Education can also reach people who never attended formal school, including informal traders. Seen this way, Business Education becomes a practical tool that can support traders' growth, improve their livelihood, and help bring them into the formal financial system.

Several things commonly stop small and informal traders from using digital tools. Some traders feel nervous or afraid of using digital devices, especially if they have never tried before. Others assume, without even trying, that digital tools will be too hard to use. Many traders also do not have access to any training that could help them learn these skills. Cost is another big issue — smartphones, internet data and transaction charges can be expensive, especially for traders who already work on small profits. Poor network or unstable electricity can also make it hard to use digital tools regularly. Lastly, some traders simply do not trust digital systems, especially because of the fear of fraud or losing money through mistakes.

This study is guided by the Technology Acceptance Model (TAM), developed by Davis (1989). TAM says that whether a person accepts and uses a technology depends mainly on two things: whether they believe the technology will be useful to them, and whether they believe it will be easy to use. These two beliefs shape how a person feels about the technology, which then affects whether they will actually use it.

TAM helps explain how informal traders relate to digital business tools. If a trader believes that WhatsApp Business or mobile money is difficult to use, or does not see how it will benefit their business, they are unlikely to adopt it — even if the technology is available to them. This is where good Business Education can help. Practical training can make digital tools feel easier to use by building traders' hands-on skills and confidence. At the same time, showing traders clear benefits, like faster transactions, more customers, or better financial records — can help them see the tools as useful. In this way, Business Education can influence both beliefs that shape technology adoption, according to TAM.

Many studies have already looked at digital financial inclusion and technology adoption among small and informal businesses, mostly focusing on how many people use these tools and why. However, fewer studies have looked closely at the role Business Education can play in deliberately building these digital and financial skills. Most existing research treats digital literacy as something to be measured, rather than something that can be actively taught and developed. This study fills that gap by looking at the real barriers informal traders face in adopting mobile money, e-commerce and digital record-keeping tools, and by identifying the kind of Business Education that can genuinely help them overcome these barriers.

METHODOLOGY

Research Design

The study adopted a descriptive survey research design. This design was considered appropriate given the study's objective of describing informal traders' current digital and financial competency levels, the barriers limiting their adoption of digital tools, and their preferences regarding Business Education support, without manipulating any of the study variables.

Participants/Sample

The population of the study comprised informal traders operating in local markets. A sample of 50 informal traders was selected for the study using a convenience sampling technique, given the practical difficulty of establishing a formal sampling frame for informal, often unregistered, market traders. Respondents were drawn from traders engaged in the direct sale of retail goods and services within their local market environment.

Instrument

Data were collected using a structured questionnaire developed on a four-point Likert-type scale. The instrument was organised around three substantive sections corresponding to the study's research questions: digital and financial competencies, barriers to digital adoption, and Business Education needs and preferences.

Data Analysis

Data collected were analysed using mean and standard deviation to answer the research questions. A criterion mean of 2.50 was adopted for interpreting results, obtained by summing the four response values (4 + 3 + 2 + 1) and dividing by four. Item and grand mean scores of 2.50 and above were interpreted as indicating a high level of competency, barrier significance, or endorsement, depending on the section, while scores below 2.50 were interpreted as indicating a low level.

Results

Research Question One: What is the level of digital and financial competencies among informal traders?

Table I: Response on the level of digital and financial competencies among informal traders

S/N	Item	VHE	HE	LE	VLE	Mean	SD	Remark
1	am able to use mobile money or digital payment platforms to receive payments from customers	28	20	4	1	3.42	0.71	High Extent
2	I am able to use WhatsApp Business or similar social commerce platforms to promote my products or services.	22	25	5	1	3.28	0.71	High Extent
3	I am able to use WhatsApp Business or similar social commerce platforms to promote my products or services.	21	18	12	2	3.09	0.88	High Extent
4	I am able to use WhatsApp Business or similar social commerce platforms to promote my products or services.	25	24	3	1	3.38	0.68	High Extent
5	I am able to use digital technologies to manage, market and improve my business activities	24	21	7	1	3.28	0.76	High Extent
	Grand Mean					**3.29**	**0.75**	

Source: Field work, 2026

As shown from this table, responses to the five items scored above the 2.50 middle point, with a grand mean of 3.29, showing that informal traders already rate their own digital and financial skills as high. The strongest area is receiving payments through mobile money (mean = 3.42), suggesting traders are most comfortable with this activity since it directly involves earning and collecting money. The item with the lowest mean (3.09) also has the widest spread (SD = 0.88), meaning not everyone agrees equally, some traders are far more skilled at using WhatsApp Business than others, so ability levels are not the same across the group. Overall, the results suggest traders already have a reasonable skill base to build on, rather than starting from zero.

Research Question Two What barriers affect informal traders' adoption of digital business technologies?

Table II: Response on barriers that affect informal traders' adoption of digital business technologies

S/N	Item	VHE	HE	LE	VLE	Mean	SD	Remark
1	Fear of making mistakes or losing money discourages me from using digital technologies in my business.	7	17	20	9	2.42	0.93	Low Extent
2	I find some digital business tools difficult to understand and use	8	15	21	9	2.42	0.95	Low Extent
3	Lack of practical and locally relevant training limits my ability to use digital technologies.	5	18	24	6	2.42	0.82	Low Extent
4	Limited access to smartphones, reliable internet services or other digital facilities prevents me from using digital business tools effectively.	7	15	19	12	2.32	0.98	Low Extent
5	The cost of internet services, devices and other digital services limits my adoption of digital technologies.	11	17	16	9	2.57	1.00	Low Extent
	Grand Mean					**2.43**	**0.94**	

Source: Field work, 2026

Responses from table II show a grand mean of 2.43, sitting just below the 2.50 middle point, the overall data suggests that fear, perceived difficulty, lack of training and poor access are **not** the main things stopping traders from adopting digital tools, a result that is worth highlighting because it goes against the common assumption that these "soft" fears are the biggest obstacles. The one item that does cross into "High Extent" is cost (mean = 2.57), the price of data, devices and digital services, making it the clearest and most agreed-upon barrier in the entire table. The very high standard deviations across all five items (0.82 to 1.00) also matter: they show that traders are quite divided in their opinions, meaning these barriers affect some traders strongly while barely affecting others, rather than affecting everyone the same way. This spread suggests the traders sampled are not a uniform group — some may already be confident digital users, while others are still struggling, and any future training programme may need to be designed with this mixed skill level in mind.

Research Question Three: What forms of Business Education can effectively support informal traders' adoption of digital technologies?

Table III: Response on forms of Business Education that can effectively support informal traders' adoption of digital technologies

S/N	Item	VHE	HE	LE	VLE	Mean	SD	Remark
1	Practical training on mobile money and digital payment systems would improve my ability to conduct digital transactions.	26	21	5	1	3.36	0.74	High Extent
2	Training on WhatsApp Business and other social commerce platforms would improve my ability to market and sell my products online.	29	23	1	0	3.53	0.54	High Extent
3	Practical training on digital record-keeping applications would improve my ability to manage sales, expenses and business records.	24	26	3	0	3.40	0.60	High Extent
4	Short-term, simple and mobile-based Business Education programmes would make it easier for me to acquire and apply digital business skills.	28	21	4	0	3.45	0.64	High Extent
5	Business Education programmes based on my actual business activities would increase my willingness and ability to adopt digital technologies.	31	19	3	0	3.53	0.61	High Extent
	Grand Mean					**3.45**	**0.63**	

Source: Field work, 2026

Table 3 shows that all five forms of Business Education had a grand mean of 3.45, meaning informal traders agree, to a high extent, that these forms can support their adoption of digital technologies.

Training on WhatsApp Business/social selling and training based on traders' real business activities ranked highest (mean = 3.53 each). This was followed by short, simple, mobile-based training (3.45), digital record-keeping training (3.40), and mobile money/digital payment training (3.36).

Overall, the results show that Business Education is most effective when it is practical, short, mobile-friendly, and closely tied to traders' actual business activities.

Discussion of Findings

The three tables show a clear pattern. Informal traders already have some digital skills (Table 1, grand mean 3.29), but soft factors like fear, difficulty, and lack of training are not their biggest problem (Table 2, grand mean 2.43), cost is. What they say would truly help them is practical, short, mobile-based training tied to their real business (Table 3, grand mean 3.45).

This matches recent studies. Research in Okere District, Ghana found that informal entrepreneurs already use mobile phones for communication, marketing, and money transactions, but they still need training that is practical and tailored to their sector, not generic digital lessons since digital tools remain underused mainly because of infrastructural, educational and economic challenges, even though mobile phones are already widely used for communication, marketing, and financial transactions, with training in digital literacy being one of the key needs identified.

On barriers, a South African study of informal businesses in Cape Town similarly identified financial constraints, low digital literacy and limited infrastructure as the main things stopping traders from using technology effectively, supporting the current finding that cost, not fear, is the clearest barrier.

On training design, a study on digital skills training for small firms found that short, structured business-app training programmes can meaningfully improve entrepreneurs' digital skills and business performance, supporting this study's finding that short, simple, mobile-based Business Education is what traders want most. Likewise, a South African study on informal women traders found that social media and digital communication training helped traders promote, advertise, and interact with clients, which helped sustain and grow their businesses, matching the current finding that WhatsApp Business/social commerce training was the most preferred form of training.

Conclusion

Informal traders are not starting from zero, they already have basic digital skills and are not strongly held back by fear or lack of confidence. Their biggest barrier is cost, and what they want most is short, practical, mobile-friendly training built around WhatsApp/social selling and their real daily business activities.

Recommendations

Here is each recommendation, explained in very simple words:

1. Design short, mobile-based courses: Traders are busy every day selling their goods. So training should be short and done on their phones, not long classes that take them away from work.
2. Focus on WhatsApp Business/social commerce and digital record-keeping. Traders already like using WhatsApp and want to learn how to keep records digitally. Training should teach these two things well, since they are what traders want most.
3. Base training on traders' real business activities, using hands-on, practical examples. Training should use the trader's own business as the example. For example, teach them using their own products and prices, not made-up examples. This makes it easier to understand and use.
4. Reduce cost barriers, subsidize data, devices, or offer low-cost/free training and devices. Money is the biggest problem for traders. Government or organizations should help by giving free or cheap phones, internet data, and training, so cost does not stop them from learning.
5. Government and NGOs should partner to fund and deliver these targeted, low-cost training programmes. Government and NGOs have money and people to organize training. If they work together, they can provide cheap, useful training that reaches many traders at the same time.

Abstract

The increasing digitalization of the business environment has heightened the need for Business Education undergraduates to acquire technopreneurship skills that can enhance their readiness for technology-driven employment and self-employment. This study examined the relationship between digital transformation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities. Three research questions and three null hypotheses guided the study. The study adopted a correlational research design and was conducted in Rivers State, Nigeria. The population comprised 544 final-year (400-level) Business Education undergraduates in the 2025/2026 academic session from Ignatius Ajuru University of Education and Rivers State University. Census sampling was adopted because the population was manageable and accessible. Data were collected using a structured 30-item questionnaire titled*:* Digital Transformation and Skills Acquisition for Technopreneurship by Business Education Undergraduates (DTSATBEU)*.* The instrument was validated by three experts and yielded Cronbach's alpha reliability coefficients of 0.77, 0.81 and 0.80 for the three clusters, with an overall reliability coefficient of 0.79. Out of the 544 questionnaires distributed, 527, representing 97%, were retrieved and found usable for analysis. Pearson Product Moment Correlation was used to answer the research questions and test the null hypotheses at the 0.05 level of significance using SPSS version 26. The findings revealed a strong and significant positive relationship between digital infrastructure and skills acquisition for technopreneurship, a moderate and significant positive relationship between administrative automation and skills acquisition, and a strong and significant positive relationship between digital pedagogical transformation and skills acquisition for technopreneurship. The study concluded that effective digital transformation is important for enhancing the acquisition of skills for technopreneurship by Business Education undergraduates in Rivers State Universities. It was therefore recommended that university management should provide adequate and functional digital infrastructure, including computers, reliable internet facilities, relevant software and electricity, to create greater opportunities for students to develop the technological and entrepreneurial skills required for technopreneurship.

Keywords: *Digital transformation, technopreneurship, skills acquisition, Business Education Undergraduate*

Introduction

The world of work is becoming increasingly digital, dynamic and innovation-driven. Across sectors, digital technologies are changing the way organizations communicate, create value, solve problems, serve customers and compete. Technologies such as artificial intelligence (AI), cloud computing, big data, machine learning, robotics and the Internet of Things are becoming integral parts of modern business operations (Jiao et al., 2025). This rapidly changing environment is also reshaping the knowledge and competencies expected from graduates of university education. Beyond possessing theoretical knowledge, graduates are increasingly expected to be digitally competent, innovative, adaptable, creative and capable of identifying and exploiting emerging opportunities. In agreement, Apata et al. (2025) observed that technological changes associated with the Fourth Industrial Revolution (4IR) are fundamentally transforming business, education and the nature of work. As a result, universities have a significant responsibility to prepare graduates who are not only employable but are also capable of creating value and entrepreneurial opportunities within the digital economy.

Presently, digital transformation in education has become a topic of discourse among researchers due to its impact on educational quality, accessibility, and preparing students for a highly

technological work environment. Pkhaladze (2026) defined digital transformation as a strategic and continuous process through which digital technologies become embedded in institutional structures, processes, services and value-creation activities. Ponsignon et al. (2019) explained that meaningful digital transformation involves restructuring internal processes, encouraging collaborative ways of working and developing the digital capabilities required for continuous adaptation. Similarly, Morze and Strutynska (2021) described digital transformation as the application of modern technologies to improve processes and activities across society. Thus, digital transformation is both technological and organizational because it changes not only the tools people use but also how institutions function, communicate, teach, learn and make decisions.

The Nigerian university environment occupies a strategic position in digital transformation because it prepares the human capital required for national development. According to Tang et al. (2025), digital technologies can make university education more accessible, flexible and collaborative by extending learning beyond the conventional classroom through digital platforms, virtual learning environments and emerging technologies. These technologies also support personalised learning, student engagement and innovative learning experiences (Zou et al., 2025). Beyond teaching and learning, digital transformation can strengthen institutional administration through automation, real-time data analysis and evidence-based decision-making, thereby improving the efficiency of academic and administrative processes (Silva Carmo et al., 2025).

Digital skills are increasingly essential for inclusive and future-ready education. However, the transformation of Nigerian universities remains constrained by inadequate digital infrastructure, unreliable electricity and internet connectivity, limited funding, insufficient staff development, weak digital competencies and resistance to institutional change (Amesi & Allison, 2022; Ogwunte et al., 2023; Ukata & Worgu, 2025). Similarly, the digital divide and unequal access to technological resources continue to create barriers to meaningful participation in digitally enabled education (Antonopoulou et al., 2023; Babalola & Genga, 2024). These realities suggest that successful digital transformation requires more than the provision of technology; it also depends on supportive institutional structures, competent staff, strategic leadership and purposeful integration of digital technologies into teaching, learning and administration.

Digital transformation in universities involves digital infrastructure, digital literacy, learning technologies, institutional automation, digital communication, collaboration, data analytics and digitally transformed pedagogy (Mabotha & Ngcamu, 2026). Other components, according to EDUCAUSE (2026), include learning management systems, data analytics, administrative automation, integrated student information systems, AI, and cloud computing technologies, supporting institutional efficiency and evidence-based decision-making. Similarly, Nadkarni and Prügl (2021) enumerated transformative leadership, managerial and institutional culture, work environment, and institutional change. The present study focused on digital infrastructure, administrative automation and digital pedagogical transformation because these dimensions provide direct opportunities for university Business Education undergraduates to access and use digital technologies in the acquisition of technopreneurship skills.

Digital infrastructure represents the essential technological foundation of transformation and includes computers, internet facilities, electricity, software, learning management systems and other digital resources.

When these facilities are available and functional in Nigerian universities, undergraduates are better positioned to develop competencies in information processing, digital communication, online research, spreadsheet applications, database management and other technology-supported business activities, which are important for employability and entrepreneurial preparedness.

However, Ogwunte et al. (2023) found that digital resources for entrepreneurship skills acquisition were not adequately available and utilized in universities, suggesting that poor infrastructure can limit meaningful digital transformation. Administrative automation is another important dimension, involving digital technologies for routine activities such as student registration, records management, communication, fee payment, scheduling and information processing, thereby making university operations faster, more accurate and accessible while exposing students to digital workflows. Digital pedagogical transformation focuses on technology-enabled teaching and learning through learning management systems, virtual classrooms, blended learning, digital assessment, simulations, online collaboration and emerging technologies such as AI and IoT. These tools can make learning more interactive, practical and student-centred, with Azeez and Ajayi (2026) and Ndom-Uchendu (2026) highlighting the growing importance of technology-supported teaching and learning in Nigerian Business Education programmes.

Business Education is positioned to benefit from digital transformation because of its vocational, entrepreneurial and business-oriented nature (Ukata & Nmehille, 2025; Ukata & Amadi, 2025). Ubulom and Enyekit (2019) defined Business Education as a skill-based education designed to equip students with the knowledge, skills, attitudes and competencies needed for employment, entrepreneurship, management and effective participation in economic activities. It equips learners with the knowledge and skills required to function effectively in the business environment. Its objectives extend to gainful employment and entrepreneurship (Musa & Auwalu, 2024). These objectives are increasingly significant because the modern business environment is no longer predominantly paper-based or dependent on conventional office practices. Instead, it is increasingly digital, connected and innovation-oriented.

The changing nature of business has heightened the need to reposition Business Education towards flexible, student-centred and technology-supported learning (Musa & Auwalu, 2024). As Okolo (2024) noted, innovation and emerging workplace skills are increasingly important, while Ikeanyionwu and Nzegwu (2024) identified digital literacy, financial management, communication, marketing, decision-making, leadership and problem-solving as essential skills for Business Education undergraduates. Bassey and Ebieme (2026) similarly positioned the programme as preparation for careers in accounting, office technology and management (OTM), marketing, entrepreneurship and related occupations. This need becomes more evident in technopreneurship, which Carter et al. (2019) describe as the strategic use of technology to identify, develop and commercialize innovative business opportunities. Ratten (2023) stated that technopreneurship encompasses innovation, technology adoption and entrepreneurial action.

A skill can be referred to as the learned ability and competence to perform a task effectively. Skills acquisition, on the other hand, is the process through which learners develop the knowledge, abilities, attitudes and practical competencies required to perform activities effectively. Skills acquisition for technopreneurship involves developing the knowledge, abilities, attitudes and practical competencies required to use technology effectively in identifying opportunities, solving problems, creating value and managing sustainable business activities. Abubakari and Kalinaki (2024) opined that higher education can support this development through entrepreneurship education, practical and experiential learning, technology-supported activities and industry engagement. Barrientos-Báez et al. (2022) and Saad et al. (2019) contended that key skills for technopreneurship include information and data literacy, digital communication, content creation, and problem-solving. Musa et al. (2025) listed skills required for technopreneurship as opportunity recognition, innovative thinking, creative problem-solving and effective use of digital resources. Others are digital marketing, e-commerce, data analytics, digital communication, financial management, online collaboration, decision-making and business management (Pennetta et al., 2024).

Universities in Nigeria provide important platforms for undergraduates to develop their relevant skills through entrepreneurship education, digital learning, practical projects, experiential activities and industry engagement (Nabi et al., 2021; Ahmad et al., 2023; Abubakari & Kalinaki, 2024). However, evidence from Nigeria suggests that students' acquisition of technopreneurial skills remains uneven. Ekoh-Nweke and Ikpeama (2023) found that digitalization significantly influenced entrepreneurial and managerial skills acquisition among Business Education students, while Osiesi et al. (2024) highlighted the growing importance of technopreneurial skills among Nigerian undergraduates.

Similarly, Iwuoha et al. (2025) emphasized the need for effective curriculum implementation to develop technopreneurship skills of university undergraduates.

In Rivers State, universities offering Business Education programmes operate in an environment that increasingly demands technological adaptability and skills for self-reliance. Studies have shown the need for greater practical exposure to skills for digital entrepreneurship (Amesi & Allison, 2022). However, inadequate digital infrastructure for entrepreneurship training negatively affects skills acquisition by Business Education undergraduates (Ogwunte et al., 2023). Ordu and Onyemekara (2023) reported a positive relationship between digital infrastructure and students' acquisition of skills for entrepreneurship.

Nmerukini et al. (2026) linked digital transformation to students' acquisition of digital entrepreneurship skills. This study therefore investigated digital transformation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities

Statement of the Problem

The contemporary business environment is increasingly technology-driven, and Business Education undergraduates are expected to possess more than traditional academic and office skills. They are required to use digital technologies to identify business opportunities, communicate with customers, analyze information, market products, manage financial transactions, collaborate with

others, solve problems, innovate, and create digital businesses. This expectation places particular responsibility on Business Education programmes in universities because the programme is designed to prepare students for employment, entrepreneurship, and effective participation in the business environment. The NUC's CCMAS further emphasizes digital literacy, creative and innovative skills, problem-solving, adaptability, and other twenty-first-century skills in Business Education.

Despite this expectation, there are indications that Business Education undergraduates in Nigerian universities may not be acquiring relevant skills for technopreneurship at the level required by the digital economy. The problem may not be attributed solely to undergraduates' unwillingness to learn, but also to the digital environment within which learning occurs. Digital infrastructure may be inadequate, administrative processes may remain partly manual, reducing undergraduates' exposure to the digitally automated workflows that characterize contemporary university education; teaching and learning may not sufficiently exploit digital technologies through which undergraduates can acquire skills for technopreneurship. The main problem of this study is that although universities are increasingly expected to transform teaching, administration, and learning environments through digital technologies, there is insufficient empirical evidence showing whether specific components of such transformation contribute to Business Education undergraduates' acquisition of skills for technopreneurship in Rivers State Universities. Existing studies have tended to investigate digital resources, digital skills, entrepreneurship skills, employability, self-reliance, or wealth creation separately. Consequently, it remains unclear whether the availability of digital infrastructure, the automation of administrative processes, and the transformation of pedagogical practices are significantly related to skills acquisition needed to create and manage technology-driven businesses. Specifically, the study determined: (1) the relationship between digital infrastructure and skills acquisition for technopreneurship by Business Education undergraduates in Rivers State Universities; (2) the relationship between administrative automation and skills acquisition for technopreneurship by Business Education undergraduates in Rivers State Universities; and (3) the relationship between digital pedagogical transformation and skills acquisition for technopreneurship by Business Education undergraduates in Rivers State Universities.

Objectives of the Study

The following are the objectives of the study:

1. Examine the relationship between digital infrastructure and technopreneurship skills acquisition among Business Education undergraduates in Rivers State Universities.
2. Evaluate the relationship between administrative automation and technopreneurship skills acquisition among Business Education undergraduates in Rivers State Universities.
3. Determine the relationship between digital pedagogical transformation and technopreneurship skills acquisition among Business Education undergraduates in Rivers State Universities.

Research Questions

The following research questions guide the study:

4. What is the relationship between digital infrastructure and technopreneurship skills acquisition among Business Education undergraduates in Rivers State Universities?
5. What is the relationship between administrative automation and technopreneurship skills acquisition among Business Education undergraduates in Rivers State Universities?
6. What is the relationship between digital pedagogical transformation and technopreneurship skills acquisition among Business Education undergraduates in Rivers State Universities?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

H_{01}: There is no significant relationship between digital infrastructure and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities.

H_{02}: There is no significant relationship between administrative automation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities.

H_{03}: There is no significant relationship between digital pedagogical transformation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities.

Methods

The study adopted a correlational research design. It was conducted in Rivers State, Nigeria. The population of the study consisted of 544 final-year (400 level) Business Education undergraduates in the 2025/2026 academic session from Rivers State Universities in Nigeria offering the Business Education programme. Ignatius Ajuru University of Education has 444 final-year undergraduates, while Rivers State University (RSU) has 110 final-year undergraduates (Source: Business Education Department of various universities, 2nd September, 2026). The study used all 544 final-year Business Education undergraduates as the population since it was manageable and accessible to the researcher and the research assistants; thus, adopting a census sampling method. The instrument for data

collection was a structured questionnaire developed by the researcher and titled “Digital Transformation and Skills Acquisition for Technopreneurship by Business Education Undergraduates (DTSATBEU)”. The instrument was divided into two sections: A and B. Section A covered personal information of the respondents, such as gender and name of institution, while Section B was divided into three clusters, B_1 to B_3. Section B_1 contained 10 items on digital infrastructure and skills acquisition for technopreneurship, Section B_2 contained 10 items on administrative automation and skills acquisition for technopreneurship, and Section B_3 had 10 items on digital pedagogical transformation and skills acquisition for technopreneurship. The questionnaire items were structured on four points rating scale of Strongly Agree (SA) – 4, Agree (A) – 3, Disagree (D) – 2, and Strongly Disagree (SD) – 1.

The validity of the instrument was ascertained through the face and content method by three experts: two experts in Business Education and one expert from Measurement and Evaluation. The reliability of the instrument was established using the trial-testing method, and the data collected were analyzed using the Cronbach alpha formula, with reliability coefficients of 0.77, 0.81 and 0.80 obtained for clusters B_1 to B_3, respectively, with an overall coefficient value of 0.79 obtained. The researcher administered copies of the questionnaires to the respondents in their universities with the help of four research assistants in their universities. Of the 544 copies of the questionnaire distributed, 527, representing 97 per cent, were retrieved and found useful for data analysis. Data collected for the study were analyzed using the Pearson product-moment correlation coefficient to answer the research question and test the null hypothesis. The research question was based on the coefficient (r), and the size of the correlation was interpreted using the interpretation of a correlation coefficient by Bryman and Bell (2011): In testing the null hypothesis, when the p-value is less than or equal to 0.05 ($P < 0.05$), the null hypothesis was rejected; otherwise, the null hypothesis was accepted. The computations were done using Special package for the Social Sciences (SPSS) version 26.

Result, Analysis and Discussion

Table 1: Pearson Product Moment Correlation (PPMC) Between Digital Infrastructure and Skills Acquisition for Technopreneurship by Business Education Undergraduates

Variables	N	R	Remarks
Digital Infrastructure (X)			
	527	0.68**	Strong Positive Relationship
Skills Acquisition for Technopreneurship (Y)			

Table 1 results show a correlation coefficient of r = 0.68 for 527 undergraduates**,** indicating a strong positive relationship between digital infrastructure and skills acquisition for technopreneurship. This implies that Business Education undergraduates' access to functional digital infrastructure is associated with higher levels of technopreneurial skills acquisition. In other words, as the availability and accessibility of digital infrastructure improve, the acquisition of skills for technopreneurship tends to increase correspondingly among Business Education undergraduates in Rivers State Universities.

Table 2: Pearson Product Moment Correlation (PPMC) Between Administrative Automation and Skills Acquisition for Technopreneurship by Business Education Undergraduates

Variables	N	R	Remarks
Administrative Automation (X)			
	527	0.59**	Moderate Positive Relationship
Skills Acquisition for Technopreneurship (Y)			

Table 2 results show a correlation coefficient of r = 0.59 for 527 undergraduates, indicating a moderate positive relationship between administrative automation and skills acquisition for technopreneurship by Business Education undergraduates in Rivers State Universities. This means that increased exposure to automated administrative processes is associated with a corresponding increase in technopreneurial skills acquisition among the Business Education undergraduates.

Table 3: Pearson Product Moment Correlation (PPMC) Between Digital Pedagogical Transformation and Skills Acquisition for Technopreneurship by Business Education Undergraduates

Variables	N	R	Remarks

Digital Pedagogical Transformation (X)			
	527	0.62**	Strong Positive Relationship
Skills Acquisition for Technopreneurship (Y)			

Table 3 results show a correlation coefficient of r = 0.62 for 527 undergraduates, indicating a strong positive relationship between digital pedagogical transformation and skills acquisition for technopreneurship by Business Education undergraduates. This means that greater integration of technology into teaching and learning is associated with higher levels of technopreneurial skills acquisition by Business Education undergraduates in Rivers State Universities.

Table 4: Significance of Pearson Product Moment Correlation on Digital Infrastructure and Skills Acquisition for Technopreneurship among Business Education Undergraduates

Variables	N	R	Sig. (2-tailed)	Decision
Digital Infrastructure (X)	527			
		0.68**	0.001	Significant
Skills Acquisition for Technopreneurship(Y)	527			

****** Correlation is significant at the 0.01 level (2-tailed).

Table 4 results show a strong positive correlation between the two variables (r = 0.68), with a significance value of p < .001. Since the p-value is less than the 0.01 level of significance, the null hypothesis is therefore not accepted. This means that there is a significant relationship between digital infrastructure and skills acquisition for technopreneurship by Business Education undergraduates in Rivers State Universities.

Table 5: Pearson Product Moment Correlation (PPMC) Between Administrative Automation and Skills Acquisition for Technopreneurship by Business Education Undergraduate*s*

Variables	N	R	Sig. (2-tailed)	Decision
Administrative Automation (X)				
	527	0.59**	0.001	Significant
Skills Acquisition for Technopreneurship (Y)				

****** Correlation is significant at the 0.01 level (2-tailed).

Table 5 results show a strong positive correlation between the two variables (r = 0.68), with a significance value of p < .001. Since the p-value is less than the 0.01 level of significance, the null hypothesis is therefore not accepted.

This means that there is a significant relationship between administrative automation and skills acquisition for technopreneurship by Business Education undergraduates in Rivers State Universities.

Table 6: Pearson Product Moment Correlation (PPMC) Between Digital Pedagogical Transformation and Skills Acquisition for Technopreneurship by Business Education Undergraduates

Variables	N	R	Sig. (2-tailed)	Decision
Digital Pedagogical Transformation (X)	527			
		0.62**	0.000	Significant
Skills Acquisition for Technopreneurship (Y)	527			

****** Correlation is significant at the 0.01 level (2-tailed).

Table 6 results show a correlation coefficient of r = 0.62 for 527 undergraduates, indicating a strong positive relationship between digital pedagogical transformation and skills acquisition for technopreneurship.

The significance value of p < .001 is less than the 0.01 level of significance, indicating that the relationship is statistically significant. Therefore, the null hypothesis is not accepted. This means that there is a significant relationship between digital pedagogical transformation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities.

Discussion of Findings

The finding of the study revealed a strong and significant positive relationship between digital infrastructure and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities. This suggests that improved access to functional computers, internet connectivity, software, electricity and other digital resources is associated with greater acquisition of

technopreneurial skills. The finding agrees with Amesi and Allison (2022)**,** who reported that the availability of digital infrastructure in Business Education departments enhanced students' acquisition of skills for self-reliance. Similarly, Ogwunte et al. (2023) reported that adequate availability and utilization of digital infrastructure in universities influenced digital entrepreneurship skills acquisition among undergraduates, highlighting the importance of adequate digital infrastructure. Ordu and Onyemekara (2023) also established a positive relationship between digital resource development and students' self-employability skills. In the same vein, Ekoh-Nweke and Ikpeama (2023) found that digitalization highly influenced entrepreneurial skills acquisition among Business Education undergraduates. Furthermore, Koko and Uweh (2025) reported that digital infrastructure contributed to employability skills development among Business Education undergraduates.

The finding revealed a moderate and significant positive relationship between administrative automation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities. This indicates that digitally automated processes such as online registration, electronic records, digital communication, financial transactions and information management can expose students to the technology-driven workflows common in modern businesses. The finding is consistent with Osiesi et al. (2024), who found moderate entrepreneurial digital skills among Business Education undergraduates in Nigeria and recommended stronger institutional support and compulsory digital education. Similarly, internationally, Zhukabayeva et al. (2025) noted that digital automation of administrative processes in higher education involves the strategic renewal of institutional processes and students' skills. Nadkarni and Prügl (2021) emphasized the importance of institutional capabilities and work environments in digital transformation.

The finding revealed a strong and significant positive relationship between digital pedagogical transformation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities. This suggests that the integration of e-learning, virtual classrooms, digital assessment, simulations, collaborative platforms and other technology-supported teaching approaches can strengthen students' technological, creative and entrepreneurial skills. The finding agrees with Abdulkarim and Danagogo (2023), who found that adoption of digital technologies in teaching Business Education courses increased students' acquisition of digital entrepreneurial skills. Similarly, Ukata and Nmehielle (2023) reported that technology-supported teaching of Business Education courses enhanced students' development of relevant skills for self-employment. In another Nigerian study, Hassan and Ajayi (2026) linked technology-based entrepreneurial pedagogies with self-employment readiness of students. Tang et al. (2025) and Zou et al. (2025) emphasized the value of digital learning technologies in instructional delivery in developing relevant student skills for self-employment.

Conclusion

The need for Business Education undergraduates to acquire skills for technopreneurship has become necessary due to the changing nature of the business environment driven by digital technologies. The findings of this study revealed significant positive relationships between digital infrastructure, administrative automation, digital pedagogical transformation and skills acquisition for technopreneurship among Business Education undergraduates in Rivers State Universities. Based on these findings, the study concludes that effective digital transformation is important for enhancing the acquisition of technopreneurship skills among Business Education undergraduates in Rivers State Universities.

Recommendations

Based on the findings and conclusion of this study, the following recommendations are made:

1. Management of Rivers State Universities should provide adequate and functional digital infrastructure such as computers, reliable internet facilities, relevant software, electricity and other digital resources for Business Education departments. This will provide undergraduates with greater opportunities to access, practice and develop the technological and entrepreneurial skills required for technopreneurship.
2. Heads of Department (HoDs) of Business Education in Rivers State Universities should promote the use of automated administrative systems such as online registration, electronic records management, digital communication and electronic financial services. This will expose undergraduates to technology-driven business processes and strengthen their ability to apply digital tools in entrepreneurial activities.
3. Heads of Department (HoDs) of Business Education should integrate digital pedagogical approaches into teaching and learning. Business Education lecturers should regularly use learning management systems, virtual classrooms, digital assessment, simulations and online collaborative

platforms to provide undergraduates with practical and interactive learning experiences that can enhance their technopreneurship skills.

4. Management of Rivers State Universities should organize regular digital skills and technopreneurship training for Business Education lecturers and undergraduates. The training should focus on the practical application of digital technologies, online business tools, digital marketing, e-commerce, data analysis and other technology-based entrepreneurial activities to strengthen students' ability to convert digital knowledge into viable business opportunities.
5. Management and HoDs of Business Education in Rivers State Universities should establish an integrated digital transformation strategy for the programme. Such a strategy should connect digital infrastructure, automated administrative services and technology teaching and learning, while providing continuous monitoring and support to ensure that digital technologies are effectively used to improve undergraduates' acquisition of skills for technopreneurship.

Abstract

The study investigated the digital technology skills required by business education students for effective entrepreneurial operations in Ebonyi State. A descriptive survey design was adopted for the study. Two research questions and two hypotheses guided the study. The population of the study comprised 47 business education educators in all tertiary institutions offering business education programmes in Ebonyi State. The entire population was used for the study because it was manageable. A structured questionnaire based on a four-point rating scale was used for data collection. Mean and standard deviation were employed to answer the research questions, while the independent samples t-test was used to test the hypotheses at the 0.05 level of significance. The findings revealed that digital financial management skills and e-commerce skills are required for effective entrepreneurial operations. Based on the findings, it was recommended that business education students should be adequately trained in digital financial management skills, including the use of electronic payment systems, online banking, digital budgeting, financial record keeping, and financial applications. The study concluded that digital financial management and e-commerce skills are important for improving the efficiency, accuracy, and sustainability of entrepreneurial operations.

Keywords: Digital technology skills, business education, entrepreneurial operations.

Introduction

The digital era has brought about significant changes across a wide range of social and economic sectors, including education, manufacturing, accounting, office occupations, and entrepreneurship. As technology continues to advance, educational institutions must adapt their approaches to ensure that students acquire the fundamental digital literacy and technological skills required for success in the contemporary digital world and modern entrepreneurial environment. The modern world of entrepreneurship is increasingly digitally driven, and only digitally equipped students are likely to cope effectively with the demands of establishing and operating businesses after graduation. Ndubuisi, Ezeani, and Okoli and Okolo (2022) noted that the world is becoming increasingly digital, creating a need for business education students to acquire appropriate digital skills for future use. This is vital because such skills can enable students and graduates to establish and manage business enterprises and maximize profitability.

Okute, Enang, and Etoma (2022) noted that digital skills are often characterized by competence in basic computing, hardware, software, and networking. They include basic information and communication technology (ICT) skills, which involve the use of computers to retrieve, store, produce, present, and exchange information, as well as to communicate and participate in collaborative networks through the internet. Udeme and Akpan (2023) noted that the acquisition of digital skills includes computer-related competencies that enable individuals to manage content and use computer applications effectively.

Digital skills refer to the ability to find, evaluate, use, share, and create content through digital devices such as computers and smartphones. Uzoka and Okoli (2022) viewed digital skills as a set of competencies that enable individuals to perform tasks effectively and efficiently using new technologies

in a digital environment. Digital skills entail knowledge and competence in the use of digital technologies for communication, collaboration, and professional development, particularly in the context of effective entrepreneurial operations.

Business education students are expected to possess digital technology skills that will enable them to engage effectively in entrepreneurial activities. Individuals equipped with relevant digital skills are better positioned to compete with their counterparts and remain relevant in the contemporary digital era. The future success of students in the contemporary world depends, to a large extent, on how effectively they are equipped with marketable skills that will enable them to establish and operate entrepreneurial ventures. The acquisition of digital technology skills by business education students will enable them to fit into and contribute meaningfully to the twenty-first-century economy, where technological competence is increasingly important for human development and entrepreneurial operations.

The effectiveness of graduates in entrepreneurial operations depends substantially on the level of competence they acquire during their educational programmes. Oko and Wagbara (2022) defined digital skills as the capacity and ability to use digital devices, communication applications, and networks to access information. One of the essential competencies acquired through business education programmes is digital technology skills. Digital devices enable individuals to create and share digital content, communicate and collaborate, and solve problems for effective and creative self-fulfilment in life, learning, work, and social activities.

Contemporary entrepreneurial operations require specialized digital skills that enable entrepreneurs to stand out, particularly in the utilization of digital technologies. Okoye and Ubaka (2025) concurred that skills acquisition in relevant areas can enable business education students to become self-reliant, independent, and productive members of society. Digital technologies have paved the way for new pedagogical approaches in which students are expected to play a more active role than before. However, this development is not without challenges. Many business education students are still unfamiliar with some of these emerging skills because of inadequate practical training in the classroom.

It is therefore imperative to engage business education students in the acquisition of various digital technology skills, including digital financial management, e-commerce, digital communication, digital business marketing, digital information management, and social media management. Business education students who acquire digital skills will not only become more employable but will also be better prepared for future career opportunities by understanding digital technology as a channel for economic and entrepreneurial advancement.

Business education, as an integral component of vocational education, is aimed at equipping students with entrepreneurial and occupational skills that will enable them to function effectively in society. Business education focuses on skills acquisition in different areas, including Office Technology and Management, Management Information Systems, Management, Marketing, Digital Marketing, Entrepreneurship, Cooperative Studies, Insurance, and Accounting (Ukata & Amini, 2022).

According to Charles-Odili (2024), business education is concerned with the acquisition and development of skills, competencies, attitudes, and attributes necessary for efficiency within the economic system. In the context of this study, business education is defined as a programme of study designed to equip its beneficiaries with the skills, competencies, attitudes, and knowledge required to become relevant and productive members of society and succeed in entrepreneurial operations. Ogwunte, Agburuga, and Abung (2023) defined business education as a means through which individuals develop the understanding and skills required to enter the business world and become self-reliant. In view of the importance of business education in skills acquisition, students of the programme are expected to acquire digital technology skills that will enable them to venture into entrepreneurial operations.

Entrepreneurial operations are the systematic activities and operational decisions involved in identifying and exploiting business opportunities, organizing and allocating resources, managing production and service processes, interacting with customers, adopting appropriate technologies, and adapting business activities to create value and achieve sustainable business performance. Long, Wood, and Bennett (2023) explained entrepreneurial organizing activities in terms of how entrepreneurs allocate scarce resources and make decisions regarding staffing and organizational functions in ways that influence the performance of emerging ventures. This perspective demonstrates that entrepreneurial operations involve organizing and deploying resources to support venture performance.

Zhang (2024) identified entrepreneurial operations as involving distinctive operational characteristics, including continuous learning and adoption, direct founder involvement in operational decisions, resource constraints, and changing operational priorities as a venture develops.

For effective entrepreneurial operations, business education students should be equipped with digital technology skills that enable them to utilize computers, digital communication tools, mobile phones, social media networks, and other digital resources to analyse, create, communicate, and use information within a digital context. This also includes the use of web tools, digital media tools, programming tools, and software applications (Tinya, 2023).

Digital technology skills, in this context, refer to the abilities, competencies, knowledge, and attitudes possessed by business education students to effectively use digital technologies and tools such as computers, smartphones, social media platforms, and digital communication tools to perform entrepreneurial activities and achieve effective entrepreneurial operations.

Digital technology skills include digital communication skills, digital marketing skills, digital financial management skills, e-commerce skills, online business skills, and digital information management skills. For the purpose of this study, attention was given to two major areas of digital technology skills required for entrepreneurial operations: digital financial management and e-commerce.

Digital financial management refers broadly to the knowledge and abilities required to plan, obtain, allocate, control, and utilize financial resources effectively to achieve business objectives. Offer (2025) described financial management skills as the competencies required by entrepreneurs and managers to effectively manage the financial aspects of their businesses.

Orah and Umoru (2024) regarded financial management as one of the important entrepreneurial skills utilized by business education graduate entrepreneurs in entrepreneurial ventures. Their study specifically examined the utilization of financial management skills alongside innovative-thinking skills among business education graduate entrepreneurs.

The Organisation for Economic Co-operation and Development (OECD) defines an e-commerce transaction as the sale or purchase of goods or services conducted over computer networks using methods specifically designed for receiving or placing orders. Williams (2024) described e-commerce as business conducted electronically, involving economic exchanges between businesses, businesses and consumers, or individuals and consumers.

For business education students to effectively use digital technologies and tools such as computers, smartphones, social media platforms, and digital communication tools in performing entrepreneurial activities and achieving effective entrepreneurial operations, it is imperative that they possess relevant digital competencies. However, some graduates of tertiary institutions may enter the business environment without adequate practical digital skills, resulting in ineffective entrepreneurial operations. Osiesi et al. (2024) observed that students may possess knowledge of digital technologies without having sufficiently developed practical entrepreneurial digital skills. This supports the need to examine the digital technology skills required by business education students for effective entrepreneurial operations.

STATEMENT OF THE PROBLEM

The rapid advancement of digital technology has significantly changed the way entrepreneurial activities are conducted. Contemporary entrepreneurs increasingly depend on digital technologies such as computers, smartphones, electronic payment systems, digital communication tools, social media platforms, and e-commerce platforms to promote products, communicate with customers, conduct business transactions, manage business records, and improve business operations.

Business education students are expected to acquire relevant digital technology skills that will enable them to function effectively in the contemporary business environment. This is one of the reasons why business education programmes are designed to prepare students to acquire practical skills, attitudes, understanding, and knowledge relating to employability and decent work in various sectors of the economy.

Despite the objectives of business education programmes and the increasing importance of digital technology in entrepreneurial operations, some business education graduates leave tertiary institutions without adequate skills to effectively utilize available digital technologies for business purposes. Some students experience difficulties in areas such as computer operation, digital communication, social media marketing, e-commerce, and other digital business activities.

The inability of some business education graduates to effectively utilize digital technologies may limit their capacity to establish, manage, and sustain entrepreneurial ventures in the contemporary economy. This situation therefore necessitated the present study to determine the digital technology skills required by business education students for effective entrepreneurial operations in Ebonyi State.

PURPOSE OF THE STUDY

The main purpose of the study was to examine the digital technology skills required by business education students for effective entrepreneurial operations in Ebonyi State.
Specifically, the study sought to determine:

1. The financial management skills required by business education students for effective entrepreneurial operations.
2. The e-commerce skills required by business education students for effective entrepreneurial operations.

RESEARCH QUESTIONS

The following research questions guided the study:

1. What are the financial management skills required by business education students for effective entrepreneurial operations?
2. What are the e-commerce skills required by business education students for effective entrepreneurial operations?

RESEARCH HYPOTHESES

The following null hypotheses were tested at the 0.05 level of significance:

Ho1: There is no significant difference between the mean ratings of male and female business education educators on the financial management skills required by business education students for effective entrepreneurial operations.

Ho2: There is no significant difference between the mean ratings of male and female business education educators on the e-commerce skills required by business education students for effective entrepreneurial operations.

METHOD

A descriptive survey design was adopted for the study because the study sought to obtain the opinions of respondents regarding the digital technology skills required by business education students for effective entrepreneurial operations in Ebonyi State. The study was conducted in all tertiary institutions offering business education programmes in Ebonyi State. These institutions are Ebonyi State University, Ebonyi State College of Education, Ikwo, and Alex-Ekwueme Federal University, Ndufu-Alike, Ikwo.

The population of the study comprised 47 business education educators in all the tertiary institutions offering business education programmes in Ebonyi State. Since the population was manageable, no sampling was conducted. The entire population of 47 business education educators was therefore used for the study. The instrument used for data collection was a structured questionnaire titled Digital Technology Skills Required by Business Education Students Questionnaire (DTSRBESQ). The questionnaire items were generated from the research questions. The instrument was validated by experts before it was administered to the respondents. The instrument was further subjected to reliability testing to determine its internal consistency.

Mean and standard deviation were used to analyse the data and answer the research questions, while the independent samples t-test was used to test the null hypotheses at the 0.05 level of significance.

RESULTS

Research Question 1: What are the financial management skills required by business education students for effective entrepreneurial operations?

Table 1: Mean Ratings and Standard Deviation of Responses on financial management skills required by business education students for effective entrepreneurial operations.

S/N	ITEM STATEMENT	N	X	STD	DECISION
1	Preparing budget by the use of digital tools	47	2.99	.25	Agree
2	Monitoring income and expenditure electronically	47	3.47	.49	Agree
3	Using spreadsheet in budgeting	47	3.17	.28	Agree
4	Recording business transactions electronically	47	3.34	.52	Agree
5	Preparing digital financial statements	47	3.12	.49	Agree
6	Use accounting software	47	3.32	.58	Agree
7	Monitoring cash inflows and outflows digitally	47	3.31	.51	Agree
8	Managing business liquidity using digital tools	47	3.45	.65	Agree
9	Use of mobile banking and internet	47	3.35	.53	Agree
10	Receiving customers payments electronically	47	3.44	.64	Agree

11	Analyzing digital financial records	47	3.28	.47	Agree
12	Calculating profit and loss using digital tools	47	3.32	.54	Agree
13	Interpreting financial reports	47	3.26	.53	Agree
14	Protecting financial reports	47	3.34	.56	Agree
15	Detecting fraudulent digital transactions	47	3.31	.50	Agree
16	Safeguarding customers' and business financial information	47	3.25	.59	Agree
	Grand Mean		**3.30**		**Agree**

Table 1 above shows that 1 to 16 are the financial management skills required of business education students for effective entrepreneurial operations. This is because each of the items attained a mean score above 2.50. The grand mean of 3.30 is an indication that financial management skills are skills required of business education students for effective entrepreneurial operations.

Research Question 2: What are the E-commerce skills required by business education students for effective entrepreneurial operations?

Table 2: Mean Ratings and Standard Deviation of Responses on the E-commerce skills required by business education students for effective entrepreneurial operations.

S/N	ITEM STATEMENT	N	X	STD	DECISION
17	Creating online advertisements	47	3.28	.48	Agree
18	Promoting products through social media	47	3.31	.53	Agree
19	Using email marketing	47	3.11	.50	Agree
20	Creating digital marketing content	47	3.60	67	Agree
21	Managing online sales transactions	47	3.09	.49	Agree
22	Tracking sales electronically	47	3.38	.58	Agree
23	Communicating with customers through online platforms	47	3.33	.54	Agree
24	Responding promptly to customers enquiries	47	3.28	.56	Agree
25	Building customer relationships online	47	3.30	.49	Agree
26	Using mobile payment platforms	47	3.30	.50	Agree
27	Processing electronic payments	47	3.14	.47	Agree
28	Creating online store	47	3.34	.52	Agree
29	Maintaining basic website security	47	3.20	.50	Agree
30	Coordinating product delivery information to customers	47	3.29	.62	Agree
31	Tracking customers' orders	47	3.22	.50	Agree
	Grand Mean		**3.28**		**Agree**

The results of data analysis as presented in table 2 revealed the E-commerce skills required by business education students for effective entrepreneurial operations. These E-commerce skills include: creating online advertisement, promoting products through social media, using email marketing, creating digital marketing content, managing online sales transactions, tracking sales electronically, building customer relationships online, using mobile payment platforms, processing electronic payments, creating online store, maintaining basic website security, coordinating product delivery information to customers and tracking customers' orders. The grand mean of 3.28 further validated this.

Hypotheses

HO_1: There is no significant difference between the mean ratings of male and female business education students on the financial management skills required for effective entrepreneurial operations.

Table 3: t-test of difference in the mean responses of business education students on the financial management skills required for effective entrepreneurial operations.

Items	Gender	N	X	STD	Df	t-cal	Alpha	t-crt	Decision
1	Male	21	2.95	.50	45	-.58	0.05	.56	Not
	Female	26	3.03	.20					Significant
2	Male	21	3.71	.46	45	-.35	0.05	.73	Not
	Female	26	3.76	.43					Significant
3	Male	21	3.19	.40	45	1.08	0.05	.29	Not
	Female	26	3.15	.37					Significant
4	Male	21	3.29	.56	45	.46	0.05	.07	Significant
	Female	26	3.38	.50					
5	Male	21	3.33	.48	45	.08	0.05	.97	Not
	Female	26	3.34	.49					Significant
6	Male	21	3.29	.46	45	1.38	0.05	.23	Significant
	Female	26	3.38	.57					
7	Male	21	3.38	.59	45	-1.34	0.05	.19	Not
	Female	26	3.26	.45					Significant
8	Male	21	3.33	.48	45	-1.03	0.05	.31	Not
	Female	26	3.54	.51					Significant
9	Male	21	3.38	.50	45	.19	0.05	.85	Not
	Female	26	3.31	.45					Significant
10	Male	21	3.43	.51	45	.54	0.05	.60	Not
	Female	26	3.46	.58					Significant
11	Male	21	3.29	.56	45	.41	0.05	.68	Not
	Female	26	3.27	.45					Significant
12	Male	21	3.33	.48	45	-.93	0.05	.36	Not
	Female	26	3.31	.54					Significant
13	Male	21	3.29	.46	45	.34	0.05	.73	Not
	Female	26	3.23	.51					Significant
14	Male	21	3.38	.50	45	-.99	0.05	.33	Not
	Female	26	3.30	.47					Significant
15	Male	21	3.43	.50	45	-.33	0.05	.19	Not
	Female	26	3.19	.49					Significant
16	Male	21	3.19	.51	45	.30	0.05	.77	Not
	Female	26	3.31	.54					Significant
	Average					**0.64**		**0.49**	**Significant**

The result of the t-test analysis presented in table 3 above indicated that there is significant difference in the mean responses of participants on the financial management skills required for effective entrepreneurial operations. This is because from the table, the average t-calculated value of 0.64 was greater than the critical value of 0.49.

HO_2: There is no significant difference between the mean ratings of male and female business education students on the financial management skills required for effective entrepreneurial operations.

Table 4: t-test of difference in the mean responses of business education students on the financial management skills required for effective entrepreneurial operations.

Items	Gender	N	X	STD	Df	t-cal	Alpha	t-crt	Decision
17	Male	21	3.29	.64	45	.65	0.05	.52	Significant
	Female	26	3.27	.53					
18	Male	21	3.43	.50	45	.19	0.05	.85	Not
	Female	26	3.19	.63					Significant
19	Male	21	3.24	.44	45	1.14	0.05	.26	Significant
	Female	26	3.08	.48					
20	Male	21	3.48	.60	45	.83	0.05	.41	Significant
	Female	26	3.73	.81					

21	Male	21	3.14	.57	45	.06	0.05	.96	Not
	Female	26	3.04	.59					Significant
22	Male	21	3.38	.50	45	.06	0.05	.96	Not
	Female	26	3.38	.50					Significant
23	Male	21	3.29	.46	45	-.95	0.05	.35	Not
	Female	26	3.12	.51					Significant
24	Male	21	3.38	.58	45	-.83	0.05	.41	Not
	Female	26	3.19	.56					Significant
25	Male	21	3.33	.58	45	.66	0.05	.52	Significant
	Female	26	3.27	.53					
26	Male	21	3.38	.50	45	-.50	0.05	.62	Not
	Female	26	3.23	.51					Significant
27	Male	21	3.05	.50	45	.36	0.05	.07	Significant
	Female	26	3.23	.51					
28	Male	21	3.33	.48	45	.08	0.05	.07	Significant
	Female	26	3.35	.56					
29	Male	21	3.10	.53	45	.90	0.05	.37	Significant
	Female	26	3.31	.61					
30	Male	21	3.23	.60	45	.45	0.05	.34	Significant
	Female	26	3.32	.56					
31	Male	21	3.05	.59	45	.20	0.05	.33	Significant
	Female	26	3.12	.67					
	Average					**0.57**		**0.46**	**Significant**

The result of t-test analysis presented in Table 4 above indicated that there is significant difference in the mean responses of business education students on the financial management skills required for effective entrepreneurial operations. This is because from the above table, the cumulative calculated value of 0.57 is greater than the critical value of 0.46.

DISCUSSION OF FINDINGS

The findings presented in Table 1 revealed that digital financial management skills are required by business education students for effective entrepreneurial operations. All the 16 items recorded mean scores above the criterion mean of 2.50, with a grand mean of 3.30, indicating agreement among the respondents. The findings therefore suggest that business education students require a broad range of digital financial management skills, including preparing budgets using digital tools, monitoring income and expenditure electronically, using spreadsheets for budgeting, recording business transactions electronically, preparing digital financial statements, using accounting software, monitoring cash inflows and outflows, managing business liquidity, using mobile and internet banking services, receiving customer payments electronically, analysing digital financial records, calculating profit and loss, interpreting financial reports, protecting financial reports, detecting fraudulent digital transactions, and safeguarding customers' and business financial information.

This finding is supported by Li *et al*. (2024), who found that financial literacy contributes to entrepreneurial behaviour by helping entrepreneurs analyse market conditions, formulate business plans, undertake cost accounting, and manage financial risks. Their study therefore supports the present finding that financial management competence is fundamental to effective entrepreneurship. Similarly, research reported in Finance Research Letters in 2024 found that digital transformation improves entrepreneurial performance and that financial literacy strengthens this relationship. The study explained that digital transformation can improve access to information, expand market reach, and enhance management efficiency. This supports the present finding that students should acquire the ability to combine financial knowledge with digital tools in managing entrepreneurial activities.

The findings presented in Table 2 revealed that e-commerce skills are required by business education students for effective entrepreneurial operations. All 15 items recorded mean scores above the criterion mean of 2.50, while the grand mean was 3.28, indicating agreement among the respondents. The identified skills include creating online advertisements, promoting products through social media, using email marketing, creating digital marketing content, managing online sales transactions, tracking sales electronically, communicating with customers through online platforms, responding promptly to customers' enquiries, building customer relationships online, using mobile

payment platforms, processing electronic payments, creating online stores, maintaining basic website security, coordinating product delivery information, and tracking customers' orders.

The finding agrees with the OECD (2024), which reported that digitalisation enables small and medium-sized enterprises (SMEs) to expand their customer reach and access wider markets through e-commerce platforms. The OECD further noted that digital platforms can help SMEs improve communication, information sharing, and the performance of various business functions. The finding also agrees with the OECD (2025) report on SME digitalisation, which identified digital marketing and search-engine optimisation, digitalisation of day-to-day operations, and data analytics among the urgent digital training needs reported by SMEs. This is particularly relevant to the present finding because digital marketing, electronic sales tracking, online customer communication, and online business operations constitute major components of the e-commerce skills identified by the respondents.

CONCLUSION

The study concluded that digital technology skills are relevant competencies required by business education students for effective entrepreneurial operations in Ebonyi State. The effective use of digital technologies enables business education graduates to perform business activities more efficiently, communicate with customers, manage financial transactions, market products and services, and participate effectively in e-commerce.

Specifically, digital financial management and e-commerce skills were identified as important competencies for improving the efficiency, accuracy, and sustainability of entrepreneurial operations. Equipping business education students with these skills can therefore enhance their preparedness for self-employment and entrepreneurial participation in the contemporary digital economy.

RECOMMENDATIONS

Based on the findings of the study, the following recommendations were made:

1. Business education students should be adequately trained in digital financial management skills, including electronic payment systems, online banking, digital budgeting, financial record keeping, and the use of financial applications.
2. Business education departments should provide practical training centres and digital financial tools that will enable students to develop competence in managing business income, expenses, cash flow, and financial records electronically.
3. Business education students should be trained in e-commerce skills such as online product marketing, online customer service, electronic ordering, digital payment processing, and online sales management.
4. Business education programmes should incorporate practical e-commerce activities into their curricula, allowing students to create and manage online business platforms and practise selling products or services electronically.

Abstract
This study assessed the digital transformation skills utilized by Business Education students in Colleges of Education in South East Nigeria. Specifically, the study examined the extent to which digital communication skills and advanced technical skills are utilized by Business Education students. A survey research design was adopted. The population comprised 83 respondents (lecturers and administrators) from federal and state Colleges of Education in South Eastern Nigeria. The entire population was studied without sampling due to its manageable size. Data collection was carried out using a structured questionnaire titled 'Digital Transformation Skills Required of Business Education Students (DITSBES)', which was validated by three experts from Michael Okpara University of Agriculture, Umudike. The instrument demonstrated high internal consistency with a Cronbach's alpha reliability coefficient of 0.71. Mean was utilized to answer the research questions; standard deviation was used to determine the closeness or homogeneity of the respondents' responses while Analysis of Variance (ANOVA) was used to test the null hypotheses at a 0.05 level of significance. Findings revealed that Business Education students possess a moderate to low extent of acquisition in both digital communication and advanced technical skills. Based on the findings, it was recommended among others that curriculum planners integrate practical-oriented digital skills modules into Business Education programs to enhance graduate employability and self-reliance.
Keywords: Digital transformation, skills, Business Education, advanced technical, digital communication.

Introduction
In today's world, where digitalization is accelerating day by day, learner profiles and learning methods are undergoing a profound transformation. While information resources are expanding and constantly being updated the speed of access to information compels educators to reassess not only existing teaching methods but also learning environment and pedagogical understandings. In the face of rapidly evolving students' needs, transforming teaching methods has become not a preference but an inevitable necessity. The transformation in instructional technologies is fundamentally core dynamics and philosophies of education. The immediate access demands of generations and their expectations for individualized learning experiences, and their tendencies, towards interactive methods are challenging traditional education models and directing educators towards more flexible, student-centered and data-driven approaches, (Babican, 2025).
An ideal and sustainable economy is one which provides greatest amount of general well-being with the least number of resources use and environmental harm. Many graduates in diverse disciplines are experiencing an ever hill in the labour market, and Business Education graduates are not exempted.

The needs to teach Business Education students the relevant skills acquisition necessary to enable them alleviate economic pressures arises. One of the ways of doing this is to engage and inspire their participation in digital transformation skills acquisition, tutorial and webinar to acquire new digital skills and stay current with emerging technologies. Digital skills acquisitions therefore appear to be the answer to this predicament.

Ekoh-Nweke, Ezeabii, and Ikpeama, (2022) described digital transformation skills as range of abilities to use digital devices, communication applications, and network to access and manage information. The digital devices enable people to create and share digital content, communicate and collaborate and solve problems for effective and creative self-fulfillment in life, learning work and social activities. Today's job seekers require specialized skills to help them stand out from the crowd, especially in the areas of utilizing digital technologies. Okoye and Ubaka (2025) contented that skills acquisition in the areas that will be useful to Business Education students will enable them to become self- reliant, independent, and productive citizens in the society. The need then is to explore and experiment with different digital tools and platforms to find what works best for the individual needs in 21st century. Digital skills acquisition also includes digital literacy, data management collaboration work, communication, security and ability to solve problems in virtual environment. Digital skills acquisition is imperative because they aid in facilitating the adoption of new strategies, and processes that are vital for an organizational digital growth. Iwuoha and Emeasoba (2025) affirmed that digital transformation skill contributes greatly to the elimination of joblessness in Nigeria, the development of a positive attitude towards work, the development of entrepreurial ability, the building of self and the reduction of poverty and crimes rates in the country. The digital Era therefore calls for continuous acquisition of new skills and updating of existing ones in order to align with global trends. Digital skills also include the tools and software one can use in daily economic structure and or transaction. These are the tools used in jobs or studies, as well as tools used in spare-time such as social media. Aruah (2024) stated that digital skills is a general understanding of basic technology to complete work tasks or abilities that relates to a specific industry like software development hence business education students need skills for effective business collaboration. Another transformation skills that can be utilized by Business Education students is communication skills.

Communication skills are attribute of all living things, and the source of all human interactions. Communication skills can be defined as the ability to effectively use digital tools and technologies to communicate, collaborate, and share information with others. It is the communication which uses electronic media to transmit the information or message using computers, email, telephone, video calling, fax machine among others. Azubuike (2023) emphasized that it is the ability to use digital tools, such as computers, smartphones, and the internet, to communicate effectively. Communication skills are set of abilities required to effectively use technology to communicate, collaborate, and share information online. This can be developed by sharing data like images, graphics, sound, pictures, maps, software, and many things. Musa and Auwalu (2024) opined that digital communication skills allow lecturers and students to access the classroom from anywhere and anytime. In recent times, communication has greatly changed due to the way public interact and communicate with each other for different purposes like personal business, by using this it is very simple to communicate with the world. In order to meet up with the trend of event in this global age. Business Education students need to utilize advance technical skills for effective performance in their various place of work.

Advance technical skills can be referred to as skills, which a head of unit possesses and uses to enhance professional knowledge and attitudes of teachers so that they might, in turn improve the learning on students. Technical skills are attributes and qualities which enable one to perform the task within a particular occupation to a defined standard. Technical skills which are sometimes referred to as functional skills which relates to the competencies and knowledge that are essential in order for a person to do a particular job appropriately. In this regard, technical skills are knowledge of accounting skills which has to do with mastery of subject contents. To produce competitive students, educational institutions required qualified teachers with world class technical skills. Ganiu, Ayodeji and Akinnodi, (2025) expressed that as a matter of fact, university Business Education graduate's ought to possess the needed technical skills for effective teaching in colleges of education. Unfortunately, many Business Education graduates who are prospective teachers of business subject seem to lack skills needed to accomplish effective instruction, most of them often run away from teaching especially that of financial accounting after graduation. They prefer to teach simple subjects. Business Education students need to embrace these skills in order to meet up with 21st century goal.

Business Education is a skill-oriented programme directed towards equipping the recipient with relevant skills for success in paid or self-employment. It is an aspect of Vocational Education which involves acquisition of skills, knowledge and competencies which makes the recipients proficient in the area of

business. Ndom-Uchendu (2026) asserted that Business Education is a programme of instruction designed to empower students with skills for world of work and create for them empowerment opportunities. Aruah (2024) stated that Business Education is a form of Vocational Education that is directed towards developing the learner to become productive in learning paid employment and self-employment. Business Education is a part of the overall educational program that equips the recipient with the knowledge, skills, understanding and attitude required to perform well in the business world as a producer or consumer of goods and services. Musa and Auwalu (2024) opined that Business Education is the phase of education that prepares students to teach business courses. Business Education is an important component of Vocational Education, which is taught at both the secondary a higher level of education. Moreover, Business Education aims to prepare graduates to satisfy the needs of a rapidly growing society. It is against this background that the need arises to determine digital transformation skills utilized by Business Education students in colleges of education in South-East Nigeria.

Statement of problem

The advent of information and communication technology in every sphere of human endeavor has greatly transformed and improved the mode of operation especially in education. The introduction of digital transformation skills in education, business organization, marketing administration using digital based instruction also becomes imperative. In order to achieve these, objectives, digital based instruction need to be adequately utilized to facilitate effective teaching. The consequence of not acquiring digital transformation and advance technical skills for effective teaching and learning in this digital era have affected the level and quality of Business Education graduates' engagement and involvement in internet and modern technology in business. These trends are affecting the composition of employment, the nature of task carried out at work, and the skill required in the labour market. Though technological advances in digital skills are high, but their utilization in most tertiary institutions like colleges of education seems to be very scanty and underutilized. Therefore, the problem of this study was to ascertain the extent of digital transformation skills utilized by Business Education students in colleges of education in South East-Nigeria.

Purpose of the study

The main purpose of the study was to determine the extent of digital transformation skills utilization by Business Education students in colleges of education in South-East Nigeria. The study sought to:

iii. Determine the extent digital communication skills are utilized by Business Education students in colleges of education.
iv. Determine the advanced technical skills are utilized by Business Education students in colleges of education.

Research questions

The following research questions guided the study

3. To what extent does digital Communication skills are utilized by Business Education students in colleges of education in South East Nigeria.
4. To what extent does advance technical skills are utilized by Business Education students in colleges of education in South East Nigeria.

Research Hypotheses

The following null hypotheses were tested at 0.05 level of significance

1. A significant difference does not exist between the mean ratings of Business Educators and students on digital communication skills utilization by Business Education students in colleges of education in south east Nigeria.
2. There is no significant difference among the mean ratings of Business Educators and students on advanced technical skills utilization by Business Education students in colleges of education south east Nigeria.

Methodology

This study adopted a survey research design. Two research questions and two hypotheses guided the study. The population of the study comprised 83 respondents from federal and State colleges of education south eastern part of Nigeria. The entire population was used for the study since it was manageable. The instrument for data collection was a structured questionnaire designed by the researcher titled digital transformation skills required of Business Education students (DITSBES) the instrument was validated by three experts, two from Agricultural and Vocational Education (Business Education Unit) and one in measurement and evaluation all from Michael Okpara University of Agriculture Umudike, Abia State. The reliability of instrument was determined using

Cronbach Alpha which yielded 0.71, mean was used to answer the research questions and standard deviation was used to determine the homogeneity or closeness of the respondents' responses while analysis of variance (ANOVA) was used to test the hypotheses at 0.05 level of significance.

Results

Research Question One

To what extent are digital communication tools utilized by Business Education students in colleges of education south east Nigeria?

Table 1: Mean scores and Standard Deviations of the respondents on the extent of utilization of digital communication tools

S/N	Indicate the extent utilization of the following digital communication tools;	Business Educators			Students			Overall		
		$\bar{X}$	SD	Rms	$\bar{X}$	SD	Rms	X	SD	Decision
1	Zoom	2.42	0.70	LE	2.40	0.88	LE	2.42	0.75	LE

	Cluster means and standard deviation	**2.43**	**0.83**	**LE**	**2.36**	**0.84**	**LE**	**2.35**	**0.74**	**LE**

Note: X = Mean, SD = Standard Deviation

The result presented in Table 1 showed that the respondents were of the view that digital communication skills are utilized to a low extent by Business Education students in colleges of education South East Nigeria. This is evidenced by the overall cluster mean scores of 2.35 which is below the criterion mean of 2.50. The overall cluster standard deviation score of 0.74 also indicated that the respondents were consistent in their opinions.

Hypothesis One

There is no significant difference in the mean scores of Business Educators and Business Education students on the extent of utilization of digital communication tools by Business Education students in colleges of education south east Nigeria

Table 2: Summary of t-test Analysis of mean scores of the respondents on the extent of utilization of digital communication skills by Business Education students

Group	N	X	SD	df	Sig	t-value	p-value	Decision
Business Educators	39	2.43	0.83					
Students	44	2.36	0.84	81	0.05	0.38	0.70	NS

DF = 81, S = Significant, NS = Not Significant

Data presented in table 2 reveal that the p-value obtained (0.70) is greater than the chosen alpha of 0.05 at 81 degrees of freedom. This indicates that Business Educators and Business Education students on the extent of utilization of digital Communication skills by Business Education students in colleges of education south east Nigeria. Therefore, the null hypothesis (H_{o1}) is not rejected.

Research Question Two

To what extent are advanced technical skills utilized by Business Education students in colleges of education south east advanced technical skills Nigeria?

Table 3: Mean scores and Standard Deviations of the respondents on the extent of utilization of advanced technical skills

S/N	Indicate the extent utilization of the following advanced technical skills;	Business Educators $\bar{X}$	SD	Rms	Students $\bar{X}$	SD	Rms	Overall X	SD	Decision
1	Tableau	1.70	0.52	LE	1.67	0.62	LE	1.69	0.57	LE
2	Lucid chart	1.10	0.40	LE	1.02	0.56	LE	1.75	0.48	LE
3	Docebo	1.51	0.62	LE	1.55	0.59	LE	1.53	0.61	LE
4	Adaptive learning platform	1.58	0.60	LE	1.40	0.85	LE	1.49	0.82	LE
5	Kaltura Learning	1.64	0.61	LE	1.50	0.72	LE	1.57	0.79	LE
6	Virtual reality simulation	1.65	0.55	LE	1.57	0.67	LE	1.61	0.61	LE
7	Coursera for Business	1.70	0.64	LE	1.55	0.78	LE	1.63	0.71	LE
8	Microsoft Power BI	1.33	0.60	LE	1.23	0.55	LE	1.28	0.71	LE
9	Advanced Excel	2.16	0.56	LE	2.10	0.70	LE	2.13	0.83	LE
10	Moodle	2.14	0.61	LE	2.11	0.58	LE	2.12	0.70	LE
	Cluster means and standard deviation	**1.65**	**0.57**	**LE**	**1.57**	**0.66**	**LE**	**1.68**	**0.68**	**LE**

The result presented in Table 3 showed that the respondents were of the view that advanced technical skills are utilized to a low extent by Business Education students in colleges of education South East Nigeria. This is evidenced by the overall cluster mean scores of 1.68 which is below the criterion mean of 2.50. The overall cluster standard deviation score of 0.68 also indicated that the respondents were consistent in their opinions.

Hypothesis Two

There is no significant difference in the mean scores of Business Educators and Business Education students on the extent of utilization of advanced technical skills by Business Education students in colleges of education south east Nigeria

Table 4: Summary of t-test Analysis of mean scores of the respondents on the extent of utilization of utilization of advanced technical skills by Business Education students

Group	N	X	SD		df	Sig	t-value	p-value	Decision
Business Educators	39	1.65	0.57						
Students	44	1.57	0.66		81	0.05	0.59	0.56	NS

Data presented in table 4 reveal that the p-value obtained (0.56) is greater than the chosen alpha of 0.05 at 81 degrees of freedom. This indicates that Business Educators and Business Education students on the extent of utilization of advanced technical tools by Business Education students in colleges of education south east Nigeria. Therefore, the null hypothesis (H_{o2}) is not rejected.

Discussion of the Findings

The findings of this study revealed that digital communication skills such as zoom, google classroom, Microsoft teams, telegram, google meet, and OneDrive are utilized to a low extent by Business Education students in Colleges of Education in South East Nigeria. The corresponding hypothesis indicated that Business Educators and Business Education students on the extent of utilization of digital Communication skills by Business Education students in colleges of education south east Nigeria. This finding suggests that, despite the global shift toward digitally mediated teaching, learning, and collaboration, Business Education students in the study area have not sufficiently embraced these platforms as functional tools for academic and professional engagement. This low level of utilization could be attributed to inadequate ICT infrastructure, poor internet connectivity, limited digital literacy training, and insufficient exposure to real-world applications of these tools within the curriculum. This finding aligns with the position of Ekoh-Nweke, Ezeabii and Ikpeama (2022), who found that Business Educators in universities in South East Nigeria adopted digital skills strategies only to a limited extent in teaching Business Education during the "new normal," largely due to inadequate digital competence and infrastructural constraints among staff and students. Similarly, Ademiluyi (2023) reported that ICT facilities were barely available, grossly inadequate, and largely underutilized for teaching business-related subjects, even where such facilities were nominally provided by government intervention. These convergent findings underscore a systemic pattern across Nigerian educational institutions, where the mere existence of digital communication skills does not translate into meaningful

or consistent utilization by students, largely because of gaps in access, training, and institutional support. The implication is that Business Education students may graduate without the collaborative and virtual communication competencies that are increasingly demanded in modern, digitally distributed workplaces, thereby widening the gap between curriculum content and industry expectations.

In addition, evidence from analysis of research question two revealed that advanced technical skills such as tableau, lLucidchart, docebo, Coursera for business, adaptive learning platforms, Moodle, and advanced excel are equally utilized to a low extent by Business Education students in the Colleges of Education studied. The corresponding hypothesis indicated that Business Educators and Business Education students on the extent of utilization of advanced technical tools by Business Education students in colleges of education south east Nigeria. This finding indicates a significant deficiency in students' exposure to and mastery of specialized, industry-relevant digital applications that support data analysis, process visualization, e-learning management, and advanced business computation. Given that these tools are central to data-driven decision-making and modern business operations, their underutilization signals a critical skills gap that could hinder graduates' competitiveness in contemporary labour markets. This finding is consistent with the work of Obi and Arhueremu (2020), who found that ICT resources for teaching Business Education programmes in Colleges of Education in Delta State were available and utilized only to a limited extent, a situation they attributed to inadequate funding, poor maintenance culture, and insufficient technical know-how among both lecturers and students. It also corroborates the findings of Ubaka (2025), who established that business education students required, but had not sufficiently acquired, digital skills necessary for self-reliance and sustainable economic ventures, noting that advanced digital competencies remained largely underdeveloped among students in Colleges of Education in Anambra State. Thus, these findings suggest that the underutilization of advanced technical tools is not peculiar to the present study area but reflects a broader national challenge rooted in infrastructural deficits, inadequate staff capacity to model the use of such tools, and curricula that have not fully integrated contemporary digital business applications.

Conclusion

Based on the findings made, the following conclusion was drawn. It can be concluded that both categories of digital transformation skills are utilized to a low extent among Business Education students in the area studied. Digital communication tools such as Zoom, Google Classroom, Microsoft Teams, Telegram, Google Meet, and OneDrive, which are essential for collaborative learning, virtual engagement, and workplace communication, remain underutilized. Similarly, advanced technical tools such as Tableau, Lucidchart, Docebo, Coursera for Business, Adaptive Learning Platforms, Moodle, and Advanced Excel, which support data analysis, digital instruction, and modern business operations, are also poorly utilized by students. The study further revealed that business educators and Business Education students ranked low on the extent of utilization of digital communication and advanced technical tools by Business Education students in colleges of education south east Nigeria.

Recommendations

Based on the findings and conclusion of this study, the following recommendations were made:

1. Colleges of Education should organize regular digital skills training workshops to expose Business Education students to the practical use of digital communication tools such as Zoom, Microsoft Teams, Google Classroom, and Google Meet, thereby improving their competence and confidence in using these platforms for learning and collaboration.
2. Government and relevant education agencies should provide adequate funding for the procurement and maintenance of ICT infrastructure, including reliable internet connectivity, computers, and software licenses, to support the effective utilization of both digital communication and advanced technical tools in Colleges of Education.
3. Lecturers in Colleges of Education should undergo continuous professional development and retraining programmes in digital transformation tools, as their own proficiency directly influences their ability to model and teach these skills effectively to students.
4. Institutions should establish functional ICT and e-learning centres equipped with adaptive learning platforms and business intelligence software, giving students hands-on access and practice opportunities beyond the classroom.

Abstract

This study investigated the impact of shifting perspectives through transformative teaching approaches on building the interpersonal and communication competence of OTM students in preparing them for the global workplace. A survey research design was adopted for the study. The population comprised 323 OTM lecturers and final-year HND students across four Federal Polytechnics, from which a sample of 175 (40 lecturers, 135 students) was drawn using simple random sampling based on the Krejcie and Morgan table. Data were gathered using a validated structured questionnaire titled "Transformative Teaching and Competence Scale" (TTCS). The internal consistency of the instruments was calculated using Cronbach's alpha which yielded a Cronbach's alpha reliability coefficient of 0.84. The null hypothesis, which stated that shifting perspectives through transformative teaching does not significantly enhance the interpersonal and communication competence of OTM students, was tested using the Pearson Product Moment Correlation Coefficient (PPMCC) at a 0.05 level of significance. The findings revealed that perspective-shifting pedagogical approaches exert a statistically significant positive effect on the development of students' interpersonal and communication abilities. Consequently, the null hypothesis was rejected. Exposure to transformative learning environments successfully catalysed a shift from a passive student mindset to an active, globally-oriented professional identity. The study concludes that OTM education must transcend technical instruction to remain relevant in the digital era; it must actively foster professional identity transformation. It is recommended that OTM educators intentionally integrate transformative strategies such as reflective journaling and collaborative workplace simulations into curriculum implementation to cultivate communicative and globally competitive graduates.

Keywords: Transformative Teaching, OTM Students, Professional Identity, Interpersonal Competence, Digital Transformation.

Introduction

The contemporary global economic landscape is undergoing an unprecedented paradigm shift driven by digital acceleration and entrepreneurial disruption. In the opinion of Asiru and Oladipo (2023), this transformation is reshaping corporate operational structures, redefining administrative workflows, and placing new demands on human capital. Historically, higher education programs in Office Technology and Management (OTM), formerly known as Secretarial Studies, primarily focused on equipping students with technical and hard skills, such as advanced word processing, shorthand, and basic data management (Ezenwafor & Okeke, 2022). In its contemporary iteration, the OTM programme is a specialized educational curriculum designed to replace these localized secretarial studies with a comprehensive, technology-driven approach to workplace administration (Iheukwumere, Uteh & Nkemjika, 2023). Akintola and Akintola (2023) note that, governed by modern vocational and technical education standards, the primary objective of the OTM curriculum is to equip students with a blend of advanced information and communication technology (ICT) competencies, electronic office

applications, and critical socio-psychological work attributes. However, Ndidi (2026) argues that in an era characterized by automated administrative processes, cloud computing, and artificial intelligence, technical literacy alone is no longer a differentiator for career readiness. This explains why Nwokike, Okechukwu, and Udoudo (2024) assert that the contemporary digital workplace requires OTM professionals who can seamlessly navigate cross-cultural communication, manage complex digital relations, and exhibit superior emotional intelligence. Consequently, global workplace readiness has increasingly come to depend on interpersonal and communication competence. Moreover, the digital and entrepreneurial transformation sweeping across the globe demands that Office Technology and Management (OTM) graduates possess robust soft skills alongside technical skills. While traditional business education heavily emphasizes technical proficiency, global workplace readiness increasingly hinges on soft skills. Transformative teaching, which triggers a shift in students' professional identity perspective, offers a critical pedagogical pathway to bridge this gap.

Despite the critical nature of these interpersonal soft skills, traditional office management education instructional models in higher education institutions remain rigidly didactic and tech-centric. This conventional framework, as confirmed by Aina and Olanipekun (2025), creates a structural disconnect in that students graduate with technical certifications but lack the communicative flexibility required to thrive in fast-paced, digital, and entrepreneurial business environments. To remedy this skills gap, scholars have advocated for a pedagogical pivot away from rote technical instruction toward transformative teaching approaches. Rooted in Mezirow's (1991, 1997) Transformative Learning Theory, transformative teaching involves intentionally designing learning environments that trigger a "disorienting dilemma" such as a complex, unscripted workplace simulation that forces students to critically reflect on their embedded assumptions, values, and mindsets. Cranton and Taylor (2012) declare that rather than simply adding new facts to an existing cognitive framework, transformative teaching changes how students think, behave, and perceive themselves.

Central to this transformative pedagogical paradigm is the concept of professional identity transformation. Academic journeying is frequently restricted to a "student identity" characterized by passive reception, compliance, and localized performance tracking. Jarvis-Selinger, Pratt, and Regehr (2012) believe that, in contrast, the globalized digital economy demands that OTM graduates undergo an internal psychological shift, shedding their passive student mindsets to adopt an active, globally-oriented professional identity before entering the workforce. When OTM educators introduce perspective-shifting pedagogical strategies such as deep reflective journaling, multi-tiered collaborative peer projects, and high-fidelity digital client simulations, they actively bridge the gap between classroom theory and corporate reality. This psychological maturation from a novice student to a strategic administrative collaborator has been theorized to naturally accelerate the acquisition of advanced communication and interpersonal competencies (Trede, Macklin & Bridges, 2012).

While the theoretical link between transformative education and identity construction is well-documented in teacher education literature, its empirical application within business education particularly within the OTM discipline remains significantly under-researched. Many institutions continue to evaluate OTM readiness purely through a technical lens, disregarding the socio-linguistic and relational adjustments necessitated by digital and entrepreneurial transformation. To address this gap, this study investigates how shifting perspectives through transformative teaching approaches build interpersonal and communication competence among OTM students. By examining these structural interactions, this paper aims to provide business education stakeholders, curriculum designers, and policy-makers with an empirical blueprint for modernizing OTM programmes to meet the fluid demands of the digital frontier.

Statement of the Problem

The traditional educational model for Office Technology and Management (OTM) programs in Nigerian tertiary institutions is facing a critical crisis of relevance. Historically engineered to produce administrative personnel with high technical and mechanical proficiency, the current curriculum remains heavily biased toward technical skills. However, the sweeping digital and entrepreneurial transformation across the nation's corporate landscape has fundamentally altered the role of the modern office manager. Technical workflows are increasingly automated, shifting the human value proposition in the workplace from routine execution to advanced relational management, strategic communication, and cross-cultural digital collaboration (Asiru & Oladipo, 2023).

Despite this shift, a stark disconnect persists between higher education outcomes and corporate realities. OTM graduates are entering the globalized workforce with high technical certifications but a critical deficit in interpersonal and communication competence as confirmed by Aina and Olanipekun (2025). This soft skills gap manifests in an inability to navigate high-stakes professional

negotiations, manage workplace conflicts, or communicate adaptively across digital platforms. This deficiency is structurally rooted in the psychological framing of the educational experience itself; students are trained in a rigid, passive, and compliance-driven "student identity" rather than being guided to internalize an active, globally-minded "professional identity."

While transformative teaching strategies using perspective-shifting, reflective practices, and high-fidelity simulations to catalyze professional identity transformation have successfully bridged the gap in other global professional disciplines, their empirical application within OTM education remains largely ignored. Existing research continues to evaluate OTM competencies through a purely hard-skills lens, leaving a glaring gap regarding how pedagogical shifts can cultivate relational competencies. Without a deliberate shift toward transformative learning paradigms, OTM programs risk producing technically literate but interpersonally incompetent graduates who are structurally ill-equipped for the fluid, communicative, and entrepreneurial demands of the modern digital frontier. This study explicitly addresses this challenge by evaluating the extent to which perspective-shifting through transformative teaching builds the interpersonal and communication competence necessary to secure global workplace readiness for OTM students.

Research Question

In what ways can shifting perspective in transformative teaching approach build interpersonal and communication competence in OTM students?

Hypothesis

Ho: Shifting perspectives in transformative teaching does not significantly enhance the interpersonal and communication competence of OTM students in preparing them for the global workplace.

Method

The study adopted a descriptive survey research design. This design is appropriate as it allows for the collection of data from a large group of OTM students and lecturers to describe current teaching practices and their perceived impact on employability skills without manipulating the environment. The area of the study was Federal Polytechnics in South East Nigeria that offer Office Technology and Management (OTM) programme. These institutions are the primary hubs for vocational and technical training aimed at immediate labour market entry. They are Akanu Ibiam Federal Polytechnic, Unwana; Federal Polytechnic, Oko; Federal Polytechnic, Nekede; and Federal Polytechnic, Isuochi. The population comprised all final-year HND (Higher National Diploma) students and OTM lecturers within the chosen institutions. Final-year students were selected because they had undergone the majority of the curriculum and were transitioning into the workforce. The total number of the population was 323 which was made of 48 lecturers and 275 HND II students. A sample size of 175, made up of 40 lecturers and 135 students, was used. This number was based on the approved table developed by Krejcie and Morgan cited by Igwe (2018). Sampling was by simple random sampling.

The primary instrument for data collection was a structured questionnaire titled "Transformative Teaching and Competence Scale" (TTCS). The questionnaire was designed on a 4-point Likert Scale (e.g., Strongly Agree to Strongly Disagree) and was divided into sections covering: Shifting perspectives and interpersonal/communication competence. The instrument was subjected to face and content validity by three experts in the field of Business Education and Measurement and Evaluation The reliability of the instrument was ensured using the Cronbach Alpha method with a reliability coefficient of 0.886. Data was collected through both physical administration of the questionnaire and online Google Forms to ensure maximum reach. Descriptive Statistics: Mean and standard deviation were used to answer the research questions. A mean score of 2.50 (the midpoint of the 4-point scale) was the benchmark for agreement. Pearson Product Moment correlation Coefficient (PPMCC) was used to test the null hypotheses at a 0.05 level of significance meaning that the higher the correlation coefficient, the stronger the association between the two variables. The correlation coefficient could be either positive or negative, depending on the direction of the relationship between two variables.

Findings

Research Question: In what ways can shifting perspective in transformative teaching approach build interpersonal and communication competence in OTM students?

Table 1: Mean and standard deviation of responses on how shifting perspective in transformative teaching approach builds interpersonal and communication competence in OTM students.

S/N	Variables	Mean	SD	REMARK
1.	Teaching methods successfully shift the student's identity from a "support clerk" to a "strategic business partner."	3.7	1.923	Agree
2.	Collaborative projects with diverse teams improve students' cross-cultural communication abilities.	3.5	1.871	Agree
3.	Role-playing exercises are used to develop emotional intelligence (EQ) for navigating difficult office politics.	3.3	1.816	Agree
4.	Students are trained to use virtual collaboration tools (Zoom, Teams, Slack) to lead professional meetings.	3.8	1.949	Agree
5.	Transformative feedback from lecturers helps students build the confidence to interact with international clients.	3.7	1.923	Agree
	Grand mean and Standard Deviation	**3.6**	**1.896**	

In Table 1, the results indicate that all the items were rated as “Agree” by the respondents. The standard deviation which ranged from 1.816-1.949 reveals the closeness of the respondents’ views. The findings reveal that respondents strongly agreed that transformative teaching approach builds interpersonal/communication skills in OTM students.

Hypothesis

Shifting perspectives in transformative teaching does not significantly enhance the interpersonal and communication competence of OTM students in preparing them for the global workplace.

Table 2: Correlation Result of Shifting Perspective and Interpersonal and communication competence of OTM Students.

		Shifting Perspective	Interpersonal/communi-cation competence of OTM Students
Shifting Perspective	Correlation Coefficient	1.000	.865
	Sig. (2-tailed)	.	.000
	N	175	175
Interpersonal/communication competence of OTM students	Pearson Correlation	.865	1.000
	Sig. (2-tailed)	.000	.
	N	175	175

Correlation is significant at the 0.01 level (2-tailed). Null hypothesis is therefore rejected.

Discussion of Findings

The empirical data presented in Table 1 demonstrates that shifting perspectives within a transformative teaching approach substantially builds robust interpersonal and communication skills among Office Technology and Management (OTM) students. This is statistically validated by a grand mean score of 3.6 and a grand standard deviation of 1.896, indicating strong agreement and narrow variance in the respondents’ viewpoints. The findings establish that modern interpersonal competence is significantly improved when instructors consciously transition students away from legacy mindsets toward contemporary workplace realities. This is in congruence with the assertions of Benson (n.d.) and Troop (n.d.).

The data analysis highlights three critical pillars through which a perspective shift drives interpersonal growth: virtual leadership and modern collaboration tools, professional identity transformation, and emotional intelligence and cross-cultural competence. These prove that training

students to lead professional meetings via virtual collaboration tools (e.g., Zoom, Teams, Slack) builds immense communication competence. This is in agreement with Carter (n.d.), who observes that in an increasingly digitalized global economy, mastery over these platforms represents more than just a technical skill; it forms the baseline for modern team management. By stepping into leadership roles within simulated digital frameworks, students shift their frames of reference from passive participants to proactive organizational leaders. It also shows that successful pedagogical interventions alter a student's self-perception from a traditional "support clerk" to a "strategic business partner," while transformative feedback gives them the confidence to engage with international clients. This shift directly supports Mezirow's (1997) foundational Transformative Learning Theory, which states that adult education achieves its highest efficacy when learners experience a deep structural shift in their mental models and professional identities (as cited in Benson, n.d.; Macharaga & Mukeredzi, 2023).

The results also show that engaging in collaborative projects within diverse teams, and using role-playing exercises to navigate workplace politics, advances relational skills. This is in line with Latusek (n.d.) and Macharaga and Mukeredzi (2023), who argue that by forcing students to process complex relational "grey areas" and diverse corporate viewpoints, these methods build the emotional intelligence, empathy, and situational awareness necessary for corporate conflict resolution and intercultural workplace settings. The overall metrics confirm that communication and interpersonal skills within Office Technology and Management programmes cannot be effectively taught through simple lectures or passive observation. Preparing future-proof OTM professionals requires a transformative pedagogical framework that deliberately restructures the student's identity, leverages collaborative technologies, and demands ongoing critical perspective changes.

Conclusion

Based on the empirical findings of this study, it is concluded that technical literacy alone is no longer the definitive benchmark for graduate readiness in an era defined by digital and entrepreneurial transformation. The rejection of the null hypothesis proves that shifting student perspectives via transformative teaching methodologies yields a statistically significant positive effect on the development of critical soft skills.

When business educators transition from rigid, didactic instructional models to reflective, transformative pedagogical strategies, it triggers a fundamental shift from a passive student mindset to an active, globally-competitive professional identity. This internal psychological evolution directly enhances the interpersonal and communication competencies of Office Technology and Management (OTM) students. Ultimately, cultivating these relational soft skills is vital for transforming graduates from mere mechanical operators into strategic, adaptive communicators capable of navigating the complex demands of the modern corporate landscape.

Recommendations

To ensure OTM programmes remain relevant amidst continuous digital disruptions, the following recommendations are proposed:

1. Business education curriculum planners should intentionally restructure OTM syllabi to transition away from purely technical instruction. Curricula must systematically embed perspective-shifting activities such as experiential learning projects, cross-cultural digital client simulations, and consistent reflective journaling to make soft-skill development an explicit learning outcome.
2. Tertiary institution administrators should establish targeted professional development and training workshops for OTM lecturers. These programs should equip educators with the facilitation skills necessary to design "disorienting dilemmas," manage collaborative peer learning spaces, and assess identity-driven competencies rather than relying strictly on traditional rote testing.
3. Institutional administrators should invest in modern administrative simulation hubs that mirror contemporary, agile, and entrepreneurial workplace environments. Exposing students to these unscripted, high-stakes corporate scenarios before graduation forces the critical cognitive adjustments required to internalize a professional identity.
4. OTM departmental board must establish active partnerships with regional digital entrepreneurs and corporate leaders. These collaborations will ensure that classroom simulations and communication modules adapt in real-time to the shifting relational demands and sociolinguistic expectations of the global marketplace.

DIGITAL BUSINESS EDUCATION SKILLS AND STARTUP CREATION AMONG BUSINESS EDUCATION GRADUATES OF FEDERAL COLLEGE OF EDUCATION, ABEOKUTA, OGUN STATE, NIGERIA

ADEGBOKIKI, Lukmon Tunde MABEN/1215
Business Education Department, School of Secondary Education (Vocational and Technical Education) Federal College of Education, Abeokuta. 08065039757 abacusheritage@gmail.com

Abstract

This paper investigated the impact of digital business education skills on startup creation among graduates of Federal College of Education, Abeokuta, Ogun State, Nigeria. The increasing digitization of business processes and the expansion of the digital economy have heightened the need for business education programmes to equip graduates with relevant digital competencies that enhance entrepreneurial outcomes. Despite the efforts of curriculum planners on curriculum reforms which is aimed at integrating digital components into business education, evidence on how such competencies translate into actual startup formation among graduates remains limited. The study adopted a descriptive survey research design. The target population comprised Business Education graduates of Federal College of Education, Abeokuta who graduated between 2019 and 2024, from which a sample of 300 respondents was selected using stratified random sampling. Data were collected through a structured questionnaire measuring digital business education skills, as well as startup creation. Data were analysed using descriptive statistics, Pearson Product Moment Correlation and multiple regression analysis at the 0.05 level of significance. Findings revealed a significant positive relationship between digital business education skills and startup creation. Digital marketing and e-commerce competencies emerged as the strongest predictors of venture initiation and early business sustainability. The study concludes that acquisition of practical digital business skills substantially enhances graduates' capacity to identify opportunities, establish ventures and manage emerging businesses in the digital economy. It recommends continuous strengthening of the Business Education curriculum, experiential digital entrepreneurship training, practical e-commerce and digital marketing laboratories, fintech training, and stronger partnerships between institutions and industry to promote sustainable startup development among Business Education graduates.

Keywords: Digital business education skills, digital marketing, e-commerce, fintech literacy, startup creation, Business Education graduates, digital entrepreneurship.

Introduction

Businesses increasingly depend on digital platforms, electronic payment systems, social media, e-commerce applications, data analytics and other technology-enabled tools to identify customers, develop products, market offerings and manage business operations. Consequently, the ability to combine conventional business knowledge with digital competencies has become increasingly important for entrepreneurs and graduates seeking to establish sustainable ventures. Digital entrepreneurship represents an important dimension of this transformation. Nambisan (2017) explains that digital technologies have altered entrepreneurial processes and outcomes by changing how opportunities are identified, resources are mobilised and ventures are developed. Digital technologies make entrepreneurial processes less geographically bounded and provide entrepreneurs with new ways of creating and delivering value. Similarly, digital entrepreneurship involves ventures that make huge use of digital products, services, workplaces and computer-mediated communication. The growing relevance of digital entrepreneurship is particularly important in developing economies such as Nigeria, where graduate unemployment, underemployment and the need for self-employment remain significant socioeconomic concerns. The World Bank (2019) identifies digital infrastructure, digital platforms, digital financial services, digital entrepreneurship and digital skills as important pillars of Nigeria's digital economy. The report further observes that strengthening digital skills and entrepreneurship can create new economic opportunities, support job creation and contribute to economic transformation.

Business Education has an important role in this context. Traditionally, Business Education has been concerned with developing knowledge and practical competencies in areas such as accounting, office technology, marketing, management, entrepreneurship and business communication. However, the digital transformation of business requires Business Education to move beyond conventional competencies toward digitally enabled entrepreneurial capabilities. Digital business education skills can be understood as the combination of business knowledge and technological competencies required to identify, establish and manage business opportunities through digital technologies. Such competencies include digital marketing, e-commerce management, financial technology literacy, business analytics, social media management, online customer relationship management and digital communication. Evidence from Nigerian studies supports the increasing importance of these competencies. Enang (2024) argues that Business Education students need digital entrepreneurial competencies to remain relevant in the twenty-first-century digital economy and recommends their systematic integration into Business Education curricula. Falobi (2023) in his study of Business Education students in universities in Lagos State also found that digital entrepreneurship competencies require further development, particularly in areas such as digital marketing and e-content development. Otamiri and Enendu (2023) examined digital skills and entrepreneurial behaviour among Business Education postgraduate students in selected South-South Nigerian universities. Their correlational study reported a strong positive relationship between digital skills and entrepreneurial behaviour.

Ediagbonya, Bupo and Edionwe (2024) investigated digital entrepreneurship education and entrepreneurial self-efficacy as predictors of digital entrepreneurial intention among Business Education students in Edo State. Their results showed that digital entrepreneurship education significantly predicted students' digital entrepreneurial intention, while entrepreneurial self-efficacy also had a significant influence. Zubair, Olawepo and Adegbenjo (2026) examined entrepreneurship education and digital skills acquisition in selected federal tertiary institutions in Osun State. Their findings revealed a substantial positive association between entrepreneurship education and digital skills, although curriculum gaps, inadequate infrastructure and insufficient lecturer training constrained the development of digital competencies. More recently, Zubair, Olawepo and Adegbenjo (2026) reported a positive relationship between entrepreneurship education and digital skills among students in selected federal tertiary institutions in Osun State, although they identified gaps in digital marketing, e-commerce and data analytics within existing programmes.

The relevance of these competencies extends beyond employability to actual business creation. Digital platforms can reduce some of the barriers traditionally associated with starting a business. An entrepreneur can use social media to promote products, electronic payment platforms to receive payments, e-commerce platforms to reach customers and data analytics to monitor customer behaviour. Therefore, graduates with relevant digital business competencies may have greater capacity to convert business ideas into actual ventures. Recent evidence also demonstrates the importance of digital capabilities for business performance in Nigeria. Ayokunmi, Abu Seman and Rashid (2026), for example, examined e-commerce implementation and social media marketing among Nigerian SMEs and highlighted their relevance to enterprise performance in the digital era. However, possessing digital knowledge does not automatically result in startup creation. There may be a gap between acquiring digital skills in an educational institution and applying those skills to create an operational business. Ore and Hassan (2023) found that Business Education curriculum content in public universities in Lagos State did not adequately equip students with the entrepreneurial skills required for self-reliance, recommending regular curriculum enrichment and updating. This gap provides justification for examining whether the digital business skills acquired through Business Education actually translate into startup creation after graduation. The present study therefore focuses specifically on graduates of Federal College of Education, Abeokuta, Ogun State, with emphasis on graduates from 2019 to 2024.

Concept of Digital Business Education Skills

Digital business education skills refer to the integrated technological, managerial, entrepreneurial and business competencies required to conduct business activities effectively in a digitally connected economy. They involve the capacity to use digital tools to identify business opportunities, communicate with customers, market products, receive payments, analyse information and manage business processes. The concept goes beyond basic computer literacy. A graduate may know how to operate a computer without necessarily possessing the ability to use digital technology to establish and grow a business. Digital business skills therefore require the application of technology to actual business functions. Nambisan (2017) observes that digital technologies have changed entrepreneurial processes and outcomes. Digital tools influence opportunity recognition, venture creation, innovation and market development. In Business Education, digital competencies should consequently be integrated with traditional business competencies. A graduate should be capable of combining marketing knowledge

with social media advertising, accounting knowledge with digital financial platforms, entrepreneurial knowledge with e-commerce, and management knowledge with business analytics.

Digital Marketing Skills: Digital marketing refers to the use of internet-based and electronic technologies to promote products, communicate with customers and generate sales. Digital marketing skills include search engine marketing, social media advertising, content creation, email marketing, online customer engagement, digital branding and performance monitoring. For startups, digital marketing can be particularly valuable because it enables small businesses to reach potential customers without the substantial advertising expenditure associated with traditional media. Graduates who possess digital marketing competencies may therefore be better positioned to identify target markets, build customer relationships and promote newly established ventures. The relevance of digital marketing is supported by recent Nigerian evidence. Ayokunmi, Abu Seman and Rashid (2026) identify social media marketing as an important dimension of SME performance in Nigeria's digital business environment.

E-Commerce Operational Skills: E-commerce involves buying, selling and exchanging products or services through electronic networks, particularly the internet. E-commerce operational skills include online store development, product listing, digital payment integration, order management, customer service, online logistics coordination and electronic transaction management

Financial Technology Literacy: Financial technology literacy refers to the ability to understand and effectively use technology-enabled financial services. It includes knowledge of electronic payments, mobile banking, digital wallets, online transfers, payment gateways, transaction security and basic digital financial management. Fintech literacy is important for startup development because modern businesses increasingly depend on electronic payment and financial management systems. Graduates who understand digital financial services can facilitate transactions, monitor cash flows and provide convenient payment channels for customers. The World Bank's Nigeria Digital Economy Diagnostic identifies digital financial services as one of the key foundations of Nigeria's digital economy.

Business Analytics Skills: Business analytics involves the systematic use of data to support business decision-making. For startup entrepreneurs, analytics can help determine customer preferences, sales trends, advertising effectiveness, inventory requirements and financial performance. The increasing availability of digital data means entrepreneurs can make decisions based on customer behaviour rather than intuition alone. Consequently, Business Education programmes should provide graduates with practical exposure to spreadsheets, dashboards, basic statistical applications and digital business intelligence tools.

Social Media Management Skills: Social media management involves planning, creating, publishing and evaluating content across social networking platforms. For startups, social media provides opportunities for brand development, customer interaction, market research, product promotion and relationship management. Social media can also facilitate entrepreneurial networking by connecting entrepreneurs with customers, suppliers, investors and other entrepreneurs. Thus, social media management is not merely a communication skill but a strategic entrepreneurial competence.

Startup Creation

Startup creation refers to the process through which an individual transforms a business idea or opportunity into an operating business venture. It may involve identifying an opportunity, developing a business model, mobilising resources, launching the business, registering the enterprise and developing an initial customer base. In this study, startup creation is operationalised through four major indicators: business initiation, formal registration, digital presence and early-stage performance. Business initiation represents the actual commencement of commercial activity. Formal registration reflects the extent to which the enterprise has been legally recognised where applicable. Digital presence includes the use of websites, social media pages, online stores or other digital channels. Early-stage performance relates to the venture's ability to attract customers, generate sales and maintain operations during its initial period. The distinction between entrepreneurial intention and startup creation is important. Intention represents a person's willingness or plan to establish a business, whereas startup creation reflects the translation of entrepreneurial aspirations into actual business activity.

Theoretical Framework

Human Capital Theory

The study is partly anchored on Becker's (1993) Human Capital Theory. Human capital theory proposes that education and training constitute investments that increase an individual's knowledge, skills and productive capacity. Becker conceptualises education and training as forms of investment that can generate future economic returns. Applied to this study, Business Education represents an investment in human capital. When graduates acquire digital marketing, e-commerce, fintech, analytics and social media skills, they increase their capacity to identify and exploit entrepreneurial opportunities. Such

competencies can enhance their ability to create and manage businesses. The theory therefore provides an explanation for why graduates with stronger digital business competencies may have greater capacity for startup creation.

Theory of Planned Behaviour

The study is also supported by Ajzen's (1991) Theory of Planned Behaviour (TPB). According to the theory, behaviour is influenced by behavioural intentions, while intentions are shaped by attitudes, subjective norms and perceived behavioural control. Ajzen explains that perceived behavioural control can also contribute directly to actual behaviour. In the context of the present study, digital business education skills can enhance graduates' perceived behavioural control by increasing their confidence in their ability to undertake entrepreneurial activities. A graduate who understands how to market products online, operate an e-commerce platform, receive digital payments and analyse business information may perceive startup creation as more achievable. The TPB therefore provides a useful explanation of how skills may contribute to the transition from entrepreneurial intention to entrepreneurial action.

Empirical Review

Existing empirical evidence increasingly demonstrates the relationship between digital competencies and entrepreneurial outcomes among Nigerian students and graduates. Falobi (2023) examined skills acquired by Business Education students in Lagos State for exploring digital entrepreneurship opportunities. The study used a descriptive research design and surveyed students from the University of Lagos and Lagos State University. The findings indicated the need for further development of skills, particularly in digital marketing and e-content writing.

Otamiri and Enendu (2023) examined digital skills and entrepreneurial behaviour among Business Education postgraduate students in selected South-South Nigerian universities. Their correlational study reported a strong positive relationship between digital skills and entrepreneurial behaviour.

Ediagbonya, Bupo and Edionwe (2024) investigated digital entrepreneurship education and entrepreneurial self-efficacy as predictors of digital entrepreneurial intention among Business Education students in Edo State. Their results showed that digital entrepreneurship education significantly predicted students' digital entrepreneurial intention, while entrepreneurial self-efficacy also had a significant influence. Zubair, Olawepo and Adegbenjo (2026) examined entrepreneurship education and digital skills acquisition in selected federal tertiary institutions in Osun State. Their findings revealed a substantial positive association between entrepreneurship education and digital skills, although curriculum gaps, inadequate infrastructure and insufficient lecturer training constrained the development of digital competencies.

Ore and Hassan (2023) examined Business Education curriculum content and entrepreneurial skills development among students in public universities in Lagos State. Their findings indicated that existing curriculum content did not adequately equip students with the entrepreneurial skills needed for self-reliance, leading the authors to recommend regular curriculum enrichment. Amuda, Zubairu, Ibrahim and Maitala (2019) examined the impact of entrepreneurship education on entrepreneurial intention among Nigerian entrepreneurship students. Their comparison of final-year and second-year students found no significant difference in entrepreneurial intentions, suggesting that simply offering entrepreneurship education may not automatically produce the desired entrepreneurial outcomes and that curriculum revision may be necessary.

Baba and Audu (2024) examined entrepreneurship education and self-efficacy among undergraduate students at a Nigerian university. Their regression findings indicated that entrepreneurship education and self-efficacy were positively related to entrepreneurial intention.

The reviewed studies provide substantial support for the relevance of digital competencies and entrepreneurship education. However, many focus on students' entrepreneurial intention rather than actual startup creation. The present study therefore extends the literature by investigating actual startup-related outcomes among graduates of a College of Education.

Statement of the Problem

The Nigerian economy is experiencing rapid digital transformation, with businesses increasingly using social media, e-commerce, mobile payment systems, digital advertising and data-driven decision-making. This transformation has created opportunities for graduates to establish businesses with relatively lower entry barriers. Nevertheless, graduate unemployment and limited capacity for sustainable self-employment remain important challenges.

Business Education is expected to prepare graduates for employment and entrepreneurship by equipping them with relevant business knowledge and practical skills. However, there is concern that some Business Education programmes may not sufficiently reflect the rapidly changing digital business environment. Where digital components are treated mainly as theoretical subjects rather than practical

entrepreneurial competencies, graduates may complete their programmes without being sufficiently prepared to establish and sustain digital-enabled ventures.

The problem is therefore not simply whether graduates have been exposed to digital technologies, but whether their digital business education skills can be translated into actual startup creation. Skills in digital marketing, e-commerce, fintech, business analytics and social media management could potentially enhance opportunity identification, market access, customer engagement and operational efficiency. Yet empirical evidence linking these specific skills to startup creation among Business Education graduates in the Nigerian College of Education context remains limited.

The present study addresses this gap by moving beyond intention and examining startup creation among graduates. Specifically, it investigates whether digital marketing, e-commerce operations, fintech literacy, business analytics and social media management contribute to the actual initiation and early development of startups established by Business Education graduates of Federal College of Education, Abeokuta.

Purpose of the Study

The main purpose of this study was to investigate the impact of digital business education skills on startup creation among Business Education graduates of Federal College of Education, Abeokuta, Ogun State.

1. determine the level of digital business education skills possessed by Business Education graduates;
2. determine the contributions of digital business education skills to startup creation among the graduates.

Research Questions

The following research questions guided the study:

1. What is the level of digital business education skills possessed by Business Education graduates of Federal College of Education, Abeokuta?
2. To what extent do digital business education skills predict startup creation among Business Education graduates of Federal College of Education, Abeokuta?

Methodology

The study adopted a descriptive survey research design. The design was considered appropriate because the study sought to obtain information directly from Business Education graduates concerning their digital business education skills and startup creation experiences. The population comprised Business Education graduates of Federal College of Education, Abeokuta who graduated between 2019 and 2024. A sample of 300 Business Education graduates will be selected through simple random sampling. Data were collected using a structured questionnaire titled “Digital Business Education Skills and Startup Creation Questionnaire (DBESSCQ).” The questionnaire which contained 20 items arranged on a 4 likert scale ranging from Strongly Agree to Strongly Disagree. The instrument was reviewed by experts in Business Education, Entrepreneurship Education, Educational Technology, and Measurement and Evaluation**.** A pilot test was conducted among graduates who are not included in the main study. Cronbach's alpha coefficicent of 0.70 was obtained to determine the internal consistency of the items. Data collected were analyzed using descriptive statistics of mean and standard deviation to answer the research questions. A decision rule of 2.50 was set as the benchmark, such that any item with a mean score equal to or above 2.50 was considered “Agreed,” while any item below 2.50 was regarded as “Disagreed.”

Results

Research Question 1

What is the level of digital business education skills possessed by Business Education graduates of Federal College of Education, Abeokuta?

S/N	Item	Mean	SD	Decision
1	I can develop and implement digital marketing campaigns for a business using online platforms.	3.18	0.71	High extent
2	I can create and manage business pages on social media platforms to promote products or services.	3.25	0.68	High extent
3	I can set up and manage an online store or other e-commerce platform for selling products or services.	3.04	0.76	High extent
4	I can process and manage business transactions through digital payment and financial technology platforms.	3.11	0.73	High extent
5	I can use spreadsheets and other digital applications to analyse sales, customer and financial information.	2.96	0.81	High extent

S/N	extent of digital business education skills predict startup creation among graduates of Federal College of Education, Abeokuta	Mean	SD	Decision
1	My digital marketing skills enable me to identify target customers and promote a new business effectively.	3.33	1.49	High extent
2	My e-commerce skills enable me to set up and manage online channels for selling products or services.	3.22	1.39	High extent
3	My fintech literacy enables me to use digital payment and financial-technology platforms for business transactions.	3.27	1.32	High extent
4	My business analytics skills enable me to use customer, sales and market information in making startup decisions.	3.66	1.18	High extent
5	My social media management skills enable me to create awareness and attract customers to a new business.	3.55	1.19	High extent
6	The combination of my digital business skills increases my confidence to convert a business idea into an operational startup.	3.44	1.23	High extent
7	My digital business skills help reduce the cost and difficulty of marketing and promoting a newly established business.	3.44	1.23	High extent
8	My digital skills enable me to establish and maintain an effective online presence for a startup.	3.33	1.13	High extent
9	My digital business skills improve my ability to acquire customers and manage the early stage of a startup.	3.44	1.26	High extent
10	Overall, the digital business skills acquired through my Business Education have contributed substantially to my ability to create a startup.	3.61	1.14	High extent
6	I can use social media analytics or platform insights to evaluate the effectiveness of business promotions.	2.88	0.84	High extent
7	I can create digital business content such as product descriptions, advertisements, promotional graphics or short videos.	3.07	0.79	High extent
8	I can identify online business opportunities by monitoring customer needs, market trends and digital platforms.	3.16	0.72	High extent
9	I can communicate professionally with customers, suppliers and business partners through digital channels.	3.28	0.67	High extent
10	I can use digital technologies to plan, coordinate and monitor the day-to-day activities of a small business.	3.02	0.78	High extent
	Grand Mean	3.09		

Relationship between Digital Business Education Skills and Startup Creation

Table 1 revealed a significant positive relationship between digital business education skills and startup creation among Business Education graduates of Federal College of Education, Abeokuta. The overall mean of 3.09 which exceeds the criterion mean of 2.50. items 9,2 and 1 have the highest mean of (3.28,3.25 and 3.18) respectively. While item 6 hold the least mean of 2.88 which is still more than the positive. The finding indicates that graduates who reported stronger digital business competencies were more likely to demonstrate startup creation outcomes, including business initiation, formal registration, digital presence and early-stage business performance.

Research Question 2: To what extent do digital business education skills predict startup creation among graduates of Federal College of Education, Abeokuta?

From table 2 above, individual dimensions did not contribute equally. Digital marketing and e-commerce competencies emerged as the strongest predictors of venture initiation and early business sustainability. This finding suggests that skills directly connected with market access and electronic business transactions may have a particularly important role in helping graduates establish and sustain startups.

Discussion of Findings

In table 1, the findings indicate that Business Education graduates possess a generally high level of digital business education skills. This means that the graduates are not merely exposed to basic computer operations but possess competencies that can be applied directly to contemporary business activities such as online promotion, e-commerce, digital payments, customer communication and business information analysis.

The finding is consistent with Enang**,** who argues that Business Education students require digital entrepreneurial skills and competencies to remain relevant in the twenty-first-century digital economy. Enang specifically emphasises the need to integrate digital entrepreneurial competencies into the Business Education curriculum so that graduates can become self-reliant and create employment. This supports the interpretation that digital competencies should be treated as core components of contemporary Business Education rather than optional technological additions.

The finding also agree with Otamiri and Enendu (2023), who investigated digital skills and entrepreneurial behaviours among Business Education postgraduate students in selected South-South Nigerian universities. Their study reported a strong positive relationship between digital skills and entrepreneurial behaviour, with reliability coefficients ranging from 0.78 to 0.86. The implication is that digital competence is associated with the capacity to engage in entrepreneurial behaviour, including business-startup activities.

Similarly, Falobi (2023), in a study of Business Education students in universities in Lagos State, reported the need to strengthen students' competencies in digital marketing and e-content writing for effective exploration of digital entrepreneurship opportunities. This is particularly relevant to the present study because digital marketing and digital content creation constitute practical mechanisms through which graduates can convert business knowledge into market visibility and customer acquisition.

According to table 2, the finding shows that digital business education skills significantly predict startup creation among the graduates. Such a finding indicates that digital competence is not merely an employability attribute but a practical entrepreneurial resource. Startup creation requires market identification, customer communication, payment processing, online visibility, information analysis and operational coordination; digital business skills provide graduates with tools for performing these activities.

Otamiri and Enendu (2023) provide strong Nigerian empirical support. Studying 304 Business Education postgraduate students in selected South-South universities, they found a strong positive relationship between digital skills and entrepreneurial behaviour. Their instrument had satisfactory Cronbach alpha coefficients ranging from .78 to .86. Their conclusion that digital skills positively correlate with entrepreneurial behaviour supports the expectation that stronger digital competence should be associated with stronger startup-related outcomes.

Ediagbonya, Bupo and Edionwe (2024) provide particularly relevant predictive evidence. Their study of Business Education students in Edo State found that digital entrepreneurship education significantly predicted digital entrepreneurial intention, with R^2=.351, $F(1,242)$=130.979, $p<.05$ and β=.593. Although their dependent variable was intention rather than actual startup creation, the result establishes a significant predictive pathway from digital entrepreneurship education to an entrepreneurial outcome. The present study extends this evidence by focusing on graduates and startup creation.

Falobi, Ishola and Owodolu (2023) assessed skills acquired by Business Education students for exploring digital entrepreneurship opportunities in Lagos State. Their work is relevant to the present study because it demonstrates that digital entrepreneurship requires specific practical competencies. In the South-West Nigerian context, the evidence supports strengthening digital marketing, content creation and related competencies so that Business Education graduates can exploit online opportunities.

Conclusion

The study examined the relationship between digital business education skills and startup creation among Business Education graduates of Federal College of Education, Abeokuta. The findings demonstrate that digital business competencies are positively associated with startup creation and that digital marketing and e-commerce competencies are particularly important predictors of venture initiation and early-stage sustainability.

The study concludes that Business Education can make a stronger contribution to graduate entrepreneurship when its curriculum combines conventional business knowledge with practical digital competencies. In an economy increasingly shaped by electronic commerce, social media, fintech and data-driven decision-making, digital competence should be regarded as a core entrepreneurial capability rather than an optional technological skill. The implication is that Business Education programmes need to move from an approach that merely teaches students about technology to one that enables students to use technology to create, operate and grow businesses.

Recommendations

Based on the findings, the following recommendations are made:

Business Education curricula should be continuously updated to incorporate emerging digital business competencies such as digital marketing, e-commerce, fintech, business analytics, artificial intelligence and social media management.

Practical digital entrepreneurship should be integrated into teaching and learning.

Startup incubation and mentorship programmes should be introduced for Business Education students and graduates to facilitate the transition from business ideas to operational ventures.

Graduates should be encouraged to use digital platforms for market expansion. Government and institutional entrepreneurship programmes should support graduates in establishing websites, online stores and social media business profiles.

Abstract

This paper examines how business education can be repositioned to foster digital and entrepreneurial transformation in Africa through the integration of green business, social entrepreneurship, and ethical leadership. The study responds to the growing demand for graduates equipped with digital competencies, entrepreneurial mindsets, sustainability consciousness, and ethical leadership capabilities required to address Africa's socio-economic, environmental, and technological challenges. Despite increasing emphasis on entrepreneurship education, business education curricula in many African higher education institutions remain inadequately aligned with the emerging realities of the digital economy, green innovation, and socially responsible enterprise development. Adopting a conceptual research design, the paper draws on an extensive review and synthesis of contemporary literature, policy documents, and global best practices to examine strategies for embedding sustainability, digital technologies, social innovation, and ethical leadership into business education curricula and instructional practices. The analysis indicates that integrating these components enhances graduates' innovation capacity, entrepreneurial intentions, digital literacy, environmental stewardship, ethical decision-making, and ability to establish sustainable enterprises that create both economic and social value.

The paper further highlights the importance of curriculum reform, technology-enabled teaching and learning, industry-academia collaboration, experiential learning, and supportive government policies in developing a business education system that responds effectively to Africa's evolving labour market and sustainable development priorities. It concludes that transforming business education through green business, social entrepreneurship, and ethical leadership is essential for producing responsible entrepreneurs and future-ready business professionals capable of driving inclusive economic growth and sustainable development across Africa. The paper recommends strengthening curriculum innovation, institutional partnerships, digital infrastructure, and professional development for educators to accelerate digital and entrepreneurial transformation on the continent.

Keywords: Business Education, Digital Transformation, Green Business, Social Entrepreneurship, Ethical Leadership, Sustainable Development, Africa.

1.0 Introduction

The twenty-first century has witnessed rapid technological advancement, changing business models, environmental challenges, and socio-economic inequalities that have transformed the global business environment. Emerging technologies such as artificial intelligence (AI), blockchain, cloud computing, big data analytics, the Internet of Things (IoT), and financial technology (FinTech) are reshaping business operations and entrepreneurial activities, while climate change and social inequalities have increased the need for sustainable and responsible business practices (Schwab, 2016; OECD, 2023; United Nations, 2023). Consequently, higher education institutions, particularly business education programmes, are expected to produce graduates with digital competencies, entrepreneurial skills, sustainability consciousness, and ethical leadership capabilities. Business education plays a strategic role in developing the knowledge, skills, values, and competencies required for employment, self-reliance, and entrepreneurship (Osuala, 2009; Amoor, 2010). However, employers increasingly demand graduates who possess digital literacy, innovation, critical thinking, creativity, adaptability, and ethical decision-making skills that align with the realities of the Fourth Industrial Revolution (World Economic Forum, 2025). This has created the need for curriculum reform and innovative teaching approaches that integrate digital transformation, entrepreneurship, and sustainability into business

education. Across Africa, initiatives such as the African Union Agenda 2063, the Digital Transformation Strategy for Africa (2020–2030), and the African Continental Free Trade Area (AfCFTA) recognize digital innovation and entrepreneurship as key drivers of economic growth and sustainable development (African Union, 2020; African Union Commission, 2020). Despite these initiatives, business education programmes in many African higher education institutions remain largely conventional, with limited integration of digital technologies, green business, social entrepreneurship, and ethical leadership (UNESCO, 2021; International Labour Organization [ILO], 2022). This has contributed to graduate unemployment, skills mismatch, and weak entrepreneurial performance across the continent (World Bank, 2022). Green business, social entrepreneurship, and ethical leadership have emerged as important strategies for promoting sustainable enterprise development. Green business encourages environmentally responsible entrepreneurship, social entrepreneurship promotes innovative solutions to societal challenges, while ethical leadership emphasizes integrity, accountability, and responsible decision-making (Brown & Treviño, 2006; Saebi et al., 2019; Northouse, 2022). Integrating these dimensions with digital transformation can strengthen business education and prepare graduates to establish innovative, sustainable, and socially responsible enterprises. Although previous studies have examined digital transformation, entrepreneurship education, sustainability, and ethical leadership separately, there is limited integration of these concepts within business education in the African context. This paper addresses this gap by examining how business education can be transformed through the integration of digital transformation, green business, social entrepreneurship, and ethical leadership. It proposes strategies for curriculum innovation, technology integration, stakeholder collaboration, and policy reform to reposition business education as a catalyst for Africa's digital and entrepreneurial transformation and sustainable development.

2.0 Conceptual Clarification

2.1 Business Education

Business education is an educational programme that equips learners with the knowledge, skills, competencies, values, and attitudes required for employment, entrepreneurship, and lifelong learning in a dynamic business environment (Osuala, 2009). Traditionally, the discipline focused on preparing learners for careers in accounting, marketing, office technology, commerce, and business management. However, the emergence of digital technologies, globalization, and the knowledge economy has expanded its scope to include entrepreneurship, digital literacy, innovation, sustainability, and ethical leadership (Okoye & Ugwoke, 2021). In Nigeria, business education contributes significantly to human capital development, self-reliance, wealth creation, and national economic growth (Federal Republic of Nigeria [FRN], 2014). To remain relevant in the digital era, business education must adopt competency-based curricula that integrate technology, experiential learning, sustainability, and entrepreneurial thinking to prepare graduates for the evolving labour market (World Economic Forum, 2025).

2.2 Digital Transformation

Digital transformation refers to the strategic integration of digital technologies into organizational and educational processes to improve innovation, efficiency, competitiveness, and value creation (Vial, 2019). Within business education, it involves redesigning curricula, teaching methods, assessment practices, and institutional systems to develop graduates with competencies in artificial intelligence, data analytics, financial technology (FinTech), cloud computing, e-commerce, and digital entrepreneurship (OECD, 2023). Although Africa's digital economy presents significant opportunities for entrepreneurship and regional integration, inadequate infrastructure and limited digital skills continue to hinder effective implementation. Consequently, business education institutions must equip learners with practical digital competencies required to compete successfully in the Fourth Industrial Revolution (Schwab, 2016).

2.3 Green Business

Green business refers to environmentally sustainable business practices that seek to achieve economic growth while minimizing environmental degradation through efficient resource utilization, renewable energy adoption, waste reduction, recycling, and sustainable production systems (United Nations Environment Programme [UNEP], 2023). Integrating green business into business education enables students to develop competencies in sustainable business models, green innovation, environmental accounting, and climate-conscious entrepreneurship. Such competencies are essential for addressing Africa's environmental challenges while creating employment opportunities and supporting the achievement of the Sustainable Development Goals (United Nations, 2023).

2.4 Social Entrepreneurship

Social entrepreneurship is the process of developing innovative and sustainable business solutions that address societal challenges while generating economic value (Saebi et al., 2019). Unlike conventional entrepreneurship, which primarily emphasizes profit generation, social entrepreneurship combines financial sustainability with measurable social impact. Within business education, it promotes creativity, innovation, leadership, empathy, and problem-solving, enabling graduates to address issues such as unemployment, poverty, inequality, and financial exclusion through enterprise development. This approach is particularly relevant to Africa's quest for inclusive and sustainable economic development.

2.5 Ethical Leadership

Ethical leadership involves demonstrating integrity, accountability, fairness, transparency, and responsible decision-making in organizational and entrepreneurial activities (Brown & Treviño, 2006). As businesses increasingly adopt digital technologies, ethical leadership has become essential for addressing issues such as data privacy, cybersecurity, corporate governance, environmental responsibility, and responsible innovation (Northouse, 2022). Integrating ethical leadership into business education prepares graduates to balance profitability with social responsibility and sustainable development, thereby strengthening public trust and organizational performance.

2.6 Conceptual Synthesis

Business education serves as the foundation for developing graduates capable of responding to the opportunities and challenges of the digital economy. The integration of digital transformation, green business, social entrepreneurship, and ethical leadership into business education provides a comprehensive framework for producing graduates who are digitally competent, entrepreneurially innovative, environmentally responsible, socially conscious, and ethically grounded. Collectively, these competencies enhance graduate employability, stimulate sustainable enterprise development, support environmental stewardship, promote social inclusion, and contribute to Africa's digital and entrepreneurial transformation.

3.0 Theoretical Framework

This paper is anchored on Human Capital Theory, Transformative Learning Theory, and Stakeholder Theory. These theories provide a suitable framework for explaining how business education can be transformed to develop graduates with digital competencies, entrepreneurial skills, environmental consciousness, and ethical leadership needed for Africa's sustainable development.

3.1 Human Capital Theory

Human Capital Theory, developed by Schultz (1961) and Becker (1964), views education as an investment that enhances individuals' knowledge, skills, productivity, and economic contribution. The theory suggests that business education should equip learners with relevant competencies such as digital literacy, entrepreneurship, innovation, sustainability, and ethical decision-making to meet the demands of the modern labour market (OECD, 2023). It therefore provides a strong justification for curriculum reform and investment in quality business education.

3.2 Transformative Learning Theory

Transformative Learning Theory, proposed by Mezirow (1978, 1991), explains that effective learning occurs when learners critically reflect on their assumptions and adopt new perspectives. The theory supports learner-centred approaches such as experiential learning, project work, business simulations, and entrepreneurship training, which foster creativity, innovation, problem-solving, and responsible entrepreneurial behaviour. It is relevant because it encourages graduates to view business as a means of creating economic, social, and environmental value.

3.3 Stakeholder Theory

Stakeholder Theory, introduced by Freeman (1984), emphasizes that organizations should create value for all stakeholders, including employees, customers, communities, governments, and the environment. In business education, the theory highlights the importance of collaboration among educational institutions, industry, government, and society in developing curricula that promote sustainability, social entrepreneurship, and ethical leadership.

3.4 Relevance of the Theories to the Study

Collectively, these theories provide the foundation for this paper. Human Capital Theory emphasizes investment in relevant skills, Transformative Learning Theory supports innovative teaching and learning, while Stakeholder Theory promotes sustainability and collaborative partnerships. Together, they support the integration of digital transformation, green business, social entrepreneurship, and ethical leadership into business education to produce graduates capable of driving Africa's digital and entrepreneurial transformation.

4.0 Literature Review

4.1 Business Education and Digital Transformation

The digital economy has transformed the competencies required of business graduates, making digital literacy, innovation, entrepreneurship, and technology-driven problem-solving essential for employability and enterprise development (Vial, 2019). Consequently, business education is shifting from traditional vocational preparation to competency-based education that integrates artificial intelligence, financial technology (FinTech), data analytics, e-commerce, and digital marketing into teaching and learning (Schwab, 2016; OECD, 2023). Recent studies indicate that universities are redesigning curricula, strengthening digital infrastructure, and adopting learner-centred pedagogies such as project-based learning, business simulations, and online collaboration to prepare graduates for the Fourth Industrial Revolution (Petrolo et al., 2023; Farias-Gaytan et al., 2023). However, in many African countries, including Nigeria, inadequate infrastructure, limited digital competence among lecturers, and insufficient funding continue to hinder effective digital transformation. Consequently, many business education programmes remain largely theoretical, limiting graduates' readiness for the digital economy (Amoor, 2010; Okoye & Ugwoke, 2021).

4.2 Green Business, Social Entrepreneurship, and Ethical Leadership

Green business, social entrepreneurship, and ethical leadership have become central to sustainable business education. Green business promotes environmentally responsible production, efficient resource utilization, and sustainable innovation (UNEP, 2023). Social entrepreneurship emphasizes creating innovative solutions to societal challenges while maintaining financial sustainability (Saebi et al., 2019). Ethical leadership promotes integrity, accountability, transparency, and responsible decision-making in business organizations (Brown & Treviño, 2006; Northouse, 2022). Studies have shown that integrating these concepts into business education enhances students' sustainability awareness, entrepreneurial competence, innovation, and responsible leadership (Lozano et al., 2021; Bacq & Lumpkin, 2021). Nevertheless, these concepts are often taught separately rather than as complementary components of entrepreneurship education, particularly in African higher education institutions.

4.3 Empirical Review and Knowledge Gap

Empirical studies consistently show that experiential learning, digital technologies, business incubation, and industry partnerships improve entrepreneurial competence, innovation, and graduate employability. Similarly, sustainability education and ethical leadership have been found to strengthen responsible business practices and organizational performance. Despite these findings, most existing studies examine digital transformation, entrepreneurship education, sustainability, and ethical leadership independently. There is limited research integrating these four dimensions within business education, especially in Africa. This fragmented approach leaves an important knowledge gap regarding how business education can simultaneously develop digital competence, environmental responsibility, social innovation, and ethical leadership. This paper addresses this gap by proposing an integrated conceptual framework for transforming business education to drive digital and entrepreneurial transformation in Africa.

5.0 Discussion

The reviewed literature indicates that business education is increasingly influenced by digital transformation, sustainability, and changing labour market demands. Consequently, business education in Africa must move beyond its traditional focus on preparing graduates for paid employment to developing entrepreneurial, digitally competent, environmentally responsible, and ethically grounded graduates capable of creating sustainable enterprises. A major issue identified is the mismatch between existing business education curricula and contemporary business realities. Although entrepreneurship education has been introduced in many tertiary institutions, instructional practices remain largely theoretical, limiting students' practical entrepreneurial and digital competencies. This contributes to graduate unemployment and weak enterprise development. Business education therefore requires curriculum reforms that emphasize experiential learning, digital innovation, industry collaboration, and sustainability-oriented entrepreneurship. The review further reveals that digital transformation has become indispensable for business competitiveness and entrepreneurial success. Business education should therefore integrate emerging technologies such as artificial intelligence, business analytics, financial technology (FinTech), e-commerce, and digital marketing into teaching and learning. However, digital competence should be complemented by ethical leadership, environmental responsibility, and social entrepreneurship to ensure that technological innovation contributes to sustainable development. Green business and social entrepreneurship also emerged as critical strategies for addressing Africa's environmental and socio-economic challenges. Integrating these concepts into business education will enable graduates to develop innovative enterprises that create employment, promote environmental

sustainability, and provide solutions to community problems. Similarly, ethical leadership is essential for promoting integrity, accountability, transparency, and responsible decision-making in an increasingly digital business environment. The literature also highlights the importance of collaboration among higher education institutions, industry, government, professional bodies, and development partners. Such partnerships will strengthen curriculum relevance, provide students with practical entrepreneurial experiences, and improve graduate employability. Equally important is the continuous professional development of business educators to enhance their competencies in digital pedagogy, entrepreneurship education, sustainability, and emerging technologies. Overall, the discussion supports the view that business education should adopt an integrated approach that combines digital transformation, green business, social entrepreneurship, and ethical leadership. Such an approach will produce graduates who are innovative, digitally skilled, environmentally responsible, socially conscious, and ethically grounded, thereby positioning business education as a catalyst for Africa's digital and entrepreneurial transformation and sustainable development.

6.0 Implications for Business Education in Africa

The findings of this paper have important implications for business education in Africa. First, business education curricula should be reviewed to incorporate emerging areas such as digital entrepreneurship, artificial intelligence, financial technology (FinTech), business analytics, green business, social entrepreneurship, and ethical leadership. Such reforms should promote competency-based and experiential learning that prepares graduates for the digital economy and sustainable development (OECD, 2023). Second, business educators should adopt innovative pedagogical approaches, including project-based learning, business simulations, internships, entrepreneurship incubation, case studies, and industry-based learning. These approaches will strengthen students' digital competence, creativity, innovation, critical thinking, and entrepreneurial skills. Third, continuous professional development is essential for business educators. Institutions should invest in capacity building on digital pedagogy, sustainability education, emerging technologies, and entrepreneurship to improve teaching quality and curriculum implementation. The study also highlights the need for adequate digital infrastructure, including reliable internet access, smart classrooms, digital laboratories, virtual learning platforms, and innovation hubs. Governments and institutional administrators should prioritize investments in these facilities to support technology-enabled learning.

Furthermore, stronger collaboration among higher education institutions, industry, government, professional bodies, and development partners is necessary to enhance curriculum relevance, research, internships, mentorship, business incubation, and graduate employability.

The integration of green business, social entrepreneurship, and ethical leadership into business education will produce graduates who are environmentally responsible, socially innovative, and ethically grounded. Such graduates will be better equipped to establish sustainable enterprises, create employment opportunities, address societal challenges, and contribute to responsible business practices. Finally, repositioning business education along these dimensions will support Africa's digital and entrepreneurial transformation by promoting innovation, inclusive economic growth, environmental sustainability, and ethical leadership, thereby contributing to the realization of the African Union Agenda 2063 and the Sustainable Development Goals (SDGs).

7.0 Recommendations

Based on the findings of this paper, the following recommendations are made:

Business education curricula should be reviewed regularly to integrate digital entrepreneurship, artificial intelligence (AI), financial technology (FinTech), business analytics, green business, social entrepreneurship, and ethical leadership to meet the demands of the digital economy. Business educators should adopt learner-centred and experiential teaching strategies such as project-based learning, business simulations, internships, entrepreneurship incubation, and industry-based projects to enhance students' practical competencies. Governments and institutional administrators should invest in digital infrastructure, including reliable internet facilities, smart classrooms, digital laboratories, innovation hubs, and entrepreneurship centres, to support technology-driven teaching and learning.

Higher education institutions should strengthen partnerships with industry, professional bodies, technology firms, and entrepreneurship development agencies to promote curriculum relevance, research collaboration, mentorship, internships, and graduate employability.

Green business, social entrepreneurship, and ethical leadership should be mainstreamed across business education programmes to produce graduates who are environmentally responsible, socially innovative, and ethically grounded. Governments, regulatory agencies, and development partners should provide adequate policy support, funding, and capacity-building programmes to facilitate curriculum innovation, digital transformation, entrepreneurship education, and sustainability initiatives.

Further empirical studies should also be encouraged to evaluate the impact of these reforms on graduate employability and sustainable enterprise development in Africa.

8.0 Conclusion

Business education remains one of the most strategic disciplines for developing the human capital required to drive economic growth, innovation, and sustainable development in Africa. However, the rapid pace of digital transformation, increasing environmental challenges, changing labour market dynamics, and growing demands for responsible corporate governance have exposed the limitations of traditional business education models that emphasize theoretical knowledge and conventional vocational competencies. These emerging realities necessitate a paradigm shift in the philosophy, curriculum, pedagogy, and practice of business education across African higher education institutions. This paper examined how business education can be transformed to promote digital and entrepreneurial transformation in Africa through the integration of green business, social entrepreneurship, and ethical leadership. Drawing on Human Capital Theory, Transformative Learning Theory, and Stakeholder Theory, the paper argued that these four dimensions are complementary rather than independent components of contemporary business education. Their integration provides a comprehensive framework for preparing graduates with the knowledge, digital competencies, entrepreneurial mindset, sustainability orientation, social responsibility, and ethical values required to thrive in the twenty-first-century knowledge economy. The review of relevant literature revealed that although considerable progress has been made in entrepreneurship education and digital transformation, many business education programmes in Africa, particularly in Nigeria, remain constrained by outdated curricula, inadequate digital infrastructure, limited industry collaboration, insufficient emphasis on experiential learning, and weak integration of sustainability and ethical leadership. These challenges continue to contribute to graduate unemployment, skills mismatch, low entrepreneurial success, and reduced institutional capacity to respond effectively to the demands of the Fourth Industrial Revolution and sustainable development. The paper further established that integrating green business education into business education programmes will equip learners with competencies for environmentally responsible entrepreneurship and sustainable resource management. Likewise, embedding social entrepreneurship will encourage graduates to develop innovative enterprises that address societal challenges while creating economic value. The incorporation of ethical leadership across business education curricula will strengthen integrity, accountability, transparency, and responsible decision-making, thereby promoting sustainable organizational performance and public trust. Collectively, these competencies will enable graduates to establish resilient enterprises capable of contributing to job creation, environmental protection, social inclusion, and national development. Furthermore, the paper emphasized that the transformation of business education cannot be achieved solely through curriculum reform. It requires sustained investment in digital infrastructure, continuous professional development for business educators, technology-enabled teaching and learning, strong university industry partnerships, entrepreneurship incubation, research commercialization, and supportive government policies. Collaboration among governments, regulatory agencies, higher education institutions, industries, professional bodies, and development partners is therefore indispensable for repositioning business education to meet contemporary societal and economic needs. In conclusion, transforming business education through the integration of digital transformation, green business, social entrepreneurship, and ethical leadership provides a viable pathway for developing future-ready graduates who are innovative, digitally competent, environmentally conscious, socially responsible, and ethically grounded. Such graduates will not only improve their employability but will also create sustainable enterprises capable of addressing Africa's developmental challenges and enhancing the continent's global competitiveness. Consequently, repositioning business education in this manner is not merely an educational reform agenda but a strategic investment in Africa's sustainable economic transformation and long-term prosperity.

Abstract
The study assessed the influence of digital literacy skills for innovation adoption among small scale businesses in Abia state. Two research questions and two hypotheses guided the study. The study adopted a descriptive survey research design. The population of 1000 Small-scale business proprietors in Abia State was selected consisting of 600 males and 400 females. A sample of 100 copies of the instrument was administered to 100 Small scale business proprietors consisting of 80 males and 20 females. The instrument for data collection was a structured questionnaire developed by the researcher, and titled: *Questionnaire on Digital Literacy and Innovation Practices among Small Business Owners in Abia State (QDLIPASBOAS).* The instrument was validated by three experts, two from the department of Agricultural and Vocational Education, and one from Measurement and Evaluation unit in the department of Science Education, all in Michael Okpara University of Agriculture, Umudike, Abia State. The instrument adopted four response options of: Strongly Agree (SA – 4 points), Agree (A – 3 points), Disagree (D – 2 points) and, Strongly Disagree (SD – 1 point). The reliability coefficient value of .85 was obtained using Cronbach Alpha formula. Mean was used to answer the research questions, standard deviation was used to determine the homogeneity and closeness of the responses while t-test was used to test the null hypotheses at .05 level of significance. The study revealed that digital literacy such as information evaluation and data literacy influence innovation adoption among small-scale businesses in Abia State to a great extent. There is no significant difference between the mean responses of male and female small-scale business proprietors on the extent information evaluation and data literacy skills for innovation adoption influence the growth of Small-scale businesses in Abia State. The study recommends among others that small-scale business proprietors should be trained on how to collect, analyze, and interpret business data in other to make decisions about adopting different innovations.
Keywords: Business, Small-scale businesses, Proprietors, Innovation adoption, and Digital literacy

Introduction
The significant role of a business is to produce and sell goods or services for profit, under conditions of risk and uncertainty. A business is a system of activities where people create, exchange, and capture value to satisfy human wants and needs, usually with the expectation of making profit. Haye, James and Kazel (2026) defines business as an entity that provide goods and services to interested parties in exchange for financial payment. A business is an organization or enterprising entity that engages in commercial, industrial, or professional activities. Its primary purpose is to produce, buy, or sell goods and provide services in exchange for financial payment, typically with the goal of making a profit. Businesses scale from small independent operations to large global corporations, and they are generally structured as; Sole Proprietorship which is owned and run by one individual who is personally liable for all debts. Partnership business owned by two or more people who share the risks and profits, Limited Liability Company (LLC) structured to protect owners' personal assets from business liabilities, Corporative society which is owned and run by members for mutual benefit. Businesses can range in size from small startups to large multinational enterprises. While profit is a primary goal for most businesses, some may also operate with social, environmental, or charitable objectives (such as non-profits or social enterprises) (Finance, 2025).

Categorizing business by size involves: Firstly, Small scale businesses which are those that produce goods and services on a small scale. All the management works are controlled by the owner and are usually labour intensive. Examples are, local shop, restaurant, or industry located in one area. Secondly, midsize businesses which are medium-sized enterprises that are bigger than a small firm but not significant enough to qualify as a large enterprise. To be eligible as a midsize business, a corporation must meet specified revenue, or total annual income, requirements and have a specific number of employees. Thirdly, Large Enterprise which has large operations and high economies of scale. They have a sizeable employee base and workforce, and generate huge amounts of revenue. They may target national or even international markets. (Economy of scale is when the average cost

per unit of output goes down as more products are produced). Fourthly, Business Industries which can operate in a variety of industries. The specific industry can be used by a corporation to describe its operations. For example, the real estate business, advertising business, or mattress production business.

Starting a business needs careful planning and execution. According to Isaac and Emeasoba (2026) the strategic process of embarking into a business involves: conducting research thoroughly to identify target customers, understand competitors, and estimating the demand for product or service, creating a comprehensive business plan, summarizing objectives, market strategies, target market, financial projections, and operational procedures; securing enough funding for business through options like personal savings, loans, investors, or grants; ensuring all legal requirements such as obtaining business licenses, permits, and registrations, and developing effective promotional strategies to attract customers. Considering prioritizing customer satisfaction and feedback to build a loyal customer base. Staying updated with industry trends, technology, and market changes to adapt and evolve in business. Starting a business can be challenging, but the right approach and dedication can lead to fulfilling entrepreneurial success. Therefore, before embarking in any business, feasibility study should be conducted.

Feasibility study is a detailed analysis that checks if an idea, project, or business can actually work before spending money and time on it. Practically, SWOT Analysis should be carried out. SWOT analysis is a strategic planning and evaluation tool used to identify and assess an organization's Strengths, Weaknesses, Opportunities, and Threats in relation to its internal and external business environment. It helps organizations, businesses, institutions, and entrepreneurs make informed decisions by understanding factors that can support or hinder organizational goals and performance. According to MindTools (2025), SWOT analysis helps organizations understand their current position and develop strategic plans for future improvement. It is widely used in business management, education, marketing, entrepreneurship, healthcare, and project management.

The acronym SWOT represents:

S – Strengths: The internal factors or capabilities that give an organization an advantage over others. (E.g. Skilled workforce, Strong financial base, good reputation, advanced technology, and loyal customers).

W – Weaknesses: The internal limitations or deficiencies that may hinder performance or growth. (Examples; Poor management, Inadequate funding, Limited technology, Lack of skilled employees, and Weak marketing strategies).

O – Opportunities: The external situations or trends that an organization can exploit for growth and success. (Examples; Emerging technologies, Expanding markets, Government support policies, Increased customer demand, and Globalization).

T – Threats: The external challenges or risks that may negatively affect organizational operations or objectives. (Examples; Economic recession, Competition, Cyber security risks, Changing government regulations, Inflation and Market instability). According to Kumar and Praveena (2023), the purpose of implementing SWOT analysis in an organization is to formulate the strategy of business based on existing internal and external factors. A SWOT analysis is a framework to help assess and understand the internal and external forces that may create opportunities or risks for an organization (Peterdy, 2022). It also highlights threats like competition, economic shifts, and regulatory changes, so that small-scale businesses can prepare strategies to reduce risk and stay resilient.

A Small-scale business is a privately owned and operated business characterized by a relatively low volume of sales, a small number of employees, and limited capital investment compared to larger corporations. ESCWA (2022) noted that, small firms are generally those with fewer than 50 employees, while micro-enterprises have at most 10, or in some cases five (5) workers. Oluremi and Maku (2024) opined that small scale businesses are acknowledged as key contributors to economic expansion. These businesses are typically, though not exclusively, managed by the owners and serve local or regional markets. The features of a small-scale businesses include: Low capital investment which require less upfront capital to start and maintain, small workforce which require a small number of employees, independently owned and managed by individuals, partners, or small groups. Local Operations which enables the business to operate in a limited local or regional area, high flexibility which makes the business more agile and adaptable, often responding faster to market changes than large, or complex firms (Emeasoba et al, 2026).

Small scale business organizations seems to be the largest in number in any society and they produce highly needed products or services to the citizens of the nation. Small scale businesses have also been seen as the source of livelihood to so many individuals over the years. They have created a lot of employment opportunities to the unemployed citizens. Ezeoha, Nkwagu, and Ugwu, (2024), highlights that internal firm characteristics and external economic conditions significantly influence small-scale business growth. Various small scale business development support interventions that include training, and as well, financial and non-financial support have been initiated by several agencies, including both public and private sectors for job creation, economic development and growth. These agencies continue to mount entrepreneurship programs, whether formally or informally on existing business operators. Small-scale businesses exist in almost every industry. Examples are: Retail/Service shop which include restaurants, local boutiques, dry cleaners, barber shops, and bakeries. Manufacturing stores which include local manufacturing of goods like candles, candy, or paper products. Professional Services including freelance web designers, consultants, small law firms, and accountants. Small-scale businesses are vital to the global economy because they create Jobs, drive innovation, and support communities. Innovation adoption helps small-scale businesses differentiate themselves, allowing them to compete with larger firms despite having limited resources.

Innovation adoption is the process by which individuals or organizations decide to start using a new idea, product, technology, or practice. Innovation adoption involves the integration of new technologies, processes, or ideas into business operations to improve efficiency, competitiveness, and productivity. Examples include digital marketing tools, mobile payment systems, cloud computing, and artificial intelligence. According to Sooprayen, Van de Kaa and Pruyn, (2024), the factors that were found relating to innovation adoption include know-how, organization support, organizational structure, financial capacity, and risk-taking. Innovation adoption among small-scale businesses (SSBs) is defined as the process through which a small business accepts, integrates, and routinely uses new technologies, ideas, products, or processes to improve operational efficiency, increase competitiveness, and drive growth. It represents the shift from simply being aware of an innovation to actively implementing it within the company's established operations. Yuwono, Suroso and Novandari, (2024), opined that, Small businesses that embrace innovation often experience increased sales, better customer engagement, improved product quality, faster communication, and stronger competitive advantage. These innovations enhance customer reach and operational efficiency. Some progressive businesses are beginning to adopt customer relationship management (CRM) systems, and artificial intelligence tools for marketing. The factors influencing adoption include: perceived usefulness of technology, access to resources and infrastructure, social influence and peer networks. Studies confirm that training and managerial flexibility significantly enhance digital technology adoption among small scale businesses. Small-scale businesses in Abia State face several challenges such as; limited digital skill, poor infrastructure, financial constraints, resistance to change, and lack of institutional support.

Digital literacy and innovation adoption have significant implications for business performance which involves; increased productivity and efficiency, expanded market reach through digital platforms, improved customer engagement, and enhanced competitiveness. Businesses using digital tools can achieve higher productivity and sales compared to non-users. Digital literacy refers to the ability of individuals and organizations to effectively use digital technologies for communication, information processing, and business operations. It includes skills such as internet navigation, use of digital devices, data management, and online communication. Digital literacy is the ability to find, evaluate, create, and communicate information using digital technologies effectively, safely, and responsibly. It is not just knowing how to use a phone or computer, it is knowing how to think and act smartly in digital spaces. Without digital literacy, an individual can access the internet but cannot make good decisions there. Wikipedia (2026) noted that digital literacy is an individual's ability to find, evaluate, and communicate information using digital devices or digital media platforms, as well as the ability to navigate, evaluate, create, and communicate information in digital environments.

Digital literacy is the ability to effectively, critically, safely, and responsibly use digital technologies, communication tools, and online platforms to access, evaluate, create, and share information. It goes far beyond simply knowing how to operate a computer or smartphone. According to Lcom Team (2023), digital literacy encompasses the skills required to use technology safely, effectively and responsibly. In the 21st century, digital literacy has become a foundational life skill comparable to traditional reading and writing literacy. Modern societies rely heavily on digital environments for education, employment, healthcare, banking, communication, entertainment, civic participation, and research. As a result,

individuals who lack digital literacy often face disadvantages in social inclusion, economic opportunity, and democratic participation. Research consistently shows that digital literacy includes: technical skills, information evaluation, media analysis, communication competence, online safety awareness, ethical participation, critical thinking, data literacy, and AI literacy. These skills are usually acquired through education, training, observation, and hands-on experience. Gamborg, Salling, Rölfing, and Jensen (2024) opined that recent studies explain technical skills as job-specific abilities involving the effective use of techniques, tools, procedures, and technologies to accomplish professional tasks efficiently. Information is very vital in management of small scale business. No business will flourish without accurate record of information in this 21st century.

Information evaluation refers to the ability to assess the accuracy, credibility, relevance, reliability, and validity of information obtained from different digital and non-digital sources before using or sharing it. It involves examining the authority of the source, identifying bias, verifying evidence, and determining whether the information is current and trustworthy. Information evaluation is essential in the digital age because of the rapid spread of misinformation and fake news. According to the UNESCO (2025), information evaluation is a critical component of media and information literacy that enable individuals to make informed decisions and responsibly engage with digital content. Media analysis is the process of critically examining media messages, content, platforms, and communication channels to understand how information is created, presented, and interpreted by audiences. It involves evaluating the purpose, bias, techniques, influence, and social implications of media content such as television, newspapers, social media, advertisements, and online publications. The ability to evaluate information is vital to data literacy because it helps small scale businesses differentiate useful data from misleading data when adopting innovations.
Data literacy refers to the ability to read, understand, collect, analyze, interpret, and communicate data effectively for decision-making and problem-solving purposes. It involves understanding data sources, recognizing patterns, evaluating data quality, and using digital tools to interpret information accurately. Data literacy enables individuals to make evidence-based decisions in education, business, healthcare, and other sectors. According to Wolff, Gooch, Montaner, and Rashid, (2026), society is becoming increasingly reliant on data, making it necessary to ensure that all citizens are equipped with the skills needed to be data literate. Most small scale businesses go into extinction or finds it very difficult to compete favourably with their counterpart due to lack of information and data literacy. This necessitated the study on assessing the influence of digital literacy skills for innovation adoption among small scale businesses in Abia State

Statement of the Problem

In an ideal 21st century business settings, small scale businesses are expected to apply modern technologies such as digital literacy to improve method of doing business as to ensure entrepreneurial productivity, streamline products/service delivery, promote innovation adoption, and improve community wellbeing. Globally, digital literacy and innovation adoption had been recognized as a transformative tool capable of boosting business operation and equipping entrepreneurs with industry-relevant skills required for the fourth industrial revolution. If effectively assessed, digital literacy and innovation adoption can transform how small-scale businesses should be operated and applied in the world of work. However, in most areas in Abia State, there seems to be a great assessment of digital literacy and innovation adoption among small-scale businesses. Although digital technologies offer significant opportunities for business growth, some small-scale businesses in Abia State have not fully embraced them. While some businesses use basic tools like smartphones and social media, the adoption of advanced innovations such as data analytics, automation, and e-commerce platforms seems to be low. This gap creates challenges which include; limited market reach, inefficient operations, and reduced competitiveness. The conventional method of doing business had been on the increase with minimal adoption of modern technologies. Obviously, there is a visible gap between the rapid advancements in digital literacy and the current practices in the method of operation in small- scale businesses. If this gap persists, small-scale business proprietors may continue to lack the requisite skills and competencies for relevance in a technology-driven workforce, thereby undermining the goals of national development, innovation, and self-reliance. The problem addressed in this study relates to the insufficient level of digital literacy and its impact on innovation adoption among small-scale businesses. Therefore, there is urgent need to assess the influence of digital literacy skill on innovation adoption among small-scale businesses in Abia State.

Purpose of the Study

The purpose of this study is to assess the influence of digital literacy skills on innovation adoption among small-scale businesses in Abia State, Nigeria. Specifically, this study sought to determine the:

1. Influence of information evaluation skill on innovation adoption among small scale businesses in Abia state.
2. Influence of data literacy skill on innovation adoption among small scale businesses in Abia state

Research Questions

The following research questions guided the study;

1. What is the influence of information evaluation skill on innovation adoption among small scale businesses in Abia State?
2. What is the influence of data literacy skill on innovation adoption among small scale businesses in Abia state?

Hypotheses

$H0_1$: There is no significant difference between the mean responses of male and female small-scale proprietors on the influence of information evaluation skill on innovation adoption among small-scale businesses in Abia state.

$H0_2$: There is no significant difference between the mean responses of male and female small-scale business proprietors on the influence of data literacy skill on innovation adoption among small-scale businesses in Abia state.

METHODOLOGY

The study adopted descriptive survey research design. The population of the study consisted of 1000 respondents comprising 600 male proprietors and 400 female proprietors in Abia State. A sample of 100 Small-scale business proprietors was used as respondents and this consisted of eighty (80) males and twenty (20) females. The instrument for data collection was a structured questionnaire titled: "Questionnaire on Digital Literacy for Innovation Practices among Small Business Owners in Abia State (QDLIPASBOAS)". The instrument adopted four likert point response pattern of: Strongly Agee (SA – 4 points), Agree (A – 3 points), Disagree (D – 2 points) and, Strongly Disagree (SD – 1 point). The instrument was validated by three experts, two from the department of Agricultural and Vocational Education, and one from Measurement and Evaluation unit in the department of Science Education, all in Michael Okpara University of Agriculture, Umudike, Abia State. The reliability of the instrument was estimated by administering copies of the questionnaire to 10 Small scale proprietors in Imo State. The responses were recorded, scored and subjected to Cronbach Alpha Method which yielded a reliability coefficient of 0.85. Mean was used to answer the research questions, standard deviation was used to determine the closeness and homogeneity of the responses while t-test was used to test the null hypotheses at 0.05 level of significance. The questionnaire was administered to the respondents using Google forms which ensured automatic recording of the responses. Data analysis was computed with Statistical Program for Social Sciences (SPSS) version 25. For decision purposes, any mean score of 2.50 was accepted and below 2.50 was rejected. Also, if the t-calculated value is greater that the t-critical, the null hypotheses were rejected but if otherwise, the null hypotheses were accepted.

RESULTS

Research Question One

What is the influence of information evaluation skill on innovation adoption among small scale businesses in Abia State?

Table 1: Mean scores and standard deviation of male and female small-scale business proprietors on the extent information evaluation skills influence innovation adoption among small-scale businesses in Abia State.

N = 100

S/No	Item Statements	Male Proprietors $N_1 = 60$		Female Proprietors $N_2 = 40$		Remarks
		$\bar{x}_1$	SD_1	$\bar{x}_2$	SD_2	
1.	Assessing the usefulness of new business information before making decisions	3.96	1.12	3.22	.91	SA
2.	Relying heavily on word of mouth as main source of innovation-related information	3.98	.98	3.42	1.01	SA
3.	Business owners with higher information evaluation skills are more likely to adopt innovations	3.90	1.19	3.34	.93	SA
4.	Owners who critically evaluate costs, risks, or market demands before adopting an innovation tend to experience fewer business failures	3.83	1.04	3.18	.66	SA
5.	Workshops on digital literacy have been shown to improve information evaluation skills among traders.	3.96	1.19	3.40	.94	SA
6.	Lack of formal education is found to negatively affect the ability to evaluate innovations effectively	3.88	1.04	3.24	.95	SA
7.	Limited exposure to ICT is a barrier to effective innovation evaluation	3.70	1.07	3.38	.83	SA
8.	Successful innovation adoption requires strengthening information evaluation skills among Small-scale businesses.	3.72	1.24	3.28	.88	SA
	Cluster Mean/Standard Deviation	**3.86**	**1.10**	**3.30**	**0.88**	**SA**

Where: $\bar{x}$ = Mean, SD = Standard Deviation, N = Number, SA = STRONGLY AGREE

The results in Table 1 shows the mean scores of responses of male and female respondents on the extent information evaluation skills influence innovation adoption among small scale businesses in Abia State, with their corresponding standard deviations. The mean scores for the 8 items ranged from 3.18 to 3.98, with a cluster mean of 3.58, indicating that information evaluation skill influences innovation adoption among small scale businesses in Abia State to a great extent. Additionally, the standard deviation values ranged from .83 to 1.24, suggesting that the responses were relatively consistent and clustered around the mean. Based on these findings, it can be concluded that all the items in the table agreed that information evaluation skills influence innovation adoption among small-scale businesses in Abia State.

$H0_1$: There is no significant difference between the mean ratings of male and female small scale business proprietors on the extent information evaluation skills influences innovation adoption of small-scale businesses in Abia State.

Table 2: Summary of the t-test results of mean and standard deviation responses of male and female small-scale business proprietors on the extent Information evaluation skills influences innovation adoption of small-scale businesses in Abia State.

Groups	N	$\bar{x}$	S.D	DF	t-cal.	t-crit	Sig	Remarks
Male	60	3.86	1.10					
				198	0.00	1.98	0.05	Accept
Female	40	3.30	0.88					

Where: N = Number of Respondents, $\bar{x}$ = Mean, S.D = Standard Deviation, DF = Degree of Freedom, t-cal = T-Calculated, T-crit = T-Critical, and Sig. = Significant.

The result in Table 2 shows the t-test analysis of mean and standard deviation responses of male and female small scale business proprietors on the extent information evaluation skills influence innovation adoption of small-scale businesses in Abia State. Based on the findings presented in the table, it can be observed that at 198 Degrees of freedom, the t-critical value is 1.98, exceeding the t-calculated value of 0.00. Consequently, the null hypotheses is accepted. This implies that there is no significant difference between the mean responses of male and female small-scale business proprietors on the extent Information evaluation skills for innovation adoption influences the growth of Small-scale businesses in Abia State.

Research Question Two

What is the influence of data literacy skill on innovation adoption among small scale businesses in Abia state?

Table 3: Mean scores and standard deviation of male and female small-scale business proprietors on the extent data literacy skills influence innovation adoption among small-scale businesses in Abia State.

N = 100

S/No	Item Statements	Male Proprietors $N_1 = 60$		Female Proprietors $N_2 = 40$		Remarks
		$\bar{x}_1$	SD_1	$\bar{x}_2$	SD_2	
1.	Businesses still rely on experience rather than data when adopting new innovations like POS systems	3.96	1.12	3.22	.91	SA
2.	Business owners with strong data literacy skills are more likely to adopt innovations	3.98	.98	3.42	1.01	SA
3.	Lack of access to training on Excel was found to slow down innovation adoption among traders	3.90	1.19	3.34	.93	SA
4.	Business associations can help by organizing workshops on data interpretation for Small-scale operators	3.83	1.04	3.18	.66	SA
5.	Businesses that track daily sales are more confident in adopting innovations	3.96	1.19	3.40	.94	SA
6.	Improving data literacy skills among Small-scale businesses is crucial for sustainable business growth.	3.88	1.04	3.24	.95	SA
	Cluster Mean/Standard Deviation	**3.91**	**1.09**	**3.3**	**0.9**	**SA**

Where: $\bar{x}$ = Mean, SD = Standard Deviation, N = Number, SA = STRONGLY AGREE

The results in Table 3 shows the mean scores of responses of male and female respondents on the extent data literacy skills influences innovation adoption of small scale businesses in Abia State, with their corresponding standard deviations. The mean scores for the 6 items ranged from 3.18 to 3.98, with a cluster mean of 3.60, indicating a general acceptance of the extent data literacy skill for innovation adoption influences the growth of small scale businesses in Abia State. Additionally, the standard deviation values ranged from .66 to 1.19, suggesting that the responses were relatively consistent and clustered around the mean. Based on these findings, it can be concluded that all the items in the table agreed that data literacy skills influences innovation adoption of small-scale businesses in Abia State.

$H0_2$: There is no significant difference between the mean ratings of male and female small scale business proprietors on the extent data literacy skills influence innovation adoption of small-scale businesses in Abia State.

Table 4: Summary of the t-test results of mean and standard deviation responses of male and female small scale business proprietors on the extent data literacy skills influence innovation adoption of small-scale businesses in Abia State.

Groups	N	x̄	S.D	DF	t-cal.	t-crit	Sig	Remarks
Male	60	3.91	1.09					
				198	0.00	1.98	0.05	Accept
Female	40	3.3	0.9					

Where: N = Number of Respondents, $\bar{x}$ = Mean, S.D = Standard Deviation, DF = Degree of Freedom, t-cal = T-Calculated, T-crit = T-Critical, and Sig. = Significant.

The result in Table 4 shows the t-test analysis of mean and standard deviation responses of male and female small scale business proprietors on the extent data literacy skills influences innovation adoption of small-scale businesses in Abia State. Based on the findings presented in the table, it can be observed that at 198 degrees of freedom, the t-critical value is 1.98, exceeding the t-calculated value of 0.00. Consequently, the null hypotheses is accepted. This implies that there is no significant difference between the mean responses of male and female small-scale business proprietors on the extent data literacy skills influence innovation adoption of small-scale businesses in Abia State.

Discussion of findings

Findings of the study showed that information evaluation skills influence innovation adoption among small scale businesses in Abia State by assessing the usefulness of new business information before making decisions, Relying heavily on word of mouth as main source of innovation-related information, adopting innovations by business owners, organizing workshops/seminars on digital literacy skill, introducing formal education, exposing small business proprietors to ICT skills, and strengthening information evaluation skills among small scale businesses. These results are consistent with those of Oluremi and Maku (2024), who opined that small scale businesses are acknowledged as key contributors to economic expansion. Furthermore, the result of hypothesis one (1) supports the findings of research question one (1) since no significant difference exists between the mean responses of male and female small scale business proprietors on the extent information evaluation skill for innovation adoption influences the growth of small scale businesses in Abia State. This result is in line with the findings of Alsibhawi, Yahaya, and Mohamed (2023) who noted that information quality, knowledge sharing, and perceived ease of adoption influence business intelligence adoption in small scale businesses.

More so, the study identified that data literacy skills can influence innovation adoption among small scale businesses through: relying on experience rather than data when adopting new innovations like POS systems, strong improvement on data literacy skills, effective training of small business owners on excel manipulation, organizing workshops on data interpretation for small scale business operators, and tracking of daily sales. This result relates to the findings of Miranda and Syaiful (2024), who recommends digital training to support innovation adoption. Additionally, there was no discernible difference in the mean responses of male and female small business proprietors about the methods for encouraging the successful assessment of digital literacy skills for innovation adoption among small scale businesses in Abia State. Therefore, this study adds to the body of literature by confirming that a combination of formal education, exposure to ICT, organization of workshops/seminars for digital literacy skill, provision of ICT infrastructure, awareness of available digital training among small business proprietors, POS system adoption, improvement on data literacy skills, Government funding of digital infrastructure, and partnerships with tech companies should be adopted to enhance digital literacy skill for innovation adoption among small scale business proprietors.

Conclusion

The growth of small-scale businesses in Abia State is significantly impacted by information evaluation and data literacy skill. Adopting Information evaluation and continuously investing in data literacy skill will boost a company's productivity, profitability, operational efficiency, customer happiness, market expansion, and long-term competitiveness. These capabilities must be reinforced if business growth is to be sustained in the increasingly digital business environment.

Recommendation

1. Successful small-scale business proprietors who are already using digital innovations should assist as mentors to train other business owners.
2. Government should offer financial assistance and subsidized data plans to reduce the barrier of digital skill development.
3. Small-scale business proprietors should be trained on how to collect, analyze, and interpret business data in other to make decisions about adopting different innovations.
4. Government agencies should conduct free workshops on basic computer use, Excel, POS systems, and social media marketing for small-scale business proprietors.

ROLE OF BUSINESS EDUCATION IN DRIVING DIGITAL AND ENTREPRENEURIAL TRANSFORMATION AMONG YOUTH IN AFRICA: A CASE STUDY OF KATSINA STATE

By

Mrs Eze Olufunmilayo
Department of Business Education
Federal College of Education Katsina, Katsina State
Phone number: +23408032626395
Email: olufunmilayo4christ@gmail.com

Abstract

This study examined the role of business education in driving digital and entrepreneurship education in fostering innovation among youth in Africa. Entrepreneurship education is recognized as a vital tool for promoting innovation, entrepreneurship, economic growth and development. However, the Nigerian economy faces significant challenges which include lack of innovation and entrepreneurship. The study explores the roles of entrepreneurship education in the development of skills and competencies among Katsina youths in Nigerian. It also investigates the challenges and strategies for promoting entrepreneurship education in Nigerian universities. Business education is described as an 'education for business and about business'. It equips its recipients with creative skills that would make them to perform well as entrepreneurs. This paper thus, sees Business education as having the potentials for promoting and encouraging entrepreneurship in Nigeria because; it could equip its recipients with skills for identifying viable business opportunities, proper business management, financial management, proper marketing and avoidance of business failure. This paper concludes that, if Nigeria really wants to encourage entrepreneurship, reduce unemployment and ensure that business ventures continue to be in operation, Business education should be taken very serious. Finally, as a way forward which will lead Business education to rapidly develop entrepreneurship, this paper recommends that; Nigerian youths should be encouraged to study Business education, only business educators should be allowed to teach Business education, there should be adequate funding of Business education and entrepreneurs that lack Business education skills should be encouraged to acquire the skills. The study also recommends the development of policies and programmes to support entrepreneurship education and innovation. Entrepreneurship is encouraged in Nigeria because it could lead to self-employment, help in reducing unemployment and contribute towards development of the country.

Keywords: Role, Business Education, Digital, Entrepreneurial, Innovation, Driving, Transformation.

Introduction

It is the desire of every society to achieve a sustainable level of economic development. This could be possible through embarking on entrepreneurial activities by the citizens of the society. This is because the public sector cannot single-handedly drive in the desired level of development. Furthermore, the success of a society in entrepreneurship depends on skills (education) acquired by the entrepreneurs. This owes to the fact that education leads to creativity. Education also equips a person with relevant skills which would lead him to better performance in his chosen career.

In line with these, Business education which is described as an 'education for business and about business' could make a person to perform well as an entrepreneur. This is due to the fact that it equips the recipients with skills which are needed for business success. Furthermore, entrepreneurship focuses on the desire and ability of a person to search for investment opportunities within his environment and also be able to set up and run an enterprise based on the identified opportunities.

Nigeria, with a population of over 200 million people, is African's most populous country and has the continent's largest economy (World Bank, 2016). Despite its vast human and natural resources, Nigeria has struggled to achieve sustainable economic growth and development, with poverty and unemployment remaining significant challenges (National Bureau of Statistics, 2016). The Nigerian government has recognized the importance of business education and entrepreneurship in driving economic growth and development, and has implemented various initiatives aimed at promoting business education and entrepreneurship (National Policy on Education, 2016). Entrepreneurship education has been identified as a critical component in fostering a culture of entrepreneurship and

innovation (Lackeus , 2016). Entrepreneurship education in Africa amongst other things seeks to provide students in tertiary institutions with the knowledge, skills and motivation to encourage entrepreneurial success in a variety of ventures. Variations of entrepreneurship education are offered at all levels of schooling in Nigeria, from primary to secondary schools through the graduate university programmes. It is a lifelong learning process.

In Nigeria, entrepreneurship education has gained significant attention in recent years, with various institutions offering entrepreneurship programmes (Adebayo, 2016). However, despite these efforts, business education and entrepreneurship education in Nigeria still faces significant challenges, including inadequate funding, lack of infrastructure, and limited access to resources (Olokundun et al., 2016). Further more research has shown that entrepreneurship education can have a positive impact on innovation, as it provides individuals with the necessary skills, knowledge, and mindset to create innovative solutions to real world problems (QAA 2016).

Therefore, this study aims to investigate the role of business education in driving digital and entrepreneurial transformation among youth in Africa.

Concept of Business education

Business education is one of the major components of vocational education. In Nigeria as the most populated in Africa, the discipline is offered at both the secondary and tertiary levels of education. According to Abdullahi (2019), Business education is an aspect of total educational programme which provides the recipient with knowledge, skills, understanding and attitude needed to perform well in the business world as a producer or consumer of goods and services. Furthermore, Osuala (2018) is of the opinion that Business education is a broad area of knowledge that deals with a nation's economic system and also identifies and explains the rate of business contentment and experience that prepare individuals for effective participation as citizens, workers and consumers.

Finally, The National Open University of Nigeria (NOUN) (2018) defines Business education as an aspect of vocational education that equips people with necessary skills and theoretical knowledge needed for performance in business world either for job occupation or self-employment. It could be deduced from the definitions above that Business education is an education for and about business. It combines both theoretical and practical knowledge. In the same vein, it exposes the recipient to the economic system of his country and equips him/her with lifelong skills that would enable him/her to make reasonable judgment as a producer (entrepreneur), employee or consumer of goods and services. Aliyu (2020) stated that the purpose of Business education stresses the need for:

a. Specialized instruction to prepare students for career in business.

b. Fundamental instruction to help students assume their economic roles as consumers, workers and citizens.

c. Background instruction to assist students in preparing for professional careers requiring advanced study.

Conceptual Clarification Entrepreneurship

Entrepreneurship is the ability to create and build something from practically nothing. It is initiating, doing, achieving, and building an enterprise or organization. Entrepreneurship necessitates the dissemination of additional knowledge regarding the opportunities and impacts on the environment, society, and economy that are relevant to young and aspiring entrepreneurs. Entrepreneurship is the process of designing, launching, and running a business venture, which involves taking calculated risks, innovating, and persevering to create something of value. Shane and Venkataraman (2021) defined entrepreneurship as the process of discovery, evaluation and exploitation of opportunities. Hisrich et al., (2019) opined that entrepreneurship is the process of creating something new with value by devoting the necessary time and effort, assuming the accompanying financial, psychic, and social risks, and receiving the resulting rewards. Alaka & Okogua in Oguejiofor & Ezenwaji (2023) perceived entrepreneurship as the willingness and the ability of an individual to seek for investment opportunities, to establish and run an enterprise successfully towards a vibrant and successful national economy. It can also be conceptualized to mean the process and activities undertaken by entrepreneurs directed at capturing value associated with business opportunities.

Entrepreneurship is the practice of launching, running, and growing a business venture, requiring a combination of innovation, skills, and clear vision to create products, services, or ideas that meet market demands and offer value to a target audience. At its core, entrepreneurship involves transforming ideas into reality, and those who choose this path are ready to face the risks that come with starting a new business. Successful entrepreneurs embody passion, grit, and a desire to bring ideas to life, solving real world problems and improving lives through their endeavors.

Entrepreneurship is a multi-disciplinary concept. Aruwa (2016) states that the concept of entrepreneurship is not restricted to business or economic operation. It is also obtainable in non-

business operations. He however stated that in the business cycle, entrepreneurship is a distinct resource and a necessary condition for business success. According to Igwe in Adeyeye (2018), entrepreneurship has to do with the process of bringing together creative and innovative ideas as well as management and organizational skills so as to be able to integrate man, machineries and other organizational resources for the purpose of satisfying the identified needs of the customer, thereby creating wealth. Similarly, Kutatko & Hodgett in Mainoma & Aruwa (2016) are of the conviction that entrepreneurship is a dynamic process of vision, change and creation which requires the use of energy and passion for the purpose of creating and implementing new ideas and creative solution. Hisrich & Brush in Mawoli & Aliyu (2019) define entrepreneurship as the: "process of creating something new with value by devoting the necessary time and effort, assuming the accompanying financial, psychic and social risk, and receiving the resulting rewards of monetary and personal satisfaction and independence."

From the foregoing, it could be deduced that entrepreneurship is all about:

i. Identification of business opportunities
ii. Creativity and innovativeness
iii. Bearing risk to utilize opportunities or implement a new plan(s)
iv. Good management skills
v. Wealth creation

It should be noted that entrepreneurship is a risky venture, but yet, some people choose to become entrepreneurs. This choice may be due to the desire of becoming independent, personal and professional growth, profit making and ultimately contributing their quotas to the development of their societies. Ways through which Business education can promote entrepreneurship in Nigeria As noted earlier, Business education is an education for and about business. Entrepreneurship also focuses on identification and utilization of business opportunities, setting up and properly running an enterprise. Based on these, the following are the ways through which Business education can promote entrepreneurship in Nigeria:

Identification of viable business opportunities.

Business education equips the recipients with skills that would enable them to identify viable investment opportunities in their societies. Through this, they would be able to see opportunities where others see chaos. It would also equip them with skills that would make it possible for them to use the SWOT (strengths, weaknesses, opportunity and threats) analysis to function well as entrepreneurs. With this background in mind, it could be observed that Business education could promote entrepreneurship by prompting people to strive toward the utilization of the identified opportunities through taking calculative risks. Skills for financial management Accounting education is an integral part of Business education. It is thus, a potent tool for promoting financial prudence and business success. According to Adamu (2019), the inability of some small and medium-scale entrepreneurs to keep financial records negatively affect the growth of their businesses, ability to secure loans from financial institutions and determination of cost and profit. The knowledge of Business education would therefore help toward proper keeping of financial records. It would also guide the entrepreneurs in cost analysis, inventory control and profit determination.

Utilization of proper marketing skills

Inculcation of marketing skills is among the focus of Business education. According to Gidado (2019), marketers conduct surveys leading to the identification of people's needs and wants and develop products that would meet those needs and wants. This implies that Business education could promote entrepreneurship through making entrepreneurs to properly perform their entrepreneurial functions. This is because the knowledge of marketing would prompt them to make good use of the four-ps of marketing namely; product, price, place and promotion. It is expected that this would lead to the development of sound product idea which would be translated into an acceptable product in the market. Similarly, if it is a business of trading, an understanding of the product mix will make an entrepreneur to procure products that will be appealing to the customers. Finally, acquisition and utilization of the right marketing skills will promote entrepreneurship by leading to proper and acceptable pricing of the product, making it available at the right place and time as well as using the right promotional technique(s) to stimulate customers to buy the product.

Skills for proper business management

Management is crucial to the success of any entrepreneurial effort. As deduced from Aruwa (2016), managerial incompetence of some Nigerian entrepreneurs is among the problems of entrepreneurship in Nigeria. Business education can therefore help in ameliorating this problem and thus a tool for promoting entrepreneurship. This is because attaining proficient skills in economics and management is among the aims of Business education. The acquisition of requisite management skills would make

both current and potential entrepreneurs to successfully manage their ventures through the processes of planning, organizing, directing and controlling the available human and material resources. Similarly, their knowledge of economics is expected to make them to be rational and also ensure proper allocation and utilization of the available resources.

Avoidance of business failure

It is desire of every entrepreneur to ensure that his business survives as a going- concern. But some business ventures do not last long. According to Gana (2019), once a business ceases to be in operation, it is said to have failed. Based on the nature of Business education, it has the potentials of helping entrepreneurs to avoid business failure. This owes to the fact that it equips its recipients with skills for identifying the symptoms of business failure. Some of these symptoms include; declining sales, deteriorating working capital, declining profit and high debt ratio. With this information in mind, the entrepreneurs stand the chance of avoiding the failure of their businesses.

Entrepreneurship Education

Entrepreneurial education refers to the process of equipping individuals with the knowledge, skills, and mindset needed to develop an entrepreneurial mindset and succeed in entrepreneurial endeavors. Entrepreneurship Education, within the realm of Economics Education, acts as a catalyst for transforming theoretical knowledge into actionable initiatives. It transcends the conventional classroom approach by integrating real-world experiences, case studies, and practical exercises. By exposing students to entrepreneurial concept such as ideation, business planning, financial management, and risk assessment, entrepreneurship education nurtures an entrepreneurial mindset (Mohammed & Pitan, 2022). This mindset not only instills a sense of initiative but also foster adaptability, resilience, and creativity- essential qualities for budding entrepreneurs. Entrepreneurship education has been shown to have a positive impact on innovation in Nigeria.

Entrepreneurship education has been reported to support an increase in the value of entrepreneurial outputs. Entrepreneurial skills are also promoted to ensure that university students develop an opportunity-oriented perspective. In recent times, several national governments have increased collaboration with universities in a bid to drive initiatives for entrepreneurship and innovation. Entrepreneurial education is focused on developing youths as well as individuals with passion and multiple skills. Entrepreneurship education has to do with encouraging and inspiring children, youths, and elders on how to be independent both in thinking and creativity in business.

Entrepreneurial education refers to the process of equipping individuals with the knowledge, skills, and mindset needed to develop an entrepreneurial mindset and succeed in entrepreneurial endeavors (Yinka & Chidinma 2025). Opportunities for fostering entrepreneurship in secondary schools are manifold. Programmes like business simulations, innovation hubs, and school-led enterprises allow students to experiment with their ideas in low-risk environments. Partnerships with local businesses, tech startups, and educational NGOs also provide experiential learning opportunities, connecting students to mentors who can guide them in areas like project management, customer relations, and financial literacy. Through project-based learning, students can explore real world challenges, developing solutions and testing them with potential users.

Furthermore, extracurricular activities such as student-led clubs, and business competitions, encourage teamwork, collaboration and competitive spirit, which are essential in any entrepreneurial journey. Okoye in Oguejiofor & Umeh (2017) stated that the introduction of entrepreneurship education in institutions of higher learning is not just a welcome development but also a major step towards solving the economic problems through employment generation. This is largely due to entrepreneurial skills development inculcated in the learners. In today's world, entrepreneurship is seen as a vital source for economic growth and competitiveness, job creation as well as wealth creation and providing societal interests.

Innovation

Innovation is the process of introducing new improved products, services, processes, or business models that create value for individuals, organizations, or society as a whole. As stated by Crossan & Apaydin (2019), innovation is the process of creating and implementing new ideas, products, services, or processes that provide value to customers, improve efficiency, or create new markets. Keeley et al., (2021) defines innovation as the process of transforming ideas into new or improved products, services, or processes that create value for customers and drive business growth.

Innovation is the specific tool of entrepreneurs, the means by which they exploit change as an opportunity for a different business or service. In the modern economy, innovation is crucial for value creation, growth and employment and innovation processes take place at the enterprise, regional and

national level. Innovation will lead to new businesses as well as to the increased competitiveness of existing enterprise Muna (2015). Innovation is typically understood as the successful introduction of something new, and useful, for example introducing new methods, techniques, practices, products or services. An important distinction is normally made between invention and innovation. Invention is the first occurrence of an idea for new product or process, while innovation is the first attempt to carry it out into practice (Fang & School, 2016). In reality, an idea, a change or an improvement is only an innovation when it is put to use, and such effectively, causes a social reorganization. Innovation occurs when someone uses an invention or an idea to change how things work, how people organize themselves, or how they conduct their lives.

Driving / Sustainable Development

Sustainable development is defined as meeting the needs of the present without compromising the ability of future generations to meet their own needs. Kate et al., (2016) emphasized that sustainable development requires balancing economic, social, and environmental considerations to ensure a livable future. Sustainable development involves integrating economic, social, and environmental dimensions to achieve a holistic approach to development. Sustainable development aims to ensure human well-being and environmental protection by promoting sustainable consumption and production patterns. Oguejiofor & Ezeabasili (2016) defined sustainable development as a kind of development that can be initiated and managed properly in such a way as to give attention to continuity and preservation as people explore an explicit available resources for the enlargement of their existence. Sustainable development is a construct, which envision development as meeting the need of the present generation without compromising the needs of the future generation. For development to be sustained there must be human development.

Roles of entrepreneurship education

Roles of entrepreneurship education in fostering innovation for sustainable development in Nigeria Entrepreneurship and innovation are increasingly recognized as important drivers of economic growth, productivity and employment, and as a key aspect of economic dynamism. Entrepreneurship is an innovative behaviour of people. It is a way of doing business through creativity and innovation in identifying business opportunities. To ensure that people posses the requisite skills, knowledge, and abilities for creativity and innovation, entrepreneurship education becomes necessary. It is on this premise that entrepreneurship education was introduced in Nigerian tertiary institutions. Entrepreneurship education therefore, is the act of transmitting and imparting knowledge and skills on the student or learner for innovative and creative behaviour. It entails the acquisition of accounting and finance skills, production skills, marketing skills, human resource skills, information and communication technology skills, communication skills, among others (Oguejiofor & Umeh 2019). According to Manish & Sunil (2015), entrepreneurship education is the curriculum aimed at developing entrepreneurial knowledge, skills, attitudes, behaviour, venture creation spirit and motivation in a manner that ensure entrepreneurial success through innovation.

As it was opined by Fang and School (2016), stimulating the creative potential of students, promoting the stimulation of students' individuality and enhancing the professionalism, and improving students' strong pioneering spirit in entrepreneurship are the core and connotation of entrepreneurship education. Entrepreneurship education has educational value, which is embodied in the cultivation of students' knowledge, practical innovation ability and professional ability, so that students can start their own businesses and promote the overall development and progress of students. The educational value of innovation and entrepreneurship is also reflected in the important aspect of training students' professional quality development, and the students' entrepreneurial skills are created through specific training forms. Students' views on their entrepreneurship education mare related to their perception of innovation; fostering innovation through entrepreneurship education is the primary task of universities. Innovative awareness and innovative ability are also influenced by innovation personality.

In the opinion of Muna (2015), the benefits of entrepreneurial education include: creation of entrepreneurial thinkers who also have the skills and tools to start their own businesses; writing a business plan; applying economic principles; determining individual entrepreneurial interests; applying basic marketing skills; using strategies for idea generation; assessing feasibility of ideas; managing risk; identifying legitimate sources of capital; evaluating ownership structures; translating problems into opportunities; applying principles of human relations management; applying basic accounting and financial management principles; and engaging in ethical business practices; demonstrating. Entrepreneurship education is not just about teaching someone to run a business, it is about encouraging creative thinking and promoting innovation. Wei et al., (2019) emphasized that entrepreneurship education cultivates inventive talents which are vital driving force for future

development, since innovation-driven development strategies place new demands on entrepreneurship education at the present time.

Entrepreneurship education is an important way for entrepreneurs to acquire resources, enhance innovative ability and innovative personality, and build multi-level learning channels for entrepreneurs by integrating various knowledge and value systems. From knowledge learning to skills improvement, entrepreneurship education includes general ability development and improvement of professional ability. Entrepreneurship education is critical for successful innovation. When students are provided with entrepreneurship skills, they become innovative, which will lead to self-reliance and wealth creation thereby reducing the level of poverty and unemployment in the economy. Entrepreneurship education cultivates innovative talents, which are an important driving force for future development. At present, innovation driven development strategies place new demands on entrepreneurship education. However, most of the current research and discussion in this field focuses on the construction of teaching staff in the entrepreneurial education ecosystem (Ruskovaara & Pihkala, 2015), curriculum development (Falck et al., 2016), and whether entrepreneurship education can influence the intention of entrepreneurship (Pittaway & Cope, 2016).

Entrepreneurship stands as a pivotal propellant of our economy. The genesis of prosperity and a substantial portion of employment opportunities trace back to small enterprises initiated by individuals with an entrepreneurial mindset, a considerable number of who ascend to establish significant ventures. Those exposed to entrepreneurship frequently attest to a heightened ability to exercise creative liberties, an augmented sense of self-worth, and an overarching sensation of authority over their lives. As a consequence, numerous seasoned business professionals, political leaders, economists, and educators assert that cultivating a resilient entrepreneurial ethos is imperative, as it holds the potential to amplify both individual and collective economic and social accomplishments at local, national, and global levels. In alignment with this vision, the formulation of National Standards for Entrepreneurship Education was undertaken. This framework was devised with the explicit objective of equipping young individuals and adults alike with the tools essential for prospering within an entrepreneurial economy. By offering a structured curriculum rooted in entrepreneurship, this education prepares individuals to seize opportunities, manifest innovative ideas, and contribute dynamically to economic growth and societal progress. It is through the cultivation of this entrepreneurial mindset that communities and nations can realize their fullest potential, fostering a future brimming with possibilities and achievements.

Entrepreneurship education plays a crucial role in fostering innovation for sustainable development in Nigeria and Africa at large. It helps to develop a sustainable mindset among students, enabling them to identify opportunities for sustainable innovation (Adejumo, 2017). It encourages innovation and creativity by teaching students how to generate and evaluate sustainable business ideas. Entrepreneurship education equips students with essential skills and competencies, such as problem solving, critical thinking, and teamwork, necessary for sustainable innovation (QAA,2018). Igwe et al., (2016) stated that entrepreneurship education enhances the skills and competences of Nigerian entrepreneurs, enabling them to develop sustainable businesses. Entrepreneurship education contributes to sustainable development by creating new businesses, jobs, and opportunities that address social, economic, and environmental challenges (Acs et al., 2016). Entrepreneurship education has a positive impact on sustainable development in Nigeria, leading to improved economic growth, social justice, and environmental protection.

Importance of entrepreneurship includes:

a) **Skill Development**: Entrepreneurship encourages essential skills such as critical thinking, problem-solving, creativity, communication, and leadership. Students learn how to set goals, manage resources, and work within a team skills valuable in any career path.

b) **Career Preparedness and Employability:** Exposure to entrepreneurial thinking helps students understand diverse career options beyond traditional employment. They become better prepared to navigate future job markets, where adaptability, innovation, and self- reliance are increasingly valued.

c) **Promoting Innovation and Creativity:** Entrepreneurship education nurtures creativity by encouraging students to think outside the box, identify unmet needs, and develop innovative solutions. This fosters a mindset of continuous improvement and curiosity.

d) **Economic Awareness and Financial Literacy:** Entrepreneurship introduces students to fundamental concepts of economics, finance, and budgeting. These lessons in financial literacy prepare them for sound decision-making in both business and personal finance.

e**) Empowerment and Confidence:** By taking ownership of projects and seeing their ideas come to life, students build self-confidence and develop a sense of responsibility. This empowerment helps them face challenges and setbacks more resiliently.

Challenges of entrepreneurship education and their proffered solutions

Entrepreneurship education faces several challenges that hinder its effectiveness. Some of the challenges include the following:

i. **Lack of practical experience**

Challenge: Entrepreneurship education often focuses on theoretical knowledge rather than practical application, resulting in a lack of hands-on experience for students.

Solution: Integrate experiential learning methods such as business incubators, accelerators and mentorship programmes, to provide students with practical experience.

ii. **Limited resources**

Challenge: Entrepreneurship education programmes often face budget constraints, limiting the availability of resources such as mentorship, networking opportunities, and funding.

Solution: Seek partnerships with external organizations, such as businesses, government agencies, and non-profit organizations, to access resources and funding.

iii. **Curriculum design**

Challenge: Entrepreneurship education curricula often fail to incorporate essential skills such as creativity, innovation, and risk management **Solution**: Revise curricula to include experiential learning, design thinking, and lean startup methodologies to foster creativity, innovation, and risk management.

iv. Faculty competence

Faculty competence refers to the combination of knowledge, skills, and attitudes that a faculty instructor possesses to effectively teach, guide, and assess students in a specific academic discipline or subject area.

Challenge: Entrepreneurship educators often lack the necessary experience and qualifications to teach entrepreneurship effectively.

Solution: Provide faculty training and development programmes to enhance their knowledge and skills in entrepreneurship education.

v. Cultural and environmental barriers

Challenge: Cultural and environmental factors such as risk aversion fear of failure, and limited access to resources can hinder entrepreneurial endeavours.

Solution: Foster a supportive entrepreneurial ecosystem by promoting entrepreneurship culture, providing resources and funding, and encouraging experimentation and risk-taking.

Conclusion

Business education is a skill-based course which inculcates entrepreneurial skills in the recipient. Entrepreneurship on the other hand, deals with creative identification and utilization of business opportunities. This paper establishes that Business education has the potentials of promoting entrepreneurship in Nigeria since it could lead to the acquisition of skills for identifying viable investment opportunities, proper marketing, financial management, proper management and avoidance of business failure. The implication of this work is that, for Nigeria to encourage entrepreneurship, reduce unemployment and help the practicing entrepreneurs to be successful and achieve the aim of making their ventures to be going-concerns, Business education should be taken serious and highly encouraged; otherwise, the desire of Nigeria to encourage self-employment through entrepreneurship may end up as a mirage.

Entrepreneurship education plays a crucial role in fostering innovation in Nigeria. By integrating entrepreneurship education into the curriculum, Nigerian universities can produce graduates with the skills and mindset to create innovative solutions to the country's challenges. As noted by Olumide et al., (2017), entrepreneurship education can enhance the entrepreneurial intentions and competencies of Nigerian youths, thereby promoting innovation and economic growth. Similarly, Akpoyomare et al., (2017) emphasized the importance of entrepreneurship education in developing the skills and knowledge required for innovative entrepreneurship in Nigeria as the lagest country in Africa.

In conclusion, entrepreneurship education is essential for fostering innovation and driving digita entrepreneurial in Nigeria as the biggest country in Africa. By providing students with the necessary skills, knowledge, and mindset, entrepreneurship education can help promote innovative entrepreneurship and drive economic growth in Nigeria.

Recommendations

Based on the presentation so far, as well as the conclusion drawn, the following recommendations are suggested as the way forward:

1. Nigerian youths should be encouraged to study Business education

Our youths should be stimulated to study Business education. This could be done through career counseling both at home and school as well as creation of awareness through the National Orientation Agency (NOA). The essence of this is because Business education could lead to the production of high level and competent entrepreneurs. These people would also be able to encourage other people to venture into entrepreneurship and turn Nigeria for better.

2. Only business educators should be allowed to teach Business education
   Teaching of Business education should be left exclusively to the business educators. This is because, by their training and orientation, they are in better positions of inculcating entrepreneurial skills in the learners.
3. There should be adequate funding for Business education
   Business education is a skill-based course which requires a lot of money for the purpose procuring the requisite teaching materials. To ensure that the society reaps from its benefits, it should be adequately funded by the stakeholders. These stakeholders are; government at all levels (Federal, State and Local), corporate organizations, Non-Government Organisations (NGOs), philanthropic individuals and the Parents-Teachers' Association (PTA).
4. Entrepreneurs that lack Business education skill should be encouraged to acquire the skills.
   The entrepreneurs that lack Business education skills should be encouraged to acquire the skills. This encouragement can be done by the government through its agencies such as Small and Medium-scale Enterprise Development Agency of Nigeria (SMEDAN) and National Directorate of Employment (NDE) as well as NGOs and professional organisations. The business
5. Integrate digital into business education and entrepreneurship training: digital should form an integral component of entrepreneurship training at all levels in Nigeria.
6. Foster entrepreneurial intentions: Entrepreneurship education should foster entrepreneurial intentions among Nigerian youths, in order to reduce unemployment and poverty.
7. Promote sustainable development: Entrepreneurship education should be able to equip undergraduates with skills to function well and contribute to the society upon graduation.
8. Address challenges and strategies: Entrepreneurship education in Nigeria should address challenges such as inadequate funding, inadequate infrastructure, and lack of qualified educators, and develop strategies to promote entrepreneurship exploration in higher education.

ENHANCING ADAPTIVE SKILLS OF BUSINESS EDUCATION STUDENTS THROUGH TECHNOLOGY-INTEGRATED INSTRUCTION

amafaithnne@gmail.Com

Abstract

The rapid digitalization of the modern workplace requires higher education graduates to possess strong adaptive skills to handle ongoing technological disruptions. This study investigated the impact of technology-integrated instruction on the enhancement of adaptive skills among final-year (400-level) Business Education students in Ebonyi State, and Alex Ekwueme Federal University, Ndufu-Alike (AE-FUNAI), Nigeria. Adopting a quasi-experimental, pre-test, post-test, non-equivalent control group design, the study sampled 114 students from the two universities. The experimental group at Alex Ekwueme Federal University, Ndufu-Alike (AE-FUNAI) (n=55) was exposed to a 6-week block of technology-integrated instruction utilizing cloud-based collaborative platforms and Learning Management Systems (LMS). The control group at Ebonyi State University (EBSU) (n=59) was taught the same curriculum using traditional methods. Data were collected using validated performance-based and self-efficacy instruments entitled "Business Education Adaptive Skills Test" (BEAST) and an accompanying "Adaptive Skills Self-Efficacy Scale" (ASSES). The internal consistency of the instruments was calculated using Cronbach's alpha for the Likert-scale items, which yielded a reliability coefficient of 0.82. Data collected were analysed using Mean, Standard Deviation, and Analysis of Covariance (ANCOVA). The results showed that technology-integrated instruction significantly improved students' digital cognitive flexibility, online learning self-efficacy, and self-directed technological problem-solving skills. The study concludes that embedding digital pedagogy into instruction is vital for preparing resilient graduates. It recommends that university managements and lecturers institutionalize technology-integrated instructional frameworks to align business education programmes with industry demands.

Keywords: Adaptive Skills, Business Education, Technology-Integrated Instruction, TPACK, Self-Efficacy.

Introduction

The contemporary global business landscape is undergoing a profound digital transformation characterized by automation, artificial intelligence, and rapid technological disruptions. Nosakhare, (2023), believes that for graduates of business education programmes, particularly within the tertiary and technical education sectors, traditional administrative and clerical proficiencies are no longer sufficient for them to secure sustainable employment. Today's workplace demands individuals who possess high levels of adaptive skills, which encompass cognitive flexibility, digital literacy, self-directed learning, problem solving and the capacity to seamlessly adjust to evolving technological environments. Okoro, (2013), asserted that business education, is fundamentally aimed at equipping students with industry-relevant competencies for economic productivity and self-reliance. However, this course stands at a critical crossroads owing to consistent and continuous technological advancements. There is therefore an urgent need to transition from conventional, teacher-centred instructional methodologies toward dynamic, technology-integrated frameworks.

Meanwhile Chiamogu, (2024) noted that despite a conceptual alignment between technical education and modern workplace needs, a persistent gap between the digital competencies possessed by polytechnic and university graduates and the actual demands of industry still exist. Oguzor, (2011), also opines that in developing economies like Nigeria, business education curricula, including specialized streams such as Office Technology and Management (OTM), rely on theoretical or superficial exposures to digital tool, whereas national educational policies explicitly advocate for the

robust integration of Information and Communication Technology (ICT). The practical classroom implementation of this policy remains highly disjointed due to systemic infrastructural deficits, frequent power supply interruptions, and inconsistent instructional frameworks (Mada, 2025; Okoro, 2013). This pedagogical disconnect directly hinders the development of adaptive skills, leaving students poorly prepared to navigate dynamic, real-world work environments.

Adaptive skills in business education refer to a student's capacity to dynamically adjust, unlearn, relearn, and perform effectively within technology-driven business environments. Unlike static technical competencies, adaptive skills focus on cognitive, technological, and behavioural agility. Adaptive skills enable learners to adjust effectively to changing workplace demands, technologies, business environments, and emerging career opportunities. According to World Economic Forum (2023) it is an important workforce skill because technological change requires that workers continuously adjust their knowledge and capabilities. This necessitates preparing business education students in a way that they are able to respond effectively to changing technologies, business practices, and employment conditions. Adaptive skill in business education should develop the ability to acquire new digital, entrepreneurial and managerial competencies throughout business education students' career. Succi and Canovi (2020) identify adaptability as one of the skills that help graduates function effectively in changing work environment. It enables students to transfer what they learn to different workplace situations. In addition, van Laar et al (2020) noted that adaptive skill in business education include the ability to use digital technologies, communicate effectively online, solve problems and adapt to emerging digital work environments.

Contemporary business education must transition from static procedural training to inculcating digital cognitive flexibility which is embedded in adaptive skills. In the view of Hidayati et al., (2024) cognitive flexibility refers to the cognitive ability to modify and adapt mental strategies in response to changing demands within dynamic, technology-driven work environment. The term is rooted in Cognitive Flexibility Theory (Spiro et al., 1988), technology-integrated instruction and serves as a vital pedagogical catalyst by exposing students to non-linear problem-solving, interactive simulations, and real-time data environments (Lu & Xie, 2024; Siller et al., 2024). In the assertion of Sweller (1988) educators reduce extraneous cognitive load when digital tools are directly embedded into instructional delivery. This allows learners to redirect mental energy toward higher-order analysis, dynamic task-switching, and decision-making (Ramírez-Montoya et al., 2025). Siller et al. (2024,) added that this continuous restructuring of cognitive frameworks enables business education students to discard obsolete practices, independently acquire proficiency in unfamiliar enterprise software, and effectively respond to technological disruptions.

According to UNESCO (2025), digital literacy which enables on-line learning serves as the foundational technical and critical cognitive competency through which technology-integrated instruction fosters student adaptive skills. Beyond mere hardware manipulation, digital literacy in business education encompasses the capacity to access, critically evaluate, synthesize, and ethically deploy digital information and emerging software tools within dynamic corporate environments (American Library Association, 2024; UNESCO, 2025).

Lu & Xie (2024), testify that through technology-integrated instruction like enterprise resource planning (ERP) systems, interactive analytics, and cloud collaboration, students transition from passive technology users to active digital problem-solvers. This mastery, in the submission of Falloon (2020), and Siller et al. (2024), reduces technological friction and anxiety, granting students the baseline operational confidence required to navigate unfamiliar digital environments. To be precise, digital literacy serves as a foundational prerequisite through which business education learners acquire and strengthen advanced adaptive competencies, including technological resilience, digital agility, and sustained self-directed reskilling, enabling them to effectively navigate evolving technology-driven enterprise environment.

Technology-integrated instruction can strengthen students' confidence, flexibility, and capacity for continuous learning, which are essential components of adaptive skills in a rapidly changing technological environment. Online learning self-efficacy is important because students who are confident in using technology are more likely to adapt to new digital tools and learning environments.

Self-efficacy is rooted in Bandura's Social Cognitive Theory. It influences learners' motivation, effort, persistence, and ability to cope with challenging learning situations (Bandura, 1997). Zimmerman and Kulikowich (2016) submit that online learning self-efficacy refers to students' confidence in their ability to successfully use digital technologies and perform learning tasks in online or technology-mediated environments. It influences learners' motivation, persistence, self-regulation, and ability to overcome technological challenges.

Morris (2019) describes self-directed learning as the critical behavioural bridge through which technology-integrated instruction translates into sustainable adaptive skills. Rather than relying on passive lecture delivery, technology-integrated environments such as learning management systems, enterprise software, and interactive business simulations provide the support necessary for students to exercise digital action and self-regulation (Kruger, 2020). Mentz & Bailey (2020) maintains that when students actively direct their learning paths, they cultivate the autonomy required to troubleshoot unexpected software errors, curate business intelligence independently, and master new digital tools without formal retraining. This self-directed posture transforms static classroom learning into dynamic problem-solving, enabling business education students to unlearn outdated routines and continuously adapt to shifting market demands. In other words, encouraging self-directed learning through technology-driven pedagogy equips future business professionals with the lifelong cognitive and technological agility and problem solving skills needed to thrive in volatile enterprise environments.

Educational researchers increasingly advocate for the adoption of the Technological Pedagogical Content Knowledge (TPACK) framework to handle the issue of adaptability. Originally conceptualized by Mishra and Koehler (2006), TPACK posits that effective learning occurs when educators do not merely treat technology as an isolated tool, but skilfully fuse it with specific pedagogical strategies and disciplinary content (Guggemos, 2020; Valliere, 2023). Fang (2024), supports the assertion that technology-integrated business education instruction has the capacity to transform the classroom from a passive environment into a simulated digital workspace. Utilizing tools like cloud-based collaborative platforms, virtual office simulations, and digital data management systems allows students to actively construct knowledge and develop online learning self-efficacy. This hands-on, active participation fosters critical problem-solving and adaptive capacities that conventional teaching methodologies fail to reproduce (Oguzor, 2011).

Confronting the realities of modern higher education requires a thorough empirical investigation into how targeted digital instruction directly influences student adaptability. While considerable funding and institutional attention are directed toward the physical procurement of computer systems and digital software, these assets frequently sit underutilized due to a lack of structured, pedagogically driven integration strategies (Habila, 2023). This paper directly addresses this gap by investigating the impact of structured, technology-integrated instruction on the development of adaptive skills among business education students. By exploring the synergy between active digital learning environments and student skill acquisition, this study provides actionable insights for curriculum designers, institutional administrators, and lecturers aiming to cultivate globally competitive, resilient, and highly employable graduates.

Statement of the Problem

The core objective of business education is to equip students with practical competencies, digital literacy, and adaptive skills necessary for immediate employment and long-term economic self-reliance (Okoro, 2013). However, the contemporary global workspace has shifted rapidly from routine clerical functions toward a digitized, dynamic environment driven by workplace technologies. This shift demands that graduates possess high levels of cognitive flexibility and technological adaptability. The fundamental problem is a persistent and widening mismatch between the traditional pedagogical methodologies employed in tertiary institutions and the highly dynamic adaptive skills required by modern industries (Chiamogu, 2024; Nosakhare, 2023).

Most institutions make heavy investments in purchasing computers and digital infrastructure; however, these technologies are frequently treated as passive or isolated tools rather than being seamlessly integrated into instructional frameworks. Classroom instruction continues to rely heavily on superficial, teacher-centred approaches to software use, thereby limiting students' ability to

independently navigate evolving technology-mediated environments. In developing contexts, these instructional challenges are further intensified by systematic constraints, including unreliable electricity supply, limited internet connectivity, and the absence of structured pedagogical frameworks such as Technological Pedagogical Content Knowledge (TPACK) to support lecturers in the effective integration of technology into teaching and learning.

Consequently, business education students frequently graduate with rigid, rote-learned technical skills but lack the critical digital cognitive flexibility, problem-solving capacity, online learning self-efficacy, and all other adaptive competencies needed to adjust when workplace technologies inevitably evolve. Despite extensive evidence on the benefits of ICT literacy, limited empirical attention has been given to how structured and pedagogically driven technology-integrated instruction influences the development of adaptive skills among business education students. Without targeted empirical research to address this instructional gap, institutions will continue to produce business education graduates who struggle with underemployment and structural unemployment due to their inability to adapt to the changing digital demands of the modern business world. This study directly addresses this deficiency.

Purpose of the Study

The primary purpose of the study was to investigate the impact of technology-integrated instruction on the enhancement of adaptive skills among business education students in Universities in Ebonyi State. Specifically, the study sought to achieve the following purposes:

1. Assess the effect of technology-integrated instruction on the digital cognitive flexibility of business education students.
2. Determine the influence of technology-integrated instruction on the online learning self-efficacy of business education students.
3. Evaluate the extent to which technology-integrated instruction improves the self-directed technological problem-solving skills of business education students.

Research Questions

The following research questions guided the study:

1. What is the difference in the mean scores of digital cognitive flexibilities between business education students taught using technology-integrated instruction and those taught using traditional instructional methods?
2. How does the mean score of online learning self-efficacy differ between business education students exposed to technology-integrated instruction and those exposed to traditional instructional methods?
3. What is the difference in the mean scores of self-directed technological problem-solving skills between business education students taught through technology-integrated instruction and those taught through traditional instructional methods?

Research Hypotheses

The following null hypotheses were tested at a 0.05 level of significance:

Ho_1: There is no significant difference in the mean scores of digital cognitive flexibilities between business education students taught using technology-integrated instruction and those taught using traditional instructional methods.

Ho_2: There is no significant difference in the mean scores of online learning self-efficacy between business education students exposed to technology-integrated instruction and those exposed to traditional instructional methods.

Ho_3: There is no significant difference in the mean scores of self-directed technological problem-solving skills between business education students taught through technology-integrated instruction and those taught through traditional instructional methods.

Methods

The study adopted a quasi-experimental, pre-test, post-test, non-equivalent control group design. A quasi-experimental design is highly appropriate for this educational study because it is neither practical nor logistically feasible to disrupt established institutional schedules or randomly assign individual students to new classrooms without disrupting their academic progress (Creswell & Creswell, 2018). Intact, pre-existing classes were selected and assigned as experimental group and the other as

the control group. The population consisted of all final-year (400 level) business education students in universities offering business education in Ebonyi State, Nigeria. Final-year students were purposely selected because they have completed a substantial portion of their technical coursework, are preparing for immediate transition into the global labour market, and are expected to demonstrate advanced professional competencies. Purposive and multi-stage sampling technique was utilized. First, two Universities with comparable infrastructure and accreditation statuses were purposely selected to prevent cross-contamination of treatment effects. Second, one intact class of final-year business education students was chosen from each of the institutions. Through a simple flip of a coin, one institution's intact class was designated as the Experimental Group (E_G), while the second institution's class served as the Control Group (C_G). The final sample size comprised the total number of students enrolled within those two selected intact classes. Data for this study were collected using a researcher-developed instrument entitled "Business Education Adaptive Skills Test" (BEAST) and an accompanying "Adaptive Skills Self-Efficacy Scale" (ASSES). To ensure the instruments' validity, they were subjected to face and content validation by three experts: two lecturers from the department of business education and one measurement and evaluation expert. To establish reliability, the instruments were pilot-tested on small cohort of 400 level business education students from a university outside the study area. Internal consistency was calculated using Cronbach's alpha for the Likert-scale items, which yielded a reliability coefficient of 0.82. Before launching the intervention, a uniform pre-test was administered concurrently to both the experimental and control groups to capture baseline data. In the Experimental Group Treatment, students were exposed to a structured, 6-week instructional block where core business management and office administration topics were delivered via technology-integrated instruction. Lectures seamlessly integrated interactive learning management systems (LMS), real-time cloud collaboration tools (such as Google Workspace and Microsoft 365), and automated data management workflows to simulate a modern digital office environment. In the Control Group Treatment, students were taught the identical academic curriculum over the same 6-week timeframe, but using traditional pedagogical approaches. Instruction relied primarily on face-to-face lectures, whiteboard illustrations, textbook-bound study materials, and individual, offline paper-and-pencil and standalone computer assignments. Upon the conclusion of the 6-week instructional period, a post-test utilizing a shuffled variant of the original instrument was administered to both groups to measure empirical gains in adaptive skill dimensions. The collected quantitative data was systematically cleaned and coded into modern statistical analysis software. The Research Questions were answered using descriptive statistics, specifically calculating the Mean ({X}) and Standard Deviation (SD) for each group's pre-test and post-test scores. Null hypotheses were tested at a 0.05 level of significance using Analysis of Covariance (ANCOVA). ANCOVA was specifically chosen because it statistically controls for any pre-existing individual variances between the non-equivalent groups by utilizing the pre-test scores as a covariate.

Results

The findings of the study are presented below.

Research Question 1: What is the difference in the mean scores of digital cognitive flexibilities between business education students taught using technology-integrated instruction and those taught using traditional instructional methods?

Null Hypothesis 1 (Ho_1): There is no significant difference in the mean scores of digital cognitive flexibilities between business education students taught using technology-integrated instruction and those taught using traditional instructional methods.

Table 1: Pre-test and Post-test Mean Scores for Digital Cognitive Flexibility

Group	Institution	N	Pre-test Mean	Pre-test SD	Post-test Mean	Post-test SD	Mean Gain
Experimental (Tech-Integrated)	AE-FUNAI	55	42.18	6.42	74.65	5.12	32.47
Control (Traditional)	EBSU	59	41.85	6.81	51.30	7.24	9.45

Table 2: Summary of Analysis of Covariance (ANCOVA) for Digital Cognitive Flexibility

Source	Sum of Squares	df	Mean Square	F	p-value	Decision
Corrected Model	15420.12	2	7710.06	196.12	.000	Significant
Intercept	8940.45	1	8940.45	227.42	.000	Significant
Pre-test (Covariate)	210.34	1	210.34	5.35	.023	Significant
Group (Treatment)	14980.25	1	14980.25	381.06	.000	Reject Ho_1
Error	4363.60	111	39.31			
Total	451200.00	114				

As shown in Table 1, the experimental group (AE-FUNAI) achieved a remarkably higher mean gain score of 32.47 compared to the control group (EBSU), which had a mean gain of 9.45. To determine if this difference was statistically significant, the ANCOVA table (Table 2) shows an F-statistic for the treatment group of F (1, 111) = 381.06, with a p-value of .000. Because the p-value is less than the chosen alpha level ($p < .05$), the null hypothesis (Ho_1) is rejected. This indicates that technology-integrated instruction significantly enhances the digital cognitive flexibility of business education students compared to traditional methods.

Research Question 2: How does the mean score of online learning self-efficacy differ between business education students exposed to technology-integrated instruction and those exposed to traditional instructional methods?

Hypothesis 2 (Ho_2): There is no significant difference in the mean scores of online learning self-efficacy between business education students exposed to technology-integrated instruction and those exposed to traditional instructional methods.

Table 3: Pre-test and Post-test Mean Scores for Online Learning Self-Efficacy

Group	Institution	N	Pre-test Mean	Pre-test SD	Post-test Mean	Post-test SD	Mean Gain
Experimental (Tech-Integrated)	AE-FUNAI	55	2.12	0.45	3.58	0.38	1.46
Control (Traditional)	EBSU	59	2.15	0.41	2.34	0.49	0.19

Table 4: Summary of Analysis of Covariance (ANCOVA) for Online Learning Self-Efficacy

Source	Sum of Squares	df	Mean Square	F	p-value	Decision
Corrected Model	44.12	2	22.06	114.30	.000	Significant
Intercept	112.45	1	112.45	582.64	.000	Significant
Pre-test (Covariate)	0.85	1	0.85	4.40	.038	Significant
Group (Treatment)	42.10	1	42.10	218.13	.000	Reject Ho_2
Error	21.42	111	0.19			
Total	1012.50	114				

As presented in Table 3, the experimental group at AE-FUNAI demonstrated a substantial mean gain score of 1.46 on the 4-point self-efficacy scale, moving from a baseline of 2.12 (low self-efficacy) to 3.58 (high self-efficacy). In contrast, the control group at EBSU experienced a minimal mean gain of 0.19, ending with a post-test mean of 2.34. The ANCOVA results in Table 4 confirm that this difference is statistically significant, $F(1, 111) = 218.13$, $p = .000$. Because the p-value is less than the .05 significance level ($p < .05$), the second null hypothesis (Ho_2) is rejected. This proves that immersive exposure to technology-integrated instruction significantly builds students' confidence and self-efficacy in navigating online learning environments.

Research Question 3: What is the difference in the mean scores of self-directed technological problem-solving skills between business education students taught through technology-integrated instruction and those taught through traditional instructional methods?

Hypothesis 3 (Ho_3): There is no significant difference in the mean scores of self-directed technological problem-solving skills between business education students taught through technology-integrated instruction and those taught through traditional instructional methods**.**

Table 5: Pre-test and Post-test Mean Scores for Self-Directed Technological Problem-Solving Skills

Group	Institution	N	Pre-test Mean	Pre-test SD	Post-test Mean	Post-test SD	Mean Gain
Experimental (Tech-Integrated)	AE-FUNAI	55	38.50	7.12	71.22	6.04	32.72
Control (Traditional)	EBSU	59	39.10	6.95	45.65	7.30	6.55

Table 6: Summary of Analysis of Covariance (ANCOVA) for Self-Directed Problem-Solving Skills

Source	Sum of Squares	df	Mean Square	F	p-value	Decision
Corrected Model	18345.60	2	9172.80	204.57	.000	Significant
Intercept	6432.18	1	6432.18	143.45	.000	Significant
Pre-test (Covariate)	195.40	1	195.40	4.36	.039	Significant
Group (Treatment)	17920.15	1	17920.15	399.65	.000	Reject Ho_3
Error	4977.20	111	44.84			
Total	395400.00	114				

Table 5 shows that the experimental group achieved a mean problem-solving score increase of 32.72, whereas the control group's improvement was limited to a mean gain of 6.55. The inferential data presented in the ANCOVA table (Table 6) shows an F-value of 399.65 for the treatment effect, with a p-value of .000. Since $p < .05$, the third null hypothesis (Ho_3) is rejected. These statistical findings demonstrate that when business education students are taught using embedded digital pedagogy rather than static lectures, they develop significantly stronger, independent troubleshooting and technological problem-solving capabilities.

Discussion of Findings

The findings of the study provide empirical evidence of the transformative impact of technology-integrated instruction on the professional preparation of final-year university business education students. By shifting instructional practices from traditional lecture-based approaches towards interactive and technology-integrated learning environments, the study highlights the ways modern pedagogical frameworks directly build the core adaptive competencies demanded by the global workplace.

The analysis of data for Research Question 1 and the subsequent rejection of Null Hypothesis 1 demonstrated that students exposed to technology-integrated instruction achieved significantly higher scores in digital cognitive flexibility than those taught via traditional methods. This result underscores the reality that when digital tools, such as cloud-based productivity software and automated workflow systems are actively embedded into business management modules, students learn to switch effortlessly between diverse interfaces and cognitive tasks. This finding is in line with the structural tenets of the Technological Pedagogical Content Knowledge (TPACK) framework proposed by Mishra and Koehler (2006), which emphasizes that technology should not be a stand-alone addition but a core method of delivering content. It is also in congruent with Onwuchekwa, (2026) assertion that, moving past static whiteboard summaries and passive learning environments allows tertiary institutions to directly enhance their students' capacity for cognitive adaptation.

The outputs for Research Question 2 and Hypothesis 2 indicated a highly significant improvement in the online learning self-efficacy of students in the experimental group. Students who navigated structured Learning Management Systems (LMS), submitted cloud-based assignments, and engaged in virtual collaborations shifted from a baseline of low technological self-belief to high confidence scores. Conversely, students confined to traditional pen-and-paper or offline instruction showed negligible self-efficacy gains. The finding strongly supports Bandura's classical self-efficacy theory, which asserts that psychological confidence is primarily built through mastery experiences and hands-on performance accomplishments (Afari et al., 2023). When students regularly interact with cloud infrastructures and successfully overcome minor operational friction, their internal anxiety decreases and their digital confidence grows. As established by recent pedagogical reviews, domain-specific technological self-efficacy acts as a vital psychological mediator that drives graduates' willingness to adopt and master emerging technologies including artificial intelligence once they enter the workforce (Ismaniati, 2024; Joshi, 2023).

Regarding Research Question 3 and Hypothesis 3, the inferential data revealed that technology-integrated instruction yielded an outstanding positive effect on students' self-directed technological problem-solving skills. Students who were actively challenged to manage digital workspaces independently learned to identify, diagnose, and resolve technical issues such as database configuration errors or cloud synchronization faults without relying on immediate lecturer intervention. This outcome must have occurred because traditional teacher-centred instruction frequently robs students of the opportunity to make mistakes, thereby stifling critical thinking. In contrast, an instructional framework that uses technology to simulate authentic, industry-grade workplace challenges fosters active self-regulated learning strategies (Onwuchekwa, 2026). This finding agrees with Benitez (2024) view that when business graduates possess the willingness and capability to troubleshoot emerging technical challenges independently, they transform into valuable corporate assets capable of steering organizations through ongoing digital transformations.

Conclusion

The findings of this study provide confirmation that the integration of digital technology into instruction is not merely an administrative upgrade, but has become a pedagogical necessity for fostering the adaptive skills demanded by contemporary industries. Therefore, this study concludes that adopting structured pedagogical models, such as the Technological Pedagogical Content Knowledge (TPACK) framework is essential for bridging the gap between higher education and modern industry demands. Simply equipping laboratories with computers is insufficient; tertiary institutions must actively transform their classrooms into active, simulated digital workspaces. If Nigerian universities are to produce globally competitive, resilient, and highly employable business professionals, curriculum planners and institutional leaders must institutionalize technology-integrated instruction as a mandatory standard for tertiary business education programmes.

Recommendations.

Based on the findings of this study, the following are put forward:

1. University Senate, Curriculum Planners, and Departmental Heads at EBSU and AE-FUNAI must redesign the practical course blueprints for business education. They should mandate the use of varied digital interfaces (such as switching between Microsoft 365, Google Workspace, and open-source database systems) within the same academic semester.

2. Business Education Lecturers must restructure their daily teaching methods. Instead of relying on manual submissions, they should conduct all continuous assessments, group projects, and peer reviews through structured Learning Management Systems (LMS) like Moodle or Canvas, allowing students to build psychological confidence through successful digital navigation.

3. Business Education Lecturers and Technical Laboratory Instructors must actively design practical laboratory manuals that incorporate problem-based learning. Simultaneously, University Management and ICT Directorates must back these initiatives by providing stable internet bandwidth, reliable power configurations, and technical support teams to ensure that operational friction remains an instructive learning challenge rather than an insurmountable barrier.

EMPOWERING WOMEN THROUGH DIGITAL ENTREPRENEURSHIP EDUCATION FOR INCLUSIVE ECONOMIC DEVELOPMENT IN AFRICA: A CONCEPTUAL REVIEW.

Blessing Emaojo Maha, PhD
Department of Social Sciences & Humanities
The Federal Polytechnic Idah, Kogi State, Nigeria
blessingmaha24@gmail.com

Abstract

Digital entrepreneurship education holds significant promise for women's empowerment and inclusive economic development in Africa. Despite progress in education and entrepreneurship initiatives, women continue to face barriers such as limited access to digital skills, entrepreneurial training, and economic opportunities. These barriers restrict their ability to participate fully in the digital economy and reduce their contributions to national and regional development. This conceptual review examines frameworks and strategies for integrating digital entrepreneurship education into business education, aiming to enhance women's digital skills, entrepreneurial mindset, and capacity for innovation. Drawing on recent literature on women's empowerment, digital entrepreneurship, and inclusive development in Africa, the study identifies key enablers and challenges to promoting women's participation in the digital economy. It highlights practical strategies including digital skills training, mentorship programmes, and access to online business platforms, and supportive policy measures that can foster entrepreneurial growth, economic security, and inclusion. The review further discusses implications for business educators, policymakers, and stakeholders, emphasizing the role of digital entrepreneurship education in creating sustainable pathways for women's economic engagement. By equipping women with digital and entrepreneurial competencies, African nations can unlock economic potential, stimulate innovation, generate employment, and foster inclusive development.
Keywords: Digital entrepreneurship, women's empowerment, business education, inclusive development, Africa.

Introduction

Across the African continent, the intersection of gender, education, and economic opportunity has emerged as one of the most consequential policy frontiers of the twenty-first century. Despite decades of investment in women's education and entrepreneurship promotion, the structural conditions that define women's participation in economic life remain deeply unequal. Women constitute more than half of Africa's population, yet their contribution to formal economic output is consistently suppressed by entrenched barriers among them, limited access to quality digital skills education, inadequate entrepreneurial support, and systemic exclusion from technology-driven markets. Against this backdrop, digital entrepreneurship education presents itself not merely as an academic intervention, but as a transformative force capable of reshaping the economic trajectories of women across the continent.

The global economy has undergone a fundamental reconfiguration in the past two decades, driven by the rapid proliferation of digital technologies, e-commerce platforms, and knowledge-based industries. In Africa specifically, the digital economy is expanding at an unprecedented pace. According to the International Finance Corporation (2023), Africa's digital economy is projected to contribute approximately 8.5% of the continent's GDP by 2050, creating an estimated 44 million jobs. However, women remain disproportionately underrepresented in this digital expansion, constituting only a fraction of digital entrepreneurs, technology workers, and online business owners. This gender gap is not incidental; it reflects the cumulative effect of educational inequities, cultural norms, infrastructural deficits, and policy neglect.

Business education, broadly conceived, has an important role to play in reversing these trends. Traditionally, business education in Africa has emphasised conventional commercial subjects accounting, marketing, office management, and economics without adequately incorporating the competencies demanded by the digital economy. The integration of digital entrepreneurship education into business education curricula presents an opportunity to bridge this gap, equipping women with the technical knowledge, entrepreneurial reasoning, and innovation capacity needed to thrive in

technology-mediated markets. This paper argues that such integration, when supported by appropriate institutional and policy frameworks, can serve as a lever for broader inclusive economic development.
This conceptual review draws on recent scholarly literature to examine the frameworks and strategies through which digital entrepreneurship education can empower women in Africa. The paper is structured as follows: a review of the conceptual landscape situating women, digital entrepreneurship, and business education within the African context; an analysis of key barriers and enablers; a discussion of practical strategies and frameworks; implications for stakeholders; and concluding reflections on future directions.

Conceptual Framework and Theoretical Underpinnings

To understand how digital entrepreneurship education can empower women, it is useful to situate the discussion within three complementary theoretical frameworks: the Capabilities Approach, Digital Entrepreneurship Theory, and Transformative Learning Theory. Together, these perspectives illuminate the conditions under which education translates into economic agency and social change.

The Capabilities Approach

Amartya Sen's Capabilities Approach, further developed by Martha Nussbaum (2000), holds that human development is best understood not in terms of income or GDP, but in terms of what individuals are actually able to do and become. Applied to women's empowerment, this framework foregrounds the importance of real freedoms substantive capabilities such as the ability to engage in economic activity, access information and communication technologies, and exercise voice in decision-making. From this perspective, digital entrepreneurship education is not simply a mechanism for skills transfer; it is a means of expanding women's capability set, enabling them to convert digital competencies into entrepreneurial functioning and, ultimately, into greater economic and social agency (Alkire, 2005; Nussbaum, 2000).

Digital Entrepreneurship Theory

Digital entrepreneurship, as conceptualised by Hull et al. (2007) and elaborated by Nambisan (2017), refers to the creation and pursuit of economic opportunity through digital platforms, networks, and technologies. It is distinguished from conventional entrepreneurship by its reliance on digital infrastructure as both a productive resource and a market mechanism. Nambisan (2017) highlights the "open" and "distributed" nature of digital entrepreneurial processes, wherein value creation is mediated by digital artefacts and ecosystems rather than physical assets. For women in Africa, digital entrepreneurship offers distinct advantages: lower barriers to market entry, reduced dependence on physical mobility and infrastructure, and the possibility of operating competitive businesses from resource-constrained settings. The theoretical salience of this framework lies in its recognition that entrepreneurship is increasingly context-independent when mediated by digital technologies an insight with profound implications for women in geographically remote or socially restrictive environments.

Transformative Learning Theory

Jack Mezirow's (1991) Transformative Learning Theory posits that meaningful learning involves a fundamental shift in the learner's frame of reference their assumptions, beliefs, and values. For women whose entrepreneurial self-efficacy has been constrained by cultural expectations or educational disadvantage, transformative learning offers a theoretical basis for understanding how digital entrepreneurship education can re-engineer not only skills but also identity and agency. Education programmes that engage critically with learners' lived experiences, challenge limiting assumptions, and foster reflective practice are more likely to produce lasting behavioural and economic change (Mezirow, 1991; Taylor, 2017). This framework underscores the importance of pedagogical design not just what is taught, but how it is taught in producing transformative outcomes for women entrepreneurs.

Women, Entrepreneurship, and the Digital Economy in Africa

The Landscape of Women's Entrepreneurship in Africa

Africa hosts one of the world's highest rates of female entrepreneurial activity by some measures, yet the quality and sustainability of that activity varies enormously by region, sector, and socioeconomic context. The Global Entrepreneurship Monitor (GEM, 2022) reports that women in sub-Saharan Africa engage in entrepreneurial activity at rates comparable to or exceeding those of men in many countries. However, much of this activity is concentrated in the informal economy petty trade, subsistence agriculture, and domestic services sectors characterised by low productivity, limited scalability, and precarious income (Amorós & Bosma, 2014; Minniti & Naudé, 2010). The persistent concentration of women's entrepreneurship in low-value-added sectors reflects not a deficit of entrepreneurial ambition but a structural limitation of opportunity: limited access to finance, formal networks, skills, and markets.
The digital economy presents a qualitatively different set of possibilities. E-commerce, fintech platforms, digital content creation, online education, and remote service provision have created entrepreneurial niches that are, at least partially, decoupled from the traditional constraints of physical capital and

geographic proximity. Across Africa, platforms such as Jumia, Paystack, Flutterwave, and a growing ecosystem of locally developed digital tools have created infrastructure for digital entrepreneurship that did not exist a decade ago. Women who can navigate these platforms have access to regional and global markets previously beyond their reach. The critical question, therefore, is whether current educational systems are preparing women to seize these opportunities.

The Gender Digital Divide in Africa

Despite the expansion of digital infrastructure, a significant gender digital divide persists across the continent. According to the Alliance for Affordable Internet (A4AI, 2021), women in low- and middle-income countries are 8% less likely than men to own a mobile phone and approximately 20% less likely to access the internet. In sub-Saharan Africa, this gap widens further in rural areas, where infrastructural deficits compound social and economic barriers to digital access. The GSMA (2023) reports that women in sub-Saharan Africa are 37% less likely than men to use mobile internet, representing a gap of 119 million women who are not connected despite living in areas with mobile internet coverage.

This digital divide is not merely a matter of hardware or connectivity. It reflects deeper asymmetries in digital literacy, confidence, and access to the time and social permission required to engage with digital tools. Women's digital exclusion is reproduced by educational systems that have historically underinvested in girls' technical education, cultural norms that frame technology as a masculine domain, and economic conditions that make digital devices prohibitively expensive for many households. Addressing this divide therefore requires educational interventions that are simultaneously technical, cultural, and economic in orientation a challenge that business education is uniquely positioned, though not always equipped, to meet.

Barriers to Women's Participation in Digital Entrepreneurship

Understanding the specific barriers that women face in accessing digital entrepreneurship opportunities is essential for designing effective educational interventions. The literature identifies a constellation of interlocking barriers that operate at the individual, institutional, and structural levels.

Limited Access to Digital Skills and Technology

At the most immediate level, many women lack the foundational digital literacy required to participate meaningfully in the digital economy. This deficit is not solely a product of individual circumstance; it reflects historical patterns of gender-differentiated access to technology education in both formal schooling and informal learning environments. Studies across Nigeria, Kenya, Ethiopia, and Ghana consistently show that women receive less exposure to computers, smartphones, and internet-based tools during their formative educational years than their male counterparts (Adegbenro et al., 2022; Hafkin & Huyer, 2007). Without a foundational base of digital competency, even motivated women find it difficult to engage with the more advanced entrepreneurial applications of digital technology.

Sociocultural Constraints

Entrepreneurship and digital entrepreneurship in particular exists within a social and cultural context. In many African societies, gender norms restrict women's mobility, professional autonomy, and access to public spaces, including educational and commercial settings. Women entrepreneurs frequently report that family obligations, spousal disapproval, and community expectations constrain the time and resources they can devote to business development (Ahl, 2006; Marlow & McAdam, 2013). These constraints are amplified in contexts where digital engagement is associated with Western values or perceived as socially inappropriate for women. The persistence of these norms underlines the need for educational approaches that are culturally sensitive and community-embedded, rather than purely technocratic.

Limited Access to Finance and Capital

Access to startup and growth capital remains one of the most formidable barriers facing women entrepreneurs in Africa. Despite the emergence of mobile banking and fintech solutions, women continue to have lower rates of financial inclusion than men in most African countries (AfDB, 2020). Formal financial institutions frequently require collateral, credit histories, and business registration documents that many women cannot provide, particularly those operating in the informal sector. Without capital, the ability to invest in digital tools, e-commerce subscriptions, or business development services is severely constrained even for women with strong digital skills and entrepreneurial capacity.

Inadequate Institutional and Policy Support

At the macro level, the absence of gender-responsive policy frameworks represents a structural barrier to women's digital entrepreneurship. While many African governments have adopted national digital economy strategies and entrepreneurship promotion programmes, these initiatives frequently lack gender-specific provisions, fail to reach women in rural areas, or are undermined by weak implementation capacity (United Nations Economic Commission for Africa [UNECA], 2021). Business education institutions, for their part, have been slow to update curricula to reflect the competencies

required in the digital economy, and even slower to develop specific programming for women. This institutional inertia represents both a challenge and an opportunity for deliberate reform.

Key Enablers and Frameworks for Integration

Despite the gravity of these barriers, the literature also reveals a set of enabling conditions and practical frameworks that can support the integration of digital entrepreneurship education into women's education in Africa. These enablers operate at the programme, institutional, and policy levels.

Digital Skills Training Programmes

Targeted digital skills training is the most direct educational lever available. Research on effective digital skills programmes for women in Africa highlights the importance of contextualised, locally relevant content; the use of mother-tongue instruction where possible; flexible scheduling that accommodates domestic responsibilities; and the progressive design of curricula that moves from foundational digital literacy to applied entrepreneurial competency (Asongu et al., 2020; Peprah et al., 2020). Programmes such as the Heifer International Digital Entrepreneurship initiative in East Africa and the Tony Elumelu Foundation's digital acceleration programme have demonstrated the feasibility of scaling targeted digital skills training for women, particularly when delivered through community-based organisations with established trust and local legitimacy.

Critically, effective digital skills training for entrepreneurship must go beyond basic computer literacy to encompass competencies in areas such as digital marketing, e-commerce platform management, social media business promotion, mobile money, and data-driven decision-making. These applied competencies are directly relevant to the markets that women entrepreneurs are most likely to enter and most able to succeed in.

Mentorship and Networking Programmes

The role of mentorship in entrepreneurial development is well-established in the literature (Bosma et al., 2012). For women entering the digital economy, mentorship has a dual function: it provides domain-specific guidance on navigating digital platforms and business challenges, and it offers psychosocial support that counteracts the isolation and discouragement that many women entrepreneurs experience. Peer mentorship networks connecting established women digital entrepreneurs with those at earlier stages of their journey have shown particular promise in African contexts, where formal mentorship infrastructure is often limited (Gamba et al., 2022). Virtual mentorship platforms, enabled by mobile internet access, extend the geographic reach of such networks and can connect women in rural areas with mentors in urban centres or even diaspora communities abroad.

Integration into Business Education Curricula

The most sustainable pathway for scaling digital entrepreneurship education for women lies in the systematic integration of digital entrepreneurship into the curricula of existing business education institutions polytechnics, colleges of education, universities, and secondary schools. Curricula reform in this direction requires the incorporation of modules on digital business models, online marketing, fintech tools, intellectual property in the digital age, and social enterprise development. It also requires investment in educator capacity: business educators who are themselves digitally literate and entrepreneurially experienced are far more effective in transmitting these competencies to students (Kakkar, 2021; Ogbuanya & Chukwuedo, 2017).

The ABEN community is particularly well-positioned to drive this reform, given its mandate to advance the quality and relevance of business education in Nigeria and across Africa. The conference theme Business Education for Digital and Entrepreneurial Transformation in Africa explicitly invites engagement with questions of how business education can be modernised to address the demands of the digital economy, and women's empowerment represents one of the most compelling and consequential application domains of this transformative agenda.

Access to Online Business Platforms and Digital Infrastructure

For digital entrepreneurship education to translate into economic outcomes, women must have access not only to knowledge but also to the digital infrastructure through which that knowledge can be applied. This includes reliable internet connectivity, affordable smartphones and computers, and access to digital platforms for business transactions and marketing. Efforts to expand digital infrastructure in rural and peri-urban areas of Africa including government initiatives, private sector investment, and community digital hubs are therefore complementary to digital entrepreneurship education and must be pursued in parallel (World Bank, 2021). Business education institutions can play a connective role, linking students to available digital resources, platform ecosystems, and business support services.

Supportive Policy Environments

Macro-level policy support is essential to the sustainability of digital entrepreneurship education for women. This encompasses gender-responsive national digital economy policies, targeted funding for women's entrepreneurship programmes, regulatory frameworks that facilitate women's access to mobile finance, and investment in digital infrastructure in underserved areas. Countries such as Rwanda, Ghana, and Kenya have demonstrated that deliberate policy commitment to gender inclusion in the digital economy can yield measurable results, including higher rates of women's digital financial inclusion and increased female participation in technology sectors (African Union Commission, 2020; Ndung'u, 2019). These experiences offer replicable models for other African governments.

Implications for Business Educators, Policymakers, and Stakeholders

Implications for Business Educators

Business educators occupy a pivotal position in the ecosystem of women's digital empowerment. The immediate implication of this review is that business educators must themselves acquire digital competencies and entrepreneurial knowledge if they are to deliver effective digital entrepreneurship education. Professional development programmes, collaborative curriculum review processes, and sustained engagement with digital entrepreneurship communities of practice are therefore strategic priorities for business education institutions. Furthermore, pedagogical approaches must evolve: experiential learning, simulation-based instruction, project-based assessment, and engagement with real digital business challenges are more effective than didactic lecturing in developing entrepreneurial competence.

Beyond pedagogy, business educators have a role in advocacy making the case within their institutions for the integration of digital entrepreneurship into existing programmes, the development of dedicated women-focused entrepreneurship courses, and the establishment of partnerships with digital businesses, fintech companies, and mentorship organisations. The credibility and institutional location of business educators give them a distinctive capacity to drive change both inside and outside the classroom.

Implications for Policymakers

For policymakers, this review underscores the importance of treating digital entrepreneurship education not as a peripheral add-on but as a core component of national strategies for women's economic empowerment and inclusive development. Concrete policy implications include the development of gender-sensitive digital entrepreneurship education standards for business education institutions; the establishment of grant and loan programmes specifically targeted at women digital entrepreneurs; the integration of digital skills and entrepreneurship components into existing women's empowerment programmes; and the use of data and monitoring systems to track women's progress in the digital economy.

At the continental level, regional bodies such as the African Union and the Economic Community of West African States (ECOWAS) have an opportunity to develop harmonised frameworks for women's digital entrepreneurship education that can be adapted by member states, enabling the sharing of best practices and the scaling of effective interventions across borders.

Implications for Other Stakeholders

Private sector actor’s telecommunications companies, fintech firms, e-commerce platforms, and technology companies have both an interest in and a responsibility to contribute to women's digital entrepreneurship education. Women represent a vast, underserved market of potential entrepreneurs and consumers; their inclusion in the digital economy is not only a social good but also a commercial opportunity. Corporate social responsibility initiatives, public-private partnerships, and direct investment in women's digital skills programmes represent avenues through which private sector actors can make meaningful contributions. Civil society organisations, development partners, and academic research institutions similarly have important roles in generating evidence, piloting innovations, and holding governments and firms accountable for gender inclusion commitments.

Discussion: Towards a Framework for Women's Digital Entrepreneurship Education in Africa

Drawing together the insights reviewed above, it is possible to sketch the contours of a framework for integrating digital entrepreneurship education into women's education in Africa. Such a framework must be multi-level, addressing individual, institutional, and structural dimensions simultaneously; gender-responsive, recognising the specific barriers and strengths that women bring to digital entrepreneurship; contextually adaptive, accounting for the significant diversity in digital infrastructure, cultural norms, and economic conditions across African countries and regions; and empirically grounded, building on evidence from effective programmes and drawing on ongoing research to refine and improve practice.

At the individual level, the framework prioritises the development of a comprehensive set of digital entrepreneurial competencies spanning digital literacy, online business management, digital marketing, financial technology, and entrepreneurial mindset—delivered through contextualised, learner-centred pedagogies. At the institutional level, it calls for the systematic integration of these competencies into business education curricula, supported by investment in educator development and institutional partnerships. At the structural level, it demands policy frameworks that actively promote gender inclusion in the digital economy, supported by infrastructure investment, regulatory reform, and sustainable financing mechanisms.

This framework aligns closely with the ABEN conference theme of Business Education for Digital and Entrepreneurial Transformation in Africa. Women's digital entrepreneurship education is not a secondary or supplementary theme within this agenda it is, arguably, one of its most urgent and consequential expressions. Africa cannot achieve genuine digital transformation without the full and meaningful participation of its women; business education cannot claim relevance to the digital economy while leaving half its potential constituency behind.

Conclusion

This paper has argued that digital entrepreneurship education is a critical and underutilised instrument for women's economic empowerment and inclusive development in Africa. Through a review of relevant conceptual frameworks and empirical literature, it has illuminated the barriers that restrict women's participation in the digital economy, identified the enabling conditions and practical strategies that can facilitate their inclusion, and discussed the implications of these findings for business educators, policymakers, and other stakeholders.

The central conclusion of this review is that the empowerment of women through digital entrepreneurship education is neither a utopian aspiration nor a luxury intervention — it is a prerequisite for the achievement of Africa's inclusive development goals. When women are equipped with the digital competencies and entrepreneurial capacities to participate fully in the digital economy, the benefits extend far beyond the individual: households become more economically secure, communities become more innovative, and national economies become more productive and resilient. The potential is vast; the need for deliberate, well-designed, and adequately resourced action is urgent.

Recommendations

On the basis of this review, the following recommendations are offered to key stakeholders:

1. Business education institutions should urgently review and update their curricula to incorporate digital entrepreneurship competencies, with specific attention to the needs and circumstances of women learners.
2. National governments should develop and fund gender-responsive digital entrepreneurship education strategies, including targeted programmes for women in rural and underserved communities.
3. Private sector actors should invest in women's digital skills programmes as a component of corporate social responsibility and long-term market development strategy.
4. Academic researchers should conduct empirical studies to assess the effectiveness of digital entrepreneurship education interventions for women across diverse African contexts, generating evidence to guide programme design and policy.
5. Regional and continental bodies should develop harmonised frameworks for women's digital entrepreneurship education, facilitating cross-border learning and the scaling of effective practices.

The path toward an Africa in which women are full partners in the digital economy is neither short nor simple. But it is navigable, and digital entrepreneurship education, delivered with intention, rigour, and gender responsiveness, is one of its most promising waypoints.

Abstract

The study examined the digital transformation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East, Nigeria. Two research questions and two null hypotheses guided the study. The study adopted descriptive survey research design. The population of the study comprised 102 business educators from four tertiary institutions that offered business education programme in South East geopolitical zone of Nigeria. There was no sampling. Instrument for data collection was structured questionnaire. The instrument was validated by three experts; two from Business Education Department and one from measurement and evaluation unit, science education department all from Ebonyi state university. The reliability of the instrument was established using trial-testing and data collected were analysed using Cronbach Alpha which yielded coefficient value 0.91. Data were analysed using mean, standard deviation and t-test. Findings showed that digital skills were highly needed in business education programme in tertiary institutions for digital economy development. It was further revealed that the identified digital skills were suitable for preparing business education students for digital economy development. The researchers concluded that the curriculum of business education should be restructured to accommodate digital skills that are critical to the growth of the nation's economy. Based on the findings, it was recommended among others that curriculum of business education should be reviewed from time to time to accommodate required digital skills to enhance digital skill acquisition among students for self employment and job creation.

Introduction

Digital technologies are electronic tools, systems, and devices that process, store and transmit data in binary code (0s and 1s). They represent the backbone of modern life, driving connectivity, automation and innovation through technologies like computers, smartphones, artificial intelligence (AI), and the internet. These tools are reshaping communication, business, healthcare, and education. Digital technologies have developed rapidly in recent time, changing people access information as well as human interaction and communication. This transformation includes emergence of digital economy and digital automation. Digital economy refers to the economic activities that emerge from connecting individuals, businesses, devices, data and operations through digital technology. It encompasses the online connections and transactions that take place across multiple sectors and technologies, such as the internet, mobile technology, big data and information and communications technology. The World Economic Forum and the Group of Twenty (G20) (2018) defined the digital economy as a broad range of economic activities comprising all jobs in the digital sector as well as digital occupations in non-digital sectors. The digital economy is estimated to make up around 5% of global GDP and 3% of global employment (Bukht & Heeks 2017). Based on this this, there is need for educational institutions to include digital skills into the curriculum of academic programme of business education students in tertiary institutions. This is to enable students to develop digital skills for business development business

Business education is a branch of vocational education programme aimed at equipping it recipients with relevant skills needed in the business world. According to Ezenwafor and Onokpaunu (2017), business education programme is a branch of vocational education concerned with exposing its recipients to the internal and external foundations and functioning of the workplace. Business education is a work-focused, skill-based, result-oriented and technology-based educational programme (Ugwoke, 2011). With the knowledge of business education, students are better informed and groomed with skills and understanding to cope with the unpredictable challenges of the business environment. However, business education programme which is charged with the responsibility of unveiling the dynamics of the world of work must ensure that its recipients possess relevant skills needed for effective entry and

efficient participation in economic development. Oguejiofor (2020) in support of the above stated that the value of any business education programme could be determined by its ability to adequately prepare and equip individuals in such a manner that they could fit into specific jobs, become technologically relevant, internationally competitive and economically prosperous, if properly packaged and adequately delivered. Extensively, business education is that aspect of general education that prepares students for employment and advancement in a broad range of office occupations, accounting profession, marketing occupation, teaching profession and entrepreneurship venture (Onokpaunu, 2016). However, the reliable medium through which the mission and vision of business education programmes can be achieved, stems from effective review and implementation of its curriculum (Ezenwafor & Onokpaunu, 2017).

A curriculum is the total plan of what students learn, how they learn it, and how teachers test their progress in a school or program. It includes goals, books, activities, and rules. It contains prescribed course of studies which students must learn in order to reach a certain level of education. According to Azubuike (2026), curriculum is the structured set of subjects, courses, and learning experiences offered by a school, college, or training program. It defines what students should learn, how learning is organized, and the skills or competencies they are expected to develop In addition, Efanimjor and Okolocha (2020) stated that curriculum is responsible for the systematic organisation of formal and informal experiences geared towards facilitating the development of the cognitive, physical, psychomotor and socio-emotional potentials of students.

Thus, Business Education curriculum in Nigeria is designed to equip students with practical skills in accounting, entrepreneurship, marketing, office management, and pedagogy, preparing them for careers in teaching, business occupations (including in the modern digital world), and self-employment. It blends general education with specialized vocational training to meet the needs of the modern economy. Correspondingly, Okoro (2015) opined that business education curriculum entails educational training which an individual receives in order to acquire adequate attitudes, concepts, knowledge, understanding and skills in business activities for vocational use in careers as administrators, managers, teachers wherever one may find oneself in the business world. It is believed that the curriculum of business education exposes students to educational and business-related experiences. One of such business related skill experiences in the modern time is technological entrepreneurship skill development otherwise known as technopreneurship.

Technopreneurship is the practice of building and running a business by combining advanced technology with an entrepreneurial mindset. Technopreneurship is a concept that combines elements of technology and entrepreneurship to create and develop innovative, technology-based businesses (Phuthong, 2023). The term "technopreneurship" stands for "technology" and "entrepreneurship". The concept emphasises the ability of individuals or groups to identify business opportunities arising from technological developments, design innovative products or services, and manage the business aspects associated with the application of technology. In the context of this study, technopreneurship, technopreneurs or technology entrepreneurs are individuals who not only have a strong business vision (Karneli, 2023), but also a deep understanding of technological developments and how technology can be applied in their business. Hence the need for business education curriculum to include technology entrepreneurship in business education curriculum.

However, it has been observed that business education in tertiary institutions in Nigeria today lacks modern digital skills required for techno-preneurship.. Oguejiofor (2020) reported that curriculum offerings at the tertiary institution levels do not cater for some of the needs of the current century skills. In agreement, Ikpesu (2017) stated that business education in Nigeria is at variance with global digital world. This variance, however portrays a total disconnection between what tertiary institutions offer and the needs of the labour market. The challenge here lies on how to ensure that the curriculum and delivery system provide satisfactory output that can compete globally in the labour market. In order to achieve this, there is need for the integration of digital skills in the teaching of business education programme.

Digital skills are the abilities to use devices, software, and networks to find, create, and share information safely and effectively. They range from basic computer use to advanced tasks like data analysis and AI tool management. According to UNESCO (2018), digital skills are a range of abilities to use digital devices, communication applications, and networks to access and manage information. They enable people to create and share digital content, communicate and collaborate, and solve problems for effective and creative self-fulfillment in life, learning, work and social activities at large. Ferrari (2013) saw digital skills as the ability to critically analyse and assess digital information, problem solving through the use of digital tools, creation and recreation of content and so forth. The International Telecommunication Union (ITU) (2018) defined digital skills as a set of technological abilities that may

be fully or partially acquired before entering the world of work. In the context of this study, digital skills are the abilities needed to use digital devices, applications, and networks effectively in work, education, and daily life. In Nigeria, programs like Digital Skills Nigeria (a Microsoft-led initiative) are helping young people gain essential skills in areas such as cloud computing, cybersecurity, data analysis, and AI to prepare for globally competitive careers.

Basic digital skills needed to be integrated into business education curriculum include computer literacy skills, digital connectivity skills and software management skills. Computer literacy skills are the essential abilities needed to use computers and digital technologies effectively. This ranges from basic operations like file management and email to advanced tasks such as data analysis, troubleshooting, and cybersecurity. In Nigeria, these skills are increasingly vital for employability, education, and entrepreneurship. According to Azubuike (2024), computer literacy skills refer to the knowledge, capabilities, and practical fluency required to effectively utilize computers, software applications, and related digital technologies to find, evaluate, create, and communicate information in the context of this study, computer literacy skills refers to computer literacy skills are the basic and advanced abilities needed to use computers and related technology effectively for everyday tasks, school, and work. Computer literacy skills are required to be integrated into business education curriculum. This will enable students to know the importance and the utilisation of computers and digital technologies in their routine daily activities. It might also enable them to develop entrepreneurial mindset in digital sector.

Apart from computer literacy skills, another skill, another important digital skill required to be integrated in the business education curriculum is digital connectivity skills. Digital connectivity skills are the practical abilities needed to use devices, software, and networks to safely access, share, and manage information online. According to Ogbonna (2025) digital connectivity skills refer to the abilities required to access, navigate, manage, and utilize digital communication tools, networks, and online resources effectively. These skills are essential for participating in the modern workforce, education, and social life. Mwafor (2023) also indicated that digital connectivity skills are the abilities that allow individuals to effectively connect, communicate, and collaborate using digital devices, networks, and platforms. In the context of this study, digital connectivity skills are the essential abilities required to operate digital devices, navigate networks, and use online communication tools safely and effectively. In Nigeria today, digital skills are critical for employability, remote work, and entrepreneurship, especially as the country faces a demand for 28 million digitally skilled workers by 2030. Therefore, integration of digital connectivity skills will enable students to develop skills in digital entrepreneurship development after graduation.

Finally, software management skills. Software management skills combine technical awareness, project control, and human leadership to guide development teams toward utilisation of software in business activities. According to Orji (2025) software management skills are the abilities required to plan, coordinate, and oversee the entire lifecycle of software projects from design to delivery and maintenance. They combine technical knowledge with leadership, communication, and risk management to ensure teams deliver high-quality software on time and within scope. In line with this, Nweze (2024) stated that software skills are technical abilities that enable one to effectively use computer programs and applications, essential for most modern jobs. Software management skills are essential because they ensure technology projects are delivered on time, within budget, and to the required quality standards. Students of business education require software management skills to enable them to gain employment as the demand for software skill workers are on the high side. In order to position business education students ahead of their counterparts, there is need to integrate software management and utilisation skills. Alyoubi (2015) noted that students need digital skills for effective participation in the development of digital economy. The World Economic Forum (2018) reported that digital skills are required for the development of every sector of economy (such as health, agriculture, finance, transportation, education, construction, tourism, information and communication technology industries among others). Business educators should therefore equip themselves with new technological skills needed to train students to fit into the demands of modern business world.

Despite the above-mentioned modern technology skills required to be integrated in business education curriculum in Nigeria, there is dearth of literature on the perception of lecturers of this noble course on the need for integration of these skills. It therefore becomes imperative to examine the necessities of these skills in Business Education curriculum Effective integration of digital skills in business education will adequately equip business education graduates with relevant ICT skills needed to establish and manage their personal digital business development for the reduction of high rate of youth unemployment in Nigeria as a whole and in Ebonyi state in particular where majority of the graduates hope on non existing government jobs. It is based on this that the study examines the digital

transformation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East, Nigeria.

Statement of the Problem

Youth unemployment remains a persistent challenge in Nigeria, particularly in South-East Nigeria (Ebonyi state in particular), where economic opportunities are limited, and many students on graduation entirely depend on government jobs for employment. With rising unemployment rates, many youths are left vulnerable to social vices, and illegal migration, which negatively impact the country's socio-economic development. Business education, is designed to equip students with entrepreneurial skills for self-reliance and job creation. However, traditional business education curricula may not adequately address the demands of the digital economy, where digital entrepreneurship skills are increasingly necessary for job creation. These new skills are in the areas of technological assets such as computers, smartphones, software applications, online operations and communication media web-based initiatives among others.

As the world is going digital there is need for business education students to acquire the right digital skills needed to meet up with the modern economy. This can only be achieved when students move with current trends in technological advancement which is reflected in the changing patterns of business education curriculum. Policymakers, researchers and educational stakeholders alike are beginning to recognize that closing this digital skills gap is essential for preparing the nations' educational sector (especially business education) for development of digital economy. Therefore, to close this gap, there is the need for the integration of digital skills into the business education curriculum in tertiary institutions to produce competent and skillful individuals that can compete with their counterparts globally in the ever-changing technological world.

Purpose of the Study

The main purpose of the study was to examines the digital transformation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state, Nigeria. Specifically, the study seeks to:

1. Determine the computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
2. Find out the Determine the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
3. Determine the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi stat

Research Questions

The following research questions guided the study:

1. What are the computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state?
2. What are the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state?
3. What are the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state?

Null Hypotheses

1. There is no significant difference in the mean rating of male and female business educators on computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
2. There is no significant difference in the mean rating of male and female business educators on the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
3. There is no significant difference in the mean rating of male and female business educators on the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

Method

The study adopted descriptive survey research design. The population of the study consisted of 50 business educators from four tertiary institutions offering business education courses in Ebonyi State, Nigeria. The whole population was studied because the population was not too large. The instrument for data collection was a structured questionnaire titled "digital transformation skills inclusion in business Education programme for undergraduate techno-prenureship attainment". The questionnaire was divided into two-parts. A and B. Part A was designed to elicit demographic information of the respondents such as school type. The instrument was developed based on a modified 4-points rating

scale. The instrument was validated by two experts in the field of business education and one experts from measurement and evaluation. Trial testing method was used to determine the reliability of the instrument using 20 business education lecturers outside the study area who were not part of the study. Data collected were analyzed using Cronbach Alpha which yielded an overall coefficient value of 0.82. The researcher personally administered copies of the questionnaire with the help of two research assistants to business educators in tertiary institutions within the area of the study. Data collected were analyzed using mean and standard deviation to answer the research questions and t-test was used to test the null hypothesis at 0.05 level of significance.

Results

Research Question 1: What are the computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state?

Table 1: Mean rating of the computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

S/N	computer literacy skills inclusion in business education programme	$\bar{x}$	SD	Remarks
1.	Skills in booting and operating computer system	3.63	0.57	Agreed
2.	skills navigating files in the computer	3.56	0.71	Agreed
3.	Skills to operate keyboard and typing	3.51	0.61	Agreed
4.	Skills in office productivity software	3.47	0.75	Agreed
5	Internet and Email Proficiency	3.40	0.80	Agreed
6	Basic troubleshooting and technical support	3.17	0.74	Agreed
7	Use of spreadsheet and data analysis	3.27	0.77	Agreed
8	Basic Graphic Design Knowledge	3.07	0.83	Agreed
9	Database Management	3.07	0.78	Agreed
	Grand mean	3.35	0.63	Agreed

Table 1 shows the mean rating of the computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state. The result from the table revealed that items 1-9 had the mean responses above 2.5 the criterion for acceptance. This means that all the 9 items were the computer literacy skills required to be included in the business education curriculum in tertiary institution for techno-prenureship attainment in Ebonyi state. The table also had the grand mean of 3.35 which indicated that computer literacy skills is required to be integrated in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state.

Research Question 2: What are the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East?

Table 2: mean rating of the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East

S/N	digital connectivity skills inclusion in business education programme	$\bar{x}$	SD	Remarks
10	Social media connectivity	3.10	0.701	Agreed
11	Use of virtual equipment for organising meetings	3.05	0.807	Agreed
12	Use of social media in social networking	2.85	0.934	Agreed
13	Use of intercom	3.24	0.655	Agreed
14	Use of webinars to communicate	3.18	0.742	Agreed
15	Use and surfing the internet	2.83	0.692	Agreed
16	use of e-mails	3.02	0.636	Agreed
17	Use of chatbots for feedbacks	3.01	0.751	Agreed
18	Use of artificial intelligence for customer care	3.10	0.701	Agreed
	Grand mean	3.05	0.807	Agreed

Table 2 shows the mean rating of the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East. Results from the table

revealed that items 10-18 were with the mean rating above 2.5 the benchmark for acceptance. This means that all the 9 items were the digital connectivity skills required for inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East. The table also had the grand mean of 3.05 to support the claim.

Research Question 3: What are the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state?

Table 3: mean rating of the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

S/N	software management and utilisation skills inclusion in business education programme	$\bar{x}$	SD	Remarks
19	Software development skills	3.15	0.740	Agreed
20	Software manipulation skills	3.46	0.556	Agreed
21	Software security skills	3.14	8.250	Agreed
22	Communication skill	3.01	0.906	Agreed
23	Skills in the adoption of software tools	3.15	0.740	Agreed
24	Utilisation of business software	3.18	0.602	Agreed
25	Technical awareness of software utilisation	3.10	0.701	Agreed
	Grand mean	3.05	0.807	Agreed

Table 3 shows the mean rating of software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state. The result from the table showed that items 19-25 were with the mean ratings over 2.50 the criterion for acceptance. This means that software management and utilisation skills is needed to be included in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state.

Hypothesis One

There is no significant difference in the mean rating of male and female business educators on computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state.

Table 3: Summary of t-test analysis of mean rating of male and female business educators on computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state.

Variable	N	X	SD	DF	t-cal	t-crit	Decision
Male	36	3.36	0.63	48	1.49	1.96	Not Rejected
Female	14	3.63	0.68				

From table 4, the calculated t-cal of 1.49 is less than the t-critical value of 1.96 at 48 degree of freedom and at 0.05 level of significance. This indicates that the null hypothesis will not be rejected. It therefore shows that the null hypothesis which states that there is no significant difference in the mean rating of male and female business educators on computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state was not rejected.

.

Hypothesis Two

There is no significant difference in the mean rating of male and female business educators on the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

Table 4: Summary of t-test analysis of mean ratings of male and female business educators on the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

Variable	N	X	SD	DF	t-value	P-value	Decision
Male	36	3.42	0.63	48	1.29	1.96	Not Rejected
Female	14	3.53	0.78				

Data in Table 4 show that t-value of 0.35 at 48 degree of freedom is greater than the criterion value of 0.05. Therefore, the null hypothesis is upheld. This means that there is no significant difference in the mean rating of male and female business educators on the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
.

Hypothesis III

There is no significant difference in the mean rating of male and female business educators on the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

Table 4: Summary of t-test result analysis of male and female male and female business educators on the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

Variable	N	X	SD	DF	t-cal	t-crit	Decision
Male	36	3.36	0.63	48	1.60	1.96	Not Rejected
Female	14	3.63	0.68				

From table 6, the calculated t-cal of 1.60 at degree of freedom of 48 and at 0.05 level of significance is lower than the critical value of 1.96. This indicates that the null hypothesis was not rejected. It therefore shows that the null hypothesis which states that There is no significant difference in the mean rating of male and female business educators on the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state was not rejected.

Discussion

Table 1 showed the mean rating of the computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state. The result from the table indicated that for technoprenurship or entrepreneurship development in digital technology to take effect, the student are supposed to be computer literate. Computer literacy is the ability to use computers and related technology effectively and safely. It ranges from basic hardware operation to using everyday programs like word processors, spreadsheets, and web browsers without needing constant help. Results from the table revealed that the respondents agreed that there is need for include skills in booting and operating computer system. Booting and operating computer system is one of the basics of computer literacy skills. according Ebeh (2019), booting a computer is the most common basic of computer system utilisation. Thus, students ought know how to boot a computer system as a basic step in using of computer. The result from the table also indicated that the respondents stated that skills to navigate files in the computer, skills in keyboarding, office productivity software, internet and Email Proficiency, basic troubleshooting and technical support, use of spreadsheet and data analysis, basic Graphic Design Knowledge as well as database Management are required for inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East. This result was supported by the hypothesis which stated that there is no significant difference in the mean rating of male and female business educators on computer literacy skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state.

Table 2 shows mean rating of the digital connectivity skills inclusion in business Education programme for undergraduate techno-prenureship attainment in South-East. There are many entrepreneurial opportunities in digital connectivity for graduates to engage in for self-employment. According to Nwigbo (2025), digital connectivity and literacy skills are the practical abilities needed to safely access, communicate, and manage information using modern digital devices and networks. The result from the study revealed that the respondents agreed that there is need to include skills in the; social media connectivity, use of virtual equipment for organising meetings, use of social media in social networking, use of intercom, use of webinars to communicate, use and surfing the internet, use of e-mails, use of chatbots for feedbacks and use of artificial intelligence for customer care. Digital media connectivity is required in business development, communication marketing and feedbacks. Hence the integration of digital media connectivity would boost the chances of techno-prenureship attainment in Ebonyi state

Table 3 showed the mean rating of the software management and utilisation skills inclusion in business Education programme for undergraduate techno-prenureship attainment in Ebonyi state. The result from the table revealed that the respondents agreed that software development skills, software manipulation skills, software security skills, such as communication skill, skills in the adoption of

software tools, skills utilisation of business software, and technical awareness of software utilisation. These results are in accordance with Nwafor (2025) who reported that software utilisation and management is required to be integrated in technology and vocational education programme as it will help to equip the recipient of this educational programme with skills in entrepreneurship development in the modern digital technologies.

Conclusion

From the foregoing, it can be said that curriculum review is very crucial for sustainable entrepreneurship development among graduates of business education. To position business education graduates to the technopreneurship world, there is need for integration of technological skills into business education curriculum. From the data collected and analysed, it was indicated that computer literacy skills digital connectivity skills and software management and utilisation skills are needed to be included in business Education curriculum programme for undergraduate techno-prenureship attainment in Ebonyi state.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. There is need for the NUC to integrate computer literacy skills in the curriculum of business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
2. There is need for the NUC to integrate digital connectivity skills in the curriculum of business Education programme for undergraduate techno-prenureship attainment in Ebonyi state
3. There is need for the NUC to integrate software management and utilisation skills in the curriculum of business Education programme for undergraduate techno-prenureship attainment in Ebonyi state

Abstract

This study examined Business Education as a catalyst for agripreneurship development and sustainable poverty reduction in Nigeria. Business Education is increasingly recognized as a tool for equipping individuals with entrepreneurial skills necessary for self-reliance, job creation, and economic empowerment. The study was anchored on Human Capital Theory and Entrepreneurship Innovation Theory, which emphasize the role of education and innovation in economic development and poverty reduction. A qualitative approach based on literature review was adopted. Findings from reviewed literature revealed that Business Education significantly contributes to agripreneurship development by equipping learners with financial, managerial, and entrepreneurial competencies required for successful agribusiness ventures. It also promotes innovation, value addition, and self-employment, thereby contributing to sustainable poverty reduction. However, challenges such as inadequate practical training, insufficient funding, lack of infrastructural facilities, and weak policy implementation hinder its effectiveness. The study concludes that Business Education is a critical driver of agripreneurship and poverty reduction in Nigeria and recommends curriculum reform, improved funding, teacher capacity development and stronger institutional linkages to enhance its effectiveness.
Keywords: Business Education, Agripreneurship Development and Sustainable Poverty Reduction

Introduction

Business Education occupies a strategic position in Nigeria's educational system as it equips learners with the knowledge, skills and competencies required for effective participation in economic activities, including entrepreneurship and self-reliance. In recent years, the focus of Business Education has expanded beyond traditional office skills to include entrepreneurial training, innovation, and practical business development, particularly in response to rising unemployment and poverty levels in the country. According to the Federal Ministry of Education (2021), Business Education is designed to prepare individuals for gainful employment and to foster entrepreneurial capabilities that can drive national development. This makes it a vital tool for promoting agripreneurship, which integrates agriculture with modern business practices to enhance productivity, value addition, and market competitiveness.

Agripreneurship has emerged as a viable pathway for economic diversification and sustainable livelihood creation in Nigeria, especially given the country's vast agricultural resources and youthful population. Ogunlela (2022) emphasized that agripreneurship combines innovation, risk-taking, and value chain development within the agricultural sector, thereby creating employment opportunities and reducing rural-urban migration. Similarly, Nwankwo (2023) noted that integrating Business Education into agricultural practices equips individuals with managerial and financial skills necessary for running profitable agribusiness ventures. This integration is crucial in transforming subsistence farming into commercial agriculture capable of generating income and improving living standards.

Despite its potential, Nigeria continues to grapple with high levels of poverty, particularly in rural areas where agriculture remains the primary source of livelihood. According to National Bureau of Statistics (2022), a significant proportion of Nigerians live below the poverty line, highlighting the urgent need for sustainable poverty reduction strategies. In this context, Business Education serves as a catalyst by empowering individuals with entrepreneurial competencies that enable them to identify opportunities, mobilize resources, and create wealth within the agricultural sector. Mohammed (2021) argued that entrepreneurship-driven education can significantly reduce poverty by promoting self-employment and enhancing income-generating capacities among youths and rural dwellers.

Furthermore, the role of Business Education in fostering agripreneurship aligns with global development goals such as sustainable development and food security. Okonjo-Iweala (2020) highlighted the importance of investing in skills development and entrepreneurship education as a means of achieving

inclusive economic growth and poverty alleviation in developing countries. Business Education provides learners with essential skills such as financial management, marketing, record keeping, and innovation, which are critical for the success of agribusiness enterprises. These competencies not only enhance productivity but also ensure sustainability through efficient resource utilization and environmental consciousness.

However, the effective utilization of Business Education as a tool for agripreneurship development faces several challenges, including inadequate curriculum implementation, limited access to practical training, and insufficient funding for educational programs. Adeyemi (2022) observed that many educational institutions in Nigeria still emphasize theoretical knowledge at the expense of practical entrepreneurial skills, thereby limiting students' readiness to engage in agribusiness ventures. Additionally, issues such as poor infrastructure, lack of access to credit facilities, and weak policy support hinder the translation of acquired skills into viable agripreneurial activities (Adeyemi, 2022). In view of these challenges, there is a growing need to reposition Business Education to effectively serve as a catalyst for agripreneurship development and sustainable poverty reduction in Nigeria. This involves strengthening curriculum content, enhancing practical training opportunities, and fostering partnerships between educational institutions, government agencies, and the private sector. Therefore, this study seeks to examine the role of Business Education in promoting agripreneurship and its impact on sustainable poverty reduction in Nigeria.

Theoretical Foundation

This study is anchored on two relevant theories that explain the link between Business Education, agripreneurship development, and sustainable poverty reduction: the Human Capital Theory and the Entrepreneurship Innovation Theory. These theories provide a comprehensive framework for understanding how education, particularly Business Education, equips individuals with the competencies required to engage in productive agribusiness ventures and improve their socio-economic conditions.

1. Human Capital Theory

The Human Capital Theory, popularized by Gary Becker (1964) and further expanded by Theodore Schultz (1961), posits that investment in education and training enhances individuals' productivity, skills, and earning potential. The theory assumes that education is a form of capital that yields economic returns both to individuals and society. In the context of this study, Business Education represents a strategic investment in human capital, as it equips learners with entrepreneurial knowledge, managerial skills, and financial literacy necessary for agripreneurship development. Olayemi (2022) asserted that skill-oriented education, such as Business Education, significantly enhances the employability and self-reliance of youths, thereby reducing poverty levels. Similarly, Ugochukwu (2023) noted that human capital development through entrepreneurial training enables individuals to identify and exploit opportunities within the agricultural value chain, leading to increased productivity and income generation.

The theory further suggests that individuals who acquire relevant business and technical skills are better positioned to establish and manage agribusiness enterprises effectively. This aligns with the objectives of Business Education, which focuses on developing competencies in areas such as financial management, marketing, record keeping, and decision-making. However, critics argue that Human Capital Theory tends to overlook external factors such as access to finance, infrastructure, and policy support, which also influence entrepreneurial success. Despite this limitation, the theory remains highly relevant to this study as it emphasizes the transformative power of education in fostering agripreneurship and reducing poverty.

2. Entrepreneurship Innovation Theory

The Entrepreneurship Innovation Theory, propounded by Joseph Schumpeter (1934), provides another important theoretical foundation for this study. The theory views entrepreneurship as a driver of economic development through innovation, creativity, and the introduction of new products, processes, and markets. According to Schumpeter, entrepreneurs are change agents who disrupt existing economic structures by creating new opportunities and value. In relation to agripreneurship, this theory highlights the importance of innovation in transforming traditional agricultural practices into modern, profitable enterprises. Okeke (2021) emphasizes that agripreneurs who adopt innovative practices such as mechanization, digital marketing, and value addition are more likely to succeed and contribute to economic growth. Likewise, Bello (2022) argues that Business Education fosters entrepreneurial mindset and innovative thinking, enabling individuals to create sustainable agribusiness ventures that can alleviate poverty.

The Entrepreneurship Innovation Theory also underscores the role of education in nurturing creativity, risk-taking ability, and problem-solving skills among learners. Through Business Education, individuals

acquire the capacity to identify gaps in the agricultural sector and develop innovative solutions that enhance productivity and profitability. This is particularly important in Nigeria, where agriculture remains largely subsistence-based and requires modernization to meet the demands of a growing population (Bello, 2022). However, the theory has been criticized for placing excessive emphasis on individual innovation while downplaying the role of institutional and environmental factors. Despite this, it provides valuable insights into how entrepreneurial skills acquired through Business Education can drive agripreneurship development and contribute to sustainable poverty reduction.

Concept of Business Education

Business Education is a vital component of the educational system that focuses on equipping learners with the knowledge, skills, attitudes, and competencies required for effective participation in the business world and entrepreneurial activities. In Nigeria, Business Education has evolved from its traditional orientation of preparing individuals for clerical and office occupations to a broader scope that emphasizes entrepreneurship, innovation, and self-reliance. According to Federal Ministry of Education (2021), Business Education is designed to develop individuals who can function effectively as employees or employers by acquiring practical and theoretical business skills. This makes it a critical tool for economic empowerment and sustainable development.

Business Education integrates various disciplines such as accounting, marketing, management, and entrepreneurship to prepare learners for real-life economic challenges. Osuala (2020) defines Business Education as a programme that provides learners with functional skills, knowledge, and attitudes necessary for gainful employment and self-employment. Similarly, Onyido and Duru (2019) posits that Business Education equips students with critical thinking, decision-making, and problem-solving skills that are essential for business creation and management. These competencies are particularly relevant in the context of agripreneurship, where individuals must combine agricultural knowledge with business acumen to achieve profitability and sustainability.

Furthermore, Business Education plays a significant role in fostering entrepreneurial intentions among youths. Bello (2023) asserts that exposure to Business Education enhances students' ability to identify business opportunities, mobilize resources, and take calculated risks. This aligns with the growing need to address unemployment and poverty in Nigeria through entrepreneurship development. In addition, Okafor (2021) emphasizes that Business Education promotes self-reliance by encouraging learners to become job creators rather than job seekers, thereby contributing to economic growth and poverty reduction.

The relevance of Business Education to agripreneurship development cannot be overstated. Modern agriculture requires not only technical farming skills but also competencies in financial management, marketing, record keeping, and value chain analysis. According to Abdullahi (2022), Business Education provides the entrepreneurial framework needed to transform traditional farming into profitable agribusiness ventures. This transformation is essential for enhancing productivity, increasing income, and improving the standard of living among rural dwellers.

Despite its importance, the implementation of Business Education in Nigeria faces several challenges, including inadequate funding, shortage of qualified teachers, and limited access to modern instructional facilities. Adeyemi (2022) observes that many institutions still emphasize theoretical teaching at the expense of practical skill acquisition, which limits the effectiveness of Business Education in promoting entrepreneurship. Additionally, poor curriculum implementation and lack of industry collaboration hinder students' exposure to real-world business environments.

Concept of Agripreneurship

Agripreneurship is an emerging concept that combines agriculture with entrepreneurship, focusing on the application of business principles, innovation, and value addition within the agricultural sector. It goes beyond traditional farming by emphasizing productivity, profitability, and market orientation. In Nigeria, agripreneurship has gained increasing attention as a strategic approach to addressing unemployment, food insecurity, and poverty. According to Adesina (2021), agripreneurship involves transforming agriculture into a business-driven enterprise that creates wealth, generates employment, and contributes to national economic growth.

Agripreneurship encompasses a wide range of activities across the agricultural value chain, including production, processing, packaging, marketing, and distribution of agricultural products. Nwankwo (2023) defines agripreneurship as the integration of innovative practices and entrepreneurial skills in agriculture to enhance efficiency and competitiveness. This implies that agripreneurs are not just farmers but business-oriented individuals who apply modern techniques, technology, and management strategies to maximize output and profitability. The concept also highlights the importance of innovation and value addition in agriculture. Okeke (2022) notes that agripreneurship encourages the development of new products, improved farming methods, and better marketing strategies that increase the economic

value of agricultural produce. For instance, processing raw agricultural products into finished goods, such as turning cassava into garri or starch, significantly enhances income generation and reduces post-harvest losses. This value chain approach is essential for sustainable agricultural development and poverty reduction.

Agripreneurship is particularly relevant in Nigeria due to the country's abundant agricultural resources and large youth population. National Bureau of Statistics (2022) reports that a significant proportion of Nigeria's workforce is engaged in agriculture, yet productivity remains low due to the predominance of subsistence farming. By adopting agripreneurial practices, individuals can transition from subsistence to commercial agriculture, thereby increasing income levels and improving living standards.

Moreover, agripreneurship plays a critical role in job creation and rural development. Bello (2023) asserts that agripreneurship provides employment opportunities for youths and reduces rural-urban migration by making agriculture more attractive and profitable. It also contributes to food security and economic diversification, which are essential for sustainable national development. Despite its potential, agripreneurship development in Nigeria faces several challenges, including limited access to finance, inadequate infrastructure, poor market linkages, and lack of entrepreneurial skills among farmers. Mohammed (2021) observes that many farmers lack the business knowledge required to manage agricultural enterprises effectively, which limits their ability to scale up production and compete in the market. This underscores the importance of integrating Business Education into agricultural practices to equip individuals with the necessary skills for successful agripreneurship.

Concept of Sustainable Poverty Reduction

Sustainable poverty reduction refers to long-term strategies and processes aimed at improving the living standards of individuals and communities by addressing the root causes of poverty while ensuring economic, social, and environmental sustainability. Unlike temporary poverty alleviation measures, sustainable poverty reduction focuses on empowering individuals with the skills, resources, and opportunities needed to generate continuous income and improve their quality of life. In Nigeria, poverty remains a major socio-economic challenge, necessitating innovative and sustainable approaches to its reduction. According to the National Bureau of Statistics (2022), a significant proportion of Nigerians still live below the poverty line, particularly in rural areas where access to basic resources and opportunities is limited.

Amartya Sen (1999) conceptualizes poverty as a deprivation of capabilities, arguing that individuals must be empowered with skills and opportunities to achieve meaningful development. Building on this perspective, Fawole and Ozkan (2019) asserts that sustainable poverty reduction can be achieved through capacity building, entrepreneurship development, and access to productive resources, which enable individuals to create wealth and improve their livelihoods. In Nigeria, sustainable poverty reduction is increasingly associated with entrepreneurship and skill acquisition. Ngozi (2020) highlights that empowering individuals through education and entrepreneurial training is essential for achieving inclusive economic growth and reducing poverty. Business Education, in this regard, plays a crucial role by equipping individuals with practical skills such as financial management, marketing, and business planning, which are necessary for establishing and sustaining income-generating ventures.

Furthermore, sustainable poverty reduction requires the development of sectors with high employment potential, such as agriculture. Akinwumi (2020) notes that agriculture has the capacity to lift millions of people out of poverty if properly harnessed through innovation, investment, and value addition. Agripreneurship, therefore, serves as a viable pathway for sustainable poverty reduction by creating jobs, increasing income, and enhancing food security. When combined with Business Education, agripreneurship can significantly improve productivity and profitability within the agricultural sector.

However, achieving sustainable poverty reduction in Nigeria is hindered by several challenges, including inadequate access to finance, poor infrastructure, unemployment, and weak policy implementation. Olufemi (2023) observes that despite various government initiatives, the lack of effective skill development programmes and limited support for entrepreneurs continue to impede poverty reduction efforts. Additionally, socio-economic inequalities and limited access to quality education further exacerbate the problem.

Business Education and Agripreneurship Development

The relationship between Business Education and agripreneurship development has attracted significant scholarly attention in recent years, particularly in developing economies like Nigeria where agriculture remains a major source of livelihood. Business Education provides the foundational knowledge and entrepreneurial competencies required to transform agricultural practices into profitable ventures. It equips individuals with skills in financial management, marketing, record keeping, and business planning, which are essential for the success of agribusiness enterprises. According to Osuala

(2020), Business Education fosters entrepreneurial capabilities that enable individuals to identify and exploit business opportunities within various sectors, including agriculture.

Chinedu (2021) found that students exposed to entrepreneurship-oriented Business Education are more likely to engage in agribusiness activities and demonstrate higher levels of innovation and risk-taking. This suggests that Business Education plays a crucial role in shaping the mindset and attitude of individuals towards agriculture, transforming it from a subsistence activity into a viable business venture. Furthermore, Business Education contributes to agripreneurship development by promoting innovation and value addition in the agricultural sector. Okeke (2022) asserts that individuals with business training are better equipped to adopt modern technologies, improve production processes, and develop effective marketing strategies. These capabilities enhance productivity and competitiveness, thereby increasing the profitability of agricultural enterprises. In addition, Business Education encourages the development of value chains, where raw agricultural products are processed and packaged to meet market demands, leading to higher income generation.

The role of Business Education in agripreneurship development is also evident in its ability to address unemployment and youth disengagement. Sadiq (2022) emphasizes that equipping youths with entrepreneurial skills through Business Education motivates them to venture into agribusiness, thereby reducing dependence on white-collar jobs. This is particularly important in Nigeria, where youth unemployment remains a major challenge. By providing practical skills and knowledge, Business Education empowers young people to become self-reliant and contribute to economic development.

Empirical studies further support the positive impact of Business Education on agripreneurship development. Grace Okafor (2021) found that graduates of Business Education programmes who received entrepreneurship training were more likely to establish and sustain agribusiness enterprises compared to those without such training. Similarly, Ibrahim Abdullahi (2022) reported that access to business knowledge significantly improves farmers' decision-making abilities and enhances their capacity to manage risks associated with agricultural production.

Despite these benefits, several challenges hinder the effective contribution of Business Education to agripreneurship development in Nigeria. Olufemi Adeyemi (2022) observes that inadequate practical training, outdated curricula, and limited collaboration between educational institutions and the agricultural sector reduce the effectiveness of Business Education programmes. Additionally, lack of access to finance and modern technology limits the ability of trained individuals to implement their agripreneurial ideas.

Business Education and Sustainable Poverty Reduction

Business Education plays a significant role in promoting sustainable poverty reduction by equipping individuals with the knowledge, skills, and competencies required for economic empowerment and self-reliance. In Nigeria, where unemployment and poverty remain persistent challenges, Business Education serves as a practical approach to enhancing individuals' capacity to generate income and improve their standard of living. According to Osuala (2020), Business Education prepares individuals for both employment and entrepreneurship, thereby reducing dependence on limited job opportunities in the formal sector.

Mohammed (2021) argues that equipping individuals with entrepreneurial skills enables them to create jobs, generate income, and contribute to economic development. This aligns with the view of Kazeem (2021), who notes that skill acquisition and entrepreneurship development are essential strategies for achieving inclusive growth and reducing poverty in developing countries. Through Business Education, individuals acquire practical skills such as financial management, marketing, and business planning, which are crucial for establishing and sustaining income-generating ventures.

Furthermore, Business Education contributes to sustainable poverty reduction by fostering a culture of innovation and self-employment. Sadiq (2023) asserts that individuals who receive entrepreneurship training are more likely to identify business opportunities and develop innovative solutions to economic challenges. This is particularly important in rural areas, where access to formal employment is limited. By promoting self-reliance and creativity, Business Education empowers individuals to improve their livelihoods and reduce poverty sustainably.

Empirical studies have also demonstrated the positive impact of Business Education on poverty reduction. Okafor (2021) found that individuals who acquire business and entrepreneurial skills are better positioned to establish small and medium-scale enterprises, which serve as a major source of employment and income generation. Similarly, Akinwale (2022) reported that entrepreneurship-oriented education significantly enhances individuals' earning capacity and reduces poverty levels by promoting economic participation and productivity.

In addition, Business Education supports sustainable poverty reduction by enhancing financial literacy and resource management skills. Bello (2022) notes that individuals with business knowledge are more

capable of managing their finances effectively, making informed investment decisions, and sustaining their enterprises over time. This ensures that income generated from business activities is effectively utilized to improve living conditions and support long-term development.

Despite its potential, the effectiveness of Business Education in reducing poverty in Nigeria is constrained by several challenges. Olufemi Adeyemi (2022) observes that inadequate funding, poor curriculum implementation, and limited access to practical training facilities hinder the development of entrepreneurial skills among learners. Additionally, external factors such as lack of access to credit, poor infrastructure, and weak policy support limit the ability of individuals to translate acquired skills into sustainable business ventures.

Challenges Affecting the Effectiveness of Business Education in Promoting Agripreneurship and Poverty Reduction

Despite the recognized potential of Business Education in fostering agripreneurship development and sustainable poverty reduction in Nigeria, several challenges hinder its effectiveness. These challenges cut across educational, institutional and socio-economic dimensions, thereby limiting the ability of individuals to translate acquired knowledge into practical agribusiness ventures.

- **Inadequacy of practical-oriented curriculum and teaching methods:** Many educational institutions in Nigeria still emphasize theoretical knowledge rather than hands-on entrepreneurial training. Olufemi (2022) observes that the lack of practical exposure in Business Education programmes reduces students' readiness to engage in real-world agribusiness activities. Similarly, Kazeem (2021) notes that outdated curricula fail to incorporate modern agricultural practices and emerging technologies, thereby limiting students' ability to innovate within the agricultural sector.
- **Inadequate funding and infrastructural facilities:** Business Education programmes require well-equipped laboratories, demonstration farms, and access to modern technologies to facilitate effective teaching and learning. However, many institutions lack these essential resources. According to Federal Ministry of Education (2021), insufficient funding has continued to affect the quality of vocational and entrepreneurial education in Nigeria. This situation is further compounded by poor maintenance of existing facilities and limited access to instructional materials.
- **Lack of qualified and experienced teachers:** This is also a significant barrier. Effective delivery of Business Education requires educators who possess both academic knowledge and practical entrepreneurial experience. Emmanuel (2020) emphasizes that teachers without practical exposure to business and agribusiness operations may find it difficult to impart relevant skills to students. In addition, limited opportunities for professional development and training further hinder teachers' ability to adopt innovative teaching methods.
- **Access to finance:** This remains another major challenge affecting the translation of Business Education into agripreneurial practice. Kazeem (2021) points out that many graduates with entrepreneurial skills are unable to start or expand agribusiness ventures due to lack of capital and limited access to credit facilities. Financial institutions often impose stringent conditions that discourage young entrepreneurs, thereby limiting the impact of Business Education on poverty reduction.
- **Poor infrastructure and weak policy support:** Inadequate transportation systems, unreliable electricity supply, and limited access to markets negatively affect agribusiness operations. Bello (2022) argues that without supportive government policies and enabling business environments, the effectiveness of entrepreneurship education in reducing poverty will remain limited. Inconsistent policies and lack of coordination among stakeholders further exacerbate these challenges.
- **Negative perception of agriculture among youths:** Many young people perceive agriculture as a low-status and labor-intensive occupation, preferring white-collar jobs instead. Sadiq (2021) notes that this mindset discourages youth participation in agripreneurship, despite the opportunities available in the sector. This highlights the need for reorientation and awareness campaigns to change attitudes towards agriculture.
- **Weak linkage between educational institutions and industry:** This limits practical exposure and skill acquisition. Okafor (2021) observes that inadequate collaboration between schools and agribusiness enterprises reduces opportunities for internships, mentorship, and experiential learning. This gap makes it difficult for students to gain the practical experience required for successful agripreneurship.

Strategies for Enhancing Business Education for Agripreneurship Development and Sustainable Poverty Reduction

To maximize the potential of Business Education as a catalyst for agripreneurship development and sustainable poverty reduction in Nigeria, several strategic measures must be implemented. These strategies focus on improving curriculum delivery, strengthening institutional capacity and creating an enabling environment for entrepreneurial growth.

- **Integration of practical and skill-based training into Business Education programmes:** Emphasis should be placed on experiential learning approaches such as internships, industrial attachments, and school-based enterprises. Adeyemi (2022) suggests that practical exposure enhances students' ability to apply theoretical knowledge in real-life situations, thereby improving their readiness for agripreneurship. Similarly, Nwosu (2023) advocates for the inclusion of modern agricultural practices and digital tools in the curriculum to equip learners with relevant and up-to-date skills.
- **Increased funding and provision of adequate infrastructural facilities:** Government and private stakeholders should invest in the development of well-equipped training centres, demonstration farms, and modern instructional resources. According to the Federal Ministry of Education (2021), adequate funding is essential for improving the quality of vocational and entrepreneurial education. Access to modern technologies and learning resources will enhance the effectiveness of Business Education in promoting agripreneurship.
- **Capacity building for teachers:** Educators should be provided with regular training and professional development opportunities to enhance their knowledge and teaching skills. Olanrewaju, Osabohien and Fasakin (2021) emphasizes that teachers with practical business experience are better positioned to impart entrepreneurial skills to students. Training programmes should focus on innovative teaching methods, agribusiness management, and the use of digital technologies in education.
- **Improving access to finance for aspiring agripreneurs:** Financial institutions and government agencies should provide soft loans, grants, and credit facilities to support individuals in establishing and expanding agribusiness ventures. Fawole and Ozkan (2019) notes that access to finance is a key determinant of entrepreneurial success and poverty reduction. In addition, financial literacy programmes should be incorporated into Business Education to enable individuals to manage resources effectively.
- **Strengthening collaboration between educational institutions and industry stakeholders:** Partnerships with agribusiness firms, non-governmental organizations, and government agencies can provide students with opportunities for practical training, mentorship, and exposure to real-world business environments. Ogunleye and Bamidele (2021) highlights that such collaborations enhance skill acquisition and bridge the gap between education and industry needs.
- **Changing societal perceptions towards agriculture:** Awareness campaigns and sensitization programmes should be organized to promote agripreneurship as a profitable and respectable career option. Bello (2023) asserts that positive reorientation can motivate youths to embrace agriculture as a viable means of livelihood. Highlighting success stories of young agripreneurs can further inspire participation in the sector.
- **Supportive government policies and a conducive business environment:** These are essential for the success of agripreneurship initiatives. Bello (2022) argues that consistent policies, improved infrastructure, and access to markets are necessary to sustain entrepreneurial activities. Government should also ensure effective implementation and monitoring of policies related to entrepreneurship and agricultural development.

Conclusion

The reviewed literature and theoretical perspectives indicate that Business Education can serve as an important catalyst for agripreneurship development and sustainable poverty reduction in Nigeria. Its contribution lies principally in developing financial, managerial, marketing, record-keeping, innovation and business-planning competencies that enable individuals to identify opportunities, establish enterprises and manage resources effectively.

Agripreneurship provides a practical pathway for applying these competencies to agricultural production and value chains. It can support employment creation, income generation, value addition, food security and rural development. However, the impact of Business Education is not automatic. Inadequate practical training, poor funding, weak infrastructure, shortages of qualified teachers, limited access to finance and inconsistent policy support can prevent skills from becoming sustainable enterprises.

The central implication is therefore that Business Education should be repositioned towards practical, market-oriented and agripreneurship-focused learning. When educational institutions, government,

industry and financial institutions work together, the skills developed through Business Education can be more effectively converted into viable agribusiness opportunities and sustainable livelihoods.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are made:

- Business Education curricula should contain stronger practical, skill-based and agripreneurship-oriented content aligned with current agricultural and economic opportunities.
- Government and educational authorities should provide adequate funding, modern instructional facilities and appropriate practical-learning environments.
- Regular training, workshops and capacity-building programmes should be provided for Business Education teachers to strengthen their entrepreneurial, agribusiness and instructional competencies.
- Educational institutions should develop sustained partnerships with agricultural industries and financial institutions to provide practical exposure, mentorship and access to funding opportunities.
- Government should implement supportive policies that encourage youth participation in agripreneurship and improve access to appropriate credit facilities.
- Entrepreneurship awareness campaigns should be intensified to present modern agriculture and agripreneurship as viable and profitable career options.

Abstract

This study investigated digital resource collection for technopreneurial skills acquisition among Business Education students in universities in Rivers State. The growing demand for digital and entrepreneurial competencies in the modern economy has made it imperative to integrate well organized digital resources in business education programme. One specific objectives, one research questions and one hypothesis guided the study. Descriptive survey research design was adopted for the study. The population and sample of the study consisted of Business Education Lecturers in four tertiary institutions offering Business Education as an undergraduate programme in Rivers State during the 2025/2026 academic session. Structured questionnaire was used for data collection, this was analysed using mean and standard deviation. The results revealed that digital resources collections such as e-book, online tutorials, virtual simulations, business software applications and multimedia instructional materials play a significant role in enhancing students' acquisition of technopreneurial skills, including digital marketing, innovation, problem solving, and online management. The study also identified challenges such as inadequate access to digital infrastructure, poor internet connectivity and limited digital competencies among students and their lecturers as barrier to effective utilization. The study concluded that digital resources collections are critical tools for promoting technopreneurial skills acquisition among business education students. Based on the finding, it was recommended among others that Management in tertiary institution in Rivers state should provide adequate digital infrastructure including high speed internet access, functional computer laboratories, digital libraries and institutional repositories to support effective digital collection and Business education Lecturers should encourage students to make effective use of credible digital resources such as e-book, e-journal, online data base, open educational resource and institutional repositories in teaching and learning. Students should be encouraged to develop the habit of continuously collecting, organising and utilizing relevant digital content to improve their technological, entrepreneurial and life long learning skill.

Keywords: Digital Resources Collection, Technopreneur Skills Acquisition, Business Education, ICT, Universities

Introduction

The rapid advancement of digital technologies has transformed the global business environment, making technopreneurship an essential component of business education. The integration of digital tools into teaching and learning has created new opportunities for students to acquire practical knowledge and entrepreneurial competences. Business education, as a discipline designed to equip learners with knowledge, skills and attitudes needed for employment and self-reliance, has increasingly embraced digital resources to improve learning outcomes and prepare students for the demands of the digital economy. A digital subject collection refers to systematic acquisition, organisation, preservation and management of digital information resources on specific subject areas to meet the information resources on specific subject areas to meet the information needs. Johnson (2018) highlighted that

traditional collections that focus on digital subject collection includes electronic books, journals, databases, multimedia resources, and other online contents organised around particular disciplines. An organized respository of electronic learning materials such as e-books, online journals, multimedia resources, digital libraries, educational websites, videos, podcasts, simulations, and other electronics instructional resources that support teaching and learning. These resources provide students with easy access to current information, promote independent learning, encourage collaboration and improve digital literacy. Unlike traditional printing materials, digital subject collections are accessible through computers, smartphones, tablets and internet-enable devices, allowing student to learn anytime and from virtually anywhere. Hobbs (2017) explained that digital Subject Collection has to do with programme designed in order to build the competences of existing teaching staff with the view of boosting their performance and attainment of specific objectives using digital technologies. Similarly, Galaczi, Poulter and Allen (2018) described digital Subject Collection as the process used to introduce teachers to new sets of skills or tools essential in the attainment of educational goals using digital platforms. Consequently, it means that for teachers to always be capable of delivering educational offerings using digital technological tools, they need to develop the appropriate digital competences from time to time. Ottestad, Kelentric, and Guomundsdottir (2014) opined that the importance of Digital Subject Collection is to enable them drive the development of students' digital competence collaboratively as the end product of the learning process.

According to Redecker (2017), to create digital content, collaborate and communicate with others in order to solve problems relating to teaching and learning, teachers need to acquire digital competencies essential for their responsibilities.Digital Subject Collection for Techno-prenuer Skills Acquisition are of benefit to both the teachers themselves and to their students. This is because teachers' proficiency in the use of new digital technologies and other resources have been discovered to have link to the exposure of students to electronic learning exercises (Fraser, Atkins, & Hall, 2013; Abdulkarim & Onwuchekwa, 2020). Consequently, the possession of digital competences among teachers should actually promote their use of new technology to prepare for and teach in this digital era.

Technopreneurship is a form of entrepreneurship that combines technological innovation with business opportunities to create products, services or processes that meet societal needs while generating economic value. Technopreneurship is the process of combining technology, innovation and entrepreneurial skills to create new products, services or business models that generate economic or social value. It involves the identification and technological opportunities, development of innovation solutions and commercialisation of technological based ideas (Nambisam 2017). Technopreneurship skills acquisition combines technology prowess with entrepreneurial talent to launch and manage high-tech ventures. It requires a blend of hard technical abilities and soft business proficiencies, such as opportunity recognition, software development, financial literacy, digital marketing, and adaptable leadership. Nambisam (2017) explains that digital technologies have transformed entrepreneurship by enabling new forms of venture creation, collaboration and marketing expansion.

In today's knowledge driven economy, technopreneurs require both technical expertise and entrepreneurial capabilities, including creativity, risk taking, opportunity recognition, strategic planning and business management skills. According to Teece (2018), successful technology ventures depend on the ability to develop, protect and capture value from innovation in rapidly changing environments. Technopreneurial skills such as digital marketing, e-commerce, innovation, creativity, problem solving, software application, business analytics, financial technology and online business management have become essential for business education graduates.These skills enable graduates not only to secure employment but also to establish and manage technology based enterprises.

Business education programme has been explained by many authors. Val-Ossai and Akpomi (2017) described business education as that aspect of vocational education programme that prepares recipients with requisite competencies for entry into and advancing on jobs related to the business world as well as teaching profession. Business education students are expected to process both enterpreneurial and technological competencies to remain relevant in a highly competitive labour market. Val-Ossai and Akpomi (2017) described business education as that aspect of vocational education programme that prepares recipients with requisite competencies for entry into and advancing on jobs related to the business world as well as teaching profession. Ordu and Abdulkarim (2020) noted that business education programme offered at the universities have optional areas such as Office Technology and Management option, marketing/Distributive option, Accounting option, Entrepreneurship option, and Management option. Okoye (2021) averred that the introduction of business education programme in Nigerian university education curriculum gave a high hope to the nation's economic development as many of its graduates can drive economy. The goal of business education programme deduced from its definition and what it constitutes is to prepare students either

for paid employment or self-employment by guiding them to develop relevant knowledge, skills and attitude for business operations and teaching. The use of digital subject collections can significantly enhance students' learning experience by exposing them to current industry trends, practical business applications, online business models, and emerging technologies. Through digital learning platforms, students can develop critical thinking, communication, collaboration, creativity and problem solving abilities that are essential for successful technopreneurship. Despite the increasing availability of digital learning resources, many business education students continue to experience challenges in accessing and utilizing these resources effectively. Factors such as inadequate internet connectivity, limited access to digital devices, insufficient digital literacy, inadequate institutional support, unstable electricity supply and lack of training among lecturers often hinder the effective use of digital subject collections for learning and skills acquisition. Consequently many graduates leave school without practical technological and entrepreneurial competencies required to compete successfully in the modern business environment. Technopreneurship which combine entrepreneurship component with digital and technological capabilities are increasingly required for business graduates to create innovative ventures, compete in the digital economy and contribute to national development. Consequently higher education institutions are expected to provide students with access to quality digital learning and digital content that support acquisition of these skills.

In Nigeria despite government efforts to promotes digital education and entrepreneurship, many business education students still experiences difficulties in accessing, collecting and utilizing relevant digital content for learning technopreneurship. Challenges such as inadequate digital infrastructure, limited internet access, insufficient digital libraries and repositories, poor digital literacy, irregular electricity supply and inadequate institutional support often hinder students from effectively sourcing and using digital learning materials. These limitation may reduce students' opportunities to acquire practical technopreneur skills needed for self employment and innovation. Furthermore, while several studies have examine entrepreneurship education and integration of information and communication technology in Nigerian higher institution, limited attention has been given to digital subject collection as a factor influencing technopreneur skills acquisition among business education students. The extent to which student access, organise and utilize digital learning resources for developing technopreneur competencies remains inadequately explored. If these challenges persist, Business education graduates may lack technological and entrepreneurial competencies required to establish technology driven enterprises or effectively participate in the digital economy. Therefore, there is a need to investigate digital content collection for technopreneur skills acquisition among business education students in Rivers State' Tertiary Institutions. This seek to address the gap by examining the factors affecting digital content collection and its influence on students' acquisition of technopreneur skills.

Research Question

The study was guided by the following research question:

3. What factors affect digital content collection for technopreneur skills acquisition among business education students in Rivers State?

Hypothesis

The following hypothesis was tested at 0.05 significant level:

v. There is no significant effect of the factors affecting digital content collection on technopreneurial skills acquisition among Business Education students in Rivers State.

Method

The design adopted for this study was a descriptive survey research design. This research design was deemed appropriate because it will enable the researcher collect data from a representative sample of Business Education lecturers on digital collection and technopreneur skills acquisition without manipulating any variables. The population for this study was made up of 147 business education lecturers from all the public tertiary institutions in Rivers State, Nigeria offering Business Education as at 2025/2026 academic session. The population was deemed appropriate for the study because only Business Education lecturers can certify their possession of digital competencies and utilization of new technologies assessed. The breakdown of the population for the study was as follows:

Table 1: Population Distribution of Business Education Lecturers

S/N	Name of institutions	Lecturers
1.	Rivers State University	31
2.	University of Port Harcourt	07
3.	Ignatius Ajuru University of Education	25
4.	FCE(T) Omoku	78
	Total	141

Source: Academic and Planning Unit of Each of the Universities, 2026

The researcher used the entire population of 141 Business Education lecturers in public universities in south-south, Nigeria as the sample of the study. The entire population was used because it is a manageable size. According to Saunders, et al (2012) in Ordu and Abdulkarim (2020), when the population is small and the cost implication of studying is not much, the entire population can be studied. One structured questionnaire designed by the researcher and titled "Digital Content Collection and Technopreneur Skills Acquisition in Business Education Questionnaire (DCCTSAQ)" was used for the study. The questionnaire consisted of two sections. Section A: Respondents' demographic information, while section B: items measuring digital content collection and technopreneurial skills acquisition on 4 points rating scales of Strongly Agree (SA – 4points), Agree (A – 3points), Disagree (D – 2 points), and Strongly Disagree (SD – 1point) with a criteria mean of 2.5 as the mid points of positive and negative responses.

The instruments developed were given to three research experts, two from Business Education department and one from the field of Measurement and Evaluation in Federal College of Education (Technical), Omoku. The copy of the instruments was attached to the objectives of the study and hypothesis formulated and distributed to those involved in the validation. The experts were requested to determine the clarity and suitability of the items formulated for generating data required for the completion of the study. The experts were asked to make correction, suggestions as well as amend any item found not suitable. The contributions of the experts to the clarity and suitability of the items in the instrument were taken into consideration before the final copy of the instrument was mass produced for use to complete the study.

The reliability of the instrument was determined using the Cronbach Alpha Co-relation Coefficient. In order to generate data for testing the reliability of the instrument, a pilot study was conducted using 10 Business Education lecturers of undergraduate programme in Federal College of Education (Technical), Omoku, Rivers State who were not part of the study. According to Gill and Johnson (2010) in Onyemekara (2023), range of Cronbach Alpha index that falls within 1to 0.69 are considered to be inadequate while from 0.70 to 1 are considered to be adequate and acceptable for most research instruments. Consequently, the present instruments were deemed to be reliable with regards to their internal consistency which Cronbach alpha determines.

To cover the five tertiary institutions in Rivers State, the researchers recruited one research assistant to assist in administration of instruments to two tertiary institutions, while the researchers handled the other two. The research assistant was briefed on the purpose of the instruments and how to administer them to intended respondents. A letter of introduction explaining the purpose of the work was attached to the instruments. The instruments were administered to the respondents and retrieved the same day. However, at the point of collation only 123 copies were properly filled and returned. This is approximately an 87% return rate . However, the copies properly filled were coded and data generated for analysis. Pearson Product Moment Correlation (r) was used to answer the research question and test the hypothesis posed at 0.05 level of significance. For the purpose of interpreting the r value obtained, relationship scale interpretation by Bryman and Bell (2011) was used:

r = 00 – 0.19 'very weak relationship
r = 0.20 – 0.30 'weak',
r = 0.40 – 0.59 'moderate relationship',
r = 0.60 – 0.79 'strong',
r = 0.80 – 1.00 'very strong'

Results and Discussion

Research Question

What factors affect digital content collection for technopreneurial skills acquisition among business education students in Rivers State?

Table 1

S/N	ITEMS	MEAN	SD	DECISION
1	Internet access affects digital content collection.	3.72	0.81	Agree
2.	Digital literacy influences digital content creation.	3.69	0.76	Agree
3.	Availability of digital libraries enhances digital content collection.	3.61	0.84	Agree
4.	Poor Electricity Supply affects digital	3.83	0.71	Agree

	content collection.			
5	Institutional support enhances digital content collection.	3.65	0.80	Agree

The table reveals that grand mean is 3.70, which is above the criterion mean of 2.50, it indicates that respondents agreed that internet access, digital literacy,digital libraries, electricity supply and institutional support are significant factors affecting digital collection for technopreneur skills acquisition.

Research Hypothesis

There is no significant effect of the factors affecting digital content collection on technopreneur skills acquisition among business education students in Rivers State.

Table 2

Variables	Beta (β)	T - value	Sig.	Decision
Factors affecting digital content collection	0.631	9.284	0.000	Rejected H_0

Table 2 reveals significance value is 0.000. Since the Significant value 0.000 is less than the 0.5 level of significant, the null hypothesis is rejected. This indicates that factors affecting digital collection have a significant effect on technopreneur skills acquisition among business education students in Rivers State, Nigeria.

Discussion of Finding

The results relating to the research question and hypothesis formulated revealed that factors affecting digital collection have a significant effect on technopreneurial skills acquisition among Business Education students in Rivers State, Nigeria. Also internet access, digital literacy,digital libraries, electricity supply and institutional support were identified as major factors affecting digital content collection for technopreneur skills acquisition among Business Education students in Rivers state, Nigeria .

The finding of this study is supported by the findings of Fakomogbon and Bolaji (2017) reported that learning through mobile learning platforms (digital platforms) enables students to develop collaborative skills and sense of sharing idea with their peers, but this have not be adequately exploited in most tertiary institutions in Nigeria. The finding of this study is also supported by the assertion of Agbagbue (2019) who noted that the use of digital resources in teaching and learning has been significantly low and do not reflect the competence of teachers in empowering their students to practice collaboratively using online activities or learning activities that may require use of digital tools. Digital content creation significantly improves innovation, digital business competence, business planning, problem solving ability and entrepreneurial readiness, there by enhancing technopreneurial skills acquisition. The regression analysis showed the statistically significant relationship between digital content collection and technopreneurial skills acquisition at the 0.05 level of significance.

Conclusions

From the findings of this study, it was concluded that digital content collection is a critical component of technopreneurship education. Business Education students who have adequate access to relevant digital learning resources and possess the skill to search, organise, evaluate and utilize such resources are more likely to acquire technological and entrepreneurial competencies required to succeed in digital economies. Strengthening digital learning environments and improving students' digital content collection practices will enhance technopreneurial skills acquisition and prepare graduates for self employment, innovation and sustainable national development.

Recommendations

1. Management in tertiary institutions in Rivers State should provide adequate digital infrastructure including high speed internet access, functional computer laboratories, digital libraries and institutional repositories to support effective digital collection.
2. Business Education Lecturers should encourage students to make effective use of credible digital resources such as e-book, e-journal, online data base, open educational resource and institutional repositories in teaching and learning. Students should be encouraged to develop

the habit of continuously collecting, organising and utilizing relevant digital content to improve their technological, entrepreneurial and life long learning skill.

Abstract

Africa is experiencing the fastest digital adoption in its history. With over 60% of the population under 25 years, the continent has a unique opportunity to leverage digital transformation to solve pressing socio-economic problems and create jobs. Digital transformation refers to the integration of digital technologies into business, education, and governance to drive innovation and productivity. However, technology alone is not enough. For Africa to fully benefit from the digital economy, its young people must acquire relevant digital and entrepreneurial skills. This is the foundation of techno-premiership — the ability to use technology to identify problems and build scalable businesses around solutions. This opinion paper argues that the future of Africa's economy depends on deliberately linking digital transformation with skills acquisition for techno-premiership. The paper examines the current state of digital transformation in Africa, the skills gap that limits youth participation in the digital economy, and the role of techno-preneurship as a vehicle for job creation and wealth generation. It draws insights from existing trends in fintech, agritech, edtech, and e-commerce across the continent to show that African problems require African techno-preneurs with the right competencies. The paper further highlights key challenges to skill acquisition for techno-preneurship as such inadequate digital infrastructure, outdated education curricula, lack of industry-school collaboration, and a mindset that favors job seeking over job creation. It contends that closing the skills gap requires a tripartite approach involving institutions, industry, and individuals. Universities should be able to shift to competency-based and project-driven learning. The private sector should invest in training, mentorship, and internships. Students should take ownership of their learning and innovation. It concluded that Africa does not need to copy digital models from other continents. It needs to build its own techno-preneurs who understand local contents and can create home-based solutions in health, agriculture, finance, education, transport and commerce. Lastly, it suggested among others that African governments, universities, and tech companies should take active part in training Africa's future workforce in technology incline programmes which can be done through internships, apprenticeships, and challenge-based learning where students solve real life problems.

***Keywords*:** Digital Transformation, Skills Acquisition, Technopreneurship, Entrepreneurship, Digital Economy

Introduction

Africa stands at a defining moment in its economic history. With about 60% of its population under the age of 25, the continent has the youngest youth population globally (United Nations, 2024). This demographic reality presents challenge and a unique opportunity for techno-preneurship development. The challenge is that traditional labor markets cannot absorb the estimated 10-12 million young Africans graduates entering the workforce each year (African Development Bank, 2023). While the opportunity is that this same youthful population, if equipped with the right skills, can drive innovation, create jobs and lead the continent's growth from resources and commodity driven economy to a digital economy. At the center of this opportunity lies digital transformation. Digital transformation has been widely discussed as a driver of economic development and productivity growth (OECD, 2023; World Bank, 2021). The Organization further explained that digital transformation is about using technology to create new or modify existing business processes, cultures, and customer experiences. According to Westerman, Bonnet, and McAfee, (2011) digital transformation "is the integration of digital technologies into all areas of business, education and governance to fundamentally change how value is created and delivered". Value creation in this wise is a function of diversification and digitalization of systems where critical thinking, creativity and innovation are the hallmark of such system. O'Brien, Scapicchio, Dowine (2025) described digital transformation as a business strategy initiative that

integrates digital technology across all areas of an organization. The authors state further that digital transformation reviews and modernize processes, products, operations and technology stack of organization's which facilitate continual and speedy customer-driven innovation. Organization for Economic Co-operation and Development (2023) asserted that digital transformation is all about using technology to create new or modify existing business processes, cultures, and customer experiences.

This implies moving from resource-dependent economies to knowledge and innovation-driven economies powered by technology which is already visible in the continent ranging from mobile money to various e-commerce platforms. This digital technology is reshaping how Africans live, work, and do business. The COVID-19 pandemic is a testament of the reshaping processes which further accelerated this shift, forcing schools, businesses, and governments to move services online within weeks. However, technology alone does not create transformation. Technology must be matched with human capacity which centered on skill acquisition. Skill acquisition is the process of gaining practical abilities and knowledge that enhance employability and entrepreneurship (NUM, 2025). Skills basically are task enablers required in the performance of specific operation in order to create value for profit. And in the context of digital economy, skills acquisition go beyond basic digital literacy to include entrepreneurial skills needed to build products, transport those products to prospective markets. The World Economic Forum (2024) identifies analytical thinking, creative thinking, and technological literacy as top skills for the future workplace. These are skills that are acquired through intentional training, mentorship, and experience. Hence, the success of digital transformation in Africa means young Africans must acquire not only technical skills but also entrepreneurial skills that allow such Africans to turn ideas into viable businesses. This combination is called techno-preneurship. Techno-preneurship is the fusion of technology and entrepreneurship. The relationship between skills and technopreneurship is therefore symbiotic. Technopreneurship cannot thrive without skills, and skills without an entrepreneurial outlet often lead to unemployment. When people acquire digital skills such as software development or data analytics but have no pathway to create businesses, they either migrate or remain job seekers.

Conversely, when they have entrepreneurial ambition but lack digital skills, their businesses remain informal and hard to grow. The success stories we see across Africa prove this point. Andela succeeded because it combined world-class coding training with a business model that connected African talent to global clients. Farmcrowdy succeeded because it combined agritech knowledge with an entrepreneurial model that connected small farmers to investors. In both cases, skills acquisition was the foundation upon which techno-preneurship was built. This suggests that any policy or programme aimed at promoting techno-preneurship in Africa should start with skills. Despite this clear link, several factors continue to limit skills acquisition for techno-preneurship in Africa. First is the issue of access. Many young people, especially in rural areas, still lack access to computers, stable internet connectivity, and electricity. Learning cloud computing skills for instance is impractical with inconsistent internet connectivity. Second is the issue of relevance of curricula. University curricula are often outdated and do not aligned with industry needs. A student can graduate with a degree in Computer Science without ever building a real product or working on a real project. Third is the issue of mindset. Africa education system still trains students to seek white-collar jobs rather than to create jobs. Entrepreneurship is often taught as a theoretical course rather than as a practical activity. These challenges mean that even when digital infrastructure improves, the human capital needed to drive it may not be ready. This creates a dangerous scenario where Africa imports digital solutions instead of creating digital solutions. To address these challenges, Africa must rethink skills acquisition from three angles: institutions, industry, and individuals. At the institution level, universities, polytechnics, and vocational centers need to redesign their programmes to be competency-based and project-driven. This means more training programmes for software skills development, more tech competitions, more startup support centers, and more partnerships with tech companies. At the industry level, private sector players should take responsibility for training. Tech companies cannot keep complaining about skill gap without investing in closing it. Models like apprenticeships, internships, and corporate schools have worked elsewhere and can work in Africa. At the individual level, young Africans should take ownership of their learning (self-learning). The internet has democratized access to knowledge, thus, individuals with smartphone can learn various software design programmes. If these three actors align, the potential for techno-preneurship in Africa is enormous. In other words, Digital transformation provides the platform. Skills acquisition provides the engine. Techno-preneurship provides the vehicle for economic growth and job creation. Africa does not need to wait for foreign investors to solve its problems. The problems of poor healthcare, inefficient agriculture, financial exclusion, and poor logistics are all opportunities for techno-preneurs who understand the local setting and have the skills to build solutions. What Africa needs now is bold action; governments that fund digital skills programmes,

universities that teach for the future, companies that mentor young techno-preneurs, and young techno-preneurs who are willing to build.

Concept of Digital Transformation and Techno-preneurship

Digital transformation is the application of technology driven methods in the management of business processes. It is changing how work processes are done, how businesses create value that meets customers expectation, and how customers experience products. Digital transformation is the process of converting traditional business activities and processes into digital systems using technology (Renad, 2025). Digital transformation is the integration of digital technology into all areas of a business, fundamentally changing how it's operate and deliver value to customers (Enterprisers, 2026). Rogers (2016) explains that digital transformation is a strategy for competing in a customer network. Gaining advantage in a competitive customer network requires businesses to first understand how people search, buy and communicate on phones and the internet. Because customers behaviors are changing, as such organizations can no longer rely on the same methods, products and services of yesteryears. They have to redesign experiences around trend, personalization, and convenience to remain relevant in the business world. In this case technology is the enabler. Technology alone, however, does not create transformation. Kane et al. (2019) found that the altering of organization culture to become more responsive, risk tolerant and experimental remains a sure way in adapting to digital disruption. Westerman, Bonnet, and McAfee (2014) argue that digital transformation requires leaders who can set a clear vision, model new ways of working, decide which old processes to drop, which data to use for decisions and how to reward innovation. The authors further reiterate that technology must be connected to business results; that moving sales to an online platform is not transformation if the organization still measures success the same old way. Real transformation happens when leaders use digital tools to change decisions, products, and how teams are organized. Bughin and Van Zeebroeck (2017) discovered that businesses that treat digital as an ongoing capability outperform those that do a single "digital project" and stop. Because technology keeps changing, organizations must keep learning, keep listening to customers, and keep updating their systems. When this happens, techno-preneurship becomes the way organization stays relevant, creates new value, and serves people better.

Technopreneurship is the act of starting and growing a business where technology is the main product, service or tool. The word itself joins "technology" and "entrepreneurship." It describes individuals who do not only use technology but build with it to solve real problems. The one who uses technology to solve problem is techno-preneur. Techno-preneur looks at daily challenges in order to designs digital solution. The core of techno-preneurship is opportunity recognition through technology. According to Drucker (2014), entrepreneurship begins when a person sees a change in the market and turns that change into a business opportunity. In the digital age, those changes happen very fast. New phones, cheaper data, and social media create new customer behaviors every year. Sarasvathy (2021) calls this "effectuation" — starting with the resources at hand to build a product step by step while learning from users. Techno-preneurs therefore does not wait for perfect conditions; rather build small version, test run, get feedback and improve on it. This is why many successful tech companies start in small rooms with laptops there after grow into platforms used across countries. However, building a product is only a part; Ries (2017) explains that technopreneurship is about learning as much as it is about building. The author idea of the "Lean Startup" shows that technopreneurs must test ideas quickly, measure what customers actually do, and be ready to change direction which is achievable through business acumen. Blank (2020) opine that customer development is central to avoid building products that nobody wants. Thus, technopreneurs must understand marketing strategies and customer preference in products creation. Blank (2020) opine that customer development is central to avoid building products that nobody wants.

Strengthening Techno-preneurship Through Skill Acquisition

Techno-preneurship is about starting, building and running businesses where technology is the main tool for seeking and identifying veritable economic opportunities and providing solutions to those needs. It is an act of being a technopreneur – an entrepreneur in the field of technology. One who owns and manages a business and assumes its risks technologically. This act begins with idea generation to seeking and seizing opportunities in establishing a business driven by technology. However, ideas must go hand-in-hand with skills in the establishment of industries/companies. Thus, strengthening techno-preneurship in Africa starts with deliberate skill acquisition, a foundation for practical and cogent ability needed to do a job or start a business. In today's world, skills are no longer limited to farming, trading or factory work but include digital skills like software development, data analysis, products design and digital marketing just to mention a few. According to World Bank (2021), countries that invest in technical and digital skills are more likely to see growth in new businesses and innovation. This implies that without skills, the possibilities of building apps, start fintech companies or make available digital services

becomes a chance factor. To overcome chance factor there are skills that could aid the establishment of techno-preneurship in Africa; this include:

Technical Skills: Technical skills are the core digital abilities needed in building solutions. Technical skills are the hands-on digital device used to create tech products, without it techno-preneurs cannot move from idea generation to working prototype. Examples of this skill include web design, mobile app design, data analytics, cloud computing and cybersecurity. These skills no doubt have been making wave in the continent, a clear example in Nigerian Fintech is Paystack. Paystack was founded in 2015 by software engineers Shola Akinlade and Ezra Olubi. Akinlade studied Computer Science at Babcock University and worked as a software engineer with banks before starting the company. The founders spend about a year building the platform and launched an API that allowed businesses to accept payments online in less than 30 minutes (Akinlade, 2016; International Finance Corporation, 2021). Equally, Flutterwave was founded in 2016 by Agboola and Aboyeji. The founding team included Fintech veterans with backgrounds in software engineering product development companies like PayPal and Google Wallet (Today Africa, 2025). Their first product was an API gateway that connected African businesses to cards, mobile wallets and bank transfers. The goal was to build "digital payments infrastructure accessible via APIs so businesses could reach millions of people across Africa. These two cases show how technical competence in software engineering made it possible to design, test, and launch products without depending on foreign developers. Gibb (2002) argues that technical competence gives entrepreneurs the confidence to create new products rather than copying existing products and that technical competence is an indispensible skill that separate mere spectators of innovation from creators of innovative products. The implication of this statement is, techno-preneurs with robust technical skills are able to create and roll out products on their own without having to rely on external force anytime; especially across Africa where tech expertise is a scarce commodity, building this capacity locally reduces cost and makes it easier for more techno-preneurs to start business and succeed.

Business and Entrepreneurial Skills: Building a product is one aspect, turning it into sustainable business crucial for employment and wealth generation is another aspect that requires skills in business model development, financial management, marketing and branding, sales and customer relations, negotiation and pitching ideas to investors. These skills are crucial to the survival of the business as well gaining competitive edge over competitors and according Ethan (2022) the failure of many businesses is attributed to entrepreneurial incompetency. Thus, business skills are vehicle needed for smooth day-day running of the enterprise while entrepreneurial skills are techno-preneur toolkits for spotting viable market opportunities and adapting to sudden market changes. Shane and Venkataraman (2000) explained that entrepreneurship is not just about invention, but also about recognizing opportunities and organizing resources to capture value from them. Techno-preneurs should know who the customer is, how much they will pay, how to reach them, and how to manage costs.

Digital and Adaptive Skills: Technology changes very fast, the rapid pace of technological and systems advancement means that skills acquired today risk becoming obsolete in a short time, making continuous learning essential for techno-preneurs. Because of this, techno-preneurs need more than just technical knowledge. They also need digital and adaptive skills. These include critical thinking, creativity, problem-solving, communication, teamwork, digital literacy, and learning-to-learn. In the context of African where infrastructure, funding, and policy can be unpredictable, these adaptive skills help techno-preneurs stay in business and keep innovating. A developer for instance who learns new programming language today may need to learn another tool next year. A founder who launches a fintech product must also understand new data privacy rules, customer behavior, and market trends. The World Economic Forum (2020) describes these as core skills for the future of work because employers and markets reward people who can adapt quickly. Kuratko (2016) also stresses that entrepreneurial success depends on resilience and the ability to solve problems in uncertain environments. Therefore, training programmes must go beyond coding to build problem-solving and learning abilities that help techno-preneurs survive constant changes.

Techno-preneurship the Pathway to Digital Economy

The world is moving away from relying only on physical shops, factories, and offices. Value today is increasingly created through apps, data, platforms, and internet-powered services. This is called digital economy, and for countries across Africa, techno-preneurship offers the clearest pathway to this type of economy. Techno-preneurship relates to building businesses where technology is the main tool for solving problems. A techno-preneur is a problem-solver and a builder. Such people look

at everyday challenges — like how small businesses collect payments, how students access quality lessons, or how goods move from one city to another and then use technology to design a solution that consumers can pay for and use. In doing this, techno-preneurs do not just look for jobs but create jobs by building products and services faster than traditional companies can. In the past, providing services to millions of people demands that business owners would need several physical locations; but today, one well-built app can reach several users across different countries within a split of seconds. Perhaps this could to be attributed to the growing number of fintech, healthtech, and edtech platforms which runs on digital infrastructure; turning local problems into products that can be used by many. Buttressing this view, the World Bank (2024) explains that digital technologies are helping businesses in developing economies cut costs, enter new markets, and create new types of work. As more techno-preneurs build and launch digital products, more transactions move online, more data is produced, and the entire economy becomes more connected and more productive. The realization of this fit is hinge on reliable internet connectivity, access to funding, mentors, and a market that trust digital systems. In this wise, institutions of learning can help by adding startup labs and practical projects to technology courses. Equally, corporate organizations like financial institutions and other stockholders can also assist by creating simple funding options for early-stage tech businesses. Government could be of immense assistance through provision of clear digital policies, investment in broadband and power. Corroborating this view African Development Bank (2023) submit that investment in digital infrastructure and entrepreneurship programmes directly increases productivity and expands participation in the digital economy. When these pieces come together, more techno-preneurs will be willing to take the risk to build businesses technologically.

Conclusion

Digital transformation of Africa economy cannot be fully achieved by copying models from the western world, rather it will thrive when local techno-preneurs are equipped with relevant skills to solve local problems that culminate into the establishment of local businesses. Techno-preneurship shows that with the right skills and determination, Africans can build solutions that fit its context and create economic opportunities for economic gains. Thus, investment in local capacity, the continent will not only participate in the digital age but also help in shaping it.

Suggestions

Based on the discussion in this paper, the following suggestions are proposed

1. Strengthen Industry-School-Government Partnerships for Skills Development: Tech companies and industrial players should take active part in training Africa's future workforce in technology incline programmes which can be done through internships, apprenticeships, and challenge- based learning where students solve real life problems. Governments should provide tax incentives for companies that invest in skills development.
2. A national "Technopreneurship Fund" can be created to support young techno-preneurs in building tech-driven businesses.
3. Entrepreneurship should be taught as a practical activity from secondary school and not just as a course in the university, this will change the mindset of students from memorization of theoretical curricula to practical skill acquisition When Africans believe they can build and not just consume technology, technopreneurship will thrive.
4. Universities, polytechnics, and TVETs must redesign programs around projects, portfolios, and products. Every graduate in business and technology-related fields should leave with a demonstrable product such as an app, a website, a data dashboard, or a business plan
5. As emphasized by the World Bank (2021) and ITU (2023), broadband, affordable devices, and digital literacy should be treated as public goods. Hence, there should be policies on data subsidization for students, expand rural connectivity, and enforce quality of service. Without cheap and reliable internet services, skills training and techno-preneurship may remain limited to urban elites.

ABSTRACT
This study examined the impact of business education-led technology incubation centers on students-led start-ups in universities and colleges of education in Anambra state. Three research questions guided the study and three null hypotheses were tested at 0.05 level of significance. Population of the study was 614 (221 Colleges of Education and 393 Universities) business education undergraduates across four public tertiary institutions in Anambra State. Due to the manageable size, the entire population was studied hence census sampling. A structured 4-point rating scale questionnaire titled: Business Education Incubation Centres and Students led start up (BEICSLSU) was validated by three experts and yielded a Cronbach alpha reliability coefficient of 0.89. Data collected were analyzed using mean to answer three research questions. Standard deviation was used to determine the homogeneity of the response, whereas the independent samples t-test was used to test three null hypotheses at a 0.05 level of significance. The findings revealed that Business Education-led Technology Incubation Centres contribute to skills acquisition, technology transfer, and business growth among Business Education students to a high extent. The independent samples t-test further showed that there was no significant difference between the mean ratings of university students and those of Colleges of Education students on the three variables investigated. Furthermore, the study showed that business education-led technology incubation centres have significant impact on technology transfer to students in tertiary institution in Anambra State. Based on these findings, the study recommended that administrators of business education programmes and curriculum planners should integrate practical incubation and innovation training into business education programmes in tertiary institutions in Anambra state.

Keywords: Business Education students, Technology transfer, Business Growth, Skill Acquisition, Incubation Centres.

Introduction
Technology incubation centres have emerged as strategic platforms for nurturing student entrepreneurship, yet their integration within Business Education (BE) programmes remains underexplored. This study seeks to examine the impact of Business Education-led technology incubation centres on students-led start-ups in universities and Colleges of Education (COEs) in Anambra State, Nigeria. However, the persistent mismatch between business education outcomes and labour market demands in Nigeria has intensified calls for entrepreneurship-driven pedagogy (Okeke & Nwankwo, 2024). In Anambra State-a commercial hub known for its vibrant small and medium

enterprises (SMEs) and a growing tech ecosystem-universities (e.g., Nnamdi Azikiwe University, Awka; Chukwuemeka Odumegwu Ojukwu University, Igbariam) and Colleges of Education (e.g., Federal College of Education (Technical), Umunze; Nwafor Orizu College of Education, Nsugbe) have begun establishing technology incubation centres. These centres are designed to provide students with workspace, mentorship, prototyping tools, and seed funding. When anchored within Business Education departments, such centres aim to transform theoretical business knowledge into technology-enabled student-led start-ups (Eze & Okafor, 2023).

The increasing shift toward knowledge-driven economies has placed entrepreneurship and innovation at the center of higher education globally. Universities and colleges are no longer seen only as centers of knowledge dissemination but as hubs for innovation, commercialization, and enterprise creation (Rambe, 2022). Business Education, as a vocational and entrepreneurial-oriented discipline, is designed to equip learners with practical skills, managerial competencies, technological knowledge, and entrepreneurial capabilities required for employment and business ownership. In recent years, Business Education programmes have expanded beyond conventional office and commerce training to include innovation, digital entrepreneurship, technology-driven business development, and startup incubation initiatives. This transformation has led to the emergence of Business Education-led Technology Incubation Centres in tertiary institutions as strategic platforms for promoting entrepreneurship and innovation among students.

Incubation is the process of providing beginning businesses with momentary assistance in the shape of a variety of intricate offerings and unique surroundings. This is done to increase the likelihood of beginning businesses surviving the early stages of their existence and laying the groundwork for future greater expansion (Abubakar-Sadeeq, Othman, Audu, Ramalan, & Abdullahi, 2021). Incubation centres are defined as places of communication and synergy, making them effective in numerous environments (Costello, 2016). Technology incubation centres are increasingly recognized as essential drivers of entrepreneurial development because they bridge the gap between theoretical learning and practical business application. Through incubation programmes, students are exposed to experiential learning opportunities that enhance creativity, innovation, entrepreneurial intention, and business startup readiness. Research has shown that incubation support contributes significantly to entrepreneurial self-efficacy, startup intention, innovation capability, and the successful development of student enterprises (Abubakar-Sadeeq et al., 2021). Technology Incubation Centres (TICs) play a crucial role in fostering entrepreneurship by providing a supportive ecosystem for early-stage technology-based startups (Rambe, 2022). They offer a range of services to startups, including: TICs provide startups with affordable office space, which allows them to focus on their business without worrying about the logistics of setting up their own office. TICs provide startups with access to necessary infrastructure and equipment, such as computers, software, and lab space. TICs provide startups with mentorship and training from experienced entrepreneurs and professionals. This helps startups develop their business acumen and technical skills. TICs provide startups with opportunities to network with other entrepreneurs, investors, and potential customers. This can help them raise capital, find partners, and build a customer base Kaggwa, Onunka, Uwaoma, Onunka, Daraojimba, & Nsisong, 2023). Similarly, Chista et al (2021), averred that business incubation improves a prospective entrepreneur's access to the tools and resources required for success. Furthermore, business incubators and accelerators have been found to enhance entrepreneurship in specialized areas such as educational technology (EdTech), demonstrating the importance of institutional support systems in fostering innovation among students (Soetan et al., 2024).

Business Education-led Technology Incubation Centres broadly refer to institution-based entrepreneurial and technological support centres established within Business Education programmes to nurture innovative ideas, develop entrepreneurial competencies, provide mentorship, facilitate access to technology, and support the transformation of students' business ideas into sustainable startup ventures (Niyaz, Arun, Riha, Madhura, & Ujwala, 2024). These centres integrate entrepreneurship education, technology training, business advisory services, innovation support, networking opportunities, and access to funding opportunities in order to assist students in developing and commercializing innovative business concepts. Business incubation centres also provide conducive environments where students receive guidance in business planning, product development, marketing strategies, financial management, and enterprise sustainability.

Business education holds the key to training the skilled workforce needed for the changing technological workforce in the e-world. It is concerned with the acquisition of knowledge and skills for the world of work to increase opportunities for productive empowerment, entrepreneurship, technological transfer and business growth (Emeasoba & Nwatalari, 2021). Skill acquisition is a major tool for extreme poverty and hunger eradication with the aim of creating an avenue for jobs and wealth which will bring self-

reliance and sufficiency and, contribute to the growth and development of a country's economy (Isaac in Oyerinde & Falade 2016). Nwaukwa, Iloeje, Nzeh and Nwagu (2018) stated that skill acquisition leads to employment generation in small and medium enterprises such as computer business centers, book binding centers, laminating centers, computer sales, computer training, internet centers (cybercafé), business registration, photocopying centers, reprographic, and printing press among others. Technology transfer is the process by which a developer of technology makes its technology available to a commercial partner that will exploit the technology. Technology transfer can be seen as the process of advancing of technology from one place to another. Technology transfer is the process sharing of knowledge that is applied to research in technology agencies, universities, laboratories and other institutions that are capable of knowledge sharing. Effective knowledge sharing among entrepreneurs will lead to technology transfer. This entails the provision of training support for developing entrepreneurs. In this case, an innovation-based incubator should involve highly specialised and qualified team Urbano in Jenyo et al, 2019).

Technology incubation has played an important role as an instrument for business growth and entrepreneurship development around the world. According to Ndagi (2019) Technology incubators are economic development tool use for promoting business growth through innovation and application of technology, support economic development strategies for small business development, and encourage growth from within local economies. These will help business education students' start-ups into commercially viable products/services by providing specialists in various area of endeavors, skilled training, guidance, critical support services, such as invention and innovation, financing, laboratory, library, networking/ ICT, in small and medium scale businesses

Students-led startups refer to business ventures initiated, owned, and managed by students or recent graduates with the aim of providing innovative products or services while generating income, employment, and entrepreneurial experience. These startups are usually developed from innovative ideas, academic projects, technological discoveries, or entrepreneurial opportunities identified by students within educational institutions. Student-led startups are characterized by creativity, innovation, adaptability, and the utilization of modern technologies to address societal and market challenges. Such startups often emerge through entrepreneurship education programmes, business competitions, incubation initiatives, mentorship schemes, and institutional innovation hubs (Jane, Egbide, Ojochide, Eze, & Ibrahim, 2025).

Globally, incubation centers provide structured support systems such as mentorship, funding access, networking opportunities, and technical assistance that significantly improve the survival and growth of start-ups. These centers are widely recognized as catalysts for innovation and economic development, especially in developing economies where youth unemployment remains a critical challenge. Empirical evidence indicates that incubation programmes enhance entrepreneurial capabilities, improve business survival rates, and foster innovation ecosystems (Kaggwa, Onunka, Uwaoma, Onunka, Daraojimba, & Nsisong, 2023). In Nigeria, the establishment of technology incubation centers has been part of broader policy initiatives aimed at promoting entrepreneurship, innovation, and economic diversification. These centers provide a conducive environment for nurturing start-ups by offering shared facilities, training, and advisory services. Studies have shown that incubation centres contribute significantly to entrepreneurship development by supporting start-ups in their early stages and increasing their chances of survival (Abubakar-Sadeeq et al., 2021). When anchored within Business Education departments, such centers aim to transform theoretical business knowledge into technology-enabled student-led start-ups (Eze & Okafor, 2023). For universities and colleges of education, especially those offering Business Education, technology incubation centers can serve as a bridge between classroom learning and actual venture creation. A recent study in Anambra State found that an entrepreneurship workshop programme positively influenced entrepreneurial intentions among students, while another study in South-East Nigeria showed that idea incubation and business growth were positively linked. Mentorship and networking significantly improved self-employment success among Business Education graduates. These findings suggest that structured incubation can strengthen students' entrepreneurial outcomes, but they still leave open the specific question of how Business Education-led technology incubation centers affect students-led start-ups in Anambra State (Obi, Akudolu, & Ikpat, 2025).

Despite these developments, the integration of business education-led technology incubation centers into teaching and learning remains uneven across Nigerian institutions. In states such as Anambra, where universities and colleges of education are expected to produce entrepreneurial graduates, the effectiveness of such incubation centers in supporting students-led start-ups is still underexplored. While some institutions have established entrepreneurship centers, there is limited empirical evidence

on how these centers directly influence students' ability to initiate and sustain start-ups. Therefore, this study seeks to assess the impact of business education-led technology incubation centers on students-led start-ups in universities and colleges of education in Anambra State with a view to determining how incubation support services influence startup development, innovation capacity, entrepreneurial skills acquisition, and business sustainability among students.

Statement of the Problem

The high rate of graduate unemployment in Nigeria has intensified the need for entrepreneurship-driven education that equips students with the skills and supports required to create their own businesses. Although business education programme has incorporated entrepreneurship courses, many graduates still struggle to translate theoretical knowledge into viable business ventures. Tertiary institutions are established to equip students with advanced knowledge, skills, and qualifications necessary for professional and academic advancement.

However, in Nigeria, these goals appear largely unrealized, as reflected in the high unemployment rate among graduates, particularly business education graduates. This growing unemployment has become a major concern for both the Anambra State government and the nation at large. According to the Nigerian Bureau of Statistics (NBS), about 47% of the 500,000 graduates produced annually remain unemployed due to a lack of requisite skills (Abbas & Osunsan, 2020). The unemployment rate increased from 27.1% in 2020 to 35.3% in 2023 while graduate employability stands at only 36% ((NBS, 2023), underscoring a significant challenge to the employability of business education students. One of the major challenges is the lack of practical support systems such as effective technology incubation centers that can guide students from idea generation to business implementation. While incubation centers are designed to provide mentorship, funding access, and business development services, studies suggest that their effectiveness varies across institutions, and in some cases, they are underutilized or poorly integrated into academic programmes (Mavuri et al., 2023). Although entrepreneurship has been integrated into Nigerian tertiary education, many programmes still struggle to convert learning into real business creation. Recent literature shows that Nigeria's universities have had a near absence of robust incubation programmes, and policy makers have only recently begun to focus more deliberately on university business and technology incubators (Obi & Okoye, 2025).

In Anambra State, universities already have entrepreneurship structures, and the state's innovation district provides support services for startups. However, these developments have not been sufficiently examined in relation to Business Education students' actual start-up outcomes across both universities and colleges of education. There is insufficient empirical research on how these centers specifically impact students during their academic training, rather than after graduation. This gap creates uncertainty about whether business education-led technology incubation centres in universities and colleges of education in Anambra State are effectively fulfilling their role in fostering student entrepreneurship and start-up development. Therefore, the problem of this study is to determine the extent to which business education-led technology incubation centres influence the development, sustainability, and success of students-led start-ups in tertiary institutions in Anambra State.

Purpose of the Study

The main purpose of the study was to determine the extent of Business Education-led technology incubation centres on students-led start-ups in universities and colleges of education in Anambra State. Specifically, the study sought to determine:

1. the extent business education –led technology incubation centres impact on skills acquisition of students in tertiary institutions in Anambra state.
2. the extent business education –led technology incubation centres impact on technology transfer to students in tertiary institutions in Anambra state.
3. the extent of business education –led technology incubation centres impact on business growth of students in tertiary institutions in Anambra state.

Research Questions

The following research questions guided the study:

1. To what extent do business education-led technology incubation centres impact on skill acquisition of students in tertiary institution in Anambra State?
2. To what extent do business education-led technology incubation centres impact on technology transfer to students' tertiary institution in Anambra State?
3. To what extent do business education-led technology incubation centres impact on business growth among students in tertiary institution in Anambra State?

Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

H_{01}: There is no significant difference between the mean ratings of Business Education students in universities and Colleges of Education on the extent to which Business Education-led technology incubation centres enhance students' skills acquisition in Anambra State.

H_{02}: There is no significant difference between the mean ratings of Business Education students in universities and Colleges of Education on the extent to which Business Education-led technology incubation centres facilitate technology transfer to students in Anambra State.

H_{03}: There is no significant difference between the mean ratings of Business Education students in universities and Colleges of Education on the extent to which Business Education-led technology incubation centres promote business growth among students in Anambra State.

Methodology

This study adopted a descriptive survey research design. The descriptive survey design was considered appropriate because it enabled the researcher to collect data from respondents using a structured questionnaire to determine their opinions on business education incubation centres and students-led start-ups in public tertiary institutions in Anambra State. The study was conducted in Anambra State, located in the South-East geopolitical zone of Nigeria. The population of the study comprised 614 Business Education undergraduates from public tertiary institutions in the state, consisting of 221 students from Colleges of Education and 393 students from universities offering Business Education programmes. Since the population was manageable, the census sampling technique was adopted; therefore, all the 614 Business Education undergraduates constituted the respondents for the study. Data were collected using a researcher-developed questionnaire titled *Business Education Incubation Centres and Students-Led Start-Up Questionnaire (BEICSLSUQ).* The instrument consisted of 30 items structured on a four-point rating scale of Very High Extent (VHE), High Extent (HE), Low Extent (LE), and Very Low Extent (VLE), with corresponding values of 4, 3, 2, and 1, respectively. The instrument was subjected to face validation by three experts: two experts in Business Education and one expert in Measurement and Evaluation from Delta State University, Abraka, Nigeria. Their observations and recommendations were incorporated in the final version of the instrument before administration. To establish the internal consistency of the instrument, a pilot study was conducted using 30 Business Education students from the Department of Business Education, University of Nigeria, Nsukka, who were not part of the study population. Data obtained from the pilot study were analysed using the Cronbach Alpha reliability method with the aid of the Statistical Package for the Social Sciences (SPSS) Version 21. The analysis yielded an overall reliability coefficient of 0.89, indicating that the instrument was highly reliable for the study. A total of 614 copies of the questionnaire were administered to the respondents through direct contact with the assistance of research assistants. All the 614 copies administered were properly completed and retrieved, representing a 100% retrieval rate. Data collected were analysed using both descriptive and inferential statistics. The research questions were answered using the mean (X) and standard deviation. The mean was used to determine the extent of respondents' ratings with each item, while the standard deviation determined the degree of homogeneity or variability of the respondents' opinions. A criterion mean of 2.50 was adopted for decision-making. Mean scores of 2.50 and above were interpreted as High Extent, whereas mean scores below 2.50 were interpreted as Low Extent. The three null hypotheses were tested using the Independent Samples *t*-test at the 0.05 level of significance. The null hypothesis was rejected where the associated probability (*p*) value was less than 0.05; otherwise, it was not rejected.

Results

Research Question 1: To what extent do business education-led technology incubation centres impact on skill acquisition of students in tertiary institution in Anambra State?

Table 1: Mean and Standard deviation of response of Students on the extent business education-led technology incubation centres has impacted on skill acquisition of students in tertiary institution in Anambra State. (N=614)

S/N	Items	Federal University			College of Education		
		Mean	SD	Remarks	Mean	SD	Remarks
1.	Technology incubation centres improve my entrepreneurial skills	3.60	0.88	**HE**	3.58	0.87	**HE**
2.	The centres improve my digital literacy skills.	3.67	0.92	**HE**	3.40	0.79	**HE**
3	The incubation programme improves my business planning skills.	3.75	0.81	**HE**	3.89	0.89	**HE**
4	The programme enhances my critical thinking and problem-solving skills.	3.76	0.78	**HE**	3.58	0.98	**HE**

5	The centres improve my communication and presentation skills.	3.72	0.85	**HE**	3.11	0.82	**HE**
6	The incubation programme develops my leadership abilities.	3.56	0.84	**HE**	3.50	0.80	**HE**
7	The centres improve my innovation and creativity skills.	3.47	0.88	**HE**	3.89	0.86	**HE**
8	The practical training prepares me for self-employment.	3.64	0.89	**HE**	3.47	0.98	**HE**
9	The incubation activities improve my managerial skills.	3.55	0.88	**HE**	3.05	0.75	**HE**

Source: Field survey, 2026

Result of Table 1 indicates mean and standard deviation scores of respondents with a mean response of 3.11 to 3.89 which means that the respondents were of opinion that business education-led technology incubation centres have impacted skill acquisition of students in tertiary institution in Anambra State. However, average standard deviation of 0.70 to 0.98 of the respondents indicate that their mean did not vary on the impact of business education-led incubation centres on skills acquisition of students in Anambra state. With a cutoff point of 2.5 a grand mean of 3.63-3.51 and grand standard deviation of 0.86-0.84, shows that all the respondents were of the opinion that business education-led incubation centres have impact on skills acquisition of students in Anambra state to a high extent.

Research Question 2: To what extent do business education-led technology incubation centres impact on technology transfer to students' tertiary institution in Anambra State?

Table 2: Mean and Standard deviation of response of Students on the extent business education-led technology incubation centres impact on technology transfer of students' tertiary institution in Anambra State. (N=614)

Source: Field survey, 2026

Data analyzed on Table 2 indicates the mean and standard deviation scores of respondents in the impact of business education-led technology incubation centres on technology transfer to students tertiary institution in Anambra State. The data revealed that ten items were rated above a mean score of 2.50 with their mean responses ranging between 3.04 and 3.87. This implies that students were in agreement that business education-led technology incubation centres facilitate technology transfer, expose students to modern technologies and enhances students' ability to solve business problems

using technology to a high extent. However, standard deviation scores ranging from 0.70 to 0.98 indicate that students had similar view in the impact of business education-led technology incubation centres technology transfer to students' tertiary institution in Anambra State. The grand mean of 3.38 and 3.40 indicated that students in colleges of education and universities were in agreement that business education-led technology incubation centres have impacted to a high extent on technology transfer to students.

Research Question 3: To what extent do business education-led technology centres impact on business growth among students in tertiary institution in Anambra State?

Table 3: Mean and Standard deviation of response of Students on the extent business education-led technology impact on business growth among students in tertiary institution in Anambra State. (N=614)

S/N	Items	Federal University			College of Education		
		Mean	SD	Remarks	Mean	SD	Remarks
1.	Participation in incubation programmes encourages students to establish businesses.	2.52	0.68	**HE**	3.29	0.85	**HE**
2.	The incubation centres improve the growth of students' businesses.	2.51	0.87	**HE**	2.62	0.72	**HE**
3	Participation in incubation programmes contributes to job creation among student entrepreneurs.	2.53	0.51	**HE**	3.37	0.78	**HE**
4	Technology incubation centres significantly contribute to the growth and survival of students' start-ups.	2.62	0.74	**HE**	2.68	0.61	**HE**
5	Participation in incubation programmes contributes to employment generation.	2.61	0.64	**HE**	2.81	0.69	**HE**

9	Students' businesses experience increased sales after incubation support.	3.38	0.83	**HE**	2.61	0.54	**HE**
10	Overall, Business Education-led Technology Incubation Centres significantly promote students-led start-ups.	2.51	0.63	**HE**	2.54	0.60	**HE**
	Grand Mean and SD	**2.75**	**0.70**	**HE**	**2.88**	**0.72**	**HE**

Source: Field survey, 2026

The data presented in Table 3 indicates mean and standard deviation scores of respondents in the impact of business education-led technology centres on business growth among students in college of education and in Anambra State. The data in Table 3 revealed that ten items were rated above a mean score of 2.50 among business education students of colleges of education and universities with their mean responses ranging between 2.51 and 3.40 which means that the respondents were of opinion that business education-led technology centres have impacted to a high extent on business growth among students in tertiary institution in Anambra State. However, grand mean of 2,75 and 2.88 showed that all the respondents were in their agreement that business education-led technology centres improve business growth among students in colleges of education and universitiesin Anambra State. This implies that the students had the same view on the impact of business education-led technology on business growth among students in tertiary institution in Anambra State.

Test of Hypotheses

H_{o1}: There is no significant difference between the mean ratings of Business Education students in universities and Colleges of Education on the extent to which Business Education-led technology incubation centres enhance students' skills acquisition in Anambra State.

Table 4: t-test results of difference between the mean ratings of students of the Federal university and College of Education in the impact of business education-led technology incubation on skill acquisition of students in tertiary institution in Anambra State.

Respondents	N	$\bar{X}$	SD	DF	t-cal.	t-crit.	Decision
Universities	393	3.63	0.86				
				612	1.32	1.96	Not Significant
Colleges of Education	221	3.51	0.84				

The result in Table 4 shows that the calculated *t*-value of 1.32 is less than the critical *t*-value of 1.96 at the 0.05 level of significance. Therefore, the null hypothesis was not rejected. This implies that there is no significant difference between the mean ratings of Business Education students in universities and those in Colleges of Education on the extent to which Business Education-led technology incubation centres enhance students' skills acquisition in Anambra State.

H_{02}: There is no significant difference between the mean ratings of Business Education students in universities and Colleges of Education on the extent to which Business Education-led technology incubation centres facilitate technology transfer to students in Anambra State.

Table 5: t-test results of difference between the mean ratings of students of the Federal University and College of Education in the impact of business education-led incubation centres on technology transfer to students in universities and colleges of education in Anambra State.

Respondents	N	$\bar{X}$	SD	DF	t-cal.	t-crit.	Decision
Universities	393	3.38	0.83				
				612	0.24	1.96	Not Significant
Colleges of Education	221	3.40	0.83				

The result in Table 5 shows that the calculated *t*-value of 0.24 is less than the critical *t*-value of 1.96 at the 0.05 level of significance. Therefore, the null hypothesis was not rejected. This implies that there is no significant difference between the mean ratings of Business Education students in universities and those in Colleges of Education on the extent to which Business Education-led technology incubation centres facilitate technology transfer to students in Anambra State.

H_{03}: There is no significant difference between the mean ratings of Business Education students in universities and Colleges of Education on the extent to which Business Education-led technology incubation centres promote business growth among students in Anambra State.

Table 6: t-test results of difference between the mean ratings of students of the Federal University and College of Education in the impact of business education-led technology incubation centres on business growth in tertiary institution in Anambra State.

Respondents	N	$\bar{X}$	SD	DF	t-cal.	t-crit.	Decision
Universities	393	2.75	0.70				
				612	1.41	1.96	Not Significant
Colleges of Education	221	2.88	0.72				

The result in Table 6 shows that the calculated *t*-value of 1.41 is less than the critical *t*-value of 1.96 at the 0.05 level of significance. Therefore, the null hypothesis was not rejected. This implies that there is no significant difference between the mean ratings of Business Education students in universities and those in Colleges of Education on the extent to which Business Education-led technology incubation centres promote business growth among students in Anambra State.

Discussion of Findings

Business Education-led Technology Incubation Centres and Students' Skills Acquisition

The findings of the study revealed that Business Education students in universities and Colleges of Education perceived that Business Education-led technology incubation centres enhance students' skills acquisition to a high extent. The respondents agreed that incubation centres improve entrepreneurial, digital literacy, business planning, communication, managerial, leadership, innovation, creativity, and self-employment skills. The hypothesis test further revealed that there was no significant

difference between the mean ratings of Business Education students in universities and those in Colleges of Education regarding the extent to which Business Education-led technology incubation centres enhance students' skills acquisition. This suggests that irrespective of the type of institution attended, students share similar perceptions about the contribution of incubation centres to skills acquisition. The finding is consistent with Lukes, Longo, and Zouhar (2019), who reported that business incubators provide coaching, mentoring, networking opportunities, and access to professional support services that significantly improve entrepreneurs' managerial and entrepreneurial competencies. The finding also supports Chitsa, Mpofu, and Moyo (2021), who found that incubation centres enhance entrepreneurial skills by providing prospective entrepreneurs with access to business development resources, technical guidance, and practical training needed for enterprise development. This therefore suggests that Business Education-led technology incubation centres provide comparable opportunities for developing entrepreneurial competencies among students, regardless of whether they are enrolled in universities or Colleges of Education in Anambra State.

Business Education-led Technology Incubation Centres and Technology Transfer

The findings indicated that Business Education-led technology incubation centres facilitate technology transfer to students to a high extent. The respondents agreed that incubation centres expose students to modern technologies, improve ICT competencies, encourage technology commercialization, strengthen technology-based product development, provide mentorship from technology experts, and improve students' entrepreneurial competence through technology integration. The hypothesis test also showed that there was no significant difference between the mean ratings of Business Education students in universities and those in Colleges of Education on the extent to which Business Education-led technology incubation centres facilitate technology transfer. This implies that students across both categories of institutions perceive incubation centres as providing similar opportunities for acquiring technological competencies and innovation skills. The finding agrees with Abubakar-Sadeeq et al. (2021), who observed that technology incubation programmes promote entrepreneurship by providing entrepreneurs with technological support, business advisory services, innovation facilities, and opportunities for commercializing new ideas. The finding is also in line with Soetan, Ogundairo, and Aiyedun (2024), who reported that business incubators and accelerators enhance innovation by exposing students to digital technologies, mentoring, networking, and practical entrepreneurial experiences that improve technology adoption and business development. This therefore suggests that Business Education-led technology incubation centres provide comparable opportunities for technology transfer and innovation development among students, irrespective of whether they are enrolled in universities or Colleges of Education in Anambra State.

Business Education-led Technology Incubation Centres and Business Growth

The findings further revealed that Business Education-led technology incubation centres promote business growth among students to a high extent. The respondents agreed that participation in incubation programmes encourages business establishment, employment generation, business sustainability, customer acquisition, business expansion, and the growth of students' start-up ventures. The hypothesis test, however, revealed that there was no significant difference between the mean ratings of Business Education students in universities and those in Colleges of Education regarding the extent to which Business Education-led technology incubation centres promote business growth. This indicates that students in both institutional categories expressed similar opinions on the contribution of incubation centres to business growth. The finding corroborates the study of Onwuzuligbo and Nwota (2023), who reported that idea incubation positively influences business growth among entrepreneurs in South-East Nigeria by providing the support structures required for enterprise development. Similarly, Niyaz, Arun, Riha, Madhura, and Ujwala (2024) found that incubation centres accelerate entrepreneurship by providing access to innovation support, mentorship, networking opportunities, and business development services that improve the growth and sustainability of start-up enterprises. This therefore suggests that Business Education-led technology incubation centres provide comparable opportunities for fostering business growth and supporting the sustainability of students' start-up ventures, irrespective of whether the students are enrolled in universities or Colleges of Education in Anambra State.

Conclusion

This study examined the extent to which Business Education-led Technology Incubation Centres contribute to students-led start-ups in universities and Colleges of Education in Anambra State. Based on the findings, it was concluded that Business Education-led Technology Incubation Centres contribute to the development of students' entrepreneurial competencies by enhancing skills acquisition, facilitating technology transfer, and promoting business growth to a high extent. The study further concluded that Business Education students in universities and Colleges of Education held similar

perceptions regarding these contributions, as there was no statistically significant difference in their mean ratings. This implies that Business Education-led Technology Incubation Centres serve as valuable platforms for fostering entrepreneurship and supporting students-led start-up development across public tertiary institutions in Anambra State, irrespective of the type of institution.

Recommendations

Based on the findings of the research the study, it is recommended that:

i. Government and institutional authorities should strengthen and expand business education-led technology incubation centres in tertiary institutions. This could involve increasing funding, providing modern ICT laboratories, digital equipment, internet facilities, and establish incubation centres in institutions where they are lacking.
ii. Administrators of business education programme in tertiary institutions should collaborate with local industries and businesses to structure and implement robust mentorship programmes. These programmes will allow students to gain hands-on experience and industry-specific skills that are essential for employment after graduation.
iii. Administrators of business education programmes and curriculum planners should integrate practical incubation and innovation training into business education programmes, such as internships, projects, and case studies, regular workshops, seminars, innovation competitions, compulsory industrial training and internship programmes. This integration will expose students to practical technological applications and industry best practices.

Abstract

This study examined the relationship between digital literacy and technopreneurial intentions among university undergraduates in Abia State. With rising youth unemployment and the expansion of Nigeria's digital economy, understanding how digital competencies influence technology-driven entrepreneurial intentions is critical for higher education and policy interventions. The study adopted a correlational research design and employed a multi-stage sampling technique to select 360 undergraduate students from Abia State University and Michael Okpara University of Agriculture. Data were collected using a structured questionnaire measuring digital literacy, technological self-efficacy, and technopreneurial intentions. Data analysis involved Pearson Product-Moment Correlation (PPMC) for research questions and linear regression analysis for testing hypotheses at a 0.05 significance level. Findings revealed a strong positive correlation between digital literacy and technopreneurial intentions ($r = 0.63$, $p < 0.05$) and a moderate positive correlation with technological self-efficacy ($r = 0.58$, $p < 0.05$). Regression results indicated that digital literacy significantly predicts both technopreneurial intentions ($\beta = 0.63$) and technological self-efficacy ($\beta = 0.58$). The study concludes that digital literacy is a key determinant of undergraduates' readiness to engage in technology-driven entrepreneurial ventures.

Keywords: Digital literacy, Technopreneurial intentions, Technological self-efficacy, University undergraduates

Introduction

Entrepreneurship is widely acknowledged as a strategic engine of economic growth, innovation, employment generation, and structural transformation, particularly in emerging and developing economies (Acs et al., 2018). In Nigeria, where youth unemployment and graduate underemployment remain persistently high, entrepreneurship has been positioned as a policy instrument for inclusive growth and sustainable development (National Bureau of Statistics [NBS], 2023). Consequently, entrepreneurship education was institutionalized across tertiary institutions through the National Policy on Education (Federal Republic of Nigeria, 2013) with the expectation that exposure to entrepreneurial training would stimulate venture creation and reduce dependency on paid employment. Empirical evidence within Nigeria generally suggests a positive relationship between entrepreneurship education and entrepreneurial intentions (Ozaralli & Rivenburgh, 2016; Akinwale et al., 2023). However, the evolving digital economy demands a re-examination of the competencies embedded within entrepreneurship curricula.

The rapid expansion of digital technologies has fundamentally reconfigured entrepreneurial processes globally. Digital infrastructures—including broadband connectivity, mobile technologies, cloud computing, artificial intelligence, financial technologies, and platform ecosystems—have altered opportunity recognition, value creation, and venture scalability (Nambisan, 2017; Autio et al., 2018). Unlike traditional entrepreneurship, digital entrepreneurship is platform-based, data-driven, ecosystem-oriented, and characterized by low marginal costs and accelerated innovation cycles. In emerging economies such as Nigeria, digital technologies reduce traditional barriers to entry and provide alternative pathways for youth economic participation (World Bank, 2020). Recent Nigerian studies confirm that digital transformation is reshaping sectors such as fintech, e-commerce, agritech, and creative digital industries (Eze & Chinedu, 2022; Oladipo & Afolabi, 2024).

Central to effective participation in this digital entrepreneurial ecosystem is digital literacy. Digital literacy extends beyond basic computer competence to include the ability to access, evaluate, create, and strategically deploy digital technologies for productive and innovative purposes. It encompasses information literacy, digital communication skills, cybersecurity awareness, data interpretation, online collaboration, and digital content creation. In the Nigerian context, digital literacy has been identified as a significant determinant of innovation capability and business competitiveness (Roseline & Harcourt, 2025). Similarly, Abiodun (2025) found that digital skill acquisition significantly predicts entrepreneurial intention among university students in southwestern Nigeria. These findings suggest that digital literacy may serve not merely as a technical skill but as a strategic entrepreneurial resource.

The emergence of technopreneurship—entrepreneurship driven by technological innovation—further underscores the importance of digital competence. Technopreneurial ventures typically leverage digital platforms, software solutions, mobile applications, and data systems to deliver scalable value propositions. Such ventures require technological self-efficacy, innovation orientation, and digital problem-solving capabilities beyond those emphasized in traditional entrepreneurship training. Studies in sub-Saharan Africa indicate that technology-related competencies significantly enhance students' propensity toward digital venture creation (Boateng et al., 2022; Aderemi et al., 2023). However, empirical evidence remains limited regarding how digital literacy specifically shapes technopreneurial intentions within Nigerian subnational contexts.

Theoretically, entrepreneurial intention is most commonly explained using the Theory of Planned Behavior (TPB) (Ajzen, 1991). The TPB posits that intention is influenced by attitudes toward the behavior, subjective norms, and perceived behavioral control. Entrepreneurship education has been shown to positively influence these antecedents by enhancing entrepreneurial self-efficacy and opportunity recognition (Krueger et al., 2000; Bae et al., 2014). However, digital entrepreneurship introduces additional cognitive dimensions, including technological self-efficacy, digital confidence, and innovation readiness. Digital literacy may strengthen perceived behavioral control by reducing technological uncertainty, enhance positive attitudes toward technopreneurship through exposure to digital opportunities, and reinforce supportive subjective norms via online entrepreneurial communities (Ogunyemi & Adeyemo, 2024). Despite these theoretical linkages, limited empirical research has systematically examined digital literacy as a direct predictor of technopreneurial intentions among undergraduates in southeastern Nigeria.

At the regional level, Abia State presents a distinctive entrepreneurial ecosystem. The commercial hub of Aba is historically renowned for its manufacturing clusters and informal innovation networks, increasingly integrating digital commerce into traditional production systems. Meanwhile, Umuahia functions as an administrative and educational center hosting key tertiary institutions such as Abia State University and Michael Okpara University of Agriculture. These institutions play a critical role in shaping the entrepreneurial orientations and digital capabilities of undergraduates within the state. Nonetheless, emerging evidence suggests disparities in digital competence levels among Nigerian undergraduates, often attributed to infrastructural deficits, inconsistent ICT integration, and limited experiential digital training (Uzoka & Okoli, 2025; Nwosu et al., 2024).

Although many students actively engage with digital technologies for social and entertainment purposes, passive usage does not necessarily translate into productive digital entrepreneurship. The distinction between digital consumption and digital innovation is critical. Without strategic digital literacy, undergraduates may lack the confidence and capability required to conceptualize, launch, and scale technology-enabled ventures. Therefore, understanding how digital literacy influences technopreneurial intentions is essential for designing responsive curricula and institutional strategies aligned with Nigeria's digital transformation agenda.

Despite growing scholarly interest in entrepreneurship education in Nigeria, most existing studies focus broadly on entrepreneurial intention without isolating digital literacy as a core explanatory variable. Furthermore, subnational empirical evidence from southeastern Nigeria remains scarce. This gap limits understanding of how contextual factors shape the relationship between digital competence and technopreneurial intention formation.

This study therefore seeks to empirically examine the relationship between digital literacy and technopreneurial intentions among university undergraduates in Abia State. By doing so, it makes three key contributions. First, it advances entrepreneurship education literature by positioning digital literacy as a strategic antecedent of technopreneurial intention. Second, it extends the Theory of Planned Behavior by integrating digital competence into entrepreneurial intention modeling within an emerging economy context. Third, it provides context-specific empirical evidence from southeastern Nigeria, thereby enriching African scholarship on digital entrepreneurship and higher education transformation. Ultimately, the findings are expected to inform curriculum reform, digital skills development initiatives,

and policy interventions aimed at strengthening technology-enabled entrepreneurial capacity among Nigerian undergraduates in an increasingly digitized economy.

Statement of the Problem

Despite the institutionalization of entrepreneurship education across Nigerian universities, graduate unemployment and underemployment remain persistently high (National Bureau of Statistics [NBS], 2023). While entrepreneurship programs are designed to stimulate venture creation, much of the curriculum remains oriented toward traditional business models, with insufficient emphasis on digitally enabled enterprise development. This misalignment is problematic in an era where entrepreneurial opportunities are increasingly embedded within digital platforms, technology ecosystems, and innovation-driven markets (Nambisan, 2017; Autio et al., 2018).

Digital literacy has emerged as a foundational competence for participation in the modern entrepreneurial landscape. Empirical studies in Nigeria suggest that digital skills significantly influence innovation capacity and entrepreneurial outcomes (Akinwale et al., 2023; Abiodun, 2025). However, existing research has largely examined general entrepreneurial intentions without isolating digital literacy as a critical predictor of technopreneurial intentions, particularly within subnational contexts. Consequently, there is limited empirical evidence on whether and to what extent digital literacy shapes undergraduates' intentions to establish technology-driven ventures.

In Abia State, universities such as Abia State University and Michael Okpara University of Agriculture play a central role in developing students' entrepreneurial capacities. However, anecdotal observations and emerging regional studies suggest disparities in students' digital competencies, infrastructural limitations, and limited integration of advanced digital skills into entrepreneurship training (Uzoka & Okoli, 2025). Without adequate digital literacy, undergraduates may lack the technological self-efficacy and perceived behavioral control necessary for technopreneurial engagement.

The problem therefore lies in the insufficient empirical understanding of the relationship between digital literacy and technopreneurial intentions among university undergraduates in Abia State. Addressing this gap is essential for informing curriculum reform, strengthening digital capacity development, and aligning higher education entrepreneurship programs with the demands of Nigeria's rapidly evolving digital economy.

Purpose of the Study

The main purpose of this study is to examine the relationship between digital literacy and technopreneurial intentions among university undergraduates in Abia State.

Specifically, the study seeks to:

1. Determine the extent to which digital literacy influences technopreneurial intentions among university undergraduates in Abia State.
2. Examine the effect of digital literacy on technological self-efficacy among university undergraduates in Abia State.

Research Questions

1. To what extent does digital literacy influence technopreneurial intentions among university undergraduates in Abia State?
2. What is the effect of digital literacy on technological self-efficacy among university undergraduates in Abia State?

Null Hypotheses (H_0)

H_{01}: Digital literacy has no significant influence on technopreneurial intentions among university undergraduates in Abia State.

H_{02}: Digital literacy has no significant effect on technological self-efficacy among university undergraduates in Abia State.

Methodology

This study adopted a correlational research design to examine the relationship between digital literacy and technopreneurial intentions among university undergraduates in Abia State. The correlational design was deemed appropriate because it allows for the assessment of the strength and direction of relationships among variables without manipulating them, thereby providing empirical evidence on the extent to which digital literacy influences technopreneurial intentions and technological self-efficacy. The population of the study comprised all undergraduate students enrolled in business-related programs at Abia State University and Michael Okpara University of Agriculture, the two major tertiary institutions offering entrepreneurship education in Abia State. According to academic records (2025), the combined population of business undergraduates across both universities is approximately 4,500 students.

A multi-stage sampling technique was employed to select a representative sample from the population. In the first stage, the two universities were purposively selected due to their relevance to

entrepreneurship and business education. In the second stage, faculties and departments offering business and entrepreneurship courses were identified, and students were stratified by level of study (100–400 level) to ensure proportionate representation. In the third stage, students were selected from each stratum using simple random sampling. Using Krejcie and Morgan's (1970) sample size determination table, a sample of approximately 360 students was drawn to ensure sufficient statistical power for correlation and regression analyses.

Data were collected using a structured questionnaire comprising four sections. Section A captured demographic information, including age, gender, level of study, and university. Section B measured digital literacy, adapted from Roseline and Harcourt (2025), assessing students' ability to access, evaluate, and strategically deploy digital technologies. Section C measured technological self-efficacy, adapted from Ogunyemi and Adeyemo (2024), while Section D measured technopreneurial intentions, adapted from Abiodun (2025). All items were rated on a 5-point Likert scale ranging from 1 ("Strongly Disagree") to 5 ("Strongly Agree").

The validity of the instrument was ensured through expert review. Three lecturers with specialization in entrepreneurship education and digital technologies evaluated the questionnaire for content clarity, relevance, and appropriateness. Their feedback was used to revise items before the pilot study. For reliability, a pilot test was conducted with 30 undergraduate students from a similar institution outside Abia State. Internal consistency was assessed using Cronbach's alpha, with coefficients above 0.70 considered acceptable (Nunnally, 1978).

Data analysis was conducted using Statistical Package for Social Sciences (SPSS) version 28. To address the research questions, Pearson Product-Moment Correlation (PPMC) was employed to determine the strength and direction of the relationships between digital literacy, technological self-efficacy, and technopreneurial intentions. For testing the hypotheses, linear regression analysis was used to evaluate the predictive influence of digital literacy on technopreneurial intentions and technological self-efficacy. The hypotheses were tested at a 0.05 level of significance, with results interpreted to either accept or reject the null hypotheses.

Ethical considerations were strictly observed throughout the study. Participants were fully informed of the study's purpose and provided informed consent prior to participation. They were assured of confidentiality and anonymity, and participation was entirely voluntary. Respondents were also informed of their right to withdraw from the study at any point without penalty, and data collected were used solely for academic purposes.

Results

Research Question 1:

To what extent does digital literacy influence technopreneurial intentions among university undergraduates in Abia State?

Table 1: Pearson Product-Moment Correlation between Digital Literacy and Technopreneurial Intentions

Variables	N	Mean	SD	r	p-value
Digital Literacy (DL)	360	4.02	0.52	0.63	0.000
Technopreneurial Intentions (TI)	360	3.85	0.58		

The results indicate a strong positive correlation between digital literacy and technopreneurial intentions ($r = 0.63$, $p < 0.05$). This suggests that as students' digital literacy increases, their intentions to engage in technopreneurial activities also increase. The relationship is statistically significant, indicating that digital literacy is meaningfully associated with technopreneurial intentions among university undergraduates in Abia State.

Hypothesis 1 (H_{01}):

Digital literacy has no significant influence on technopreneurial intentions among university undergraduates in Abia State.

Table 2: Linear Regression Analysis of Digital Literacy on Technopreneurial Intentions

Model	B	SE	β	t	p-value
Constant	1.02	0.21		4.86	0.000
Digital Literacy	0.58	0.05	0.63	11.60	0.000

The regression analysis shows that digital literacy significantly predicts technopreneurial intentions ($\beta = 0.63$, $t = 11.60$, $p < 0.05$). The null hypothesis (H_{01}) is therefore rejected, indicating that students with

higher digital literacy are more likely to exhibit stronger intentions to engage in technopreneurial activities.

Research Question 2:

What is the effect of digital literacy on technological self-efficacy among university undergraduates in Abia State?

Table 3: Pearson Product-Moment Correlation between Digital Literacy and Technological Self-Efficacy

Variables	N	Mean	SD	r	p-value
Digital Literacy (DL)	360	4.02	0.52	0.58	0.000
Technological Self-Efficacy (TSE)	360	3.91	0.55		

There is a moderate positive correlation between digital literacy and technological self-efficacy ($r = 0.58$, $p < 0.05$). This indicates that higher levels of digital literacy are associated with increased confidence in using technology to create and manage digital ventures. The relationship is statistically significant, highlighting digital literacy as an important factor in developing students' technological self-efficacy.

Hypothesis 2 (H_{02}): Digital literacy has no significant effect on technological self-efficacy among university undergraduates in Abia State.

Table 4: Linear Regression Analysis of Digital Literacy on Technological Self-Efficacy

Model	B	SE	β	t	p-value
Constant	0.98	0.22		4.45	0.000
Digital Literacy	0.54	0.05	0.58	10.36	0.000

The results indicate that digital literacy significantly affects technological self-efficacy ($\beta = 0.58$, $t = 10.36$, $p < 0.05$). Consequently, the null hypothesis (H_{02}) is rejected, suggesting that students with higher digital literacy demonstrate greater confidence in using technology to undertake technopreneurial tasks.

Discussion of Findings

The findings of this study indicate that digital literacy significantly influences technopreneurial intentions and technological self-efficacy among university undergraduates in Abia State. The positive and significant correlation between digital literacy and technopreneurial intentions ($r = 0.63$, $p < 0.05$) suggests that students who possess higher digital competence are more likely to develop the intention to engage in technology-driven entrepreneurial ventures. This aligns with previous Nigerian studies indicating that digital skills are critical enablers of entrepreneurial orientation and innovative behavior (Abiodun, 2025; Roseline & Harcourt, 2025).

Furthermore, the significant relationship between digital literacy and technological self-efficacy ($r = 0.58$, $p < 0.05$) highlights the role of digital competence in building confidence to use technology for entrepreneurial purposes. Students with higher digital literacy are better equipped to navigate digital tools, evaluate opportunities, and implement technology-based solutions, consistent with findings by Ogunyemi and Adeyemo (2024) in the Nigerian higher education context.

The regression analyses further confirm that digital literacy is a strong predictor of both technopreneurial intentions ($\beta = 0.63$) and technological self-efficacy ($\beta = 0.58$). This implies that integrating digital skills development into entrepreneurship curricula can enhance students' readiness and capability to launch technology-driven ventures. These results support the theoretical assertions of the Theory of Planned Behaviour, suggesting that digital literacy strengthens perceived behavioral control and positive attitudes toward technopreneurship (Ajzen, 1991; Krueger et al., 2000).

Overall, the study demonstrates that fostering digital literacy among undergraduates is crucial for promoting technopreneurial behavior, particularly in the context of Nigeria's evolving digital economy. It underscores the need for universities to design curriculum interventions that combine entrepreneurship education with practical digital skill acquisition to prepare students for technology-enabled venture creation.

Conclusion

The study investigated the relationship between digital literacy and technopreneurial intentions among university undergraduates in Abia State. The findings revealed that digital literacy significantly influences both technopreneurial intentions and technological self-efficacy. Students with higher digital competence are more confident in using technology and more likely to engage in technology-driven entrepreneurial ventures. These results underscore the critical role of digital literacy as a strategic

antecedent of technopreneurial behaviour, supporting the theoretical framework of the Theory of Planned Behaviour.

In conclusion, enhancing digital literacy among undergraduates is essential for fostering technopreneurial mindsets and equipping students with the skills and confidence necessary to participate effectively in Nigeria's rapidly evolving digital economy.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. **Integration of Digital Skills into Curriculum:** Universities in Abia State should incorporate comprehensive digital literacy modules into entrepreneurship and business programs, emphasizing practical skills such as digital marketing, data analytics, platform-based business models, and online collaboration tools.
2. **Capacity Building for Students:** Workshops, seminars, and digital bootcamps should be organized to enhance students' technological self-efficacy, enabling them to confidently apply digital tools for venture creation.
3. **Infrastructure and Resources:** Tertiary institutions should invest in digital infrastructure, including high-speed internet, computer labs, and access to relevant software, to support experiential learning in technology-driven entrepreneurship.
4. **University–Industry Collaboration:** Partnerships with tech companies, incubators, and startup hubs should be strengthened to provide students with exposure to real-world digital entrepreneurial environments and mentorship opportunities.
5. **Policy Support:** Educational policymakers should prioritize digital entrepreneurship in higher education by developing guidelines that integrate digital literacy and technopreneurial skills into national curriculum frameworks.

Implementing these recommendations will enhance undergraduates' readiness to establish and manage technology-driven ventures, thereby contributing to innovation, job creation, and sustainable economic development in Abia State and beyond.

Abstract

This paper focused on digital marketing as the viable tool for Small and Medium-sized Enterprises(SMEs)survival in Nigeria economy. The emergence of digital marketing platforms has transformed how business operate and interact with customers. It has proven to be an effective and efficient channel for marketing goods and services. The study examined digital marketing such as social media marketing, content marketing and customer engagement and online advertising. SMEs owners can grow and make their businesses to survive through digital marketing platforms. The study concluded that it is imperative for SMEs in Nigeria to recognize the importance of digital marketing and integrate it into their overall business growth and survival. Based on the conclusion, it was therefore recommended that SMEs owners should embrace the approach of digital marketing as this will lead to their businesses survival; SMEs should tailor digital campaigns to reflect local conditions, including consumer trust levels, payment systems, and cultural behaviours; Targeted workshops, mentorships, and peer learning groups should focus on equipping SMEs owners and Amongst others.

Keywords: Digital Marketing, Small and Medium-sized Enterprises(SMEs)

1. Introduction

The development of digital marketing can be traced to the 1990s, with the advent of the internet, marking the beginning of an era in global communication and business (Faruketal.,2021). As internet accessibility grew, businesses began leveraging this medium for marketing (Cosmuleseetal.,2019). The rise of search engines like Yahoo and Google emphasized the importance of search engine optimization (SEO), which helps improve website visibility in search results (Gregoriadesetal.,2021).

Overtime, businesses used graphical advertisements to attract users, although the effectiveness of banner advertisement decreased with ad-blocking technologies (Kontisetal.,2022). This led to the introduction of pay-per-click (PPC) advertising, a model popularized by Google Ads in 2000, allowing businesses to pay only for clicks on their ads (Faruketal.,2021). Social media marketing soon followed, enabling companies to build brand awareness, foster customer relationships, and drive website traffic through targeted content and advertising. By the late 2000s, the wide spread use of smart phones brought about mobile marketing, with businesses optimizing their websites and apps for mobile devices and using location-based ad store ach consumers on the go (Sansernetal., 2022; Harikrishnan & Vinith, 2022). Digital marketing strategies provide various ways to promote products, engage audiences, and drive growth (Chomiak-Orsa & Liszczyk, 2020; Pascuccietal.,2023).

In today's business environment, digital technologies have become deeply intertwined with how consumers make decisions and interact with brands. The wide spread use of the internet, social media, and mobile devices means that consumer behavior is now largely shaped by digital engagement. For small and medium enterprises (SMEs), this shift has transformed the way they could approach marketing and survival in competitive markets. Digital marketing is no longer a secondary or optional

tool; it has become a central pillar in how SMEs attract customers, communicate value, and sustain business growth (Supriadi, 2024; Zamrietal., 2024).

The digital revolution has transformed how businesses operate and interact with customers. It has proven to be an effective and efficient conduit for marketing goods and services (Okolo, et al.,2018). Digital marketing refers to using channels such as websites, search engines, social media, email, and mobile applications to promote products and services (Leetal., 2021; Faruk et al., 2021). These digital marketing tools have gained global popularity for their ability to target specific markets, measure performance, and provide a personalized customer experience(Jadhavetal.,2023).

Unlike traditional marketing methods, which often require significant financial resources and have limited reach, digital marketing allows SMEs to level the playing field with larger firms by offering cost-effective platforms that reach wider audiences. Social media, search engine optimization, email campaigns, and content marketing now serve as strategic avenues for SMEs to establish brand visibility, enhance customer relationships, and increase sales performance (Nwawume & Anukam, 2024; Odita, 2023). In this sense, digital tools are not just additions to existing practices but are essential drivers of competitiveness and long-term survival.

The traditional way of doing business only has become inadequate for business operators. Nowadays the hike in the cost of getting an office space in Nigeria economy now is affecting the SMEs greatly. Even after succeeding in getting an office space, the funds to equip the office becomes difficult and almost impossible. The low patronage they deal with from time to time, having their goods on the shelves for longer time even to the point of some getting expired due to lack of sales and their services not been noticed or reached even when they have the ability to offer the best services as a result of their location has made many SMEs close their businesses. But with the emergence of digital marketing and utilization of its various strategies, SMEs can actually make their goods and service visible to larger audience thereby achieving their businesses aims and objectives.

Small and Medium Enterprises are businesses that have a fairly important role and cannot be ignored in efforts to restore economic conditions in Nigeria. With the Covid-19 that hit Nigeria and the whole wide world, it had an impact on the community's economy which declined. Therefore, competition in business is getting tighter and tighter, especially for SMEs. In business, competition is normal and common place. However, in order for businesses to survive in the midst of a pandemic and many competitors, SME actors need to have innovations and strategies to maintain their business. Basically, the marketing concept is very simple, because it is built on the basic principle of maximizing satisfaction through the use of scarce resources.

The presence of digital media has clearly increased the level of effectiveness of product advertising, including in the SMEs environment which has made it easy and possible for all SMEs even those just starting out to be able to shift their views to digital promotional media compared to ways outside of new technology like spreading outside the network.

Alghizzawi et al. (2023) emphasized that those who embraced digital marketing during the COVID-19 pandemic were better able to sustain customer engagement and navigate economic disruptions. The COVID-19 pandemic provided a striking example of how SMEs can adapt through digital marketing. With physical operations disrupted by lockdowns, many SMEs were compelled to accelerate their digital transformation. Online platforms became crucial for maintaining visibility, engaging customers, and attempting to secure revenue streams. Alghizzawi et al. (2023) observed that SMEs that embraced digital platforms during the crisis were better able to remain resilient, demonstrating the importance of digital marketing as not only a growth strategy but also a survival mechanism during periods of uncertainty. This experience underscores the need for SMEs to integrate digital tools into their core operations, rather than treating the mass secondary or temporary solutions. This paper, therefore, sets out to assess how digital marketing tools is viable for the survival of small and medium-sized enterprises survival in Nigeria

Digital Marketing tools for Small and Medium-Sized Enterprises survival

Digital marketing has evolved significantly overtime, transitioning from a focus on websites and email marketing to a more complex land scape that includes social media, search engines, digital content, and various online platforms (Dsouza & Panakaje, 2023). This evolution has been driven by technological advancements and changes in consumer behavior, with digitalization playing a crucial role in establishing competitive advantages and developing new business models (Andersen et al.,2021). Small and medium-sized enterprises (SMEs) are particularly impacted by these changes, as they often have limited resources and unique challenges in adopting effective digital marketing strategies (Albatsetal.,2021). This paper, look at digital marketing tools for SMEs business survival which includes: Social Media Marketing, Content Marketing, and Online Advertising.

Social Media Marketing (SMM)

One of the most widely used digital marketing tool in SMEs is social media marketing, which involves the use of platforms such as Facebook, Instagram, Twitter(X), and YouTube. Social media marketing platforms if used appropriately can substantially reduce the marketing cost and improves the relationship with customers thus creating a positive impact on the business (Mokhtaretal.,2016). Social media has become an essential element in digital marketing, providing direct interactions with audiences, expanding brand reach, and enhancing consumer engagement. Brands utilize social media platforms to communicate with their audiences, share content, drive engagement, and foster lasting relationships (Gbandi & Iyamu, 2022). The adoption of social media has significantly assisted small and medium-sized enterprises (SMEs) in overcoming challenges and achieving marketing objectives (Effendi et al., 2020). Social media enables SMEs to extend their reach, boost brand awareness, enhance consumer engagement, and drive sales (Salam et al., 2021). Close observation has shown that social media marketing is transformative for SMEs, enabling direct connections with customers through platforms like Facebook and Instagram (Abbasi et al., 2022). Leveraging social media allows SMEs to access a vast market, influence consumer purchasing decisions, increase sales, and expand market share (Shauri et al., 2023). Moreover, the effective adoption and maintenance of digital and social media marketing strategies can help SMEs attract more customers, enhance customer engagement, and raise brand awareness among a broader demographic (Malesev & Cherry, 2021). The use of social media by SMEs presents challenges but also offers significant benefits. Social media platforms serve various functions for SMEs, including market research, customer acquisition, marketing, and customer support (Goel & Donaldson, 2021). By embracing social media, SMEs can engage stakeholders economically and effectively, enhancing their performance and market presence (Muna et al., 2022). Information and communication technologies provide a solid foundation for SMEs to effectively leverage social media in their marketing strategies (Belás et al.,2021).

Furthermore, social media plays a pivotal role in the success of digital marketing for SMEs by strategically utilizing social media platforms, SMEs can overcome challenges, expand their market reach, boost brand awareness, drive engagement, and increase sales. Understanding the dynamics of social media adoption and leveraging its potential can empower SMEs to thrive in the digital marketing and scape.

These platforms enable SMEs to build brand visibility, foster interaction with customers, run targeted advertisements, and even create virtual communities around their products or services. Social media allows businesses to communicate in real time with audiences at relatively low cost, making it especially valuable in volatile markets. Odita (2023), in a study of SMEs in Delta State, Nigeria, found that social media marketing often acts as a lifeline for small businesses during uncertain economic conditions, as it provides immediate reach and continuous engagement with customers (FEPBL).

Content Marketing and Customer Engagement

Beyond simply having an online presence, SMEs are increasingly turning to content marketing as a way of creating value for their customers. This strategy focuses on generating relevant and engaging materials such as blogposts, videos, infographics, and product stories that educate and inform consumers. By sharing useful content, SMEs not only promote their offerings but also build trust and credibility with their target audience. Nwawume and Anukam (2024) argue that content-driven marketing lies at the heart of digital entrepreneurship, giving SMEs global exposure. in communication, and stronger visibility in their chosen markets (BW Journal). Importantly, this approach often requires minimal financial investment, making it accessible even to resource-constrained enterprises.

Online Advertising

Online advertising. By optimizing their websites and online stores, SMEs can increase their chances of being discovered by potential customers searching for products or services. Paid strategies such as pay-per-click (PPC) advertisements or sponsored search results further enhance visibility in crowded market places. According to Supriadi (2024) and Zamrietal. (2024), these tactics help SMEs to expand customer reach and improve overall sales performance, particularly when competition for consumer attention is high (IJBTOB). Online advertising also provides measurable data on customer behaviour, which can guide better decision-making.

The Viable Tool for Small and Medium-Size Enterprises (SMEs) Survival in Nigeria Economy

The adoption of digital marketing strategies has proven to be a double-edged sword for the survival of small and medium-sized enterprises (SMEs). On one hand, it offers numerous prospects

that improve visibility, customer engagement, and resilience. On the other hand, SMEs often face challenges linked to resources, skills, and infrastructure that limit the full realization of these benefits.

Prospects Improved Market Reach and Visibility

Digital marketing has opened new doors for SMEs by helping them overcome geographical barriers. Through online platforms, even small businesses located in remote areas can now connect with customers across cities, states, and even international markets. Supriadi (2024) observes that the use of digital tools enables SMEs to expand their customer base and significantly improve business performance by reaching a broader audience (IJBTOB). Similarly, Ajedeetal. (2025), studying SMEs in Kwara State, found that online marketing initiatives played a pivotal role in extending market presence and improving visibility, thereby boosting competitiveness in the local economy.

Enhanced Customer Engagement and Brand Building

Digital marketing also transforms show SMEs build relationships with their customers. Unlike traditional one-way communication, social media platforms and content marketing allow businesses to interact directly with clients, gather feedback, and foster stronger emotional connections. This kind of engagement enhances brand loyalty and can lead to repeat purchases. Alghizzawi et al. (2023) highlight that SMEs which embraced digital marketing as both useful and user-friendly were able to maintain customer relationships and strengthen brand presence ven during crises such as the COVID-19 pandemic.

Cost Effectiveness and Flexibility

One of the major attractions of digital marketing for SMEs is its affordability compared to traditional advertising channels like radio, print, or television. Digital campaigns can be tailored to specific budgets and scale up or down as business conditions change. A study published by *Emerald* on SMEs in Ghana found that digital marketing allows businesses to reduce marketing costs while still achieving measurable and positive performance outcomes, provided that strategies are carefully planned and executed (EmeraldInsight,2022). This flexibility makes it especially suitable for SMEs with limited financial resources.

Crisis Resilience and Adaptability

The COVID-19 pandemic provided clear evidence of the resilience that digital marketing can bring to SMEs. While many traditional businesses collapsed under the pressure of lock downs and restrictions, firms that had adopted digital tools managed to sustain customer contact, generate sales online, and remain visible in their markets. According to Alghizzawi et al. (2023), digital marketing served as a “survival strategy,” enabling SMEs to adapt quickly and maintain operations under conditions of uncertainty.

Digital Marketing as a Necessity, not a Choice

Digital marketing is no longer an optional add-on; it has become a critical enabler of survival and competitiveness in today’s economy. SMEs that fail to adopt digital tools risk exclusion from the modern marketplace. Nwawume and Anukam (2024) argue that firms delaying adoption are more likely to lose visibility, as consumer behavior increasingly favours businesses that maintain a strong online presence and provide 24/7 accessibility. From this perspective, digital marketing should be positioned not as an alternative to traditional marketing but as a central component of business strategy.

The Centrality of Training and Capacity Building

The entrepreneurial spirit of many SMEs owners is undeniable, but enthusiasm Alone does not translate into effective digital campaigns. Knowledge gaps in areas such as social media management, content creation, and online analytics remain significant obstacles. Etuk, Akpan, and Awah (2024) identify digital literacy as a decisive factor influencing the successor failure of digital marketing adoption among Nigerian SMEs. Thus, capacity- building initiatives through government-led workshops, industry mentorship programmes, or peer learning networks are essential to empower SMEs operators to maximize digital opportunities.

Challenges of Adoption of Digital Marketing Strategies by Small and Medium-Sized Enterprises (SMES)

Digital Literacy and Technical Skills Gaps

One of the most persistent challenges for SMEs is the lack of adequate digital skills among owners and staff. Effective use of digital platforms requires knowledge of online advertising, analytics, and customer engagement tools. In their study of service-based SMEs in Akwa Ibom State, Etuk, Akpan, and Awah (2024) identified digital illiteracy and weak ICT infrastructure as major obstacles to digital marketing adoption (ASP Journals). Without these skills, businesses often run poorly designed campaigns that fail to deliver expected results.

Perceived Cost and Investment Risks

Although digital marketing is relatively cost-effective, SMEs often perceive the initial investment as high. Expenses linked to content creation, platform subscriptions, or paid online advertising can discourage businesses, particularly when short-term returns are uncertain. Etuk et al. (2024) note that this perception of cost, coupled with financial constraints, deters many SMEs from fully adopting digital strategies despite their long-term benefits.

Sustainability and Continuous Effort

Digital marketing is not a one-off activity. To deliver meaningful results, it requires continuous effort in producing content, monitoring campaigns and responding to customer trends. Without sustained commitment, results are often short-lived. Supriadi (2024) and Zamri et al. (2024) caution that SMEs which treat digital marketing as a quick fix rather than a long-term strategy often fail to see consistent performance improvements.

Infrastructure and Access Constraints

In developing economies like Nigeria, poor infrastructure significantly limits SMEs' ability to maximize digital tools. Erratic electricity supply, slow or unstable internet connections, and limited access to afford able digital devices often disrupt marketing efforts. Okafor and Chia (2024) highlight that such infrastructural bottlenecks create inefficiencies that dampen the gains of online advertising, particularly for SMEs in North Central Nigeria.

Measurement and Return on Investment (ROI) Uncertainty

Finally, many SMEs struggle with measuring the actual impact of digital marketing on sales and profitability. Without clear metrics or analytics expertise, it becomes difficult to determine which strategies are working and which are not. Alghizzawi et al. (2023) stress that perceived usefulness and ease of use as framed by the Technology Acceptance Model strongly influence SMEs decisions to sustain digital marketing adoption. When SMEs cannot clearly link efforts to outcomes, enthusiasm and investment often decline.

Contextualizing Digital Strategies to Local Realities

Digital marketing strategies that succeed in one region may fail in another if contextual differences are ignored. Nigeria's diverse socio-economic environment, uneven internet penetration, and varied consumer behaviours require locally adapted strategies. Gbandi and Iyamu (2024), in their study of SMEs in Benin City, observed that social media marketing can be highly effective, but its impact is shaped by how local audiences interact with online platforms. Consequently, SMEs in rural or semi-urban regions may need different approaches compared to their counterparts in urban areas or cities, especially with respect to payment trust and online transaction behaviours.

Measuring Outcomes and Avoiding Vanity Metrics

While digital marketing opens new doors, the temptation to overemphasize "vanity metrics" likes, clicks, and follower counts can obscure the true business impact. For SMEs, the critical question is how digital efforts affect tangible out comes such as revenue growth, customer retention, and repeat patronage. Alghizzawi et al. (2023) stress that without clear measures of return on investment (ROI), SMEs risk investing in campaigns that look good on paper but contribute little to performance. Affordable tools such as Google Analytics, social media insights, and simple sales tracking can provide valuable feedback for evidence-based decisions.

Conclusion

Digital marketing strategies have undergone a significant evolution from the use of websites and email marketing to the use of social media platforms. These changes have impacted companies, especially small and medium-sized businesses (SMEs), which often have limited resources and unique challenges in adopting effective digital marketing strategies. However, by understanding important trends in digital marketing, such as the use of social media and e-commerce technology, SMEs can allocate their resources effectively and increase the success of their digital marketing strategies.

However, despite the evident prospects, several challenges remain for SMEs in effectively adopting and implementing digital marketing strategies. These challenges include limited resources, lack of digital literacy and skills, infrastructural constraints, and evolving market dynamics. Addressing these challenges requires concerted efforts from SMEs, policymakers, industry associations, and other stakeholders to provide necessary support, resources, and training initiatives to facilitate digital transformation.

Furthermore, it is imperative for SMEs in Nigeria to recognize the strategic importance of digital marketing and integrate it into their overall business strategies. Investing in digital marketing training, technology infrastructure, and talent acquisition will be crucial for SMEs to capitalize on the opportunities presented by the digital age and remain competitive in an increasingly digitalize market

place. When considering the influence of digital marketing on the sustainability of SMEs, it becomes clear that these strategies hold significant promise for enhancing growth, competitiveness, and resilience. Nonetheless, the degree of their effectiveness depends on how well SMEs incorporate digital tools into their business frameworks, tailor them to local contexts, and develop the expertise required to manage them. Digital marketing should be regarded not as a supplementary activity but as a fundamental driver of contemporary business success.

Recommendations

1. Policy makers should focus on creating an enabling environment for SME digitization by improving digital infrastructure, provide financial incentives and facilitate knowledge sharing and collaboration among SMEs.
2. SMEs owners should adopt a lean approach of digital marketing instead of large-scale resources-intensive campaign. As this will allow them to conserver sources while learning in real-time.
3. SMEs should tailor digital campaigns to reflect local conditions, including consumer trust levels, payment systems, and cultural behaviours.
4. Targeted workshops, mentorships, and peer learning groups should focus one quipping SMEs owners and staff with practical skills in social media management, analytics, and content creation.
5. SMEs owners should integrate digital marketing not just as a growth tool but as a resilience mechanism to withstand future crises.

Abstract

The current global economy is challenged with interconnected environmental, social and governance issues that have increased the need for responsible and sustainable approaches to business and entrepreneurship. Climate change, environmental degradation, resource scarcity, poverty, unemployment, inequality and declining trust in institutions validate the limitations of conventional business models that emphasize financial performance without satisfactory consideration of social and environmental consequences. Against this background, green business, social entrepreneurship and ethical leadership have arose as complementary approaches for advancing sustainable and inclusive development. This paper examines the conceptual foundations, theoretical underpinnings and interrelationships among green business, social entrepreneurship and ethical leadership. Drawing upon contemporary literature, the paper contends that green business promotes environmental value creation through sustainable production, resource efficiency, green innovation and circular economic practices, while social entrepreneurship maintain entrepreneurial innovation and market-based approaches to address persistent social challenges. Ethical leadership provides the moral and governance basis necessary for ensuring that economic, environmental and social objectives are pursued with integrity, fairness, transparency and accountability. The paper is underpinned primarily on stakeholder theory and social learning theory. It proposes that the integration of green business, social entrepreneurship and ethical leadership creates a responsible sustainable enterprise capable of generating economic value while promoting environmental stewardship and social inclusion. Major barriers, including limited access to finance, inadequate skills, institutional weaknesses, greenwashing, mission drift and competing 866ecognize866onal objectives, are examined. The paper concludes that sustainable transformation entails a fundamental shift from profit-centred business practices towards integrated models of enterprise that combine economic viability, environmental responsibility, social value creation and ethical governance. Practical and policy recommendations are offered for governments, educational institutions, business organisations, entrepreneurs and development partners.

Keywords: Green business, social entrepreneurship, ethical leadership, sustainable entrepreneurship, sustainable development, responsible enterprise.

Introduction

The global economy is undergoing a profound transformation in the way business success, entrepreneurship and leadership are understood. For many decades, economic development and business performance were largely appraised using indicators such as profitability, productivity, market growth and shareholder returns. Although financial performance remains crucial for 866ecognize866onal survival, current global challenges have established that economic growth alone cannot provide a satisfactory basis for sustainable human development. The environmental and social consequences of economic activities have become progressively important in defining the long-term legality and sustainability of organisations.

Climate change, biodiversity loss, environmental pollution, resource depletion, poverty, inequality and unemployment have deepened concerns regarding the traditional model of economic development. These challenges are interrelated. Unsustainable production and consumption patterns donate to environmental deprivation, while social inequality can limit access to economic chances and deteriorate social interconnection. Similarly, environmental deterioration often affects economically vulnerable populations excessively. Consequently, sustainable development needs approaches that 866ecognize the interdependence of economic prosperity, environmental protection and social wellbeing.

Businesses occupy a fundamental position in this transformation. Business organisations influence how resources are extracted and 866ecogniz, determine production and consumption patterns, generate employment opportunities and develop technologies that shape society. Their activities can hence

create positive or negative consequences for individuals, communities and ecosystems. Contemporary organisations are progressively expected to establish responsibility beyond the traditional objective of generating profit.

This changing anticipation has contributed to the growth of green business and sustainable entrepreneurship. Green business seeks to create economic value while reducing environmental damage through ecologically responsible production, resource efficiency, renewable energy, waste reduction, sustainable supply chains and green innovation. Research progressively reveals that green entrepreneurial positioning and green innovation can contribute simultaneously to environmental and economic performance (Khan et al., 2023). A recent meta-analytic review also determines the growing importance of green entrepreneurial orientation in influencing green innovation, economic performance and sustainable 867ecognize867onal performance (Bindeeba et al., 2026).

Alongside environmental alarms, persistent social problems have increased interest in social entrepreneurship. Social entrepreneurship applies entrepreneurial knowledge, innovation and 867ecognize867onal proficiencies to tackle social problems and create quantifiable social value. Social entrepreneurs seek to address challenges such as poverty, unemployment, exclusion, inadequate access to education and health services and environmental vulnerability. Contrary to traditional benevolent approaches, social entrepreneurship often employs market-based and financially sustainable mechanisms to enhance long-term social impact.

The growing relationship between social and sustainable entrepreneurship reflects the recognition that contemporary development challenges require integrated approaches. Bonfanti et al. (2024) perceive that social and sustainable entrepreneurship have developed as related but separate fields, with important convergence around entrepreneurial enablers, business models, impact and financial constraints. Similarly, Kamaludin (2023) contends that sustainability within social entrepreneurship should encompass social, economic and environmental dimensions rather than treating social impact as independent of broader sustainability concerns.

However, environmental responsibility and social value creation cannot be excellently sustained without proper leadership. Leaders impact 867ecognize867onal priorities, allocate resources, create 867ecognize867onal cultures and regulate the standards by which employees and organisations are held responsible. Ethical leadership is therefore an imperative dimension of sustainable enterprise.

Ethical leadership refers to leadership accredited by integrity, honesty, fairness, accountability, transparency and responsibility. Ethical leaders are expected not only to behave morally but also to promote ethical conduct among 867ecognize867onal members. The significance of leadership to sustainability is evident in sustainable entrepreneurship research. Ribeiro and Leitão (2024), through a systematic literature review, revealed that sustainable leadership and sustainable entrepreneurship are closely interconnected. Leaders can influence entrepreneurs and organisations to adopt responsible practices, integrate environmental and social values and generate economic value while contributing to wider socio-environmental objectives.

The relationship among green business, social entrepreneurship and ethical leadership is therefore increasingly vital. Nonetheless, these concepts are often observed separately. Green business literature frequently focuses primarily on environmental performance and innovation. Social entrepreneurship literature focusses on social value creation and hybrid 867ecognize867onal models. Ethical leadership research frequently examines employee behaviour, 867ecognize867onal culture and governance. A more integrated understanding is required because contemporary sustainability challenges do not transpire autonomously.

A green business might decrease environmental harm but fail to promote social inclusion. A social enterprise might pursue an important social task while experiencing environmental challenges or governance weaknesses. Likewise, an 867ecognize867on may publicly adopt sustainability principles without genuinely implementing them. Ethical leadership is necessary to ensure that 867ecognize867onal commitments to sustainability are reflected in actual practices.

This paper therefore contends that green business, social entrepreneurship and ethical leadership should be understood as complementary scopes of responsible sustainable enterprise. Green business provides the environmental dimension of sustainable value creation. Social entrepreneurship provides the social innovation dimension. Ethical leadership offers the moral and governance basis required to balance economic, environmental and social objectives.

The purpose of this paper is to examine these three concepts and develop an integrated narrative framework for understanding their contribution to sustainable and inclusive development. The paper addresses four major objectives:

1. To examine the concept and characteristics of green business.

2. To analyse the role of social entrepreneurship in social value creation and sustainable development.
3. To examine the meaning and importance of ethical leadership in sustainable 868ecognize868onal practice.
4. To develop an integrated theoretical and conceptual understanding of how green business, social entrepreneurship and ethical leadership can contribute to sustainable and inclusive development.

Literature Review

The Concept of Green Business

Green business refers to business activities that seek to create economic value while reducing negative environmental effects and promoting environmental sustainability. The concept involves integrating environmental considerations into 868ecognize868onal strategy, production, operations, products, services and supply chains.

Green businesses may function in sectors specifically connected with environmental sustainability, such as renewable energy, recycling, waste management and sustainable agriculture. However, the concept spreads beyond these sectors. Conventional organisations can adopt green business practices by improving energy efficiency, reducing waste, using environmentally responsible materials and restructuring production processes.

The fundamental postulation of green business is that environmental responsibility and economic performance can be equally supportive. Environmental challenges can create new opportunities for entrepreneurial innovation. The need to reduce waste, for example, can arouse recycling enterprises and rotary business models. Energy challenges can instigate investment in renewable technologies. Apprehensions about environmental pollution can encourage the development of purified production processes.

Green entrepreneurship has accordingly emerged as a central area of sustainable business research. Khan et al. (2023) established that green entrepreneurial orientation and 868ecognize868onal resilience donated to green innovation amongst manufacturing firms. Their findings revealed that environmental sustainability can be incorporated into entrepreneurial and 868ecognize868onal strategy rather than being considered exclusively as a regulatory requirement.

More recently, Bindeeba et al. (2026) carried out a meta-analytic review exploring the influence of green entrepreneurial orientation on green innovation, economic performance and sustainable performance. The study replicates the increasing recognition that environmentally responsible entrepreneurship can create multiple 868ecognize868onal outcomes rather than simply environmental benefits.

Green business should therefore be considered as a strategic approach to value creation. It necessitates organisations to identify environmental sustainability as a basis of innovation, resilience and long-term competitiveness.

Green Innovation and the Circular Economy

Green innovation signifies an important mechanism through which businesses can lessen environmental harm while sustaining economic feasibility. It involves the development of products, services, technologies and procedures that reduce resource consumption, contamination and waste.

The globular economy provides an important framework for understanding this process. Conventional economic systems frequently follow a linear model involving resource extraction, production, consumption and disposal. Circular economic models seek to reduce waste by extending the useful life of products and materials through reuse, repair, remanufacturing and recycling.

Entrepreneurial organisations can contribute to the circular economy by developing new business models around waste repossession, product life extension and resource proficiency.

The transition towards circular and green business models needs 868ecognize868onal leadership. Green entrepreneurial leadership can stimulus innovation by encouraging organisations to involve environmental priorities into entrepreneurial decision-making.

The Concept of Social Entrepreneurship

Social entrepreneurship refers to the application of entrepreneurial capabilities and innovative business approaches to address social problems and create social value (Certo and Miller, 2008). According to the writers social entrepreneurs recognize problems that are inadequately addressed by conventional markets, governments or charitable organisations. They then develop innovative and sustainable solutions. More recently, Robertson (2025) opines that social entrepreneurship prioritizes social wellbeing, inclusiveness, and ethical value creation, distinguishing it from traditional profit centered

entrepreneurship. It entails using innovative business strategies to address social, cultural or environmental problems while ensuring financial sustainability.
Similarly, Kamaludin (2023) argues that sustainability within social entrepreneurship should include social, economic and environmental dimensions. Social entrepreneurship should thus not be interpreted scarcely as charitable or welfare-oriented activity. Instead, it signifies a larger approach to creating sustainable solutions to persistent social problems. The social problems addressed by social entrepreneurship include poverty, unemployment, inequality, inadequate access to education and health services, gender inequality and community exclusion.
Nevertheless, the connection between financial sustainability and social mission can generate 869ecognize869onal pressures. Enterprises may experience tension to obtain more profitable activities at the cost of their social objectives. This challenge highlights the importance of ethical governance and leadership.

Social Entrepreneurship and Social Value Creation
The primary objective of social entrepreneurship is the creation of social value. Social value refers to positive changes in human wellbeing, social inclusion, employment, education, health and community development (Urmanaviciene, 2025).
Social enterprises can contribute to employment creation by providing opportunities for individuals and communities exempted from common labour markets. They can also reinforce community capacity by including beneficiaries in 869ecognize869onal activities.
An important contribution of social entrepreneurship is its capability to address problems through innovation. Rather than depending exclusively on government intervention or charitable donations, social entrepreneurs pursue to develop sustainable and scalable solutions.
However, social value creation can be hard to quantity. Financial outcomes can be assessed through conventional accounting indicators, but social outcomes may be more intricate and context dependent. Organisations must therefore develop appropriate mechanisms for assessing social impact.
The growing integration of social entrepreneurship with sustainable development recommends that social enterprises should also reflect their environmental consequences. A social enterprise that generates employment while creating significant environmental harm may have restrict long-term sustainability. Accordingly, contemporary social entrepreneurship progressively requires an integrated understanding of economic, social and environmental value.

The Concept of Ethical Leadership
Ethical leadership refers to the demonstration and promotion of morally appropriate behaviour through personal actions, 869ecognize869onal decisions and relationships with others (Liu, Huang, Kim, & Na, 2023). Ethical leaders display integrity, fairness, honesty, accountability and concern for stakeholders. They also establish expectations concerning ethical behaviour within organisations. Ethical leadership hence involves both personal morality and the active promotion of ethical 869ecognize869onal conduct.
The role of ethical leadership to sustainability has increased significantly. Environmental and social challenges frequently involve difficult 869ecognize869onal trade-offs. Leaders may face pressure to reduce costs, increase profitability or expand market share in ways that could negatively affect employees, communities or ecosystems.
Ethical leadership requires decision-makers to consider the consequences of 869ecognize869onal actions for multiple stakeholders.
Tabaghdehi et al. (2026), through a systematic review of ninety-five peer-reviewed studies, recognize ethical leadership as an significant contributor to corporate sustainability. The review stresses the importance of transparency, accountability and ethical decision-making in creating sustainability-oriented 869ecognize869onal environments.
Ethical leadership should consequently be regarded as an important mechanism for explaining sustainability commitments into 869ecognize869onal practice.

Ethical Leadership and Green Organisational Behaviour
Organisational sustainability grounded not only on strategic decisions but also on daily actions. Employees can reduce energy consumption, curtail waste and enhance environmentally responsible practices. Leadership behaviour can influence these actions.

Research on green behavior lament that ethical leaders pay much attention to the ethical responsibilities of employees, and this sort of responsibility, in turn can reduce the business organizations' damaging effects on the environment. It was further stressed that ethical leadership can stimulate environmentally responsible 870ecognize870onal practices by strengthening green competencies and 870ecognize870onal culture (Ahmad, Islam, Sadiq, & Kaleem, 2021).
Therefore, ethical and sustainable leadership can influence environmental outcomes indirectly by creating 870ecognize870onal environments in which responsible behaviour is valued and supported. Ethical leadership is thus necessary to ensure that environmental and social objectives are pursued responsibly.

Theoretical Foundations
This paper is supported by two complementary theoretical perspectives: stakeholder theory and social learning theory .

Stakeholder Theory
Stakeholder theory provides an important background for understanding responsible business behaviour. The theory argues that organisations have responsibilities towards various groups affected by 870ecognize870onal activities. These groups comprise of employees, customers, suppliers, investors, governments and communities. The theory challenges the assumption that businesses should focus exclusively on shareholder interests.
Green business reflects stakeholder theory because environmental damage can affect communities and future generations. Social entrepreneurship echoes stakeholder theory because its objective is directly related with addressing the desires of communities and vulnerable groups.
On the other hand, ethical leadership provides the governance mechanism through which leaders 870ecognize and balance competing stakeholder interests. Stakeholder theory is therefore useful for understanding why sustainable enterprise needs wider responsibility beyond financial performance.
Social Learning Theory
Social learning theory explains for how leadership effects 870ecognize870onal behaviour. Individuals often learn through observing the behaviour of influential individuals.
Within organisations, leaders serve as important role models. Employees observe leadership decisions and behaviour to determine 870ecognize870onal expectations. Ethical leaders can therefore stimulate employees to accept responsible and environmentally sustainable practices.
This theory is particularly pertinent to green 870ecognize870onal behaviour because environmental sustainability requires participation throughout the 870ecognize870on. When leaders establish responsible environmental behaviour, employees are more likely to observe sustainability as an important 870ecognize870onal value.

Major Challenges and Ethical Dilemmas
Limited Access to Finance
Green technologies regularly require substantial initial investment. Social enterprises may also experience financing challenges because investors may consider social objectives less financially attractive than conventional commercial activities. Specialized financing mechanisms are hence important. These may include influenced investment, green financing, concessional credit and public support programmes.

Inadequate Entrepreneurial and Leadership Competencies
Sustainability-oriented entrepreneurs need knowledge beyond conventional business management. They require understanding of environmental management, innovation, stakeholder engagement, ethics and social impact. Leadership development is therefore essential.
Mission Drift
Social enterprises may steadily prioritize revenue generation over their original social mission. Mission drift can occur when organisations experience financial pressure or become progressively dependent on commercial markets. Ethical leadership and strong governance mechanisms are essential to protect 870ecognize870onal missions.
Greenwashing
Greenwashing befalls when organisations emphasize or misrepresent their environmental performance. This practice can undermine public confidence and reduce the credibility of genuine green businesses.
Ethical leadership and transparent reporting are essential for preventing greenwashing.

Policy and Practical Implications

The transition towards responsible sustainable enterprise requires coordinated action among governments, educational institutions, businesses, entrepreneurs and development partners.

First, governments should establish policies that support green and social entrepreneurship. Policies may include motivations for renewable energy, recycling, sustainable agriculture and environmentally responsible innovation.

Second, financial institutions should develop specialized funding mechanisms for sustainability-oriented enterprises. Conventional financing models may not sufficiently 871ecognize social and environmental value.

Third, educational institutions should integrate sustainability, social entrepreneurship and ethical leadership into business and entrepreneurship curricula. Fourth, organisations should initiate transparent systems for evaluating environmental and social performance. Such systems can strengthen accountability and reduce greenwashing.

Fifth, leadership development programmes should emphasize ethical decision-making and stakeholder responsibility. Sixth, social enterprises should establish governance structures proficient of protecting social missions while ensuring financial sustainability.

Finally, collaboration among governments, businesses, universities and civil society organisations should be reinforced. Complex environmental and social challenges cannot be effectively addressed by individual organisations acting independently.

Conclusion

The contemporary global economy requires a fundamental reassessment of the relationship among business, society and the natural environment. Economic growth remains vital, but business models that focus exclusively on financial returns without considering environmental and social consequences are increasingly insufficient.

Green business, social entrepreneurship and ethical leadership provide corresponding pathways for responding to contemporary sustainability challenges.

Green business promotes environmental responsibility through sustainable production, resource efficiency and green innovation. Social entrepreneurship applies entrepreneurial capabilities to persistent social challenges and promotes social value creation. Ethical leadership offers the moral foundation required to ensure that economic, environmental and social objectives are pursue with integrity, fairness, transparency and accountability.

Green business, social entrepreneurship and ethical leadership collectively provide a credible pathway towards an economic system that is productive, innovative, socially inclusive, environmentally responsible and ethically governed.

Abstract
The study examined pedagogical strategies for teaching green office practices in the digital age within Office Technology and Management (OTM) programmes in tertiary institutions. A descriptive survey research design was adopted. The study was guided by three research questions and three hypotheses tested at the 0.05 level of significance. The population comprised 163 OTM educators from universities, polytechnics, and colleges of education offering Business Education and OTM programmes in Anambra State. Due to the manageable size, the entire population was used without sampling, data were collected using a structured questionnaire validated by experts. The instrument's reliability was established using the Pearson Product Moment Correlation method, yielding coefficients of 0.78, 0.84, and 0.73. Data were analysed using mean and standard deviation, findings revealed that OTM educators generally agreed on the effectiveness of experiential, collaborative, reflective, and technology-enhanced pedagogical strategies such as project-based learning and green office audits. However, the integration of digital tools into teaching remained limited, with only basic tools like cloud storage and electronic document management being moderately 873ecogniz. Key challenges identified included unreliable internet connectivity and frequent power outages. The study also found no significant differences based on gender or type of institution. The study concludes that although OTM educators 873ecognize the value of innovative teaching strategies, infrastructural and capacity-related constraints limit full adoption of digital-age pedagogical practices. It recommends the integration of green office practices into OTM curricula, continuous professional development for educators and improved digital infrastructure to support effective teaching.
Keywords: Green office practices, pedagogical strategies, digital tools, Office Technology and Management Educators

Introduction
The 21st century has ushered in an era in which ecological degradation and climate change are no longer distant threats but urgent global realities. For a developing nation like Nigeria, this presents a significant paradox, while rapid economic growth is essential, such growth must avoid replicating the carbon-intensive pathways followed by industrialised countries (Adebayo, 2020). This challenge places a considerable responsibility on educational institutions particularly universities, polytechnics and colleges of education which are tasked with preparing the future workforce. Within these institutions, Office Technology and Management (OTM) programmes occupy a strategic position. They are designed to produce middle-level administrative professionals, including secretaries and office managers, who serve as the operational backbone of both public and private organisations. The practices adopted by these professionals especially those related to office operations have direct implications for the environmental performance and ecological footprint of administrative activities in Nigeria. Teaching green office practices in the digital age therefore requires OTM educators to adopt innovative pedagogical strategies that integrate environmental responsibility with digital competence.

However, current instructional approaches remain largely traditional and often overlook environmental considerations.

Teaching green office practices refers to the intentional process of equipping learners with the knowledge, skills and attitudes needed to promote environmental sustainability within office environments. This form of education emphasizes practical, everyday actions that administrative workers can consistently apply. Such actions include reducing paper waste through duplex printing and digital documentation, conserving energy by switching off unused devices, managing electronic waste responsibly, minimising single-use plastics and selecting eco-friendly office supplies (Okoro & Eze, 2021). Research by Bhuttah, Xusheng, Abid, and Sharma (2024) indicates that project-based learning fosters active engagement and enhances both knowledge acquisition and environmental awareness among learners. For OTM students whose future roles involve managing records, scheduling activities, handling correspondence and procuring office supplies green office competencies are immediately applicable in the workplace.

In Nigeria, where many offices still depend heavily on paper-based systems and diesel-powered electricity, the adoption of green office practices is not merely desirable but necessary for both cost efficiency and environmental sustainability (Nwachukwu, 2019). However, beyond identifying what should be taught, the context of the digital age fundamentally shapes how such knowledge should be delivered. The digital age is characterised by the widespread use of technologies such as cloud computing, artificial intelligence, the Internet of Things and mobile communication, all of which have transformed modern office operations. For OTM educators, this presents both opportunities and challenges. On one hand, digital tools support green practices for instance, virtual meetings reduce travel-related emissions, electronic document systems minimise paper use and digital signatures eliminate the need for printed approvals (Ogunlade & Bello, 2022). On the other hand, digitalisation introduces new environmental concerns, including electronic waste, energy consumption from idle devices and the carbon footprint of data centres.

A truly green office does not simply replace paper with digital tools, rather it promotes mindful digital practices such as deleting unnecessary files, extending the lifespan of equipment and recycling electronic devices responsibly (Selwyn, 2021). In the Nigerian context, where access to digital infrastructure is uneven, educators must prepare students for hybrid realities that combine both traditional and digital systems (Adebayo, 2020). This raises a critical question: what pedagogical strategies are most effective for teaching green office practices in this evolving context?

Pedagogical strategies refer to the methods and techniques educators use to facilitate learning (Xiong, 2025). Traditional OTM instruction has largely relied on lecture-based teaching and rote memorisation, often due to large class sizes and limited resources. However, sustainability education requires more interactive, experiential and context-based approaches. For example, project-based learning can involve students conducting a green office audit tracking paper usage, monitoring energy consumption and analysing waste generation. Based on their findings, students can propose practical solutions such as adopting shared digital platforms, creating awareness campaigns, or establishing recycling systems (Okoro & Eze, 2021). Similarly, simulation exercises can engage students in decision-making scenarios where they manage office resources within environmental and financial constraints.

Other effective strategies include flipped classrooms and digital storytelling, where students create multimedia narratives illustrating sustainable office practices (UNESCO, 2017). Assessment methods must also evolve to include practical outputs such as portfolios, reflective journals and sustainability action plans rather than relying solely on written examinations. Despite the potential of these innovative approaches, their success largely depends on the preparedness of OTM educators. In Nigeria, many OTM educators possess qualifications in business education or related fields and often have industry experience. However, their training has rarely included environmental sustainability or green office practices. A study by Shi and Li (2024) revealed that fewer than 10% of OTM educators in South-Eastern Nigerian polytechnics have received formal training in sustainability-related practices.

This gap limits their ability to effectively teach green office concepts. Furthermore, many educators are accustomed to traditional, resource-intensive office practices and may not fully appreciate the environmental impact of routine activities. Structural challenges such as outdated curricula, limited access to digital tools, poor internet connectivity and insufficient institutional support further hinder effective teaching (Eze & Okonkwo, 2018). Additionally, some educators may feel unprepared to integrate modern technologies into their teaching.

Statement of the Problem

Office Technology and Management programmes in Nigerian polytechnics are designed to produce graduates capable of handling modern administrative tasks efficiently. However, contemporary workplaces increasingly require two critical competencies: environmental sustainability and digital

proficiency. Ideally, office professionals should be able to reduce paper consumption, conserve energy, manage electronic waste and effectively utilise digital platforms. Unfortunately, many OTM graduates lack these essential skills. This shortfall is largely attributable to existing teaching practices, which remain focused on outdated content such as shorthand and basic typing, with minimal emphasis on sustainability. Although digital tools offer opportunities to enhance green practices, they also introduce new challenges such as electronic waste and increased energy consumption. Effective teaching of green office practices therefore requires pedagogical strategies that leverage digital innovations while mitigating their environmental impact. OTM educators face multiple constraints, including inadequate training in sustainability, limited access to digital infrastructure, unreliable internet connectivity and curricula that do not adequately address green office concepts. These challenges highlight a significant gap in both teaching practice and curriculum design.

This study, therefore, seeks to address this gap by identifying effective pedagogical strategies, examining existing barriers and proposing context-appropriate solutions for teaching green office practices in Nigeria's digital age.

Purpose of the Study

The main purpose of this study is to:

1. Identify the pedagogical strategies considered most effective by OTM educators for teaching green office practices in the digital age.
2. Examine the extent to which OTM educators integrate digital tools into their teaching of green office practices.
3. Determine the barriers that hinder the effective implementation of digital-age pedagogical strategies in OTM programmes.

Research Questions

The study is guided by the following questions:

1. What pedagogical strategies do OTM educators consider most effective for teaching green office practices in the digital age?
2. To what extent do OTM educators integrate digital tools into their teaching of green office practices?
3. What barriers constrain OTM educators from effectively implementing digital-age pedagogical strategies?

Hypotheses

The following hypotheses were tested at the 0.05 level of significance:

1. **$H0^1$:** There is no significant difference in the preferences of OTM educators regarding pedagogical strategies for teaching green office practices.
2. **$H0^2$:** OTM educators do not significantly integrate digital tools into their teaching of green office practices.
3. **$H0^3$:** There is no significant difference between polytechnic and university OTM educators regarding the barriers to implementing digital-age pedagogical strategies.

Method

This study adopted a descriptive survey research design, which is appropriate for collecting and analysing data to describe characteristics of a population without manipulating variables (Nworgu, 2015). The study was conducted in public tertiary institutions in Anambra State, Nigeria, offering Business Education and OTM programmes. The population comprised 176 lecturers from institutions including Nnamdi Azikiwe University, Chukwuemeka Odumegwu Ojukwu University, Federal College of Education (Technical) Umunze, Nwafor Orizu College of Education Nsugbe, and Federal Polytechnic Oko. Data were collected using a structured questionnaire divided into two sections: Section A: respondents' biodata and Section B: items addressing the research questions. Responses were measured using a four-point Likert scale: Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The instrument was validated by three experts, and its reliability was established using the Pearson Product Moment Correlation method, yielding coefficients of 0.78, 0.84, and 0.73. The questionnaire was administered electronically, and 163 copies (92%) were returned and used for analysis. Mean and standard deviation were used to answer the research questions, with a criterion mean of 2.50 for agreement. Hypotheses were tested using the independent t-test at the 0.05 level of significance. A null hypothesis was rejected when the calculated t-value exceeded the critical value and accepted otherwise.

Result

Research Question 1: What specific pedagogical strategies do OTM educators consider most effective for teaching green office practices in the digital age?

Table 1: Mean and standard Deviation responses on specific pedagogical strategies OTM educators consider most effective for teaching green office practices in the digital age.

SN	Pedagogical Strategies	X	SD	Remark
1	Project-based learning where students design a complete green office plan.	2.89	0.78	Agree
2.	Green office audits to assess paper use, energy, and waste.	2.74	0.83	Agree
3	Students role-play as office managers	2.62	0.88	Agree
4.	Flipped classroom using video tutorials for green office topics.	2.91	0.72	Agree
5.	Digital storytelling projects about a day in a green office	2.80	0.79	Agree
6.	Study analysis of Nigerian offices with green practices.	2.76	0.84	Agree
7	Organise group discussions on paperless vs. traditional offices	2.95	0.70	Agree
8	Reflective journals on personal green habit adoption.	2.2.99	0.75	Agree
9	Inviting guest speakers from environmental agencies	2.58	0.90	Agree
10	Conducting field trips to organisations with green practices	2.92	0.73	Agree
	Grand Mean and standard deviation	2.80	0,79	Agree

The table 1 shows that all the pedagogical strategies Items 1 to 10 recorded mean scores above the benchmark value of 2.50, indicating that respondents generally agreed that pedagogical strategies identified such as project-based learning for designing green office plans, conducting green office audits, role-play simulations, flipped classroom approaches using video tutorials, digital storytelling case study analysis of Nigerian offices, group discussions on paperless versus traditional offices, reflective learning through journals on green habit adoption, experiential strategies and organising field trips are pedagogical strategies to be considered most effective for teaching green office practices in the digital age. The grand mean of 2.80, which is above the benchmark of 2.50, which means confirms that OTM educators generally consider all identified strategies most effective for teaching green office practices in the digital age

$H0^1$: There is no significant preference among male and female OTM educators regarding the pedagogical strategies employed effective teaching of green office practices in the digital age.

Table 2: Summary of t-test analysis of mean rating of male and female OTM educators regarding the pedagogical strategies employed effective teaching of green office practices in the digital age

Gender	**No**	**Mean X**	**SD**	**Df**	**t-cal**	**t-crit**	**Decision**
Male	63	3.92	0.71	161	-0.547	1.975	Reject Ho
Female	100	3.98	0.65	161			

The result of t-test analysis presented in table 2 shows that calculated t-value (-0.547) is less than the critical t-value (1.975). Therefore, the null hypothesis is not rejected. This means there is no significant difference between male and female OTM educators regarding their preference for pedagogical strategies in teaching green office practices in the digital age. Both male and female educators perceive the effectiveness of these strategies, therefor indicating same interest in pedagogical choice.

Research question 2; To what extent do OTM educators integrate digital tools into their pedagogical approaches for teaching green office practices?

Table 3: Mean and standard Deviation responses on OTM educators integrate digital tools into their pedagogical approaches for teaching green office practices

SN	OTM Educators Integrate Digital Tools	X	SD	Remark
11	I use cloud storage to share materials instead of printing	2.78	0.81	Agree
12.	I teach electronic document management systems	2.65	0.88	Agree
13.	I use virtual meeting platforms to model travel emission reduction.	2.21	0.85	Disagree
14.	I demonstrate energy-monitoring applications	2.05	0.92	Disagree
15.	I use digital assessment tools to eliminate paper exams.	2.18	0.79	Disagree
16.	I incorporate digital calendars for efficient planning.	2.30	0.83	Disagree
17	I use collaborative writing platforms for group work.	2.14	0.87	Disagree
18	I teach digital signature tools to replace printed forms.	2.09	0.90	Disagree
19	I use learning management systems to host content digitally.	2.24	0.84	Disagree
20	I introduce e-waste tracking apps for responsible electronics disposal.	1.98	0.93	Disagree
	Grand Mean and Standard deviation	2.26	0.86	Disagree

Table 3 shows that items 11 and 12 were accepted by the respondents that is use cloud storage to share materials instead of printing and teach electronic document management systems. This suggests a moderate level of adoption of digital tools that directly reduce paper usage and support environmentally friendly office practices. The items 13 to 20 recorded mean scores below the 2.50 benchmark and were therefore rejected. This indicates that OTM educators generally do not integrate several important digital tools into their teaching practices. These include the use of virtual meeting platforms to model travel emission reduction, energy-monitoring applications, digital assessment tools to eliminate paper exams, digital calendars for efficient planning, collaborative writing platforms, digital signature tools, learning management systems and e-waste tracking applications were also not widely utilized. The grand mean of 2.26, which falls below 2.50, further confirms that, overall, OTM educators do not significantly integrate digital tools in their instructional practices. The standard deviation of 0.86 indicates a relatively moderate spread in responses, suggesting that respondents' opinions are somewhat consistent.

$H0^2$: OTM educators do not significantly integrate digital tools into their pedagogical approaches for teaching green office practices

Table 4: Summary of t-test analysis of mean rating of OTM educators on integration of digital tools into their pedagogical approaches for teaching green office practices

Institutions	**No**	**Mean X**	**SD**	**Df**	**t-cal**	**t-crit**	**Decision**
Colleges of Education	72	33.49	0.70	161	1.21	1.975	Reject Ho
Universities	91	3.58	0.68	161			

The result of t-test analysis presented in Table 4 indicates that the calculated t-value 1.21 is less than the critical t-value 1.975 at 0.05 significance level. Therefore, the null hypothesis is not rejected. This indicates that there is no statistically significant difference between OTM lecturers in Colleges of Education and Universities regarding the integration of digital tools into their pedagogical approaches for teaching green office practices.

Research Question 3; What barriers and challenges constrain OTM educators for effectively implementing digital-age pedagogical strategies for green office instruction

Table 5: Mean and standard Deviation responses on barriers and challenges constrain OTM educators for effectively implementing digital-age pedagogical strategies for green office instruction

SN	Barriers and Challenges	X	SD	Remark
21	My institution lacks reliable connectivity	2.76	0.81	Agree
22	There is insufficient access to computers for me and my students	2.22	0.88	Disagree
23	I have not received formal training on green office concepts	2.58	0.78	Agree
24.	I have not received training on integrating digital tools.	2.18	0.86	Disagree
25.	The official OTM curriculum excludes green office topics	2.30	0.83	Disagree
26.	My institution provides no support for developing green materials.	2.12	0.89	Disagree
27	There is inadequate time in the course structure for green content	2.25	0.87	Disagree
28	Frequent power outages disrupt digital tool usage	2.78	0/87	Agree
29	Students lack interest in environmental issues	2.14	0.90	Disagree
30	There is no institutional policy mandating green office teaching	2.29	0.84	Disagree
	Grand Mean and Standard Deviation	2.36		

Table 5 revels that out of the ten items, three were agreed upon as major challenges such as lack of reliable internet connectivity, frequent power outages, and insufficient formal training on green office concepts. Other seven items, including insufficient access to computers, curriculum exclusion, lack of digital tool training, inadequate institutional support, time constraints, students' low interest and absence of policy, were all disagreed, suggesting they are not perceived as significant barriers perhaps if it is included in the curriculum other barrier would been listed in the barriers item because one can not have low interest on what one have not involve self. The grand mean of 2.36, which is below the benchmark of 2.50, indicates that barriers and challenges are generally not perceived as highly significant in constraining the implementation of digital-age pedagogical strategies.

$H0^3$: There is no significant different between ability of polytechnics and universities OTM Educator on barriers and challenges of implementing digital-age pedagogical strategies for green office practices.

Table 6: Summary of t-test analysis of mean rating of OTM educators from polytechnic and universities regarding barriers and challenges of implementing digital-age pedagogical strategies for green office practices.

Institutions	**No**	**Mean X**	**SD**	**Df**	**t-cal**	**t-crit**	**Decision**
Colleges of Education	72	33.49	0.70	161	1.63	1.975	Reject Ho
Universities	91	3.58	0.68	161			

The table 6 indicates that calculated t-value 1.63 is less than the critical t-value 1.975 at 0.05 significance level. Therefore, the null hypothesis is not rejected. This indicates that there is no significant difference in the ability of polytechnics and universities OTM educators on barriers and challenges of implementing digital-age pedagogical strategies for green office instruction

Discussions

The findings in research question 1 revealed that OTM educators acknowledge a wide range of pedagogical strategies that are experiential, collaborative, technology-driven, and reflective as effective for teaching green office practices. This aligns with global trends in sustainability education, which emphasize active learning, real-world engagement and the integration of digital tools. The agreement across all items suggests that these strategies are necessary for preparing students to function effectively in environmentally conscious and digitally driven office settings. Macagno, Nguyen-Quoc & Jarvis (2024) opine green office practices strategies shift away from traditional lecture-based methods toward more engaging approaches that encourage critical thinking, collaboration, creativity, and real-world application. This aligns with contemporary educational practices which emphasize active participation and meaningful learning experiences as essential for sustainability education Sundman, Feng, Shrestha, Johri, & Väris, (2025).

The finding on research question 2 revealed that while educators demonstrate basic awareness and limited use of digital tools, there is insufficient integration of more advanced and interactive

technologies that support green office practices. The acceptance of cloud storage and electronic document management implies that lecturers are beginning to adopt digital alternatives that reduce paper usage. This aligns with recent studies which indicate that digital tools can significantly support sustainable practices by minimizing resource consumption and promoting efficiency (Bond et al., 2022). The general disagreement across most items indicates a gap between awareness and practical implementation. This suggests that many educators are not fully leveraging digital technologies to model environmentally responsible green office practices. Recent research highlights that despite the recognized potential of educational technologies, their effective integration into teaching remains limited due to factors such as inadequate training, lack of infrastructure, and resistance to change (Ifenthaler & Yau, 2023). According to Redecker and Punie (2022), educators' digital competence plays a critical role in determining the extent to which technology is effectively integrated into teaching and learning processes. The limited use of digital tools for modelling sustainability green office practices indicates that environmental applications of technology are not yet fully embedded in teaching practices. Contemporary sustainability education emphasizes the integration of digital solutions to promote environmentally responsible behavior and prepare students for green workplaces (Zhao et al., 2023)

The findings from research question 3 revealed that OTM educators generally disagreed that most of the listed factors constitute major barriers. However, a few critical issues, particularly poor internet connectivity, lack of training on green office practices and frequent power outages were identified as significant challenges. This suggests that while institutional and curricular constraints may not be perceived as dominant obstacles, infrastructural and capacity-related factors remain key limitations to effective implementation green office practices. Tondeur et al., (2022) states that stable internet access and electricity supply are foundational requirements for effective digital pedagogy, and their absence limits both teaching innovation and student engagement. Zhang et al. (2022), emphasizes that teacher training is essential for integrating sustainability into curricula, as it equips educators with the competencies needed to deliver relevant and impactful instruction. Without further training of OTM Educators on green office practice, even willing educators may struggle to implement green office practices effectively.

Conclusion

The study reveals that OTM educators in Nigeria recognise and value a wide range of innovative pedagogical strategies for teaching green office practices. However, the actual integration of digital tools into teaching remains low, with only basic technologies being moderately utilised. Although most barriers were not widely acknowledged, critical issues such as poor internet connectivity, power instability and lack of training significantly affect effective implementation. The absence of significant differences across gender and institution type suggests that these challenges are widespread. Overall, the findings point to the need for stronger institutional support, improved infrastructure and targeted capacity building to advance green office education in the digital.

Recommendations

Based on the findings, the following recommendations are proposed:

1. Curriculum planners and regulatory bodies should formally incorporate green office practices and digital sustainability into OTM programmes across universities, colleges of education, and polytechnics.
2. Institutions should provide continuous training for educators and improve access to digital tools such as learning management systems, virtual meeting platforms, and collaborative technologies to support sustainable teaching practices.
3. Policymakers and institutional administrators should invest in reliable internet connectivity, stable power supply, and ongoing professional development to address the key barriers identified in this study.

INVESTIGATING THE ROLE OF DIGITAL SKILLS IN ENHANCING ENTREPRENEURIAL SUCCESS AMONG OYO STATE BUSINESS EDUCATION GRADUATES

By:
Risikat Mojisola FOLORUNSO
Emmanuel Alayande University of Education, Oyo
Department of Business and Entrepreneurship Education

Abstract

The growth of the digital economy has intensified the need for graduates to develop skills that support self-employment and decent work. This study examined the digital entrepreneurial skills acquired by Business Education undergraduates for decent work in tertiary institutions in Oyo State. A descriptive survey research design was adopted. The population comprised 2,013 undergraduates, from which 379 students were selected using the Krejcie and Morgan (1970) sample size determination table. Data were collected through a self-developed four-point rating scale questionnaire validated by three measurement and evaluation experts. A Cronbach's Alpha reliability coefficient of .87 was obtained from a trial test. Of the 379 questionnaires administered, 350 were properly completed and retrieved, representing a 92.35% retrieval rate. Data were analysed using arithmetic mean, standard deviation, and one-way Analysis of Variance (ANOVA) at the .05 level of significance, followed by a Tukey HSD Post Hoc Test. Findings showed that the level of digital marketing and social media skills acquired by the undergraduates was very low (M = 1.70, SD = 0.67). The ANOVA result indicated a statistically significant difference in digital skill acquisition among six student support profile groups, F(5, 344) = 14.382, p < .001. The Tukey HSD Post Hoc Test identified specific between-group differences. The study recommends that Business Education undergraduates obtain professional certifications in digital marketing and social commerce to complement the skills provided through the tertiary education curriculum.

Keywords: *digital entrepreneurial skills, Business Education, undergraduates, decent work, tertiary institutions, Oyo State*

Introduction

Changes in the economies of developing countries have increased the need for self-reliance, youth empowerment, and enterprise development — areas that are central to economic growth and employment creation (Zubair et al., 2026). In Nigeria, tertiary institutions are expected to equip students with professional knowledge, vocational skills, and other forms of training that prepare them for employment and self-employment (Enebeli & Alete-Omoni, 2026). However, the expansion of tertiary education enrolment has not resolved the problem of graduate unemployment. One contributing factor is the persistent gap between the skills acquired in tertiary institutions and those demanded by the labour market (Arogundade, 2011).

Business Education is designed to prepare students for teaching, office administration, entrepreneurship, and other business-related activities. The programme is expected to produce graduates capable of establishing and managing small and medium-scale enterprises and contributing to economic development (Ukata et al., 2022). It also equips graduates with the knowledge required to function in diverse business and administrative settings (Ndubuisi et al., 2022). Despite these objectives, some Business Education programmes in Nigerian tertiary institutions continue to rely heavily on traditional instructional methods, with greater emphasis on manual bookkeeping, secretarial procedures, and conventional office management than on digital business activities (Uzoamaka & Okpuzor, 2025).

The growth of the digital economy has fundamentally altered how businesses market products, engage with customers, and process payments. Enterprises now depend on online marketing, customer relationship management platforms, social media, e-commerce, and electronic payment systems — activities that require demonstrable digital competencies from anyone intending to start or manage a business (Eze et al., 2020).

A central concern is therefore the gap between what students learn through traditional Business Education programmes and the digital skills required for entrepreneurial activities. Digital marketing and social media skills are increasingly relevant to business promotion, customer engagement, and online sales. Nevertheless, available evidence suggests that students in some Nigerian tertiary institutions have limited opportunities to acquire these practical competencies (Ismail & Diala, 2025).

The acquisition of digital skills may also vary among students due to differences in personal backgrounds and institutional support available. Students with prior access to computers, internet services, ICT training, and personal funding tend to have greater opportunities to practise digital skills. At the institutional level, factors such as functional computer laboratories, electricity supply, internet connectivity, appropriate software, qualified lecturers, and adequate funding influence the quality of digital skills students develop.

It is therefore necessary to examine the level of digital marketing and social media skills acquired by Business Education undergraduates in Oyo State tertiary institutions, and to determine whether students from different combinations of personal and institutional support backgrounds differ in their levels of digital skill acquisition.

Research Questions

The study was guided by the following research questions:

- What is the level of digital marketing and social media skills acquired by Business Education undergraduates in Oyo State tertiary institutions?
- Is there a significant difference in the digital entrepreneurial skill acquisition of Business Education undergraduates based on their combined personal and institutional support profiles?

Null Hypothesis

H_0: There is no significant difference in the mean digital skill acquisition levels of Business Education undergraduates among the six mutually exclusive student support profile groups.

Literature Review

Theoretical Underpinning

This study is grounded in Human Capital Theory, originally formulated by Schultz (1961) and elaborated by Becker (1964). The theory posits that individuals invest in education, training, and skills because such investments enhance their productive capacity and future economic opportunities. Human capital encompasses the knowledge, skills, and abilities developed through education and experience, enabling individuals to work more effectively, solve problems, and contribute to economic activities.

The theory is particularly relevant to Business Education because digital skills constitute a valuable form of human capital. Students who develop competencies in digital marketing, social media management, e-commerce, and related areas are better positioned to start businesses or secure employment. From this perspective, Business Education should extend beyond theoretical knowledge to provide students with practical skills relevant to contemporary business practice, as the acquisition of digital skills can enhance the productive capacity of graduates and better prepare them for entrepreneurial activities (Okute, 2021).

Digital Marketing and Social Media Competencies in Entrepreneurship

Digital marketing has become a fundamental component of modern business practice. Enterprises use digital platforms to promote products, engage with customers, and generate sales, drawing on competencies such as Search Engine Optimisation (SEO), online advertising, content creation, digital analytics, and social media marketing (Eze et al., 2020). Social media platforms offer additional opportunities for advertising, customer feedback, product promotion, and online sales. Nwosu (2025) highlighted the importance of digital marketing skills among Business Education students for the promotion of small and medium-scale enterprises.

The growing centrality of these skills creates an urgent need for tertiary institutions to deliver practical digital training. However, some Business Education programmes continue to rely on traditional instructional approaches, leaving students with conceptual knowledge of why digital tools matter but without the practical ability to apply them in real business contexts (Ndubuisi et al., 2022). Uzoamaka and Okpuzor (2025) reported a gap between the digital skills employers require and those many graduates possess, reinforcing the need for practical digital training to become a central feature of Business Education.

Personal and Institutional Determinants of Skill Acquisition

The acquisition of digital skills is influenced by both student-level and institutional factors. Personal factors include prior ICT experience, access to computing devices, financial resources, and prior digital training. Students with access to these resources typically have greater opportunities to practise and consolidate their skills (Zincware & Kifordu, 2026). Ismail and Diala (2025) found that digitalisation is associated with youth employability and identified access to digital resources as a key factor, suggesting that students' personal circumstances significantly affect the level of digital skills they acquire.

Institutional support equally plays a critical role. Tertiary institutions need functional computer laboratories, reliable electricity supply, internet connectivity, appropriate software, and lecturers equipped to teach current digital competencies — all of which require adequate funding and the

effective implementation of ICT policies. Okute (2021) stressed the importance of human capital development in vocational and technical education, while Zubair et al. (2026) highlighted the significance of digital skills for entrepreneurship education. The literature thus indicates that both student-level resources and institutional conditions contribute to digital skill acquisition, a consideration that informs the analytical framework of this study.

Methodology

Research Design

A descriptive survey research design was adopted for the study. This design was appropriate because the study sought to obtain information from students about their existing level of digital entrepreneurial skill acquisition without any experimental treatment or manipulation of variables.

Population and Sample

The study population comprised 2,013 full-time Business Education undergraduates enrolled in tertiary institutions in Oyo State offering vocational and business education programmes. A sample size of 379 students was determined using the Krejcie and Morgan (1970) sample size determination table. Proportionate stratified sampling was used to distribute the sample across the selected institutions.

Table 1

Population and Sample Distribution of Business Education Undergraduates

Institution	Population (N)	Sample (n)	%
Emmanuel Alayande University of Education, Oyo	750	141	37.25
Federal College of Education (Special), Oyo	620	117	30.87
The Polytechnic, Ibadan	450	85	22.43
Ajayi Crowther University, Oyo	193	36	9.45
Total	**2,013**	**379**	**100.00**

Note. Percentages are based on the total population of 2,013 students. Minor discrepancies may arise from rounding.

Of the 379 questionnaires administered, 350 were correctly completed and retrieved for analysis, representing an effective retrieval rate of 92.35%.

Instrumentation

A self-developed structured questionnaire titled Digital Entrepreneurial Skills for Business Education Undergraduates Questionnaire (DESBEUQ) was used for data collection. The instrument was based on a four-point rating scale: Strongly Agree (SA) = 4, Agree (A) = 3, Disagree (D) = 2, and Strongly Disagree (SD) = 1. The draft questionnaire was subjected to face and content validation by three experts in Business Education and Measurement and Evaluation, and their observations informed revisions before final administration. A trial test conducted with 30 students yielded a Cronbach's Alpha reliability coefficient of .87, indicating a high level of internal consistency.

Data Collection Procedure

The researcher personally administered 379 copies of the questionnaire to the selected respondents. Completed questionnaires were examined for completeness upon collection. A total of 350 copies met the inclusion criteria, yielding a 92.35% effective retrieval rate.

Data Analysis Techniques

Arithmetic mean and standard deviation were used to answer the research questions, with a mean of 2.50 serving as the decision benchmark. One-way ANOVA was used to test the null hypothesis at the .05 level of significance, and the Tukey HSD Post Hoc Test was applied where a significant difference was found to identify the specific groups responsible. The decision benchmarks for interpreting mean scores were:

Mean Range	Decision
3.50–4.00	Very High Level
2.50–3.49	High Level
1.50–2.49	Very Low Level
1.00–1.49	Not Acquired

Results

Research Question 1

What is the level of digital marketing and social media skills acquired by Business Education undergraduates in Oyo State tertiary institutions?

Arithmetic mean and standard deviation were computed for each item, with a benchmark of 2.50. Table 2 presents the results.

Table 2

Mean and Standard Deviation of Digital Marketing and Social Media Skills Acquired by Business Education Undergraduates (N = 350)

Item	Skill Description	M	SD	Decision
1	Social media advertising and campaign management	1.84	0.72	Very Low
2	Search Engine Optimisation (SEO) execution	1.62	0.65	Very Low
3	E-commerce store set-up and payment integration	1.75	0.69	Very Low
4	Data analytics interpretation for online customer targeting	1.58	0.61	Very Low
5	Digital content creation and copywriting for online campaigns	1.71	0.68	Very Low
Overall	**Grand Mean and Standard Deviation**	**1.70**	**0.67**	**Very Low**

Note. Decision benchmark: 3.50–4.00 = Very High Level; 2.50–3.49 = High Level; 1.50–2.49 = Very Low Level; 1.00–1.49 = Not Acquired.

Table 2 shows that all five skills had mean scores below the 2.50 benchmark. Social media advertising and campaign management recorded the highest mean (M = 1.84, SD = 0.72), while data analytics interpretation for online customer targeting recorded the lowest (M = 1.58, SD = 0.61). The overall mean of 1.70 (SD = 0.67) falls within the 1.50–2.49 range, indicating that the level of digital marketing and social media skills acquired was very low.

Hypothesis Testing

H_0: There is no significant difference in the mean digital skill acquisition levels of Business Education undergraduates among the six mutually exclusive student support profile groups.

The 350 respondents were classified into six mutually exclusive support profile groups based on composite scores for personal factors (ICT background, skill experience, and personal funding) and institutional factors (policy implementation, learning environment, and institutional funding):

- Group 1: High Personal Support / High Institutional Support (n = 58)
- Group 2: High Personal Support / Moderate Institutional Support (n = 62)
- Group 3: High Personal Support / Low Institutional Support (n = 45)
- Group 4: Low Personal Support / High Institutional Support (n = 55)
- Group 5: Low Personal Support / Moderate Institutional Support (n = 70)
- Group 6: Low Personal Support / Low Institutional Support (n = 60)

Table 3

One-Way Analysis of Variance of Digital Skill Acquisition by Student Support Profile

Source	SS	df	MS	F	p
Between Groups	48.621	5	9.724	14.382	< .001
Within Groups	233.114	344	0.677	—	—
Total	**281.735**	**349**	**—**	**—**	**—**

Note. Critical F(5, 344) = 2.21. Significant at p < .05.

Table 3 shows that the calculated F-value of 14.382 exceeded the critical F-value of 2.21, and the result was statistically significant (p < .001). The null hypothesis was therefore rejected: there was a significant difference in mean digital skill acquisition levels across the six student support profile groups.

A Tukey HSD Post Hoc Test was subsequently conducted to identify the specific pairs of groups that differed significantly.

Table 4

Tukey HSD Post Hoc Comparisons of Digital Skill Acquisition Across Student Support Profile Groups

(I) Group	(J) Group	Mean Diff. (I − J)	SE	p
Group 1: High Personal / High Institutional	Group 3: High Personal / Low Institutional	0.68*	0.14	< .001
Group 1: High Personal / High Institutional	Group 6: Low Personal / Low Institutional	1.12*	0.13	< .001
Group 2: High Personal / Moderate Institutional	Group 5: Low Personal / Moderate Institutional	0.54*	0.12	.001

Group 4: Low Personal / High Institutional	Group 6: Low Personal / Low Institutional	0.44*	0.13	.004

Note. * Mean difference is significant at the .05 level.

Table 4 shows that Group 1 (high personal and high institutional support) scored significantly higher than both Group 3 and Group 6. A significant difference also existed between Group 2 and Group 5, and between Group 4 and Group 6. These results indicate that greater combined personal and institutional support was associated with higher digital skill acquisition scores.

Discussion of Findings

Digital Marketing and Social Media Skills Acquisition

The first finding revealed that the level of digital marketing and social media skills acquired by Business Education undergraduates in Oyo State tertiary institutions was very low, with an overall mean of 1.70 (SD = 0.67). All five skills examined fell below the 2.50 benchmark. Social media advertising and campaign management recorded the highest mean (M = 1.84, SD = 0.72), while data analytics interpretation for online customer targeting recorded the lowest (M = 1.58, SD = 0.61).

This finding is consistent with Uzoamaka and Okpuzor (2025), who identified deficiencies in digital skills among Business Education graduates, and with Ndubuisi et al. (2022), who advocated for greater integration of digital skills into Business Education curricula. It also corroborates Ukata et al. (2022), whose study similarly recorded low levels of digital entrepreneurial skill acquisition among Business Education undergraduates in Rivers State. The results suggest that students are not receiving sufficient practical training in key digital business competencies, a gap likely attributable to the continued use of traditional instructional methods and limited access to practical digital learning environments.

Differences in Digital Skill Acquisition Among Support Profile Groups

The second finding revealed a statistically significant difference in digital skill acquisition among the six student support profile groups, $F(5, 344) = 14.382$, $p < .001$. The Tukey HSD Post Hoc Test identified specific between-group differences: Group 1 (high personal and high institutional support) scored significantly higher than both Group 3 and Group 6; Group 2 scored significantly higher than Group 5; and Group 4 scored significantly higher than Group 6.

These findings suggest that both students' personal resources and institutional conditions are associated with their level of digital skill acquisition. Students with prior ICT experience, practical exposure, and financial resources have more opportunities to develop digital competencies, while students in better-resourced institutions benefit from superior facilities and instruction. This is consistent with Human Capital Theory (Schultz, 1961; Becker, 1964), which holds that investment in education and training enhances individual productive capacity.

The results also align with Zincware and Kifordu (2026), who linked digital skills acquisition to employability outcomes among university graduates in Nigeria, and with Ismail and Diala (2025), who identified access to digital resources as a key determinant of youth employability. Okute (2021) and Zubair et al. (2026) further underscore the importance of institutional investment in digital education. Collectively, the findings indicate that improving digital skill acquisition among Business Education students requires simultaneous attention to student-level resources and institutional learning conditions.

Limitations of the Study

The study was confined to selected tertiary institutions in Oyo State, Nigeria, and the findings may not be directly generalisable to institutions in other parts of the country where educational facilities and conditions may differ. Additionally, data were gathered through self-reported responses, which may introduce response bias if students' perceptions of their skill levels do not accurately reflect their actual digital performance. Future studies could incorporate practical skills assessments to provide more objective evidence of digital competency levels.

Practical and Policy Implications

Curricular Restructuring

Business Education curricula should accord greater emphasis to practical digital competencies, with explicit coverage of digital marketing, social media analytics, SEO, e-commerce, and online payment systems. Students need structured opportunities to apply these tools in realistic business contexts rather than relying primarily on theoretical instruction.

Professional Certification

Undergraduates should be encouraged to complement their formal education by obtaining recognised professional certifications in digital marketing, social media management, and social commerce, which can provide additional practical experience and strengthen readiness for employment and self-employment.

Government and Institutional Support

Government and educational authorities should invest in the infrastructure required for digital learning, including functional computer laboratories, reliable electricity, internet connectivity, relevant software, and adequate institutional funding. Tertiary institutions also need academic staff with current digital competencies who can deliver effective practical instruction.

Conclusion

This study examined the level of digital marketing and social media skills acquired by Business Education undergraduates in Oyo State tertiary institutions and explored whether skill acquisition differed across student groups with varying combinations of personal and institutional support. Findings showed that the level of digital marketing and social media skills was very low overall ($M = 1.70$, $SD = 0.67$), and that significant differences existed across the six student support profile groups, $F(5, 344) = 14.382$, $p < .001$. Students with stronger combinations of personal and institutional support recorded markedly higher digital skill acquisition scores.

These findings indicate that the challenge of low digital skill acquisition cannot be addressed through classroom instruction alone. Students need practical exposure, access to digital resources, and dedicated skills development opportunities, while tertiary institutions and government authorities must provide suitable learning environments, adequate funding, and coherent policy support for digital education. Greater emphasis on practical digital marketing, social media, e-commerce, and related competencies in Business Education — alongside encouragement for students to pursue relevant professional certifications — can improve graduates' readiness for employment, self-employment, and entrepreneurial activity in the digital economy.

Abstract

This study examined the relationship between green entrepreneurial orientation and venture creation intentions among Entrepreneurship Education students in universities in Rivers State, Nigeria. Specifically, the study investigated the relationships between green innovativeness, green proactiveness, green competitive aggressiveness and students' venture creation intentions. A correlational research design was adopted. The population comprised 210 final-year Entrepreneurship Education students in the Business Education programmes of Rivers State University and Ignatius Ajuru University of Education. Census sampling was used, and all 210 students participated in the study. Data were collected using structured questionnaires titled Green Entrepreneurial Orientation Questionnaire (GEOQ) and Venture Creation Intentions Questionnaire (VCIQ), measured on a five-point rating scale. The instruments were validated by experts, while their internal consistency was established using Cronbach's Alpha. Pearson Product Moment Correlation Coefficient was used to answer the research questions and test the hypotheses at the 0.05 level of significance. The findings revealed a significant moderate positive relationship between green innovativeness and venture creation intentions ($r = .362$, $p < .001$). Green proactiveness also demonstrated a significant strong positive relationship with venture creation intentions ($r = .608$, $p < .001$). However, green competitive aggressiveness had a weak and statistically non-significant relationship with venture creation intentions ($r = .092$, $p = .182$). The study concludes that green innovativeness and proactiveness are important correlates of students' intentions to create sustainable ventures. It recommends stronger integration of practical green entrepreneurship education into university curricula to foster environmentally responsible innovation, opportunity recognition and sustainable venture creation.

Introduction

The increasing problems of climate change, environmental degradation, pollution, poor waste disposal and the loss of natural resources have changed the way entrepreneurship is viewed. Entrepreneurship is no longer focused only on making profit and creating economic value. More attention is now being given to businesses that can make profit while also protecting the environment and contributing to the well-being of society. This has led to the growth of green entrepreneurship, where environmental problems are seen as opportunities to develop sustainable products, services, technologies and business ideas (Tuncer & Korchagina, 2024). This is particularly important in Nigeria, where environmental problems exist alongside unemployment, poverty and the need for sustainable means of livelihood. Therefore, universities have an important role to play in preparing students to develop businesses that can address environmental challenges while also creating income and economic value. Nigeria faces serious environmental challenges arising from industrial activities, poor waste management, deforestation, pollution and climate change. These problems affect people's livelihoods, economic activities, public health and sustainable development (UNEP, 2024). The situation is particularly serious in the Niger Delta, where petroleum exploration and exploitation have contributed to oil spills, gas flaring, pollution of waterways, damage to ecosystems and loss of biodiversity (UNDP, 2022; UNEP, 2024). Rivers State, which is a major centre of petroleum-related activities, continues to experience environmental problems that affect agriculture, fishing, water resources and the livelihoods of local communities. The Federal Ministry of Environment (2021) has also emphasised the need for

stronger environmental management and sustainable development practices. These challenges make Rivers State an important setting for developing graduates who can identify environmental problems and turn them into opportunities for sustainable businesses and enterprise creation.

Green entrepreneurship provides an avenue for addressing these challenges while promoting employment, innovation and responsible resource utilisation. Activities such as recycling, renewable energy, sustainable agriculture, waste management, environmental services and environmentally friendly production can generate economic value while reducing environmental harm (United Nations, 2023; UNEP, 2024). Universities therefore have a responsibility to equip students with entrepreneurial knowledge, skills and attitudes that enable them to recognise opportunities and establish sustainable ventures. Evidence from Rivers State indicates that entrepreneurship education contributes to entrepreneurial identity, intention, self-employment and entrepreneurial development among students (Ahiamadu & Allen, 2020; Ikpesu & Ekweme, 2023; Nwineh et al., 2023). Ogwunte (2023) also found that innovativeness and business alertness influence entrepreneurial intentions among Business Education students, while Bamson et al. (2026) reported the relevance of entrepreneurship education, entrepreneurial attitude and self-efficacy to students' entrepreneurial intentions.

However, the environmental side of entrepreneurship still needs greater attention, particularly among young people preparing to become entrepreneurs. This concern has contributed to the development of the concept of green entrepreneurial orientation (GEO), which brings environmental responsibility into the way entrepreneurs identify opportunities, develop new ideas, make strategic decisions and compete in the marketplace. Rather than focusing only on profit and business growth, GEO encourages entrepreneurs to consider how their business activities can protect the environment and make better use of available resources. Qin et al. (2024) explained that GEO combines environmental sustainability with the pursuit of entrepreneurial opportunities and strategic business decisions. This means that entrepreneurs with a green orientation are expected to consider environmental concerns when deciding what products or services to offer and how their businesses should operate.

Existing entrepreneurship studies in Rivers State have largely focused on entrepreneurship education, entrepreneurial intention, entrepreneurial mindset, skills acquisition, opportunity recognition and self-employment (Ahiamadu & Allen, 2020; Biranee & Dambo, 2021; Ikpesu & Ekweme, 2023; Nwineh et al., 2023; Ogwunte, 2023; Aleru & Isi, 2024). While these studies provide valuable evidence on conventional entrepreneurial development, comparatively limited attention has been given to the environmental dimension of entrepreneurial orientation. In particular, there is insufficient empirical evidence on whether green innovativeness, green proactiveness and green competitive aggressiveness are related to venture creation intentions among entrepreneurship students in Rivers State universities. International studies have increasingly examined GEO and sustainable entrepreneurial outcomes (Qin et al., 2024; Tuncer & Korchagina, 2024), but findings from other contexts cannot automatically be generalised to university students in Rivers State, who are still developing entrepreneurial knowledge, practical experience, market awareness and resource mobilisation capabilities.

The problem, therefore, is not merely the existence of environmental degradation or limited employment opportunities. The more specific problem is the insufficient empirical understanding of whether the green entrepreneurial orientation of entrepreneurship students is associated with their intentions to create ventures. In particular, it remains unclear whether green innovativeness, green proactiveness and green competitive aggressiveness are significantly related to venture creation intentions among entrepreneurship students in Rivers State universities. Without such evidence, entrepreneurship educators and curriculum developers may find it difficult to determine which green entrepreneurial competencies require greater emphasis in preparing students for sustainable venture creation.

It is based on this premise that the main purpose of this study is to examine the relationship between green entrepreneurial orientation and venture creation intentions among entrepreneurship students in universities located in Rivers State, Nigeria. The objectives are to determine the relationship between green innovativeness and venture creation intentions among entrepreneurship students; ascertain the relationship between green proactiveness and venture creation intentions among entrepreneurship students; and to examine the relationship between green competitive aggressiveness and venture creation intentions among entrepreneurship students in universities in Rivers State. The main research hypothesis was that there was no significant relationship between green innovativeness and venture creation intentions among entrepreneurship students in universities in Rivers State.

Purpose of the Study

The main purpose of this study is to examine the relationship between green entrepreneurial orientation and venture creation intentions among entrepreneurship students in universities in Rivers State.

Specifically, the study seeks to:

1. Determine the relationship between green innovativeness and venture creation intentions among entrepreneurship students in universities in Rivers State;
2. Ascertain the relationship between green proactiveness and venture creation intentions among entrepreneurship students in universities in Rivers State;
3. Examine the relationship between green competitive aggressiveness and venture creation intentions among entrepreneurship students in universities in Rivers State.

Research Questions

1. What is the relationship between green innovativeness and venture creation intentions among entrepreneurship students in universities in Rivers State?
2. What is the relationship between green proactivenessand venture creation intentions among entrepreneurship students in universities in Rivers State?
3. What relationship exists between green competitive aggressiveness and venture creation intentions among entrepreneurship students in universities in Rivers State?

Hypotheses

H01: There is no significant relationship between green innovativeness and venture creation intentions among entrepreneurship students in universities in Rivers State.

H02: There is no significant relationship between green proactiveness and venture creation intentions among entrepreneurship students in universities in Rivers State.

H03: There is no significant relationship between green competitive aggressiveness and venture creation intentions among entrepreneurship students in universities in Rivers State.

Methodology

The study adopted a correlational research design. This design is appropriate because it seeks to determine the extent and direction of the relationship between green entrepreneurial orientation and venture creation intentions among entrepreneurship students in universities in Rivers State. The design enables the researcher to establish whether variations in green innovativeness, green proactiveness, and green competitive aggressiveness are associated with corresponding variations in students' intentions to establish business ventures without manipulating any of the study variables. It is particularly suitable because the study is interested in examining naturally existing relationships. This design also aligns with the research questions and hypotheses, which focus on the relationships among the variables. The population of this study comprised 64 final year Entrepreneurship Education students in Business Education programme in Rivers State University and 142 Entrepreneurship Education students in Ignatius Ajuru University of Education making it a total of 210 students in Business Education programme in Rivers Universities. The census sampling technique was used because the population was a manageable a size. be The instrument for data collection were self-structured questionnaires titled Green Entrepreneurial Orientation (GEOQ) and Venture Creation Intentions (VCI). The sets of questionnaires were structured on a 5 - point rating scale with options: Very High Extent (VHE) = 5, High Extent (HE) = 4, Moderate Extent (ME) = 3, Low Extent (LE) = 2, Very Low Extent (VHE) = 1. The sets of instruments were designed for students. To ensure the validity of the instruments, copies of the sets of questionnaire were subjected to face and content validation by three experts, two among the experts were from Business Education department and one from Measurement and Evaluation department all from the Faculty of Education. Their comments, observations, and suggestions were incorporated into the final version of the sets of questionnaires before it was administered to the respondents. The reliability of the instrument was established using Cronbach's Alpha, and a reliability coefficient of 0.70 or above was considered acceptable for internal consistency. The 210 questionnaire were administered and retrieved. The research questions were answered using Pearson Product Moment Correlation Coefficient (PPMC) to determine the extent of the relationship between the independent and dependent variables. The hypotheses were tested using the Pearson Product Moment Correlation Coefficient (PPMC) at the 0.05 level of significance. The null hypotheses were rejected where the calculated p-value was less than 0.05 and retained where the p-value was greater than 0.05. All data analyses were carried out using the Statistical Package for the Social Sciences (SPSS), Version 27.

Results

Table 1: There is no significant relationship between green innovativeness and venture creation intentions among entrepreneurship students in universities in Rivers State.

Correlations

		Green innovation	Venture creation
Green innovativeness	Pearson Correlation	1	.362
	Sig. (2-tailed)		.000
	N	210	210
Venture creation	Pearson Correlation	.362	1
	Sig. (2-tailed)	.000	
	N	210	210

. Correlation is significant at the 0.01 level (2-tailed).

There is no significant relationship between green proactiveness and venture creation intentions among entrepreneurship students in universities in Rivers State.

Correlations

		Green Proactiveness	Venture Creation

	Sig. (2-tailed)	.182	210
	N	210	

Correlation is significant at the 0.01 level (2-tailed).

Discussion of findings

The finding of the study revealed a significant positive relationship between green innovativeness and venture creation intentions among entrepreneurship students in universities in Rivers State. The correlation coefficient of r = .362 with a significance value of p < .001 indicates a moderate positive relationship, suggesting that students who demonstrate greater willingness to generate environmentally friendly ideas, develop green products and services, and apply innovative approaches to environmental problems are more likely to express stronger intentions to establish their own ventures. This finding is understandable because green innovativeness enables students to view environmental challenges not only as ecological problems but also as potential areas for entrepreneurial opportunity. In the context of Rivers State, where environmental challenges such as pollution, poor waste management and ecological degradation are prevalent, innovative students may identify opportunities in areas such as recycling, renewable energy, environmental services and sustainable production. The finding is consistent with Ameer and Khan (2025), who established that green entrepreneurial orientation contributes to entrepreneurial success through green innovation capability. It also agrees with Okiridu and Golden (2024), who found that practical teaching approaches enhance entrepreneurial skills acquisition among Business Education students in Rivers State universities. Similarly, Ikpesu and Ekweme (2023) emphasized the importance of entrepreneurship learning experiences in developing students' entrepreneurial identity and capacity for innovative thinking. Therefore, the present finding suggests that developing students' capacity to think creatively about environmental problems can strengthen their willingness to translate green business ideas into actual venture creation

The finding further revealed a strong positive and statistically significant relationship between green proactiveness and venture creation intentions, with a correlation coefficient of r = .608 and a significance value of p < .001. This result indicates that students who are more proactive in identifying environmental needs, seeking emerging green business opportunities, anticipating future environmental demands and taking initiative are considerably more likely to develop intentions to establish business ventures. The relatively stronger correlation obtained for green proactiveness, compared with green innovativeness, suggests that the ability to anticipate and act upon emerging opportunities may be particularly important in stimulating venture creation intentions among entrepreneurship students. A proactive student is more likely to identify environmental problems before they become more severe and consider how such problems can be converted into viable business opportunities. This is particularly relevant to Rivers State, where continuing environmental challenges create emerging demands for waste management, recycling, sustainable agriculture, environmental remediation and other green services. The finding is in agreement with Aleru and Isi (2024), who reported that entrepreneurship education contributes to students' ability to identify entrepreneurial opportunities and develop self-employment capacities. It is also consistent with Umesi (2021), who argued that effective entrepreneurship education should equip graduates with competencies that support job creation and sustainable development. The result therefore reinforces the view that students' willingness to take initiative and anticipate future environmental and market needs can play an important role in shaping their intentions to create sustainable ventures.

The third finding showed that green competitive aggressiveness has no statistically significant relationship with venture creation intentions among entrepreneurship students in universities in Rivers State. The result produced a correlation coefficient of r = .092 with a significance value of p = .182, which is greater than the 0.05 level of significance. This indicates a very weak positive association that is not statistically significant, implying that students' willingness to compete through environmentally friendly products, differentiate their prospective businesses through sustainability practices, or gain competitive advantage through green strategies does not, by itself, appear to be sufficiently associated with their intentions to create ventures. One possible explanation is that entrepreneurship students may recognize the importance of environmental responsibility and competition but may not yet possess the practical resources, market experience, financial capacity or confidence required to translate competitive green strategies into actual venture-creation intentions. This finding differs from Qin et al. (2024), who reported that green entrepreneurial orientation contributes to business success and sustainable competitive advantage through environmental innovation and strategic flexibility. The difference may be explained by the context of the present study, which focused on university students who are still developing entrepreneurial capabilities, rather than established entrepreneurs operating in competitive markets. The finding also suggests that competitive aggressiveness alone may not be sufficient to motivate students to establish green ventures. Rather, as indicated by the significant relationships observed for green innovativeness and green proactiveness, students may require the capacity to generate innovative environmental solutions and proactively identify opportunities before competitive strategies can meaningfully influence their intentions to create ventures. This result is

important for entrepreneurship education in Rivers State because it indicates that simply encouraging students to compete may have limited influence unless such competitiveness is supported by practical green innovation, opportunity recognition and proactive entrepreneurial capabilities.

Conclusion

The study concludes that green entrepreneurial orientation is important in strengthening venture creation intentions among entrepreneurship students in Rivers State universities. The three dimensions—green innovativeness, green proactiveness, and green competitive aggressiveness—provide complementary capacities for transforming environmental challenges into viable business opportunities. Green innovativeness enables students to develop environmentally friendly products, services and processes; green proactiveness enables them to anticipate emerging environmental needs and identify future green markets; while green competitive aggressiveness encourages them to pursue and differentiate sustainable business opportunities in a competitive environment.Overall, the study concludes that entrepreneurship education in Rivers State universities should move beyond conventional business creation and deliberately integrate environmental sustainability into entrepreneurial learning. Developing these three dimensions can prepare students not only to seek employment but also to create sustainable ventures that contribute to self-employment, environmental protection, wealth creation and sustainable economic development in Rivers State.

Recommendations

1. Universities in Rivers State should strengthen green entrepreneurship education by integrating environmental sustainability, green business models, recycling, waste-to-wealth, renewable energy and sustainable production into entrepreneurship courses. This will help students connect entrepreneurial knowledge with the environmental challenges and business opportunities within their communities.
2. Entrepreneurship educators should emphasise practical and experiential learning to develop green innovativeness and proactiveness. Students should be encouraged to identify environmental problems and develop innovative business solutions through business idea competitions, practical projects, field activities and interaction with successful green entrepreneurs.
3. Universities and relevant government agencies should establish stronger support systems for student-led green ventures, including mentorship, business incubation, start-up support and access to appropriate funding. Such support would help students move beyond merely having intentions to create green ventures towards actually establishing sustainable businesses.

GREEN ENTREPRENEURIAL PRACTICES OF MICRO-SCALE BUSINESS OPERATORS FOR ENVIRONMENTAL SUSTAINABILITY AND BUSINESS TRASFORMATION IN CALABAR MUNICIPALITY AND CALABAR SOUTH LGAs OF CROSS RIVER STATE, NIGERIA

OLIVER OKECHUKWU OKANAZU AND KYRIAN IBI MFAM
DEPARTMENT OF BUSINESS EDUCATION
FACULTY OF VOCATIONAL AND TECHNICAL EDUCATION
UNIVERSITY OF NIGERIA, NSUKKA
oliver.okanazu@unn.edu.ng

Abstract

This study ascertained extent of adoption of green entrepreneurial practices by micro-scale business operators for environmental sustainability and business transformation in Calabar Municipality and Calabar South Local Government Areas of Cross River State, Nigeria. Micro-scale enterprises are pivotal to the local economy but often overlook the potential impact of their practices on environment. Yet, the most important issues of today are protecting the environment. Without green values and practices, local economies struggle to thrive sustainably, as sure create poor business transformation and thus, resulting in increased resource depletion and waste generation. Three purposes and three research questions were stated to guide the study. Three null hypotheses were also postulated and tested at 0.05 significance level. Related literatures were reviewed. Descriptive survey research design was adopted. Population of the study consisted of 721 micro-scale business operators of which a sample of 257 was studied. Taro Yamane was used to determine sample size. 15-item questionnaire was adopted for data collection. Cronbach Alpha was used to determine reliability coefficient of the instrument which was 0.89. 257 copies of questionnaires were administered with 243 copies returned making a return rate of 95%. Mean and standard deviation were used to answer research questions while z-test was used to test hypotheses. Findings showed insignificant differences in the adoption of sustainable sourcing and supply chain management, renewable energy and energy efficiency, and waste reduction and recycling practices for environmental sustainability and business transformation. It was recommended that micro-scale business operators should adopt sustainable sourcing and supply chain management, renewable energy and energy efficiency, and waste reduction and recycling practices for environmental sustainability and business transformation.

Keywords: Green entrepreneurial practices, sustainable supply chain management, renewable energy efficiency, waste reduction and recycling, environmental sustainability

Introduction

In recent years, the global discourse on environmental sustainability has increasingly highlighted the role of micro-scale businesses in promoting sustainable practices. This discourse has gained prominence overtime because of the negative impact of poor and irresponsible business practices on the global environment. In Calabar Municipality and Calabar South Local Government Areas (LGAs) of Cross River State (CRS), Nigeria for instance, micro-scale enterprises are pivotal to the local economy yet often overlook the potential impact of their practices on environmental sustainability. This is irrespective of the assertion of European Development Institute (2025) that the most important issues of today are protecting the environment and leaving a clean eco-system to future generations. This study explores the extent which these business operators adopt green entrepreneurial practices to mitigate environmental degradation, negatively impactful on the society. By this understanding, the research aims to provide insights into fostering responsible green entrepreneurial behaviours that contribute to both economic growth and ecological preservation in CRS in particular and Nigeria in general.

Green entrepreneurs (entrepreneurs with green values) are presently very essential to the development of our local and global economies because they facilitate the creation of new jobs by introducing sustainable green innovations on the markets and responding to the demands for change in society (Farinelli et al., 2011; Silajdžić et al., 2015).Micro-scale business operators in Calabar Municipality and Calabar South LGAs of CRS largely overlook green entrepreneurial practices. Key areas of green entrepreneurial model such as sustainable sourcing and supply chain management,

renewable energy and energy efficiency, as well as waste reduction and recycling remain underutilized, hindering environmental sustainability efforts.

Green entrepreneurship is the creation and implementation of entrepreneurial ideas that contribute to environmental conservation, waste reduction, products recycling and promotion of the use of renewable resources. Green entrepreneurial practice is a venture operation path way that creates sustainable economic value, delivered to secure and protect the environment while adopting echo-friendly approaches in the process. Teece (2010) explained that green entrepreneurial practice is the conscious development and implementation of echo-friendly entrepreneurial strategies that largely prioritize economic success of a business, and positive environmental and social impacts. Fulvia et al. (2011) further averred that green entrepreneurial practices are those business practices that have to do with goods or procedures that involve resource reduction, reuse, and recycling for social, environmental, and economic sustainability. Operationally, green entrepreneurial practice is an eco-friendly or environmental-friendly venture practice that offers sustainable products or services, adopting green operational models in entrepreneurship, and contributing to a healthier planet and society. Sustainable sourcing and supply chain management is one of the novel green entrepreneurial practices.

Sustainable sourcing (SS) and supply chain management (SCM) is the integration of environmental and socio-economic considerations into the process of selecting suppliers and managing the flow of goods and services. SS is the procurement of goods and services taking cognizance of environmental, social, and economic factors throughout the entire supply chain (Pagell et al., 2010). WWF-SCP (2025) contended that SS refers to the assurances that products and services being sold are an outcome of a production process that considers sustainability aspects, with the lowest environmental impact and most positive economy and social results. Operationally, sustainable sourcing is the integration of environment, social, and governance (ESG) criteria and performance factors into an entrepreneurial venture's sourcing process and decisions around purchased goods, services, and materials. Supply chain management (SCM) on the other perspective, is the oversight and coordination of all activities related to the production and distribution of a product or service, from raw materials to the final destination. Fernando (2024) asserted that SCM is the supervision and optimization of the production and distribution services of a company's products and services. Operationally, supply chain management is the coordination of a business' holistic production and distribution process, covering sourcing raw materials to delivering a finished item while sustainable sourcing and supply chain management (SSSCM) practice is the act of procuring materials and products that consider environmental, social, and economic impacts while also ensuring the facilitating the echo-friendly coordinating of a business venture's production and distribution process. One way of achieving such a practice is to deploy renewable energy and energy efficiency practices.

Renewable energy is energy derived from natural resources that replenish at a rate faster than consumption, like solar, wind, and hydropower while energy efficiency is the use of less energy to perform the same tasks, minimizing waste and reduce overall energy consumption and maintaining or enhancing productivity same time. Ehrlich et al. (2018) noted that renewable energy is energy made from renewable natural resources that are replenished on a human timescale. Operationally, renewable energy is an energy harnessed from naturally endowed resources. It is energy derived from natural processes that are replenished at a faster rate than they are usually consumed. On the other hand, energy efficiency is the adoption of innovative technologies and practices to reduce energy consumption, lower costs, and minimize environmental impact (WTS Energy, 2025). Energy efficiency is the usage of less energy to perform the same task – that is, eliminating energy waste (Environmental and Energy Study Institute, 2025). Operationally, renewable energy and energy efficiency practices are those innovative technologies and measures adopted to reduce energy consumption while performing the same task or achieving the same result. Renewable energy and energy efficiency practices are sustainable green values like waste reduction and recycling practices.

Waste reduction and recycling are practices aimed at reducing the amount of waste that ends up in landfills and optimizing the reuse of materials. Waste reduction is an act of preventing waste generation in the first place, such as reducing consumption, reusing items, and choosing products with less packaging. Waste reduction (source reduction) is the practice of decreasing the quantity of waste generated in order not to pollute the environment. Commonwealth of Pennsylvania (2025) posited that waste reduction is minimizing or reducing municipal waste even before recycling. Waste reduction is the prevention of solid waste generation through changes in behaviour and changes in products, packaging and purchasing by focusing on sustainable practices [New York State Department of Environmental Conservation (NYSDEC, 2025)].Operationally, waste reduction is a set of processes and practices aimed at minimizing the quantity of waste produced, by this act of reducing or eliminating the generation of harmful and persistent wastes, the practice supports efforts to promote a more green and

sustainable society. Waste recycling on the other hand, is the process of collecting and processing or transforming material waste that would otherwise be discarded, converting them into new products for reuse. Waste recycling is the act of collecting and processing materials that would otherwise be dumped away, and transforming them into new, usable products (Sharma & Arora, 2023). Waste recycling is the process of collecting and transforming materials that would otherwise be thrown away as trash and converting them into new products [United States Environmental Protection Agency (USEPA, 2025)]. Operationally, waste recycling is the process by which disposed materials by one user are collected and reprocessed or reused for other productive ends, that is, the extraction of additional value from products that have been disposed of. Waste management is the responsibility of all including micro-scale business operators.

By scale of operation, a micro business venture is the smallest in size using the parameters number of employees and annual turnover as comparative basis, when compared to small and medium enterprises. Udechukwu (2003) stated that the National Council on Industry explained that a micro enterprise is an enterprise with a labour size of not more than 10 workers, or total cost of not more than N1.50 million, including working capital but excluding cost of land. Nigerian Economic Submit Group (2025) reported that in National Policy on Micro, Small and Medium Enterprises (MSMEs), micro enterprise is categorized as one that has fewer than 10 employees and an annual turnover of less than ₦5 million. Micro enterprise, like Small and Medium Enterprises often operate in informal sectors, such as street vending, small retail shops, and local artisans. Operationally, micro enterprises are entrepreneurial units whose total assets (excluding land and buildings) are less than Five Million Naira with a workforce not more than ten employees. The economic activities of micro enterprises impact on environmental sustainability.

Sustainability is the achievement recorded by an organization in meeting its current needs without compromising its future needs while environmental sustainability is the practice of using natural resources responsibly to achieve their availability for future generations, while reducing negative impacts on the environment (Diri, 2021).Patterson (2024) contended that environmental sustainability is the responsible management of natural resources to meet current needs without compromising the ability of future generations to meet theirs. It is the ability of maintaining an ecological balance in our planet's natural environment and conserve natural resources to support the wellbeing of current and future generations sustainably (Microsoft, 2025). Operationally, environmental sustainability is the making of life choices to improve the quality of human existence without putting unnecessary strain on the earth's supporting ecosystems. Environmental sustainability in Calabar Municipality and Calabar South LGSs of Cross River State is one of the major policy thrusts of the incumbent administration.

Calabar Municipality is bounded by Odukpani Local Government Area in the North-East by the great Kwa River. Its headquarters is in Calabar, the seat of government. Its Southern shores are bounded by the Calabar river and Calabar South LGA. Calabar South LGA on the other hand is in the Southern Senatorial District and was created from the former Calabar Municipal Government. The headquarter is located at Anantigha. Calabar municipality and Calabar south are host to many micro-scale businesses whose operational activities impact on green environment and sustainability.

In recent times, scholars have beamed their research lights on green entrepreneurial practices and sustainability. These empirical research efforts include Menikpura et al. (2012) who studied "evaluation of the effect of recycling on sustainability of municipal solid waste management in Thailand" and found that recycling contributes substantially to improving overall social, economic and environmental sustainability of the waste management system; Govindan et al. (2014) who studied "impact of supply chain management practices on sustainability" and found that waste elimination, supply chain risk management and cleaner production have significant impact on supply chain sustainability; Jabbour et al. (2015) who studied "green supply chain management and firms' performance: understanding potential relationships and the role of green sourcing and some other green practices" and found that the green supply chain management practice of "internal environmental management" has the greatest positive effect on environmental performance indicators; Riti and Shu (2016) who studied "renewable energy, energy efficiency, and eco-friendly environment (R-E5) in Nigeria" and found negative impact of renewable energy consumption on environmental degradation; and Ponce and Khan (2021) who studied "a causal link between renewable energy, energy efficiency, property rights, and CO_2 emissions in developed countries: a road map for environmental sustainability" and found that renewable energy and energy efficiency are negatively correlated with CO_2 emissions.

Other studies include Wang, et al. (2022) who studied "Dynamic role of renewable energy efficiency, natural resources, and climate technologies in realizing environmental sustainability: implications for China" and confirmed a bidirectional causality between energy efficiency and ecological footprints (EFP) and climate technologies and EFP; Enyi et al. (2023) who studied "green

entrepreneurial practices and the sustainability of manufacturing SMES in North-Central Nigeria" and found that green entrepreneurial practices (green entrepreneurial initiatives, green entrepreneurial innovation, green entrepreneurial recruitment and selection, green entrepreneurial inclination and green entrepreneurial marketing) can be considered a veritable vehicle that has potentials for enhancing and sustaining innovativeness, competitiveness, growth and customer response in manufacturing SMEs; and Yasir et al. (2023) who studied "the environmental values play a role in the development of green entrepreneurship to achieve sustainable entrepreneurial intention" and found that environmental value has a direct and indirect impact on attitudes towards sustainable entrepreneurship, and perceived behavioral control and environmental value support sustainable entrepreneurial intentions.

Finally, other studies are Hussain (2023) who studied the "green entrepreneurial practices among small and medium enterprises in Karachi, Pakistan" and revealed that SMEs were using green business practices in their business areas; Adebanjo et al. (2024) who investigated "green entrepreneurship practices and sustainability of manufacturing small and medium enterprises in Nigeria" and established that green entrepreneurial inclination, green entrepreneurial business model, green entrepreneurial marketing and green entrepreneurial innovation have significant and positive effect on sustainability of manufacturing small and medium enterprises in Nigeria; and Tekala et al. (2024) who studied "green entrepreneurship for business sustainability: do environmental dynamism and green structural capital matter?" and found that green entrepreneurship (GEN) significantly enhances business sustainability (BS) and green structural capital (GSC), with GSC serving as a vital mediator in the GEN-BS relationship; however, environmental dynamism (ED) does negatively moderate the GEN-BS relationship, indicating that GEN's positive impact on BS is accentuated under lower environmental uncertainties.

However, these studies have failed to consider green entrepreneurial practices of micro-scale business operators and environmental sustainability. Specifically, they failed to address sustainable sourcing and supply chain management, renewable energy and energy efficiency; and waste reduction and recycling practices adopted by micro-scale business operators for environmental sustainability in Calabar municipality and Calabar south Local Government Areas (LGAs) of Cross River State, Nigeria. Additionally, there is insufficient empirical works on green entrepreneurial practices of micro-scale business operators and environmental sustainability. Of more concern is the continuous existence of the practical problem of environmental threat caused by entrepreneurial activities of micro-scale business operators in Calabar Municipality and Calabar South LGAs of Cross River State due to their inability to adopt green practices. The inability to integrate these sustainable practices not only jeopardizes local ecosystems but also poses challenges to public health and overall community well-being. It is against this background that this study was designed to ascertain the extent of adoption of green entrepreneurial practices by micro business operators for environmental sustainability in Calabar Municipality and Calabar South Local Government Areas (LGAs) of Cross River State (CRS), Nigeria.

Statement of the Problem

Adopting green entrepreneurial practices by micro-scale business operators is vital for environmental sustainability as it reduces resource consumption and waste (Hockerts & Wüstenhagen, 2010). These practices promote eco-friendly innovations that can lead to a circular local economy, encouraging sustainable environmental and entrepreneurial development (Lüdeke-Freund, 2010). Furthermore, micro-scale enterprises contribute to local economies while fostering a culture of sustainability, which can inspire larger businesses to follow suit (García-Álvarez et al., 2014).

Unfortunately, green entrepreneurial practices are not commendably adopted by micro-scale business operators in Calabar Municipality and Calabar South LGAs of Cross River State. Many of these micro-scale businesses still prioritize short-term profits over sustainable practices are fixed to traditional business practices that are not eco-friendly. This oversight limits innovation in eco-friendly solutions and hinders the transition to a circular local economy. Without these practices, local economies struggle to thrive sustainably, resulting in increased resource depletion, waste generation, and missed opportunities for larger businesses to engage in environmentally-conscious strategies. Consequences of this include heightened environmental degradation and stunted economic growth in local communities. The inability to integrate these sustainable practices not only jeopardizes local ecosystems but also poses challenges to public health and overall community well-being. The desire to fill this research gap prompted the designing of this study to ascertain the extent of adoption of green entrepreneurial practices by micro business operators for environmental sustainability in Calabar Municipality and Calabar South Local Government Areas (LGAs) of Cross River State (CRS), Nigeria.

Purpose of the Study

The general purpose of the study is to ascertain the extent of adoption of green entrepreneurial practices by micro-scale business operators for environmental sustainability in Calabar Municipality and

Calabar South Local Government Areas (LGAs) of Cross River State (CRS), Nigeria. Specifically, the study sought to ascertain the extent of adoption of:

1. sustainable sourcing and supply chain management practices by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.
2. renewable energy and energy efficiency practices by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.
3. waste reduction and recycling practices by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Research Questions

The following research questions were stated to guide the study:

1. to what extent are sustainable sourcing and supply chain management practices adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria?
2. to what extent are renewable energy and energy efficiency practices adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria?
3. to what extent are waste reduction and recycling practices adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria?

Research Hypotheses

The following hull hypotheses were postulated for the study and tested at 0.05 level of significance:

1. significance does not exist on the extent to which sustainable sourcing and supply chain management practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.
2. significance does not exist on the extent which renewable energy and energy efficiency practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.
3. significance does not exist on the extent which waste reduction and recycling practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Methodology

This study adopted descriptive survey design and was conducted in Calabar Municipal and Calabar South LGAs of Cross River State, Nigeria. The population for the study was 721 micro-scale business operators. This was made up of 281 micro-scale business operators in Food and Beverage sub-sector, 135 in Fashion and Apparel sub-sector, 127 in Beauty and Personal Care sub-sector, 104 in Home and Lifestyle sub-sector, and 74 in Technology and Services sub-sector in Calabar Municipal and Calabar South LGAs (CRS Ministry of Commerce, 2025). These set of business operators were used as the units of data collection because they fit into the definition of micro business as recognized in Nigeria and have been in micro business operation for onwards of five years. Therefore, they are in a position to provide the necessary opinions on the problem of this study. The sample of this study was 257micro-scale business operators. The sample was determined using Taro Yamane formula given as: n = $\frac{N}{1+N(e)^2}$ where: n = the sample size, N = the finite population, e = level of significance (i.e., limit of tolerable or allowable error); and 1 = unity (a constant). The sample size was further proportionately distributed into Food and Beverage, Fashion and Apparel, Beauty and Personal Care, Home and Lifestyle; and Technology and Services micro-entrepreneurs using ratio: $\frac{281}{721}$ x 257 = 100Food and Beverage micro-entrepreneurs, $\frac{135}{721}$ x 257 = 48Fashion and Apparel micro-entrepreneurs, $\frac{127}{721}$ x 257 = 45Beauty and Personal Care micro-entrepreneurs, $\frac{104}{721}$ x 257 = 37Home and Lifestyle micro-entrepreneurs; and, $\frac{74}{721}$ x 257 = 26Technology and Services micro-scale business operators, approximately. Stratified random sampling technique was adopted in selecting the sample. Researchers-constructed questionnaire with response options of 4-points consisting of 15questionnaire items was used for data collection.

The questionnaire was divided into two parts - I and II. Part I was designed to seek information on the Biographical characteristics (Bio-data/Background) of the respondents. The part contained three items numbered a – c. Part II was further sub-divided into three sections (A-C) according to the specific purposes of the study and structured on four response options of Very High Extent (VHE), High Extent (HE), Low Extent (LE), and Very Low Extent (VLE). Section A contained five item statements (1-5)

designed to elicit data on extent of adoption of sustainable sourcing and supply chain management practice by micro business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria. Section B contained five item statements (6-10) designed to elicit data on extent of adoption of renewable energy and energy efficiency practice by micro business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria. Finally, section C contained five item statements (11-15) designed to gather data on extent of adoption of waste reduction and recycling practice by micro business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

The instrument was face-validated by three experts from Department of Business Education, Faculty of Vocational and Entrepreneurial Education, University of Calabar, Nigeria teaching business and entrepreneurship courses. The internal consistency of the instrument for data collection was determined using Cronbach Alpha reliability coefficient and the test yielded a coefficient value of 0.89. Two hundred and fifty-six copies of the questionnaire were administered to the respondents by the researchers. Out of the 256 copies administered 243 were retrieved making a return rate of 95%.Data collected for this study were analyzed using mean and standard deviation to answer research questions and z-test was used to analyze the null hypotheses and tested at 0.05 level of significance.

Results

Research Question One: To what extent are sustainable sourcing and supply chain management practices adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria?

Table 1: Mean Responses on Extent which Sustainable Sourcing and Supply Chain Management Practices are Adopted by Micro-Scale Business Operators for Environmental Sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria

N = 243 Micro-scale Business Operators: [Cal.Municipal – 139; Cal. South - 104]

S/N	Item Statements	Cal. Municipal		Cal. South		Grand Mean	Remarks
		$\overline{X_1}$	SD_1	$\overline{X_2}$	SD_2		
1.	Our business prioritizes sourcing materials from suppliers who have environmentally friendly policies and practices	2.45	0.61	2.130	.13	2.29	D
2.	Our business supply chain management practices are designed to reduce waste and environmental harm	2.22	0.11	2.160	.44	2.19	D
3.	We patronize suppliers who share our commitment to environmental sustainability and responsible business practices	2.10	0.15	2.61	0.64	2.36	D
4.	We strive to source products that are recyclable, reusable, or sustainably produced	2.33	1.01	2.14	0.21	2.24	D
5.	Our business regularly assesses and mitigates the environmental risks connected with our supply chain operations	1.89		0.13	1.77	0.16	
		1.88	D				
	Total	**11.08**	**2.01**	**10.8**	**.11**	**.58**	

Cluster Mean ($\overline{X}$) = 2.19 (Disagreed)

Data presented in table 1 reveals that the means ($\overline{X}$) in respect of item statements 1 – 5 are less than 2.5 being the decision point. Hence, it is concluded that the item statements are not adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria. Finally, since the cluster mean ($\overline{X}$) of 2.19 is less than 2.5, it is concluded that sustainable sourcing and supply chain management practices are not adopted for environmental sustainability.

Hypothesis One: Significance does not exist on the extent which sustainable sourcing and supply chain management practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Table 2: z-Test of Statistical Difference on Extent which Sustainable Sourcing and Supply Chain Management Practices are Adopted by Micro-Scale Business Operators for Environmental Sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria

Respondents	$\bar{X}$	SD	N	df	Standard Error	z-Cal	z-Critical	Decision
Operators in Cal.Municipal	11.08	2.01	139	241	0.32	0.84	1.65	Accept Ho_1
Operators in Cal. South	10.81	1.58	104					

In table 2, the z – ratio (z distribution or z-test) indicates that the critical value of z with 241degree of freedom at 0.05 level of statistical probability is 0.84. Since the calculated value of z is 0.84, being less than the critical value, we accept the null hypothesis (Ho_1) because there is insignificant difference in mean responses. This implies that sustainable sourcing and supply chain management practices are not adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Research Question Two: To what extent are renewable energy and energy efficiency practices adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria?

Table 3: Mean responses on extent which renewable energy and energy efficiency practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria

N = 243 Micro-scale Business Operators: [Cal.Municipal – 139; Cal. South - 104]

S/N	Item Statements	Cal. Municipal $\overline{X_1}$	SD_1	Cal. South $\overline{X_2}$	SD_2	Grand Mean	Remarks
6.	Our business uses renewable energy source such as solar power, to reduce dependence on fossil fuel	2.51	0.71	2.54	1.14	2.53	A
7.	We have implemented energy-efficient practices and technologies to minimize energy consumption in our operations	2.01	0.13	2.17	0.44	2.09	D
8.	We invest in energy-efficient equipment and appliances to reduce our energy consumption and environmental impact	2.61	1.11	2.52	0.64	2.57	A
9.	Our business has set targets to reduce energy consumption and increase the use of renewable energy sources	2.32	0.12	2.13	1.22	2.23	D
10.	Our business explores opportunities to use energy storage solutions or grid-connected renewable energy systems to improve our energy efficiency	2.00	0.14	1.86	0.16	1.95	D
	Total	**11.45**	**2.21**	**11.25**	**3.60**		

Cluster Mean ($\bar{X}$) = 2.27 (Disagreed)

Data presented in table 3 indicates that the means ($\bar{X}$) in respect of item statements 6 and8 are more than 2.5 being the decision point. Hence, it is concluded that the item statements are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria. However, the means ($\bar{X}$) in respect of item statements 7, and 9 -10 are

less than 2.5 being the decision point. Hence, it is also concluded that the item statements are not adopted for environmental sustainability. Finally, since the cluster mean ($\bar{X}$) of 2.27 is less than 2.5, it is concluded that renewable energy and energy efficiency practices are not adopted for environmental sustainability.

Hypothesis Two: Significance does not exist on the extent which renewable energy and energy efficiency practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Table 4: z-Test of Statistical Difference on Extent to which Renewable Energy and Energy Efficiency Practices are Adopted by Micro-Scale Business Operators for Environmental Sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria

Respondents	$\bar{X}$	SD	N	df	Standard Error	z-Cal	z-Critical	Decision
Operators in Cal. Municipal	11.45	2.21	139					
				241	0.43	0.47	1.65	Accept Ho_1
Operators in Cal. South	11.25	3.60	104					

In table 4, the z – ratio (z distribution or z-test) indicates that the critical value of z with 241degree of freedom at 0.05 level of statistical probability is 1.65. Since the calculated value of z is 0.47, being less than the critical value, we accept the null hypothesis (Ho_2) because there is insignificant difference in mean responses. This implies that renewable energy and energy efficiency practices are not adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Research Question Three: To what extent are waste reduction and recycling practices adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria?

Table 5: Mean Responses on Extent to which Waste Reduction and Recycling Practices are Adopted by Micro-Scale Business Operators for Environmental Sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria

N = 243 Micro-scale Business Operators: [Cal.Municipal – 139; Cal. South - 104]

S/N	Item Statements	Cal. Municipal		Cal. South		Grand Mean	Remarks
		$\overline{X_1}$	SD_1	$\overline{X_2}$	SD_2		
11.	Our business strives to reduce waste generation by packaging with bio-degradable materials	2.55	0.62	2.52	0.25	2.54	A
12.	We strive to regularly recycle paper, plastic, or other materials in our operations	2.56	0.13	2.61	1.45	2.59	A
13.	We have a system in place for segregating and decomposing of waste in an environmentally responsible manner	2.41	0.15	2.19	0.64	2.30	D
14.	We have implemented a composting programme for waste goods or other organic materials	2.32	0.33	2.08	1.22	2.20	D
15.	We partner with suppliers who use minimal or biodegradable packaging materials	2.13	0.17	2.21	0.18	2.17	D
	Total	**11.97**	**1.40**	**11.61**	**3.74**		

Cluster Mean ($\bar{X}$) = 2.36 (A)

Data presented in table 5 indicates that the means ($\bar{X}$) in respect of item statements 11 and 12 are more than 2.5 being the decision point. Hence, it is concluded that the item statements are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria. However, the means ($\bar{X}$) in respect of item statements 13 – 15 are less than 2.5 being the decision point. Hence, it is also concluded that the item statements are not adopted by micro-scale business operators for environmental sustainability. Finally, since the cluster mean ($\bar{X}$) of 2.36 is less than 2.5, it is concluded that waste reduction and recycling practices are not adopted by micro-scale business operators for environmental sustainability.

Research Hypothesis Three: Significance does not exist on the extent which waste reduction and recycling practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Table 6: z-Test of statistical difference on extent which waste reduction and recycling practices are adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria

Respondents	$\bar{X}$	SD	N	df	Standard Error	z-Cal	z-Critical	Decision
Operators in Cal. Municipal	11.97	1.40	139	241	0.42	0.87	1.65	Accept Ho_1
Operators in Cal. South	11.61	3.74	104					

In table 6, the z – ratio (z distribution or z-test) indicates that the critical value of z with 241degree of freedom at 0.05 level of statistical probability is 1.65. Since the calculated value of z is 0.87, being less than the critical value, we accept the null hypothesis (Ho_3) because there is insignificant difference in mean responses. This implies that waste reduction and recycling practices are not adopted by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South LGAs of CRS, Nigeria.

Discussion of Findings

The purpose of this study was to gain a better understanding of the extent of adoption of green entrepreneurial practices by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South Local Government Areas (LGAs) of Cross River State (CRS), Nigeria. Firstly, it was discovered that sustainable sourcing and supply chain management practices are not adopted by micro-scale business operators for environmental sustainability. Secondly, it was found that renewable energy and energy efficiency practices are not adopted by micro-scale business operators for environmental sustainability. Finally, it was revealed that waste reduction and recycling practices are not adopted by micro-scale business operators for environmental sustainability.

These results ignore the claims that recycling contributes substantially to improving overall social, economic and environmental sustainability of the waste management system (Menikpura et al., 2012), that waste elimination, supply chain risk management and cleaner production have significant impact on supply chain sustainability (Govindan et al., 2014); that the green supply chain management practice of “internal environmental management” has the greatest positive effect on environmental performance indicators (Jabbour et al., 2015); that renewable energy consumption negatively impact on environmental degradation (Riti & Shu, 2016); and that renewable energy and energy efficiency are negatively correlated with CO_2 emissions (Ponce & Khan, 2021).

These results also ignore the claims that there is bidirectional causality between energy efficiency and ecological footprints (EFP) and climate technologies and EFP (Wang, et al., 2022), that green entrepreneurial practices (green entrepreneurial initiatives, green entrepreneurial innovation, green entrepreneurial recruitment and selection, green entrepreneurial inclination and green entrepreneurial marketing) can be considered a veritable vehicle that has potentials for enhancing and sustaining innovativeness, competitiveness, growth and customer response in manufacturing SMEs (Enyi et al., 2023); and that environmental value has a direct and indirect impact on attitudes towards sustainable entrepreneurship, and perceived behavioral control and environmental value support sustainable entrepreneurial intentions (Yasir et al., 2023).

Finally, these results also ignore the claims that green entrepreneurial inclination, green entrepreneurial business model, green entrepreneurial marketing and green entrepreneurial innovation have significant and positive effect on sustainability of manufacturing small and medium enterprises in

Nigeria (Adebanjo et al., 2024); and that green entrepreneurship (GEN) significantly enhances business sustainability (BS) and green structural capital (GSC), with GSC serving as a vital mediator in the GEN-BS relationship; however, environmental dynamism (ED) does negatively moderate the GEN-BS relationship, indicating that GEN's positive impact on BS is accentuated under lower environmental uncertainties (Tekala et al., 2024). However, these results are consistent with the claims that SMEs were using green business practices in their business areas (Hussain, 2023).

In our view, the most compelling explanation for the present set of findings is that a significant gap exists in the adoption of green entrepreneurial practices among micro-scale business operators in the Calabar Municipality and Calabar South LGAs. One compelling explanation for this lack of adoption may be the limited resources and knowledge available to these operators. Many micro-scale businesses often face financial constraints, making it challenging to invest in sustainable practices like renewable energy or efficient supply chain management. Additionally, there may be a lack of awareness or education surrounding the benefits of green practices, leading to their neglect. Furthermore, local regulations and incentives for sustainable practices may be insufficient, failing to motivate businesses to prioritize environmentally friendly approaches. The combination of economic pressures, insufficient education on sustainable practices, and inadequate policy support likely contributes to the low levels of green entrepreneurship observed in this context.

While the study provides valuable insights into the adoption of green entrepreneurial practices among micro-scale business operators in Calabar Municipality and Calabar South LGAs, several potential limitations may affect the results and their generalizability. The research focuses exclusively on two local government areas in Cross River State, Nigeria. This limitation may restrict the applicability of the findings to other regions within Nigeria or to broader contexts in different countries. Variations in cultural, economic, and environmental factors could influence how micro-scale business operators engage with sustainable practices. Therefore, more extensive studies that encompass a wider geographical area would be beneficial for a more comprehensive understanding of green entrepreneurial practices.

Although a sample size of 257 micro-scale business operators was utilized, the distribution among the different sub-sectors may not accurately represent the overall population of micro-enterprises. If certain sectors were overrepresented or underrepresented in the sample, the results could skew perceptions of green practices in the business community. Additionally, since the sampling technique was stratified random sampling based on existing sub-sector classifications, the insights may miss some nuances within each sub-sector, particularly regarding unique challenges or opportunities tied to their specific business contexts.

The data collection relied on self-reported questionnaires, which can introduce response bias. Respondents may have over-reported or under-reported their adoption of green practices due to social desirability, fear of judgment, or lack of understanding of the concepts being surveyed. This bias can lead to inaccuracies in assessing the extent of environmental practices being utilized. Combining qualitative methods, like interviews or focus groups, could enhance the reliability of the findings by capturing more in-depth perspectives from the entrepreneurs regarding their environmental strategies. Addressing these limitations in future research could provide a broader and more balanced understanding of green entrepreneurial practices among micro-scale businesses.

Despite the limitations discussed, the results of this study suggest several significant theoretical and practical implications for green entrepreneurship and environmental sustainability among micro-scale business operators. Theoretically, the findings highlight a gap in the adoption of green practices among micro-scale businesses, suggesting that existing theoretical frameworks on green entrepreneurship may need to be expanded or revised to better address the barriers faced by these operators. This can lead to the development of new models that focus on the unique characteristics and challenges of micro-scale enterprises, particularly in developing regions. The study also contributes to the theoretical understanding of why sustainable practices are not widely adopted. It suggests that micro-scale businesses may face systemic issues—such as limited access to resources, knowledge, or technology—that inhibit their ability to implement green practices. This could prompt further research into specific barriers and the contextual factors that influence sustainability in micro-enterprises.

Practically, the results indicate a need for targeted support from governmental and non-governmental organizations to foster the adoption of green practices among micro-scale businesses. Policymakers may consider creating programs that provide resources, training, and incentives specifically tailored to the needs of this sector, thereby encouraging more sustainable business practices and enhancing overall environmental sustainability in the region. Again, the lack of adoption of sustainable sourcing, renewable energy, and waste reduction practices suggests a need for increased educational initiatives. By developing training programs focused on the benefits and

implementation of green practices, stakeholders could help micro-scale business operators understand how these practices can enhance both their competitive advantage and environmental responsibility. Finally, the findings emphasize the importance of collaboration among micro-scale businesses, government agencies, and non-profits to create a supportive ecosystem for green entrepreneurship. Initiatives that encourage networking, sharing of best practices, and cooperative purchasing of sustainable goods could facilitate the collective adoption of environmentally friendly practices among micro-scale operators.

In conclusion, while the study's limitations should be acknowledged, its results provide meaningful insights that can inform both theoretical advancements and practical strategies to promote environmental sustainability in micro-scale businesses. Addressing these implications can lead to more effective approaches in encouraging sustainable entrepreneurship at the grassroots level.

To enhance understanding of green entrepreneurial practices among micro-scale businesses, future research should consider several avenues. Expanding studies to multiple regions can facilitate comparative analysis and identify specific barriers and enablers. Longitudinal research would track the adoption of green practices over time, revealing trends and impacts of sustainability initiatives. Utilizing mixed methods, including qualitative interviews and quantitative surveys, can provide deeper insights into operators' motivations and challenges. Focusing on specific sub-sectors allows for targeted strategies, while examining the tangible benefits of green practices can strengthen their appeal. Collaboration and networking research can further inform effective approaches to promoting sustainability.

Despite the identified limitations, the present study has enhanced our understanding that micro-scale business operators do not adopt green entrepreneurial practices for environmental sustainability. We hope that the current research will stimulate further investigation of this important area especially why micro-scale business operators are not adopting these green values.

Conclusion

This study sought to ascertain the extent of adoption of green entrepreneurial practices by micro-scale business operators for environmental sustainability in Calabar Municipality and Calabar South Local Government Areas (LGAs) of Cross River State (CRS), Nigeria. Results indicated that sustainable sourcing and supply chain management practices, renewable energy and energy efficiency practices, and waste reduction and recycling practices are not adopted by micro-scale business operators for environmental sustainability. This implies that operators of micro-scale businesses lack green values and that they exhibit care-free attitude towards environmental management. It also implies that they should be given orientation or sensitization on the importance of green entrepreneurship to environmental sustainability. Based on the findings of this study, it is recommended that:

1. sustainable sourcing and supply chain management practices should be adopted by micro-scale business operators for environmental sustainability
2. renewable energy and energy efficiency practices should be adopted by micro-scale business operators for environmental sustainability, and
3. waste reduction and recycling practices should be adopted by micro-scale business operators for environmental sustainability.

Abstract

This study empirically examined green business practices and sustainable entrepreneurship development among tertiary institution students in Rivers State: An empirical analysis. Three specific objectives, research question and corresponding hypotheses were posed, formulated analysed and tested in the study. The study adopted a explanatory cross-sectional survey design. Data were gathered via a structured, validated questionnaire administered to a stratified sample of 382 undergraduate students across major universities in Rivers State. Multiple linear regression analysis was deployed to test three null hypotheses. The empirical findings revealed that green knowledge acquisition (beta = 0.342, $p < 0.01$), eco-innovation mindset (beta = 0.415, $p < 0.01$), and waste minimization orientation (beta = 0.218, $p < 0.01$) exert positive and statistically significant effects on sustainable entrepreneurship development.The study concludes that embedding strategic environmental consciousness into youth entrepreneurship constructs serves as a potent engine for clean economic transitions. It recommends a paradigm shift in institutional curriculum design, advocating for experiential eco-accelerators, active green venture funding, and structural policy linkages to transition student intentions into operational, ecologically resilient micro-enterprises.

Keywords: Green Business Practices, Sustainable Entrepreneurship, Eco-Innovation, Waste Minimization, Rivers State.

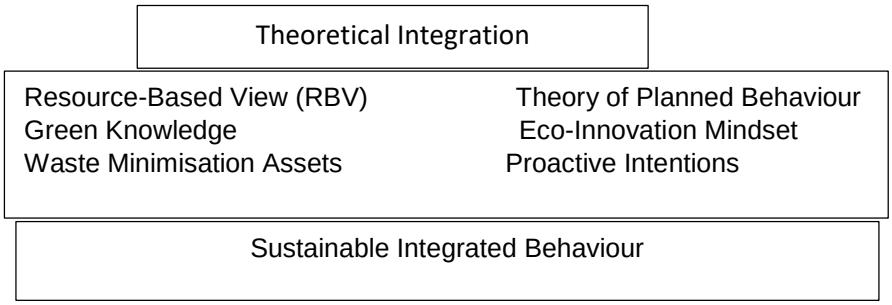
Introduction

The intersection of economic growth, natural resource conservation, and societal equity has emerged as a central paradigm of modern economic science. Historically, conventional models of entrepreneurship prioritized capital accumulation, market penetration, and profit maximization, treating environmental externalities as secondary concerns. However, accelerating climate volatility, resource depletion, and ecological degradation have exposed the fragility of these traditional frameworks. This has accelerated a structural shift toward sustainable entrepreneurship a process wherein entrepreneurs exploit commercial opportunities by bringing economic value, ecological restoration, and social equity into systemic alignment.

In developing sub-Saharan economies like Nigeria, the imperative for sustainable entrepreneurship is exceptionally acute. The country simultaneously confronts a severe youth unemployment crisis and profound environmental vulnerabilities. Rivers State, situated within the hydrocarbon-rich Niger Delta region, sits at the epicenter of this dual challenge. For decades, the region has endured extensive environmental pollution, oil spills, gas flaring, and ecosystem degradation. These issues have systematically undermined traditional livelihoods like fishing and agriculture, while escalating local climate risks. Concurrently, the formal labor market is unable to absorb the thousands of graduates turning out from tertiary institutions across the state annually. This mismatch deepens regional poverty and risks fueling youth restiveness.

In response to these compounding structural crises, higher education institutions have been repositioned as critical engines for transformation. In 2006, the Federal Government of Nigeria made entrepreneurship education compulsory across all tertiary institutions to foster self-reliance and reduce reliance on white-collar employment (Igbokwe-Ibeto, 2020). However, conventional entrepreneurship courses often focus narrowly on basic retail, generic services, or traditional manufacturing, without integrating environmental sustainability.

To foster long-term socio-ecological resilience, youth entrepreneurship must transition from traditional, resource-intensive models to green business practices. These practices encompass eco-innovation, green knowledge acquisition, and waste minimization orientation. Instilling these foundational values in students provides a pathway to dual objectives: generating employment and cultivating a new class of "ecopreneurs" capable of engineering commercially viable solutions to the region's environmental challenges.



This study holds significant value for a diverse group of stakeholders:

Socio-Economic & Policy Value: For policymakers and educational administrators, it provides empirical insights to reform current entrepreneurship curricula, transitioning them from basic survivalist business training into green entrepreneurship frameworks. This supports Nigeria's commitments under United Nations Sustainable Development Goals (SDGs) 8 (Decent Work and Economic Growth) and 12 (Responsible Consumption and Production).

Institutional & Academic Value: For tertiary institutions in Rivers State, the study offers actionable data to design targeted environmental workshops, university-linked green incubators, and campus eco-ventures. Empirically, it fills an important geographic and conceptual gap in the literature regarding youth ecopreneurship within sub-Saharan Africa and hydrocarbon-dependent regions.

Student & Community Value: For aspiring student entrepreneurs, it highlights green business practices as a pathway to competitive differentiation and long-term business resilience. Finally, for the broader Rivers State community, fostering green entrepreneurship supports localized environmental mitigation, waste reduction, and sustainable job creation.

This study is theoretically grounded in two complementary frameworks: the **Resource-Based View (RBV)** and the **Theory of Planned Behavior (TPB)**.

Originally conceptualized by Penrose (1959) and formalized by Wernerfelt (1984) and Barney (1991), the RBV asserts that a firm's competitive advantage and long-term survival depend primarily on its accumulation of valuable, rare, inimitable, and non-substitutable (VRIN) resources. In small business and entrepreneurship literature, this framework has evolved into the *Natural Resource-Based View*, which argues that integrating environmental strategies represents an essential intangible capability (Ajor, 2020).

Applied to student entrepreneurs, green knowledge acquisition and a waste minimization orientation function as internal intangible resources. When students acquire advanced ecological literacy and structural waste mitigation skills, they develop unique human capital. This capital enables them to design highly efficient, cost-effective, and climate-resilient enterprise models that competitors cannot easily replicate.

Developed by Ajzen (1991), the TPB states that an individual's behavior is driven by their behavioral intention, which is shaped by three core factors: attitude toward the behavior, subjective norms, and perceived behavioral control.

In the context of sustainable entrepreneurship development, student intentions are not formed in a vacuum. An eco-innovation mindset reflects a deeply internalized positive attitude toward environmental stewardship. Perceived behavioral control is strengthened through formal green training and actionable waste minimisation skills. Together, these elements give students the confidence and perceived capability to launch sustainable green enterprises rather than defaulting to traditional business formats (Agu et al., 2021).

The core architecture of this study examines the relationship between Green Business Practices (the independent variable, conceptualized across three dimensions) and Sustainable Entrepreneurship Development (the dependent variable).

Green business practices refer to the strategic integration of environmental sustainability objectives into core enterprise operations. This approach seeks to minimize ecological footprints, reduce hazardous emissions, and optimize resource efficiency throughout the value chain. For student entrepreneurs, these practices are defined by three primary dimensions:

Green Knowledge Acquisition: The formal and informal accumulation of ecological literacy, encompassing environmental regulations, renewable energy principles, carbon accounting, and eco-efficient operational frameworks.

Eco-Innovation Mindset: A cognitive orientation that prioritizes developing new or altered products, services, or processes that deliver commercial value while significantly lowering environmental risks and resource consumption compared to conventional alternatives (Ajor, 2020).

Waste Minimization Orientation: A systematic commitment to lean production, circular economy principles, recycling, upcycling, and optimizing resource inputs to eliminate waste at its source.

Sustainable entrepreneurship development is the process of identifying, evaluating, and exploiting entrepreneurial opportunities that generate financial returns while simultaneously advancing ecological restoration and societal well-being. Unlike traditional entrepreneurship, which treats environmental costs as externalities, sustainable entrepreneurship embeds the "Triple Bottom Line" People, Planet, and Profit into the core business design. For students, this development manifests as a progression from basic environmental awareness to launching viable, climate-conscious micro-enterprises.

Scholarly interest in sustainable entrepreneurship within emerging economies has expanded significantly over the past decade, driven by growing environmental challenges.

Agu et al. (2021) investigated the drivers of sustainable entrepreneurial intentions among university students in Nigeria using an integrated structural model. Analyzing data from 435 students, they discovered that explicit education for sustainable entrepreneurship significantly shaped students' attitudes and self-efficacy. This, in turn, acted as a primary driver of their intent to establish green ventures, though the direct path from education to intention required activation through personal attitude and perceived control.

At a localized level within the Niger Delta, corporate environmental management studies have shown mixed results. For example, a recent study by the Dr. Amadi Foundation investigated the relationship between green entrepreneurship dimensions such as eco-product, eco-service, and green agriculture entrepreneurship and the economic sustainability of 20 long-standing MSMEs in Rivers State. Their findings revealed strong positive correlations: eco-product innovations scored $\rho = 0.922$ and green agriculture recorded $\rho = 0.685$. This suggests that integrating ecological considerations directly enhances profitability and operational resilience within the state's challenging business climate.

Similarly, Ajor (2020) evaluated the impact of an innovative mindset on organizational sustainability among 50 selected SMEs in Rivers State. Using Spearman Rank Order Correlations, the study demonstrated that eco-innovation practices like cleaner production and life-cycle assessments were vital for sustaining small firms facing strict environmental challenges and shifting consumer preferences.

However, a major gap persists in the literature. While these studies focus on established MSMEs or broad, non-localized student intentions, there is a lack of rigorous, regression-based empirical evidence assessing how specific green business practices directly influence sustainable entrepreneurship development among students in Rivers State. This study bridges that gap.

Statement of the Problem

Despite decades of compulsory entrepreneurship education in Nigerian universities, graduate unemployment remains persistently high, while the environmental conditions of regions like Rivers State continue to decline (Agboola, 2010; Igbokwe-Ibeto, 2020). Traditional entrepreneurship models taught in higher education institutions often lack the ecological components required to address contemporary climate and environmental challenges. This pedagogical gap frequently results in student-led business ideas that replicate unsustainable, resource-heavy, and high-waste production processes.

While regional scholarship has increasingly examined the economic sustainability of established micro, small, and medium enterprises (MSMEs) in Rivers State (Ajor, 2020), empirical focus on the developmental stage of student entrepreneurship remains sparse. Existing literature heavily documents student entrepreneurial *intentions* in general, but fails to analyze how specific green business inputs—such as systemic green knowledge, an eco-innovative mindset, and structural waste minimization orientations—influence sustainable entrepreneurship development (Agu et al., 2021).

Furthermore, much of the foundational research on green entrepreneurship originates from developed market contexts with mature eco-industrial frameworks, institutional venture funding, and strict environmental enforcement. These findings cannot be applied directly to the unique socio-economic and institutional realities of Rivers State, where student entrepreneurs face infrastructural deficits, erratic power supply, limited green financing, and uneven policy enforcement. This study addresses this empirical gap by conducting a localized analysis of how adopting green business practices influences sustainable entrepreneurship development among students within the unique socio-ecological context of Rivers State.

Objectives of the Study

The primary objective of this study is to empirically analyze the relationship between green business practices and sustainable entrepreneurship development among tertiary institution students in Rivers State. The specific objectives are to:

1. Determine the effect of green knowledge acquisition on sustainable entrepreneurship development among students in Rivers State.
2. Evaluate the influence of an eco-innovation mindset on sustainable entrepreneurship development among students in Rivers State.
3. Investigate the impact of a waste minimization orientation on sustainable entrepreneurship development among students in Rivers State.

Research Questions

To achieve the objectives outlined above, the study addresses the following research questions:

1. To what extent does green knowledge acquisition affect sustainable entrepreneurship development among students in Rivers State?
2. How does an eco-innovation mindset influence sustainable entrepreneurship development among students in Rivers State?
3. What is the impact of a waste minimization orientation on sustainable entrepreneurship development among students in Rivers State?

Research Hypotheses

The following null hypotheses were formulated to guide the empirical analysis and were tested at a 0.05 level of significance:

1. Green knowledge acquisition has no significant effect on sustainable entrepreneurship development among tertiary institution students in Rivers State.
2. An eco-innovation mindset has no significant influence on sustainable entrepreneurship development among tertiary institution students in Rivers State.
3. Waste minimization orientation has no significant impact on sustainable entrepreneurship development among tertiary institution students in Rivers State.

Methodology

This study adopted an **explanatory cross-sectional survey research design**. This approach allows for the collection of quantitative data from a representative sample at a single point in time, facilitating the measurement of specific dimensions and the statistical testing of hypothesized causal relationships.

The target population comprised full-time final-year undergraduate students enrolled in business- and entrepreneurship-related programs across three major universities in Rivers State:

1. University of Port Harcourt (UNIPORT)
2. Rivers State University (RSU)
3. Ignatius Ajuru University of Education (IAUE)

These final-year students were selected because they had completed all mandatory institutional entrepreneurship courses. The aggregate accessible population across these three institutions was determined to be approximately 8,500 students.

To determine an appropriate sample size, **Taro Yamane's formula** for finite populations was applied:

n = frac{N}{1 + N(e)^2}

To ensure equitable representation across the institutions, a stratified random sampling technique was employed, allocating the 382 questionnaires proportionally based on each university's final-year student enrollment.

Primary data were gathered using a self-administered, structured questionnaire titled the *"Green Business Practices and Sustainable Entrepreneurship Questionnaire" (GBPSEQ)*. The instrument was structured on a 5-point Likert scale, ranging from 5 (Strongly Agree) to 1 (Strongly Disagree).

To ensure measurement integrity, the questionnaire was adapted from validated scales in existing literature. Content and construct validity were verified by two senior experts in entrepreneurship measurement from the Faculty of Management Sciences at Rivers State University.

Internal consistency and reliability were assessed via a pilot study involving 40 student respondents from a non-sampled institution (Ken Saro-Wiwa Polytechnic). The calculated **Cronbach's Alpha (α)** coefficients for all constructs exceeded the acceptable academic threshold of 0.70, as detailed in Table 1.

Table 1: Reliability Analysis of Research Constructs

Variable Index	Research Construct Dimension	Number of Items	Cronbach's Alpha (α)	Status
GKA	Green Knowledge Acquisition	5	0.842	Reliable
EIM	Eco-Innovation Mindset	5	0.811	Reliable
WMO	Waste Minimization Orientation	4	0.789	Reliable
SED	Sustainable Entrepreneurship Dev.	6	0.865	Reliable

To test the hypotheses and evaluate the relative impact of the independent variables on the dependent variable, a **multiple linear regression model** was specified:SED = beta_0 + beta_1 GKA + \beta_2 EIM + \beta_3 WMO + \epsilon

Where:

i. SED = Sustainable Entrepreneurship Development (Dependent Variable)
ii. beta_0 = Constant intercept
iii. GKA = Green Knowledge Acquisition (Independent Variable 1)
iv. EIM = Eco-Innovation Mindset (Independent Variable 2)
v. WMO = Waste Minimization Orientation (Independent Variable 3)
vi. beta_1, \beta_2, \beta_3$ = Partial regression coefficients for the respective independent variables
vii. epsilon = Stochastic error term designed to capture unobserved variations

Analytical Techniques

The gathered data were audited, coded, and analyzed using the Statistical Package for Social Sciences (SPSS) Version 27. Descriptive statistics (means and standard deviations) were calculated to analyze the distribution characteristics of the data. Inferential statistics, specifically ordinary least squares (OLS) multiple linear regression, were utilized to evaluate the hypothesized relationships. Prior to running the regression model, diagnostic assessments were conducted to ensure compliance with classical linear regression assumptions, confirming the absence of severe multicollinearity and heteroscedasticity.

Results and Discussion

Data Retrieval and Descriptive Analysis

Out of the 382 structured questionnaires distributed, 356 were retrieved fully completed and free of errors, representing an effective response rate of 93.2%.

Table 2 presents the descriptive analysis, displaying the mean and standard deviation for each item cluster across the research variables.

Table 2: Descriptive Statistics of Variables

Construct Variables	Mean Score	Standard Deviation	Interpretation
Green Knowledge Acquisition (GKA)	3.84	0.72	High Agreement
Eco-Innovation Mindset (EIM)	4.12	0.65	Very High Agreement

Construct Variables	Mean Score	Standard Deviation	Interpretation
Waste Minimization Orientation (WMO)	3.65	0.81	Moderate-High Agreement
Sustainable Entrepreneurship Dev. (SED)	3.91	0.69	High Agreement

The descriptive statistics indicate that students strongly perceive an Eco-Innovation Mindset (Mean = 4.12) as a critical driver of sustainable venture development. This is followed by Green Knowledge Acquisition (Mean = 3.84) and Waste Minimization Orientation (Mean = 3.65), reflecting general agreement across all three dimensions of green business practices.

Diagnostic Testing

To verify the validity of the regression model, collinearity diagnostics were performed to evaluate multicollinearity among the independent variables.

Table 3: Collinearity Diagnostics

Independent Construct Variables	Tolerance	Variance Inflation Factor (VIF)	Diagnostic Status
Green Knowledge Acquisition (GKA)	0.642	1.558	No Multicollinearity
Eco-Innovation Mindset (EIM)	0.589	1.698	No Multicollinearity
Waste Minimization Orientation (WMO)	0.711	1.406	No Multicollinearity

Because all computed Variance Inflation Factors (VIF) fell well below the conservative academic threshold of 5.0, and tolerance scores exceeded 0.20, multicollinearity was determined not to pose an issue for the model's estimations.

Regression Analysis and Hypotheses Testing

The ordinary least squares (OLS) multiple regression analysis evaluated the simultaneous effects of Green Knowledge Acquisition, Eco-Innovation Mindset, and Waste Minimization Orientation on Sustainable Entrepreneurship Development. Tables 4, 5, and 6 present the model summary, ANOVA results, and partial coefficients.

Table 4: Model Summary

Model Index	R	R-Squared (R2)	Adjusted R-Squared	Std. Error of the Estimate
1	0.748	0.560	0.556	0.4593

The model summary indicates a strong positive correlation ($R = 0.748$) between the combined green business practices and sustainable entrepreneurship development. The coefficient of determination ($R^2 = 0.560$) reveals that **56.0% of the total variance in sustainable student entrepreneurship development** within Rivers State is explained by the three independent variables in this model. The remaining 44.0% is attributable to external factors not captured in this study.

Table 5: Analysis of Variance (ANOVA)

Model	Sum of Squares	df	Mean Square	F-Statistic	Significance (p-value)
Regression	94.612	3	31.537	149.464	0.000

Model	Sum of Squares	df	Mean Square	F-Statistic	Significance (p-value)
Residual	74.272	352	0.211		
Total	168.884	355			

The ANOVA results confirm the overall statistical significance of the specified model. The calculated F-statistic ($F = 149.464, p < 0.01$) indicates that the probability of these regression results occurring by chance is virtually zero, validating the choice of variables for this model.

Table 6: Regression Coefficients

Independent Variables	Unstandardised B	Std. Error	Standardized Beta (β)	t-value	Sig. (p)
(Constant Intercept)	0.814	0.162	—	5.025	0.000
Green Knowledge (GKA)	0.328	0.041	0.342	8.000	0.000
Eco-Innovation (EIM)	0.441	0.046	0.415	9.587	0.000
Waste Minimization (WMO)	0.186	0.038	0.218	4.895	0.000

Hypotheses Testing and Interpretations

Testing Hypothesis 1 ($\mathbf{H_01}$): Table 6 reveals that Green Knowledge Acquisition exerts a positive and statistically significant partial effect on Sustainable Entrepreneurship Development ($\beta = 0.342, t = 8.000, p < 0.01$). Consequently, the null hypothesis $\mathbf{H_01}$ is rejected.

This indicates that a one-unit increase in green knowledge acquisition leads to a 0.342-unit increase in sustainable entrepreneurship development among students, holding all other variables constant.

Testing Hypothesis 2 ($\mathbf{H_02}$): The regression results show that an Eco-Innovation Mindset has the strongest relative effect on the dependent variable ($\beta = 0.415, t = 9.587, p < 0.01$). Thus, the null hypothesis $\mathbf{H_02}$ is rejected. This demonstrates that fostering an innovative mindset focused on ecological solutions significantly drives sustainable student entrepreneurship development in Rivers State.

Testing Hypothesis 3 ($\mathbf{H_03}$): Table 6 indicates that Waste Minimization Orientation also has a positive and significant impact on the dependent variable ($\beta = 0.218, t = 4.895, p < 0.01$). Therefore, the null hypothesis $\mathbf{H_03}$ is rejected. This confirms that a structural focus on lean operations, reduction of material waste, and circular economy principles significantly improves the capacity for sustainable entrepreneurship development.

Discussion of Empirical Findings

The quantitative results of this study demonstrate that green business practices are significant drivers of sustainable entrepreneurship development among tertiary institution students in Rivers State. The finding that **Green Knowledge Acquisition** significantly drives sustainable entrepreneurship development (beta = 0.342, $p < 0.01$) underscores the role of structural education. When students acquire explicit environmental literacy, it changes how they identify market opportunities, shifting their focus toward greener options. This aligns with the findings of Agu et al. (2021), who noted that explicit education for sustainable entrepreneurship enhances students' self-efficacy and intentions to launch green businesses.

Crucially, Eco-Innovation Mindset emerged as the most powerful predictor within the model (beta = 0.415, $p < 0.01$). This strong relationship highlights that simply possessing technical green knowledge is insufficient; students must develop a cognitive orientation that views ecological problems as

commercial opportunities. This finding corresponds with Ajor (2020), who observed that small businesses in Rivers State that adopted eco-innovations achieved stronger competitive advantages and superior long-term survival rates. Fostering this mindset during a student's formative years helps bridge the gap between academic theory and practical business application.

Finally, the significant effect of a Waste Minimization Orientation (beta = 0.218, $p < 0.01$) has practical implications within the context of Rivers State. Given the region's infrastructure challenges and limited startup capital, a focus on waste minimization encourages students to adopt lean structures and reuse local materials. This structural orientation aligns with findings from the Dr. Amadi Foundation, which demonstrated that circular business models and eco-product innovations significantly enhance the economic viability and resilience of small firms operating in challenging economic environments.

Conclusion

This study provides empirical evidence on the relationship between green business practices and sustainable entrepreneurship development among tertiary institution students in Rivers State. The analysis demonstrates that green knowledge acquisition, an eco-innovation mindset, and a waste minimization orientation explain a substantial proportion of the variance in sustainable student entrepreneurship development.

Among these factors, an eco-innovation mindset serves as the primary cognitive driver, while green knowledge provides the necessary foundation, and a waste minimization orientation offers a practical framework for resource-constrained environments.

The study concludes that expanding youth entrepreneurship to incorporate explicit environmental values is essential for building regional socio-ecological resilience. Cultivating a generation of student ecopreneurs offers a dual pathway to address graduate unemployment while generating localized solutions to the long-standing ecological challenges of the Niger Delta.

Recommendations

Based on these findings, the following recommendations were proposed:

1. Institutional Curriculum Reform: The National Universities Commission (NUC) and university administrators should update the mandatory entrepreneurship curriculum. Training should transition from generic retail business models to specialized modules on green business practices, eco-innovation metrics, and circular economy frameworks.
2. Establishment of Campus Green Incubators: Tertiary institutions in Rivers State should establish dedicated green business accelerators and ecopreneurship labs. These spaces can provide students with mentorship, access to clean-tech equipment, and the structural support needed to develop eco-friendly prototypes.
3. Targeted Green Venture Funding: The Rivers State Government, in partnership with private financial institutions and international environmental NGOs, should establish a dedicated *Youth Green Seed Capital Fund*. This initiative would offer micro-grants and low-interest loans specifically targeted at viable student-led green startups, helping transition academic business plans into operational enterprises.
4. Campus Recycling Partnerships**:** Universities should deploy campus-wide waste sorting and recycling programs. These initiatives can serve as practical training grounds for students, allowing them to test waste-to-wealth and upcycling business models in a real-world setting.

GREEN BUSINESS AND SOCIAL ENTREPRENEURSHIP AS PREDICTORS OF ENTREPRENEURIAL SKILLS ACQUISITION AMONG BUSINESS EDUCATION STUDENTS IN THE UNIVERSITY OF CALABAR.

BY
Otum, Nneka Ihekaugwu (Ph. D)
otumnneka@gmail.com
and
Akeke, Mercy Nkurika Godwin (Ph.D)
mercyakeke@unical.edu.ng
Department of Business Education,
Faculty of Vocational and Entrepreneurial Education,
University of Calabar, Calabar

Abstract:

This study investigated Green Business and Social Entrepreneurship as Predictors of Entrepreneurial Skills Acquisition among Business Education Students in the University of Calabar. Three objectives with their corresponding research questions and hypotheses, guided the study. The study adopted a descriptive survey research design. The population of the study comprises all fifty four (54) final year Business Education students in the University of Calabar in the 2025/2026 academic session. Since the population is relatively small and manageable, the researchers adopted a census sampling, whereby the entire population was used for the study. The instrument for data collection was a researchers developed questionnaire titled "Green Business and Social Entrepreneurship as Predators for Entrepreneurial Skills Acquisition Questionnaire (GBSEPESAQ)." The questionnaire was validated by three experts in the University of Calabar. To determine the reliability of the instrument, the instrument was subjected to pilot test and the data collected was analyzed using Cronbach's Alpha reliability index. The test result showed a reliability coefficient of 0.83. The instrument was administered to the respondents and 50 copies were successfully retrieved as against 54 copies printed. The research questions were answered using mean and standard deviation while the hypotheses were tested using independent t-test statistical analysis at 0.05 level of significance. The findings revealed low extent of green business skills and social entrepreneurship skills acquisition among students, which indicates that students' ability to apply environmental sustainability principles to entrepreneurial activities remains relatively limited and students are not sufficiently equipped to identify social problems and transform them into viable entrepreneurial opportunities. In conclusion, while the findings demonstrate the relevance and low level of green business and social entrepreneurship skills, a claim that green business and social entrepreneurship statistically predict entrepreneurial skills should be based on additional inferential evidence, such as correlation or multiple regression analysis. It was recommended among others that green business education and social entrepreneurship should be integrated more strongly into the curriculum.

Keywords: Green Business, Social Entrepreneurship, Entrepreneurial Skills, Predictor, skill acquisition, and Business Education.

Introduction

The increasing challenges of environmental degradation, climate change, unemployment, and social inequality have transformed the global business environment, making sustainability and social responsibility central to entrepreneurial development. Consequently, universities are expected to equip students with entrepreneurial competencies that not only promote economic growth but also address pressing environmental and social challenges. This shift has brought greater attention to the concepts of green business and social entrepreneurship as emerging approaches to entrepreneurship development that foster innovation, sustainability, and community development. (Alao & Alao, 2021).

Green business refers to business practices that minimize negative environmental impacts while promoting efficient resource utilization, environmental conservation, and sustainable economic development. It encourages entrepreneurs to develop environmentally friendly products, adopt cleaner production methods, and integrate sustainability into business operations. In Nigeria, green entrepreneurship has been identified as a viable strategy for addressing youth unemployment while

contributing to the achievement of the Sustainable Development Goals (SDGs). (Anabaraonye, Onnoghen, Nwafor & Obinna 2024). The Green entrepreneur sees the problems caused by climate change, environmental pollution, and global warming and perceives the business opportunities in waste management and recycling engaging in the process of waste recycling to ensure a sustainable environment and the sustainable economic growth of his/her community and nation (Anabaraonye, Okafor & Eriobu, 2019). Green Business is an ecofriendly business practice and operations which encourages the reuse of renewable energy and natural resources and reduction of resources wastage while providing high quality goods and services maintaining clean and healthy environment as well as business sustainability. To achieve this, entrepreneurial green skills are required. Entrepreneurial green skills are non-technical soft skills needed to perform ecofriendly business operations to promote healthy business environmental conversation and prosperity through prevention of environmental pollution, minimizing material wastage and recycling of resources. Examples of Green Skills are ability to recycle resources, ability to reuse materials, ability to reduce material waste (3R), creativity to design solution to environment issues and create ecofriendly practice. Green Business in the society is important in the following ways: job creation for graduates, creates opportunity for graduates' upgrade from job seekers to job creators (green job creators), helps to solve environmental problems through the creation of eco-friendly business practices. Green business is an ecofriendly business practice which encourages the reuse of renewable energy, recycling of resources especially energy by saving energy ability to maintain environmental cleanliness and save energy and healthy business environment.eg e-marking skills. These skills help to maintain green practices to ensure business safety and heathy living. Green skills are skills needed to prevent environmental pollution to maintain good and healthy business and occupational environment aim of environmental prosperity.

Social entrepreneurship strives to impact positively in the society with low profit intentions by proffering to social issues through innovative strategies. Social entrepreneurship offers a framework for addressing social challenges, empowering communities, and fostering innovation. Social entrepreneurship has been defined as an innovative, social value creating business activity that can occur within or across the non-profit, business, or government sectors, and the leaders of those enterprises, the "social entrepreneurs", have been characterized as being primarily interested in improving society rather than maximizing profits while nonetheless demanding high performance standards and accountability for results (Gutterman, 2025). Similarly, social entrepreneurship emphasizes the creation of innovative solutions to social problems through entrepreneurial initiatives that generate both social and economic value. Unlike conventional entrepreneurship, which primarily focuses on profit maximization, social entrepreneurship seeks to improve the welfare of communities by addressing issues such as poverty, unemployment, health, education, and environmental sustainability. Exposing business education students to social entrepreneurship will enhance multiple entrepreneurial skills among students such as: creativity, problem-solving ability, collaboration, and opportunity-recognition skills necessary for successful entrepreneurial practice.

Entrepreneurial skills acquisition has become a major objective of Business Education programmes in Nigerian universities because these skills enable graduates to become self-reliant, innovative, and capable of identifying and exploiting business opportunities. However, despite the inclusion of entrepreneurship education in university curricula, concerns remain regarding whether students acquire sufficient practical entrepreneurial competencies to succeed after graduation (Haruna Mamman & Oyelekan, 2025). Akamobi (2020) stated that entrepreneurial skills are those competencies required by individuals to assume, manage and sustain a business venture. Possession of entrepreneurial skills by university graduates will transform them from employees to employers and provide opportunities for establishment new business enterprises. Acquisition of entrepreneurial skills is a great weapon for destruction of poverty and economic frustration. Rowell (2020) stated that entrepreneurial skill acquisition is a step-by-step training approach given to individuals to empower them with lifelong skills for life transformation and positive contributions to the society. Examples of entrepreneurial skills include critical thinking, communication, financial management, digital competence, opportunity recognition, risk-taking, decision-making, innovation Problem solving skill, Communication skill, Leadership skill, Networking skill, accounting skill, Business management skill, Marketing skill, Risk management skill, Critical thinking, Emotional intelligence, entrepreneurial mindset, financial management skill, entrepreneurial mindset and creativity. In the words of Akeke and Eyo (2018), entrepreneurial skill acquisition reduces the high level of rural-urban migration and enhances graduates employability and self-reliance, as well as provides the youth with adequate training creativity and innovative in identifying noble business opportunities.

Business education is that aspect of vocational education which involves the preparation of learner with relevant skills, knowledge, competencies, abilities, values and experience needed to perform effectively

in a specific business occupation either as employee or entrepreneur (Otum and Oduma 2022). Business education students at the University of Calabar are expected to acquire entrepreneurial competencies that prepare them for self-employment and sustainable enterprise development. Integrating green business and social entrepreneurship into their learning experiences may strengthen these competencies by exposing students to environmentally sustainable business practices and socially innovative ventures. These approaches have the potential to improve students' entrepreneurial mindset, practical skills, and readiness to establish enterprises capable of generating economic, environmental, and social value (Shahid & Alarifi 2021).

Relatively, Alao and Alao (2021) investigated the influence of social entrepreneurship education on Business Education students in Nigeria. Using a descriptive survey design, the study sampled undergraduate Business Education students from selected universities. Data were collected using structured questionnaires and analyzed using descriptive statistics and regression analysis. The findings revealed that exposure to social entrepreneurship significantly improved students' opportunity recognition, leadership ability, creativity, problem-solving skills, and entrepreneurial intention. The study concluded that social entrepreneurship should be integrated into Business Education curricula to enhance students' entrepreneurial competencies and promote sustainable economic development.

Social entrepreneurship is identifying social problems and addressing the problem while attaining social change through the application of entrepreneurship theories, principles and practices. It deals with a search for social challenges and creation of social ventures to create social transformation. Social entrepreneurial organization are non-profit and non-governmental organization who raise funds through community events and activities. In addition, Shahid and Alarifi (2021) conducted a conceptual and empirical review on social entrepreneurship education and entrepreneurial competence among university students. The study synthesized evidence from higher education institutions across different countries and found that students who participated in social entrepreneurship programmes demonstrated higher levels of innovation, critical thinking, teamwork, and social responsibility than those who did not. The authors concluded that social entrepreneurship education serves as an effective mechanism for developing entrepreneurial skills required for solving societal challenges while creating sustainable businesses.

Furthermore, Anabaraonye et al. (2024) examined the role of green entrepreneurial skills in promoting sustainable production and economic development in Nigeria. Using a qualitative research approach involving document analysis and stakeholder interviews, the study found that green business practices encourage innovation, efficient resource utilization, environmental responsibility, and sustainable enterprise creation. The researchers concluded that equipping young entrepreneurs with green business competencies improves their capacity to establish environmentally sustainable ventures while contributing to national economic growth. Also, Alao, et al (2024) investigated the development of entrepreneurial skills among Business Education students for sustainability in Nigerian universities. The study adopted a survey research design involving Business Education students from selected tertiary institutions. Data were analyzed using mean scores and inferential statistics. The findings indicated that entrepreneurship education integrated with sustainability concepts significantly enhanced students' innovation, business planning, communication, financial management, and problem-solving skills. The researchers recommended incorporating green business and sustainability education into entrepreneurship programmes to improve graduates' employability and self-reliance. Moreover, Haruna, Mamman, and Oyelekan (2025) examined the impact of entrepreneurship education on entrepreneurial intention and skills acquisition among Business Education students in tertiary institutions in North-Eastern Nigeria. Using a descriptive survey design, data were collected from undergraduate students through structured questionnaires and analyzed using multiple regression analysis. The study found that entrepreneurship education positively influenced entrepreneurial skills acquisition, especially when practical learning experiences and sustainability-oriented business practices were emphasized. The researchers concluded that entrepreneurship education should be strengthened through experiential learning and exposure to innovative business models.

Although previous studies have established significant relationships between green business, social entrepreneurship, and entrepreneurial skills acquisition, most focused on general entrepreneurship education or students from multiple institutions. There is limited empirical evidence specifically examining green business and social entrepreneurship as predictors of entrepreneurial skills acquisition among Business Education students in the University of Calabar and none of the research was carried out in the university of Calabar. This study therefore seeks to bridge this gap by investigating the predictive influence of these two variables on entrepreneurial skills acquisition among Business Education students in the University of Calabar.

Statement of the problem

Entrepreneurship education was introduced into Nigerian universities to equip students with the knowledge, skills, and competencies required for self-employment, innovation, and job creation. Business Education programmes, in particular, are expected to produce graduates who possess entrepreneurial skills that enable them to identify business opportunities, establish sustainable enterprises, and contribute meaningfully to economic development. Despite these expectations, there is growing concern that many Business Education graduates still lack the practical entrepreneurial skills needed to compete effectively in today's dynamic and sustainability-driven business environment. This situation is reflected in the increasing rate of graduate unemployment, dependence on paid employment, and limited capacity among graduates to establish viable businesses.

The emergence of environmental challenges such as climate change, resource depletion, pollution, and increasing social problems has shifted global attention toward sustainable business practices and socially responsible entrepreneurship. Consequently, green business and social entrepreneurship have become important approaches for developing entrepreneurial competencies that promote environmental sustainability, innovation, and social value creation.

Although studies have reported positive relationships between entrepreneurship education, green business, social entrepreneurship, and entrepreneurial skills acquisition, much of the existing research has focused on entrepreneurship education in general or has been conducted in institutions outside the University of Calabar. There is limited empirical evidence on the extent to which green business and social entrepreneurship predict entrepreneurial skills acquisition among Business Education students in the University of Calabar. This gap in knowledge makes it difficult to determine whether integrating these sustainability-oriented entrepreneurial approaches significantly contributes to developing the entrepreneurial competencies expected of Business Education graduates. It is against this background that this study sought to examine green business and social entrepreneurship as predictors of entrepreneurial skills acquisition among Business Education students in the University of Calabar.

Research objectives

The major objectives of this study examined green business and social entrepreneurship as predictors of entrepreneurial skills acquisition among Business Education students in the University of Calabar.

The study was designed specifically to examine the extent to which:

1. Business Education students acquire entrepreneurial skills through green business and social entrepreneurship.
2. Green business predicts entrepreneurial skills acquisition among Business Education students in the University of Calabar.
3. Social entrepreneurship predicts entrepreneurial skills acquisition among Business Education students in the University of Calabar.

Research Questions

The following research questions guided the study:

1. To what extent do business education students acquire entrepreneurial skills through green business and social entrepreneurship?
2. How does green business predict entrepreneurial skills acquisition among business education students in the University of Calabar?
3. To what extent does social entrepreneurship predicts business education students' entrepreneurial skills acquisition in the University of Calabar?

Research Hypotheses

The following null hypotheses will be tested at the 0.05 level of significance:

1. There is no significant difference between the mean responses of male and female respondents on the extent of entrepreneurial skills acquisition among Business Education students in the University of Calabar.

2. There is no significant differences between the responses of male and female respondents on how green business predicts entrepreneurial skills acquisition among business education students in the University of Calabar

3. There is no significant difference between the mean responses of male and female respondents on extent social entrepreneurship predicts business education students' entrepreneurial skills acquisition in the University of Calabar?

Method

This study adopted the descriptive survey research design. The design is considered appropriate because it enables the researcher to collect data from respondents to determine the extent to which green business and social entrepreneurship predict entrepreneurial skills acquisition among Business Education students. The design also facilitates the collection of quantitative data for analyzing the relationships among the variables under investigation without manipulating them. The study was

conducted at the University of Calabar, Cross River State, Nigeria. The University of Calabar is one of Nigeria's federal universities and offers Business Education programmes through its department of business education in Faculty of Vocational and Entrepreneurial Education. The institution provides entrepreneurship education aimed at equipping students with the knowledge, skills, and competencies required for self-employment, innovation, and sustainable enterprise development. The population of the study comprises all fifty-four (54) final-year Business Education students in the University of Calabar during the 2025/2026 academic session. The choice of final-year students is based on the assumption that they have completed most of the entrepreneurship and business education courses and are therefore in a better position to provide reliable information regarding green business, social entrepreneurship, and entrepreneurial skills acquisition. Since the population is relatively small and manageable, the researcher adopted a census sampling technique, whereby the entire population of 54 final-year Business Education students was utilized. This approach eliminates sampling error and ensures that every member of the population participates in the study. The instrument for data collection was a researchers-developed questionnaire titled "Green Business and Social Entrepreneurship as Predators for Entrepreneurial Skills Acquisition Questionnaire (GBSEPESAQ)." The questionnaire consisted of two sections. Section A elicited respondents' demographic information on gender while Section B contained items measuring the study variables: Green Business, Social Entrepreneurship, and Entrepreneurial Skills Acquisition. The questionnaire items will be structured on a four-point rating four scale as follows: Very High Extent (VHE) = 4, High Extent (HE) = 3, Low Extent (LE) = 2, Very Low Extent (VLE) = 1. The questionnaire was subjected to face and content validation by three experts, two from Business Education and one from Measurement and Evaluation in the University of Calabar. Their observations and suggestions helped to restructure the instrument before its final administration. The reliability of the instrument was determined through a pilot study involving Business Education students from University of Cross River State, Calabar who are not part of the study population. Data obtained from the pilot test was analyzed using Cronbach's Alpha reliability coefficient to determine the internal consistency of the instrument. The test result showed a reliability coefficient of 0.83 which is acceptable. The researchers administered the questionnaire independently to the respondents using on- the- spot method. The completed questionnaires were retrieved immediately with a retrieval rate of 93% showing that 50 copies completed were retrieved as against 54 copies printed. Data collected was coded and analyzed using the Statistical Package for the Social Sciences (SPSS). Research questions were answered using mean and standard deviation. A criterion mean of 2.50 was used as the benchmark for decision-making. Any item with a mean score of 2.50 and above was regarded as an indication for acceptance of the item statement, while items with mean scores below 2.50 were regarded as an indication for rejection of the item statement. The hypotheses formulated for the study were tested using independent t-test statistical analysis at 0.05 level of significance to determine the predictive influence of green business and social entrepreneurship on entrepreneurial skills acquisition among business education students in the University of Calabar. The independent t-test was considered appropriate because the study involved comparison of responses between two independent groups. The decision rule for the hypotheses was that any probability value (p-value) less than 0.05 led to the rejection of the null hypothesis, while any probability value greater than 0.05 resulted in the acceptance of the null hypothesis.

Results

Research Question 1: To what extent does green business influence entrepreneurial skills acquisition among Business Education students in the University of Calabar?

Table 1: Mean and Standard Deviation of Respondents' Responses on Entrepreneurial Skills Acquisition among Business Education Students in the University of Calabar (N = 50)

S/N	Entrepreneurial skills acquisition statements	MEAN	SD	DECISION
1	To what extent does your Business Education programme expose you to the concept of green business?	1.07	0.75	Low Extent
2	To what extent have you acquired knowledge of environmentally friendly business practices?	2.74	1.07	High Extent
3	To what extent have you learned how businesses can reduce waste and environmental pollution	1.70	0.04	Low Extent
4	what extent has green business education helped you identify environmentally sustainable business opportunities?	1.64	0.66	Low Extent
5	To what extent have you learned to develop products or services that minimize environmental damage?	1.62	0.60	Low Extent
6	To what extent has green business education improved your ability to identify business opportunities	1.72	0.76	Low Extent
7	what extent has green business education enhanced your creativity in developing business ideas?	1.90	0.95	Low Extent
8	To what extent can you identify business opportunities arising from environmental challenges?	1.72	0.81	Low Extent
9	what extent has green business education developed your ability to innovate?	1.68	0.74	Low Extent
10	To what extent has green business education improved your problem-solving skills?	1.68	0.74	Low Extent
	Grand Mean	**1.81**		**Low Extent**

Table 1 shows the mean and standard deviation of respondents' ratings on entrepreneurial skills acquisition through Business Education. The results indicate that the respondents generally reported a low extent of entrepreneurial skills acquisition, as reflected by the grand mean of 1.81. The highest mean score was recorded for the statement concerning the acquisition of knowledge of environmentally friendly business practices, with a mean of 2.74 and standard deviation of 1.07, indicating a high extent. This was followed by the statement on enhanced creativity in developing business ideas, which recorded a mean of 1.90 and standard deviation of 0.95. The lowest mean was recorded for the statement concerning the development of products or services that minimize environmental damage, with a mean of 1.62 and standard deviation of 0.60. Overall, the findings suggest that although students have acquired some knowledge of environmentally friendly business practices, the broader acquisition of entrepreneurial skills related to green business remains relatively low.

Research Question 2: How does green business predict entrepreneurial skills acquisition among business education students in the University of Calabar?

Table 2: Mean and Standard Deviation of Respondents' Responses on how green business predicts entrepreneurial skills acquisition among business education students in the University of Calabar (N = 50)

S/N	Green business item statements	MEAN	SD	DECISION
11	Extent to which Business Education exposes students to the concept of green business	1.68	0.77	Low Extent

12	I have acquired the ability to identify business opportunities that promote environmental sustainability.	1.56	0.64	Low Extent
13	I have acquired the ability to develop environmentally friendly products and services.	1.52	0.54	Low Extent
14	I have acquired the ability to identify ways of reducing waste in business activities.	1.70	0.76	Low Extent
15	I have acquired the ability to develop innovative business ideas that address environmental problems.	1.84	0.91	Low Extent
16	I have acquired problem-solving skills for addressing environmental challenges through business activities.	1.50	0.51	Low Extent
17	I have acquired the ability to make business decisions that consider environmental sustainability	1.60	0.67	Low Extent
18	I have acquired the ability to identify and utilize environmentally sustainable business resources.	2.86	1.01	High Extent
19	I have acquired creativity and innovation skills through green business activities.	1.58	0.67	Low Extent
20	I have acquired the ability to identify market opportunities for environmentally friendly products and services.	1.66	0.75	Low Extent
	Grand Mean	**1.75**		**Low Extent**

Table 2 indicates that the respondents generally rated their acquisition of green business skills at a low extent, with a grand mean of 1.75. The highest mean score of 2.86 was recorded for the ability to identify and utilize environmentally sustainable business resources, with a standard deviation of 1.01. This was the only item in this category that fell within the high-extent range. The result suggests that students may have comparatively better awareness of sustainable resources than of other practical green business competencies. This falls within the high extent category. The next highest mean was 1.84 for the ability to develop innovative business ideas that address environmental problems. The lowest mean score was 1.50, recorded for problem-solving skills for addressing environmental challenges through business activities. The result therefore suggests that the respondents' acquisition of practical green business skills is generally low, although they appear to have comparatively better ability to identify and utilize environmentally sustainable business resources.

Research Question 3: To what extent does social entrepreneurship predicts business education students' entrepreneurial skills acquisition in the University of Calabar?

Table 3: Mean and Standard Deviation of Respondents' Responses on how social entrepreneurship predicts entrepreneurial skills acquisition among business education students in the University of Calabar (N = 50)

S/N	Social Entrepreneurship Statements	Mean	SD	DECISION
21	To what extent does your Business Education programme expose you to the concept of social entrepreneurship?	1.60	0.67	Low Extent
22	To what extent have you acquired knowledge of how businesses can address social problems?	1.52	0.54	Low Extent
23	To what extent have you learned to identify social problems that can be addressed through entrepreneurial activities?	1.52	0.54	Low Extent
24	To what extent has social entrepreneurship education helped you develop solutions to community problems?	1.60	0.49	Low Extent
25	To what extent have you learned to create businesses that generate both social and economic value?	1.84	0.91	Low Extent
26	To what extent has social entrepreneurship enhanced your creativity and innovation skills?	1.52	0.54	Low Extent
27	To what extent has social entrepreneurship education improved your ability to recognize opportunities in your community?	1.72	0.73	Low Extent
28	To what extent can you develop business ideas that address social needs?	1.66	0.75	Low Extent
29	To what extent has social entrepreneurship education increased your confidence to start a business?	1.52	0.65	Low Extent
30	To what extent has social entrepreneurship education improved your decision-making skills?	1.66	0.75	Low Extent
	Grand Mean	**1.62**		**Low Extent**

Table 3 shows that the respondents generally indicated a low extent of social entrepreneurship skills acquisition, with a grand mean of 1.62. The highest mean score was 1.84, obtained for the statement relating to the ability to create businesses that generate both social and economic value. However, this still falls within the low extent category. This was followed by the ability to recognize business opportunities in the community, which recorded a mean of 1.72. The lowest mean scores of 1.52 were recorded for the acquisition of knowledge of how businesses can address social problems, identification of social problems that can be addressed through entrepreneurial activities, enhancement of creativity and innovation skills, and confidence to start a business. These findings indicate that the respondents generally perceive their exposure to and acquisition of social entrepreneurship skills as limited.

Test of Hypothesis

H01: There is no significant difference between the mean responses of male and female respondents on the extent of entrepreneurial skills acquisition among Business Education students in the University of Calabar.

Table 4: Independent t-test Analysis on the mean responses of male and female respondents on the extent of entrepreneurial skills acquisition among Business Education students in the University of Calabar.

Variables	N	Mean	SD	Df	t-cal	t-crit	Sig.	Decision
Male Respondents	12	3.46	0.69					

				78	1.27	1.99	0.208	Accepted
Female Respondents	38	3.41	0.73					

The result presented in Table 4 revealed that the calculated t-value of 1.27 was less than the critical t-value of 1.99 at 78 degrees of freedom and 0.05 level of significance. In addition, the significance value of 0.208 was greater than 0.05. Therefore, the null hypothesis was accepted. This implies that there is no significant differences between the responses of respondents on green business as a predictor of entrepreneurial skills acquisition among Business Education students in the University of Calabar based on gender. The finding suggests that both male and female students similarly support that green business influences entrepreneurial skills acquisition among Business Education students.

H02: There is no significant differences between the responses of male and female respondents on how green business predicts entrepreneurial skills acquisition among business education students in the University of Calabar

Table 5: Independent t-test Analysis on the mean responses of male and female respondents on how green business predicts entrepreneurial skills acquisition among business education students in the University of Calabar.

Variables	N	Mean	SD	Df	t-cal	t-crit	Sig.	Decision
Male Respondents	12	3.45	0.71					
				78	1.11	1.99	0.27	Accepted
Female Respondents	38	3.42	0.68					

The results in Table 5 indicated that the calculated t-value of 1.11 was less than the critical t-value of 1.99 at 78 degrees of freedom and 0.05 level of significance. The significance value of 0.270 was also greater than 0.05. Therefore, the null hypothesis was accepted. This means that there is no significant difference between the responses of male and female respondents on Social entrepreneurship influence on entrepreneurial skills acquisition among Business Education students in the University of Calabar. Both groups similarly agreed that social entrepreneurship predicts entrepreneurial skills acquisition.

H03: There is no significant difference between the mean responses of male and female respondents on extent social entrepreneurship predicts business education students' entrepreneurial skills acquisition in the University of Calabar?

Table 6: Independent t-test Analysis on the mean responses of male and female respondents on extent social entrepreneurship predicts business education students' entrepreneurial skills acquisition in the University of Calabar?

Variables	N	Mean	SD	Df	t-cal	t-crit	Sig.	Decision
Male	12	3.5	0.67					
				78	1.18	1.99	0.241	Accepted
Female	38	3.45	0.71					

The independent t-test analysis revealed that male respondents had a mean score of 3.50 (SD = 0.67), while female respondents had a mean score of 3.45 (SD = 0.71) regarding the extent to which social entrepreneurship predicts entrepreneurial skills acquisition among business education students in the University of Calabar. The result showed a calculated t-value of 1.18, which was lower than the critical t-value of 1.99 at 78 degrees of freedom. Furthermore, the significance value of 0.241 was greater than the 0.05 level of significance. Consequently, the null hypothesis was retained, indicating that there is no significant difference in the mean responses of male and female respondents. This implies that both male and female respondents generally have similar perceptions of the role of social entrepreneurship in predicting entrepreneurial skills acquisition among business education students.

Discussion of Findings

The study examined green business and social entrepreneurship as predictors of entrepreneurial skills acquisition among business education students in University of Calabar. The first research question revealed that respondents generally reported a low extent of entrepreneurial skills acquisition through the business education programme. This finding suggests that although students may have been exposed to entrepreneurial concepts, the programme may not be providing sufficient opportunities for

students to develop and apply entrepreneurial competencies in practical situations. This is important because entrepreneurship education is expected not only to provide theoretical knowledge but also to develop students' ability to recognize opportunities, innovate, solve problems and translate ideas into viable business activities. Maheshwari et al. (2023) noted that entrepreneurship education is an important educational factor in shaping students' entrepreneurial intentions and developing entrepreneurial knowledge and cognitive and non-cognitive skills. There is an indication of a high extent of acquisition of knowledge of environmentally friendly business practices which suggests that students have acquired some theoretical understanding of environmentally responsible business practices. This finding is consistent with the broader objectives of education for sustainable development, which emphasizes equipping learners with knowledge, skills, values and attitudes that enable them to respond responsibly to environmental, economic and social challenges (UNESCO, 2026). The finding revealed a possible gap between knowledge acquisition and practical entrepreneurial competence. Students may understand the principles of green business but may not have sufficient opportunities to apply them through practical projects, product development or business simulations. A study by Hou et al. (2023) found that university-based entrepreneurship education contributes to the development of entrepreneurial competencies, including the recognition of business opportunities.

The second research question revealed a low extent of acquisition of green business skills, which indicates that students' ability to apply environmental sustainability principles to entrepreneurial activities remains relatively limited. The relatively high score in this area is encouraging because sustainable entrepreneurship requires entrepreneurs to recognize environmental issues as potential opportunities for innovation and business development. This is in consonance with Yahya et al. (2021) who examined sustainable entrepreneurial intentions among university students and specifically incorporated education for sustainable entrepreneurship into its model, demonstrating the relevance of sustainability-oriented entrepreneurship education within the Nigerian higher-education context. This result is also supported by Akeke et al (2022) who stated that more than half business education students graduating from the universities each year are left without job and most of them lacks employability skills needed to perform in the employment market thereby exposed them untold poverty and hardship.

However, there is very low extent of acquisition of green business skills which suggests that students may not have sufficient practical competence to convert environmental challenges into innovative business solutions. This finding is consistent with the argument of Hermann and Bossle (2020) that sustainability education needs to incorporate entrepreneurial competencies such as foresight, complex problem-solving and interdisciplinary thinking rather than treating sustainability only as a body of theoretical knowledge. More recent evidence also suggests that entrepreneurship education can strengthen green entrepreneurial intentions through mechanisms such as green entrepreneurial self-efficacy and environmental awareness (Mambali et al., 2024). The finding also suggests that business education programme may need to move beyond the teaching of environmental concepts and place greater emphasis on experiential green entrepreneurship education. Students could be exposed to practical activities such as recycling enterprises, waste-to-value projects, development of eco-friendly products, sustainable resource management and environmental business challenges.

The findings on the third question revealed poor perception of social entrepreneurship skills acquisition and high perception of ability to create businesses that generate both social and economic value among students. This suggests that respondents may have some awareness of the dual purpose of social entrepreneurship but may lack sufficient practical experience in developing businesses capable of creating both economic and social value. The findings also indicate that students may not be sufficiently equipped to identify social problems and transform them into viable entrepreneurial opportunities. This finding is supported by the literature on social entrepreneurship education by Bazan et al. (2020) who found that university environments and support systems can play an important role in shaping students' social entrepreneurial intentions. The low mean scores recorded for knowledge of how businesses can address social problems, identification of social problems that can be addressed through entrepreneurial activities, creativity and innovation, and confidence to start a business are particularly noteworthy.

Conclusion

The study concludes that students possess relatively better knowledge of environmentally friendly business practices than practical abilities to develop environmentally friendly products, recognize environmental business opportunities and solve environmental problems through entrepreneurial activities. This indicates a gap between what students know and what students can practicalize. that students have not acquired adequate competencies in general entrepreneurial skills, green business and social entrepreneurship. Students possess limited competence in identifying social and

environmental problems, developing innovative solutions and converting such problems into sustainable business opportunities. Green business and social entrepreneurship are important educational pathways through which Business Education can develop entrepreneurial skills relevant to contemporary environmental and social challenges. However, based on the descriptive results presented in this study, the current level of acquisition of these competencies remains low.

Recommendations

Based on the findings and conclusion of the study, the following recommendations are made:

1. Green business education and social entrepreneurship should be integrated more strongly into the curriculum.
2. Lecturers should adopt experiential and student-centered teaching approaches.
3. University of Calabar should strengthen partnerships with entrepreneurs, industries and non-governmental organizations for students practical skill acquisition.

SOCIAL ENTREPRENEURSHIP AND DEVELOPMENT OF PROBLEM-SOLVING SKILLS AMONG BUSINESS EDUCATION STUDENTS IN TERTIARY INSTITUTIONS IN OGUN STATE, NIGERIA

Dr David Akintunde Akinlabi
Department of Business Education
Federal College of Education, Abeokuta Ogun State-Nigeria
davidakinlabi@yahoo.com

Abstract

The rising cases of socially detrimental entrepreneurial activities prompted the researcher to examine the influence of social entrepreneurship on the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria. The study was guided by two purposes, twr research questions, and one null hypothesis. The researcher adopted correlational survey research design while the population of the study consisted of 888 final year Business Education students registered for the 2025/2026 academic sessions in four public tertiary institutions offering Business Education programme in Ogun State. The study sample comprised 275 final year students. A structured questionnaire was used as instrument for data collection. The data collected were analysed using simple percentage, frequency count, mean and standard deviation for the research questions, while Linear Regression Analysis was used to test the null hypothesis at 0.05 level of significance. Findings of the study revealed among others that social entrepreneurship has significant influence (F (1.273=1.514; p= 0.617) on the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria. Finally, the study recommended among others, that Business Education lecturers should adopt case study method of instruction by putting the students in different groups to explore the immediate surroundings of their institutions, identify societal problems, analyse available information, generate appropriate solutions, and assess the outcomes to solve the problems.

Keywords: Business Education, Problem-solving Skills, Social Entrepreneurship, Societal Orientation, and Innovation

Introduction

Two major elements of the 21st century workplace and business environment are dynamism and unpredictability. These two elements often give rise to unforeseen circumstances and challenges. It is therefore imperative that anyone operating in the 21st century workplace and business environment must possess transversal skills. Some of the most prominent transversal skills are problem-solving skills. According to Adebanjo et. al., (2025), problem solving skills refer to the ability of students to identify problems, analyse available information, generate appropriate solutions, and evaluate outcome to resolve challenges effectively. Similarly, Calma (2025) described problem solving skills as the ability to explore and understand problems, formulate possible solutions, plan and execute strategies, and monitor and reflect on the effectiveness of the solutions in real-life situations. The Organization for Economic Cooperation and Development (OECD) (2021) defined problem-solving skills as an individual's ability to engage in cognitive processing to understand and resolve situations where the method of solution is not immediately obvious, including exploring the problem. It involves planning, executing strategies, and reflecting on the results. From the foregoing, it is obvious that problem-solving skills are hinged on proactive and analytical reasoning.

Closely related to the concept of problem-solving is social entrepreneurship. According to Lancastre et al (2023), social entrepreneurship is a multidimensional concept that combines entrepreneurial behavior with the primary objective of creating social value through innovative, sustainable and market oriented solutions to societal problems. In like manner, Glasbeck et al (2024) described social entrepreneurship as entrepreneurial market-based approaches, and available resources to address persistent social or environmental challenges while creating sustainable social value. In a nutshell, social entrepreneurship refers to the process of identifying and exploiting opportunities to develop innovative, financially sustainable solutions that prioritise social impact over profit maximization while creating long-term value for communities.

The Business Education programme is designed to inculcate technical skills (Hard skills) and transversal skills (Soft skills) in individuals. Udo et al (2025) described Business Education as a programme of study that prepares students for job competence, occupational intelligence, and work

adjustment. It also promotes creativity, self-actualisation, and critical thinking, which assists the learners in problem-solving and skill acquisition. Business Education is one of the most prominent and viable programme in tertiary institutions of learning in Nigeria, it is therefore very expedient that Business Education students be adequately grounded in social entrepreneurship and problem-solving so as to remain relevant in the 21st century world of work and the global economy.

The relationship between social entrepreneurship and problem-solving skills is positive and complementary. Social entrepreneurship requires individuals to identify social problems and develop innovative, sustainable solutions. Consequently, strong problem-solving skills are essential for successful social entrepreneurship, while engaging in social entrepreneurship also strengthens problem-solving abilities.

This study was anchored on two theories namely: The Social Learning Theory propounded by Albert Bandura in 1977 and the Experiential Learning Theory propounded by Kolb (1984). Bandura's social learning theory posits that people acquire knowledge, skills and behaviours through observation, imitation, modelling and direct experience. The theory is relevant to this study because it explains how social entrepreneurship serve as a practical learning environment that promotes the development of problem-solving skills. Kolb (1984) proposed that learning is achieved through experience and follows a cycle of concrete experience, reflective observation, abstract conceptualization, and active experimentation. The theory is applicable to this study because the theory supports the notion that practical engagement is essential for developing higher-order thinking skills. Social entrepreneurship exposes Business Education students to real-life social and economic challenges. As students engage in projects, reflect on their experiences, develop new ideas, and test solutions they strengthen their problem solving abilities.

Recent empirical studies indicate that social entrepreneurship education enhances students' ability to identify societal problems, think creatively and develop practical solutions. Ibrahim and Park (2023), evaluated social entrepreneurship education programme designed for Nigerian students using a pre-test and post-test research design. The study found that participation in the programme significantly improved learners' social entrepreneurship competencies, including empathetic problem identification, creative problem-solving, innovation, and social impact orientation.

Haruna (2026) investigated the influence of entrepreneurship education on entrepreneurial skills and intentions among Business Education students in tertiary institutions in North Eastern Nigeria, using a mixed-methods research design. The findings showed that entrepreneurship education significantly enhanced communication, ICT and problem-solving skills. Students who engaged in practical and experiential entrepreneurial activities demonstrated stronger problem-solving skills than those exposed mainly to theoretical instruction.

Mamman et al (2025) investigated the influence of human relations, innovation, and problem-solving skills on the entrepreneurial success of Business Education graduates in South-West, Nigeria. The study reported that problem-solving skills significantly contributed to entrepreneurial skills, while innovation and interpersonal skills further strengthened graduates entrepreneurial performance.

The reviewed studies consistently demonstrate that social entrepreneurship and entrepreneurship education positively influence the development of problem-solving skills through experiential learning, innovation, collaborative activities and community-based projects. However, there remains limited empirical research specifically examining the direct relationship between social entrepreneurship and problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria. This gap justifies the need for the present study, which sought to provide empirical evidence within the Ogun State context.

Statement of the Problem

The increasing rate of unemployment, poverty and social challenges in Nigeria has heightened the need for graduates who possess not only academic knowledge but also practical skills for identifying and solving societal problems. Business Education programmes in tertiary institutions are expected to equip students with entrepreneurial competencies that will enable them to become innovative, self-reliant, and capable of creating sustainable solutions to social and economic problems. Social entrepreneurship has emerged as an important approach to achieving these objectives because it combines entrepreneurial principles with a commitment to addressing societal needs through innovative and sustainable ventures.

Despite the growing emphasis on entrepreneurship education in Nigerian tertiary institutions, the researcher observed that many Business Education graduates still exhibit inadequate problem solving skills. They often experience difficulties in identifying community needs, generating innovative solutions, making sound decisions, adapting to changing business environment and transforming social challenges into entrepreneurial opportunities.

Several studies (Haruna 2026; Mamman et al, 2025, and Ibrahim & Park, 2023) have shown that entrepreneurship education promotes creativity, innovation, collaboration and opportunity recognition, all of which are essential elements of effective problem solving skills. However, majority of the existing literature focused on entrepreneurial intention, venture creation, and employability while limited empirical attention has been given to the relationship between social entrepreneurship and the development of problem-solving skills among Business Education students, particularly in tertiary institutions in Ogun State, Nigeria.

Consequently, there is insufficient empirical evidence to determine the extent to which social entrepreneurship influences students' ability to identify, analyse and solve real-life social and business problems, thus creating a knowledge gap which this study sought to fill. It is against this background that the researcher investigated the relationship between social entrepreneurship and development of problem-solving skills among Business Education students in Ogun State, Nigeria, in order to provide empirical evidence that inform curriculum development, formulation of appropriate entrepreneurship education policies, and design of effective interventions that boost students' problem-solving skills through social entrepreneurship education.

Purpose of the Study

The main purpose of this study was to examine the relationship between social entrepreneurship and the development of problem-solving skills among Business Education student in tertiary institutions in Ogun State, Nigeria. Specifically, the study:

1. Identified essential elements of social entrepreneurship
2. Examined the essential components of problem-solving skills

Research Questions

The following research questions guided the study

1. What are the essential elements of social entrepreneurship?
2. What are the essential components of problem-solving skills?

Research Hypothesis

The following null hypothesis was tested at 0.05 level of significance

Ho1: Social entrepreneurship has no significant influence on the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria.

Methodology

The study adopted the correlational survey research because the design enabled the researcher to determine the relationship between the social entrepreneurship (independent variable) and development of problem-solving skills (dependent variable). The population of the study consisted of four public tertiary institutions offering Business Education programme in Ogun State, and final year students registered for the 2025/2026 academic session. The sample for the study comprised 276 final year Business Education students. The sample was selected using the Taro Yamene sample selection formula as follows:

$$n = \frac{N}{1 + N(e)^2}$$

Where

n = sample size

N = Total population size

1 = constant

e = sampling error (0.05)

$$\text{therefore, } n = \frac{888}{1 + 890\ (0.05)^2}$$

$$n = \frac{888}{1 + 890\ (0.0025)}$$

$$n = \frac{888}{1 + 2.225}$$

$$n = \frac{888}{3.225}$$

$$n = 275$$

The multistage sampling technique was adopted for the study. At the first stage, purposive random sampling technique was used to select only final year Business Education Students in the four selected tertiary institutions. At the second stage, proportionate random sampling technique was used to select the respondents. The breakdown of the population and sample is presented in the table below:

Table 1: Population and Sample for the Study

S/N	Institutions	Population of the final year students	Sample
1	Federal College of Education, Abeokuta	144	45
2	Olabisi Onabanjo University, Ago-Iwoye	236	73
3.	Tai Solarin Federal University of Education, Ijagun	416	129
4.	Sikiru Adetona College of Education, Science and Technology, Omu Ijebu	92	28
	TOTAL	**888**	**275**

Source: Offices of the Heads of Department

A percentage rate of 31% was used to determine the proportional sample selection. A structured questionnaire tagged, Social Entrepreneurship and Problem-Solving Skills Questionnaire (SEPSSQ) was used to obtain data from the respondents. The instrument consisted of two parts. The research instrument was validated by two experts in Business Education and one expert in Test and Measurement from the Lagos State University, Ojo for content and construct validity. A pilot study was conducted at the University of Lagos, using 30 final year Business Education students. The final draft of the instrument was administered twice on the pilot study sample within an interval of two week. The test-retest method of reliability was adopted while the results of the first and second administrations were analysed using Pearson Product Moment Correlations which yielded a coefficient of 0.78, meaning that the research instrument was adequate and reliable. Copies of the research instrument were administered on the respondents in their various institutions with the help of research assistants. The data gathered were analysed using frequency count, mean and standard deviation to answer the research questions, while the null hypothesis was tested at 0.05 level of significance, using Linear Regression Analysis (LRA). The following boundary units were adopted for the research question items

Response Categories	Points	Boundary Limits
Strongly Agree (SA)	4	3.25-4.00
Agree (A)	3	2.50- 3.24
Disagree (D)	2	1.75-2.49
Strongly Disagree	1	1.00-1.74

Decision rule of 2.50 was applied for the questionnaire items, while the hull hypothesis was rejected if the regression p-value (sig) is less than or equal to 0.05, otherwise the Ho was retained.

Results

Research Question 1: What are the essential elements of social entrepreneurship?

Table 2: Mean and Standard deviation of responses on the essential elements of social entrepreneurship

S/N	Essential Elements	Mean	SD	Remarks
1	Social mission orientation	3.25	0.74	Strongly Agree
2	Social innovation	3.22	0.80	Agree
3.	Opportunity recognition	3.28	0.82	Strongly Agree
4.	Social value creation	3.38	0.71	Strongly Agree
5.	Community engagement	3.26	0.72	Strongly Agree
6.	Resource mobilization	3.23	0.75	Agree
7.	Sustainability orientation	3.20	0.77	Agree
8.	Ethical leadership and accountability	3.18	0.85	Agree
9.	Environmental adaptability	3.30	0.68	Strongly Agree
10	Linguistic proficiency	3.37	0.78	Strongly Agree

N= 275, Decision rule = 2.50, Weighted Mean/(SD) = 3.27/ 0.76

Source: Field survey, 2026

With a weighted mean of 3.27, the results in Table 2 showed that respondents strongly agreed that all the items are essential elements of social entrepreneurship. The weighted standard deviation of 0.76 implied that the responses were very similar.

Research Question 2: What are the essential components of problem-solving skills?

Table 3: Mean and standard deviation of responses on the essential components of problem-solving skills.

S/N	Components	Mean	SD	Remarks
1	Problem identification	3.26	0.55	Strongly Agree
2	Problem analysis	3.10	0.73	Agree
3.	Critical thinking	3.36	0.78	Strongly Agree
4.	Creative thinking	3.34	0.77	Strongly Agree
5.	Effective decision making	3.35	0.74	Strongly Agree
6.	Solution implementation	3.07	0.84	Agree
7.	Evaluation and reflection	3.04	0.76	Agree
8.	Monitoring and assessment	3.31	0.80	Strongly Agree
9.	Effective communication	2.80	0.86	Agree
10	Analytical thinking	3.02	0.84	Agree

N= 275, Decision rule = 2.50, Weighted Mean/(SD) = 3.17/ 0.77

Source: Field survey, 2026

The result in Table 3 indicated that respondents agreed that all the items are essential components of problem-solving skills. Their position is hinged on the weighted mean (3.17) which is higher than the criterion mean (2.50). The weighted standard deviation (0.77) implies that the responses are closely knitted.

Ho1: Social entrepreneurship has no significant influence on the development of problem-solving skills among Business Education Students in tertiary institutions in Ogun State, Nigeria.

Table 4: Summary of Regression Analysis of the Influence of Social entrepreneurship on the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria.

Model	Unstandardized Coefficients		Standardized Coefficients	T	P
	B	Std. Error	Beta		
(Constant)	.601	.175		2.662	.004
Social entrepreneurship	.621	.066	.606	4.176	.0617
$R = 0.645^a$; $R^2 = 0.461$; Adjusted $R^2 = 0.458$; F 1.273 = 1.5148 = 0.617					

Dependent variable: Problem-solving skills development

Source: Field survey, 2026

The results in table 4, showed positive correlation between social entrepreneurship and development of problem-solving skills ($R = 0.645^a$). Furthermore, the results equally revealed that a significant relationship exists between social entrepreneurship and development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria (; F 1.273 = 1.5148 = 0.617). The null hypothesis was rejected. This implies that social entrepreneurship has significant influence on the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria.

Discussion of Findings

The study was conducted to examine the influence of social entrepreneurship in the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria. The findings from the first research question and table 2 revealed that social value creation (mean = 3.37; SD = 0.71), linguistic proficiency (mean = 3.37; SD = 0.78) and environmental adaptability (mean = 3.30; SD = 0.78) are the most essential elements of social entrepreneurship. These findings supported the findings of Ibrahim and Park (2023) that innovation, social impact orientation and empathetic problem identification are some of the elements of entrepreneurship.

The responses to the second research question as contained in Table 3 indicated that critical thinking (mean = 3.36; SD = 0.78), effective decision making (mean = 3.36; SD = 0.74), and creative thinking (mean = 3.34; SD = 0.77) are the most essential components of problem-solving skills. These findings buttressed the findings of Haruna (2026) and Calma (2025) that identification of societal problems, creative thinking, and development of practical solutions are some of the components of problem-solving skills.

It was hypothesized that social entrepreneurship has no significant influence on the development of problem-solving skills among Business Education in tertiary institutions in Ogun State, Nigeria. Consequently, the results in Table 4 showed that social entrepreneurship has a statistically significant influence on the development of problem-solving skills among Business Education students in tertiary institutions in Ogun State, Nigeria. The findings corroborated the opinions of Lancastre et al (2023), and Glasbeek et al (2024) that social entrepreneurship education enhances students' ability to identify societal problems, think creatively and develop practical solutions. The findings also aligned with the findings of Mamman et al (2025) that human relations and problem-solving skills significantly contributed to the entrepreneurial success of Business Education graduates in Southwest, Nigeria.

Conclusion

Based on the findings of this study, it was confirmed that social entrepreneurship enhances the development of problem-solving skills among Business Education students. The study therefore concluded that social entrepreneurship has significant influence on the development of problem-solving skills among Business Education students in Ogun State, Nigeria. The implication of this study is that consideration for social safety and environmental protection should be emphasized in entrepreneurship classes for Business Education students in tertiary institutions in Ogun State, Nigeria.

Recommendations

Based on the findings of this study, the following recommendations were made.

1. Lecturers of entrepreneurship courses in tertiary institutions adopt pragmatic methods to inculcate in Business Education students adopt innovative and market-based approaches to tackle persistent social challenges and create sustainable social values.
2. Business Education lecturers should adopt case-study methods of teaching in which students are put in different groups to explore the immediate surroundings of their institutions, identify societal problems, analyse available information, generate appropriate solutions and assess the outcomes to solve the problem permanently.
3. Business Education lecturers should inculcate social entrepreneurial competencies in their students in order to facilitate the students' abilities to solve societal and personal problems.

PERCEIVED INFLUENCE OF GREEN BUSINESS PRACTICES ON ENTREPRENEURIAL COMPETENCIES OF BUSINESS EDUCATION STUDENTS IN OGUN STATE, NIGERIA

Dr. David Akintunde Akinlabi
Department of Business Education,
Federal College of Education, Abeokuta
Ogun State, Nigeria.
davidakinlabi@yahoo.com
+2347065990160

Abstract

The rampant cases of environmental pollution due to industrial and commercial activities prompted the researcher to examine the perceived influence of green business practices on entrepreneurial competencies of Business Education students in public tertiary institutions in Ogun State, Nigeria. The study was guided by five purposes and five research questions. The researcher adopted correlational survey research design, while the population of the study consisted of 50 Business Education lecturers from the four public tertiary institutions, offering Business Education programme in Ogun State, Nigeria. The entire population was taken as the sample. A structured questionnaire was used as instrument for data collection. The data collected were analysed using simple percentage, frequency count, mean, and standard deviations. Findings from the study revealed among others, that green product innovation enhances opportunity recognition competency to a great extent (mean=3.03; SD = 0.75), and that sustainable resource utilization influences strategic (business planning) competency to a high extent (mean = 3.19; SD = 0.83). Finally, the study recommended among others, that lecturers of entrepreneurship courses should teach students how to identify opportunities arising from environmental challenges, and encourage innovation in environmentally friendly products and services.

Keywords: Business Education, Entrepreneurial Competencies, Green Business Practices, Tertiary Institutions, and Self Employment.

Introduction

Unemployment and underemployment have become serious concerns among parents and discerning minds in Nigeria. On yearly basis, thousands of youths and graduates are churned out of educational institutions, seeking gainful employment. In order to stem the tide of unemployment among youths, the government introduced entrepreneurship education into the national curriculum. The introduction of entrepreneurship education in tertiary institutions is a major step towards solving problems of unemployment and poverty. In contemporary human society, entrepreneurship is a catalyst for economic growth, job creation, wealth creation and provision of societal needs.

In entrepreneurship education, students are expected to inculcate entrepreneurship competencies that are essential for starting and growing a business enterprise. The major purpose of entrepreneurship education is to promote the culture of self-reliance and self-employment among the citizens. According to Bernado and Bratzke (2024), entrepreneurial competencies refer to the combination of knowledge, skills, attitudes, and psychological capabilities that enable individuals identify opportunities, create value, and successfully perform entrepreneurial activities. Li and Antoncic (2023) described entrepreneurial competencies as a multidimensional set of cognitive, conative (motivational), social and experimental capabilities that enable entrepreneurs to recognize opportunities, mobilize resources, and achieve entrepreneurial success, while Mai and Thai (2025) defined entrepreneurial competencies as the integrated knowledge, skills, attitudes, and abilities that enable individuals to initiate, manage and sustain entrepreneurial ventures while adapting to changing business environments. From the foregoing, it is obvious that entrepreneurial competencies can be acquired through education and experience.

Green business practices refer to the integration of environmentally sustainable strategies into business operations to reduce negative environmental impact, improve resource efficiency, promote responsible production and consumption, as well as support long-term economic, social and ecological sustainability (Omowole et al, 2024). Similarly, Ahmed Calloghan, and Arsian (2024) described green business practices as organizational actions and behaviours that translate environmental policies into practical leadership and employee activities aimed at minimizing environmental harm and improving sustainability performance, while Odeyemi et al (2024) defined green business practices as business activities that integrate environmentally responsible production, resources conservation, waste reduction, and sustainable innovation while maintaining economic competitiveness and long-term value creation.

It is noteworthy that green business practices have a significant positive relationship with entrepreneurial competencies because the adoption of environmentally sustainable practices enhances entrepreneurs' innovation, opportunity recognition, strategic thinking, leadership and problem-solving abilities, thereby improving business performance and sustainability. At any rate, the relationship between green business practices and entrepreneurial competencies is generally positive and complementary. Green business practices stimulate entrepreneurs to develop the knowledge, skills, attitudes, and abilities needed to create and sustain environmentally responsible businesses. At the same time, robust entrepreneurial competencies make it easier to adopt and successfully implement green business practices. Basically, green business practices significantly enhance entrepreneurial competencies, while entrepreneurial competencies facilitate the successful adoption of green business practices.

A veritable platform for a functional alignment of green business practices and entrepreneurial competencies is Business Education. According to Udo et al (2025), Business Education is a programme of study that prepares students for job competence, occupational intelligence, and work adjustment. It also promotes creativity, self-actualization, and critical thinking, which assists learners in problem-solving and skill acquisition. Business Education is one of the most prominent and viable programmes in tertiary institutions of learning in Nigeria, it is therefore very expedient that Business Education students be exposed to relevant training in green business practices and entrepreneurial competencies. Such exposure will position the students for proper functioning and relevance in the 21st century world of work. Inculcation of green business practices and entrepreneurial competencies will also help to promote the culture of self-reliance and self-employment, which are the core values of Business Education.

This study was anchored on two theories namely: The Natural-Resource-Based View (NRBV) Theory and the Resource-Based View (RBV) Theory. The Natural Resourced-Based View (NRBV) Theory was propounded by Stuart L. Hart (1995). The NRBV Theory extends the Resource-Based View by arguing that firms gain sustainable competitive advantage through environmentally responsible practices such as pollution prevention, product stewardship, and sustainable development. The theory is relevant to this study because green business practices require entrepreneurs to develop competencies such as innovation, opportunity recognition, strategic thinking, environmental problem-solving, and resource management. Thus, entrepreneurial competencies enable businesses to adopt and sustain green business effectively.

The Resource-Based View (RBV) Theory was developed by Jay B. Barney (1991), the theory proposes that organizations achieve superior performance by developing valuable, rare, inimitable, and non-substitutable (VRIN) resources. Entrepreneurial competencies are considered strategic internal resources that help firms implement green business practices successfully. The theory is relevant to this study because entrepreneurial competencies (e.g. innovation, opportunity recognition, leadership, and risk-taking) are valuable capabilities that support the adoption and successful implementation of green business practices. From the foregoing, the NRBV theory is the primary theory because it directly links environmental sustainability with the capabilities and competencies needed to create competitive advantage, while RBV theory is the complementary theory because it explains entrepreneurial competencies as strategic resources that facilitate green business practices.

The dimensions of green business practices are quite numerous; However, this study was limited to the five major dimensions of green business practices highlighted below:

(a) Green Products Innovation: This deals with developing environmentally friendly products and services.
(b) Waste Management Practices: These entail, reducing, reusing, recycling, and properly disposing off waste materials.
(c) Energy Conservation Practices: Efficient use of energy resources through energy-saving technologies and renewable energy sources.

(d) Sustainable Resource Utilization: Efficient and responsible use of natural resources, including water, raw materials, and other inputs, to minimize depletion.
(e) Green Marketing Practices: Promoting products and services based on their environmental benefits and encouraging sustainable consumption. (Pablo & Sarsale, 2026; Odeyemi et al, 2024; and Ahmed et al, 2024).

In contemporary times, Business Education Students in tertiary institutions are expected to acquire a wide range of entrepreneurial competencies. According to Bernado & Bratzke (2024), Li & Antoncic (2023), and Oyeku, et al (2024), Some of the most appropriate entrepreneurial competencies for Business Education students include: Opportunity recognition competency, strategic (business planning) competency, as well as communication and interpersonal (relationship) competency.

Zhang et al (2026) investigated how students' entrepreneurial behaviour contributes to green entrepreneurship environmental sustainability and the creation of business opportunities. Using quantitative analysis, the study found that entrepreneurial behaviour significantly and positively predicts students' engagement in green entrepreneurship. In turn, green entrepreneurship enhances environmental sustainability and facilitates the identification of sustainable business opportunities. The study also established that knowledge of the Sustainable Development Goals (SDGs) strengthens the relationship between entrepreneurial behaviour and green entrepreneurship.

Chatterjee et al (2024) examined the relationship between students' green engagement and entrepreneurial behaviour. The study developed and validated the concept of student green engagement and found that it positively influences green entrepreneurial intentions. Findings of the study also revealed that university entrepreneurial support and entrepreneurial motivation serially mediate the relationship between student green engagement and green entrepreneurial behaviour, emphasizing the role of higher education institutions in fostering sustainable relationship among students. Mambali et al (2024) examined the relationship between entrepreneurship education and green entrepreneurial intentions of business and science students. The study found that entrepreneurship education has a significant positive effect on students' green entrepreneurial intentions, both directly and indirectly through green entrepreneurial self-efficacy. It also established that environmental awareness strengthens the relationship between self-efficacy and green entrepreneurial intentions among university students.

In a bid to promote innovation, self-reliance and self-employment without compromising environmental preservation and health of the inhabitants, it is imperative that Business Education students are exposed to green business practices so that they will undertake entrepreneurial activities that are not only economically viable but equally environmentally beneficial. It is against this background that the researcher examined the relationship between green business practices and entrepreneurial competencies of Business Education students in tertiary institutions in Ogun State, Nigeria.

Statement of the Problem

The global move towards sustainable development has made green business practices a critical component of Business Education universally. Therefore, tertiary institutions are increasingly expected to equip students with the knowledge, skills, values, and competencies required to establish and manage environmentally responsible enterprises. Green business practices such as efficient resource production, and environmental responsibility are considered essential for preparing graduates to contribute to economic development without compromising environmental sustainability. Similarly, entrepreneurial competencies, including opportunity recognition, creativity, innovation, problem-solving, risk-taking, business management, and decision-making skills, are fundamental attributes expected of Business Education students to aspire to become successful entrepreneurs. Despite the increasing emphasis on sustainability and entrepreneurship in Nigeria's educational system, there are concerns that many Business Education graduates still lack the entrepreneurial competencies required to establish and sustain environmentally responsible businesses. Reports of graduate unemployment, underemployment, low entrepreneurial success, and limited adoption of sustainable business practices suggest that students may not be adequately prepared to tackle contemporary environmental and economic challenges. This situation raises questions about whether the green business practices promoted within tertiary institutions are contributing meaningfully to the development of entrepreneurial competencies among Business Education students.

Although previous empirical studies have examined green business practices and entrepreneurial competencies separately, and a few have explored their relationship in different countries and educational contexts, there is limited empirical evidence focusing specifically on Business Education students in tertiary institutions in Ogun State, Nigeria. In recent times, many business enterprises in Ogun State have been shut down by government agencies, due to flagrant disregard for the ecosystem, environmental pollution, and practices inimical to human health. Since entrepreneurship

is the livewire of any economy, therefore, any problem that erodes the tremendous benefits of entrepreneurship, must be empirically addressed, if this is not done, entrepreneurial practices might become detrimental to the well-being of the citizens, hence the need for this study.

Purpose of the Study.

The main purpose of this study was to examine the relationship between green business practices and entrepreneurial competencies of Business Education students in tertiary institutions in Ogun State, specifically the study:

1. Examined the extent to which green product innovation practice enhances opportunity recognition competency.
2. Investigated the extent to which sustainable resource utilization practice stimulates strategic (business planning) competency.
3. Assessed the extent to which energy conservation practice boosts leadership practice.
4. Determined the extent to which waste management practice fosters decision making competency.
5. Ascertained the extent to which green marketing practice enhances communication and interpersonal competency.

Research Questions

The following research questions guided the study.

1. To what extent does the green product innovation practice enhance opportunity recognition competency?
2. To what extent does sustainable resource utilization stimulate strategic (business planning) competency?
3. To what extent does energy conservation practice boost leadership?
4. To what extent does time management practice foster decision-making competency?
5. To what extent does green marketing practice enhance communication and interpersonal competency?

Methodology

The study adopted correlational survey research design because the study determined the nature and strength of the relationship between two variables namely: green business practices (independent variable) and entrepreneurial competencies (dependent variable), without manipulating either variable. The population of the study consisted of 50 business educators lecturing in 4 tertiary institutions offering Business Teacher Education Programme in Ogun State. The institutions are: Federal College of Education, Abeokuta; Olabisi Onabanjo University, Ago-Iwoye; Sikiru Adetona College of Education, Science and Technology, Omu-Ijebu, and Tai Solarin Federal University of Education, Ijagun. The entire population was taken as the sample, thus the census sampling technique was adopted. A structured questionnaire tagged, Green Business Practices and Entrepreneurial Competencies Questionnaire (GBPECQ) was used to gather data for the study. The questionnaire was divided into two sections. Section A deals biographic information, while Section B contains 25 items in line with the five research questions. The instrument was validated by two experts in Business Education, and one expert in test and measurement from the Lagos State University of Education, Ojo-Ijanikin. A pilot study was conducted on ten business educators from the Federal College of Education (special), Oyo, and the results from the pilot study Cronbach Alpha formula. The split-half reliability method was adopted, and the reliability test yielded a coefficient of 0.81. The questionnaire items were uploaded to a Google form and a link was generated and distributed electronically to the respondents, 48 respondents, representing 96% filled the form and sent back to the researcher, Data gathered were analysed using simple percentage, frequency count, for the biographic data, while mean and standard deviation were used to answer the five research questions. The acceptance or rejection of each questionnaire item was guided by the mean ratings, interpreted based on the following real limits: 3.25 – 4.00 (Very High Extent), 2.50 – 3.24 (High Extent), 1.75-2.49 (Low Extent), and 1.00 – 1.74 (Very Low Extent).

Results

Research Question One: To what extent does green product innovation practice enhance opportunity recognition competency?

Table 1: Mean responses on the extent of the influence of green innovation practice on opportunity recognition competency

S/N	ITEMS	MEAN	SD	REMARKS
1.	Enhancement of environmental awareness	2.72	0.82	High Extent
2.	Stimulation of creative thinking	2.93	0.68	High Extent
3.	Improvement of problem-solving skills	3.01	0.67	High Extent
4.	Increased market sensitivity	3.34	0.74	Very High Extent
5.	Improvement of resource efficiency	2.93	0.87	High Extent
6.	Promotion of entrepreneurial mindset	3.22	0.70	High Extent
N = 48, Decision rule, = 2.50 Weighted mean/SD =		**3.03**	**0.75**	**High Extent**

Source: Field Survey, 2026

Analysis of data in Table 1 shows the mean and standard deviation of responses on the extent of the influence of green innovation practice on opportunity recognition competency. The weighted mean of 3.03 implied that business educators perceived that green innovation practice enhances opportunity recognition competency to a high extent. The weighted standard deviation of 0.75 indicated that the responses are consistent.

Research Question Two: To what extent does sustainable resource utilization stimulate strategic (business planning) competency?

Table 2: Mean responses on the extent of the influence of sustainable resource utilization on strategic (business planning) competency

S/N	ITEMS	MEAN	SD	REMARKS
1.	Enhancement of long-term thinking that ensures business continuity and resilience	3.16	0.74	High Extent
2.	Efficiency in resource allocation	3.20	0.83	High Extent
3.	Improved adaptation in planning, in anticipation of risks	2.90	0.91	High Extent
4.	Facilitation of regulatory compliance	3.12	0.91	High Extent
5.	Boost in competitive advantage by attracting environmentally conscious customer and investors.	3.30	0.86	Very High Extent
6.	Creation of innovative products and services.	3.45	0.73	Very High Extent
N = 48, Decision rule, = 2.50 Weighted mean/SD =		**3.19**	**0.83**	**High Extent**

Source: Field Survey, 2026.

Analysis of data in Table 2 reveals the mean and standard deviation of responses on the extent of the influence of sustainable resource utilization on strategic (business planning) competency. The weighted mean of 3.19 indicated that business educators perceived that sustainable resource utilization stimulates strategic (business planning) competency to a high extent. The weighted standard deviation of 0.83 showed that responses are largely homogeneous.

Research Question Three: To what extent does energy conservation practice boost leadership competency?

Table 3: Mean responses on the extent of the influence of energy conservation practice on leadership competency

S/N	ITEMS	MEAN	SD	REMARKS
1.	Encouragement of strategic decision making that balance economic, environmental, and social consideration	3.42	0.81	Very High Extent
2.	Promotion of ethical leadership that is committed to environmental stewardship and social responsibility	3.08	0.82	High Extent

3.	Enhancement of change-management skills	3.06	0.72	High Extent
4.	Promotion of long-term vision	3.23	0.90	High Extent
5.	Efficiency in the use of limited resources by allocating resources wisely	3.15	0.76	High Extent
6.	Enhancement of positive role modelling	3.40	0.84	Very High Extent
N = 48, Decision rule, = 2.50 Weighted mean/SD =		**3.22**	**0.81**	**High Extent**

Analysis of data in Table 3 shows the mean and standard deviation of responses on the extent of the influence of energy conservation practice on leadership competency. The weighted mean of 3.22 revealed that business educators perceived that energy conservation practice boosts leadership competency to a high extent. The weighted standard deviation of 0.81 shows the homogeneity of the responses.

Research Question Four: To what extent does waste management practice foster decision-making competency?

Table 4: Mean responses on the extent of the influence of waste management practice on decision-making competency

S/N	ITEMS	MEAN	SD	REMARKS
1.	Enhancement of problem identification and analytical thinking for evidence-based decision-making	3.32	0.70	Very High Extent
2.	Proper evaluation of costs, benefits and environmental impact of waste recycling and safe disposal of wastes.	3.46	0.88	Very High Extent
3.	Development of risk assessment skills for responsible and informal decisions	3.22	0.78	High Extent
4.	Enhancement of data-driven decision-making	3.23	0.81	High Extent
5.	Promotion of ethical and sustainability-oriented decisions	3.01	0.69	High Extent
6.	Preparation of students to make effective entrepreneurial decisions in both conventional and business environments	2.99	0.63	High Extent
N = 48, Decision rule, = 2.50 Weighted mean/SD =		**3.21**	**0.75**	**High Extent**

Analysis of data in Table 4 reveals the mean and standard deviation of responses on the extent of the influence of waste management practice on decision making competency. The weighted mean of 3.21 indicated the business educators perceived that waste management practice fosters decision making competency to a high extent. The weighted standard deviation of 0.75 implied that the responses are clustered around the mean.

Research Question Five: To what extent does green marketing practice enhance communication and interpersonal competency?

Table 5: Mean responses on the extent of the influence of green marketing practice on communication and interpersonal competency

S/N	ITEMS	MEAN	SD	REMARKS
1.	Improvement in communication skills	3.04	0.96	High Extent
2.	Enhancement of active listening	3.29	0.74	Very High Extent
3.	Development of interpersonal skills like respect, cooperation, and customer engagement.	2.96	0.88	High Extent
4.	Enhancement of teamwork and cooperation	3.17	0.83	High Extent
5.	Development of persuasion and advocacy skills	3.37	0.85	Very High Extent
6.	Promotion of ethical communication	3.03	0.88	High Extent
N = 48, Decision rule, = 2.50 Weighted mean/SD =		**3.14**	**0.86**	**High Extent**

Analysis of Data in Table 5 reveals the mean and standard deviation of responses on the extent of the influence of green marketing practice on communication and interpersonal competency of Business Education students. The weighted mean of 3.14 indicated that business educators perceived that green marketing practice enhances communication and interpersonal skills to a high extent, while the weighted standard deviation of 0.86 implied that the responses were consistent.

Discussion of Findings

This study was conducted to examine business educators' perceptions on the influence of green business practices on entrepreneurial competencies of Business Education students in tertiary institutions in Ogun State, Nigeria. The findings of the study are discussed in line with the research purposes and research questions. The findings from research question one and Table 1 revealed that green product innovation practices enhances opportunity recognition competency of Business Education students in tertiary institutions in Ogun State, Nigeria. These findings align with the findings of Zhang et al (2026) that green entrepreneurship facilitates the identification of sustainable business opportunities.

The findings from research question two and Table 2 showed that sustainable resource utilization stimulate strategic (business planning) competency to a high extent. These findings are in consonance with the observations of Odeyemi et al (2024) that green business practices enhances long-term value creation. Furthermore, findings based on research question three and Table 3 indicated that energy conservation practice boost leadership competency of Business Education students in tertiary institutions in Ogun State, Nigeria, to a high extent. These findings are in tandem with the findings of Mambali et al (2024) that environmental awareness had a significantly positive influence on entrepreneurial self-efficacy of university students.

Research question four investigated the influence of waste management practice on decision-making competency. Results in Table 4 implied that waste management practice fosters decision-making competency of Business Education students in tertiary institutions in Ogun State to a high extent. These findings buttress the findings of Pablo and Sarsale (2026) that waste management practices help entrepreneurs to take appropriate decisions when confronted with various options concerning, reusing, recycling or disposing waste materials.

Research question five sought to determine the influence of green marketing practice on communication and interpersonal competency. The results in Table 5 indicated that green marketing practices enhances communication and interpersonal competency to a high extent. These findings corroborate the assertion of Ahmed et al (2024) that green marketing practice helps entrepreneurs to enlighten customers on the environmental benefits of their products and services.

Conclusion

Based on the findings of this study, it was concluded that business educators in tertiary institutions in Ogun State, Nigeria perceived that green business practices influences entrepreneurial competencies of Business Education students to a high extent. The implication of this is that green business practices should be fully integrated in the entrepreneurship education curriculum of Business Education students in tertiary institutions.

Recommendations

Based on the findings of this study, it was recommended that:

1. Lecturers of entrepreneurship class should teach students how to identify opportunities arising from environmental challenges, and encourage innovation in environmentally friendly products and services.
2. Business educators should train students on the use of digital tools for market analysis, budgeting, financial planning, and business forecasting.
3. Business education students should be involved in sustainability initiatives such as waste management, energy conservation, recycling, and environmental awareness campaigns.
4. Students should be presented with real life business challenges that require them to analyze situations, generate alternatives and justify their decisions.
5. Lecturers of entrepreneurship courses should involve students in community-based entrepreneurship and outreach projects that require interaction with diverse groups and collaborative problem-solving.

INTEGRATING GREEN ENTREPRENEURSHIP AND ETHICAL LEADERSHIP INTO BUSINESS EDUCATION CURRICULA FOR ACHIEVING THE SUSTAINABLE DEVELOPMENT GOALS (SDGS) IN NIGERIA

Saheed Olatunde, Akinsanya (Ph.D), Virginia Ochanya, Onche (Ph.D) & Ifeloluwa Janet, Oyeleye (Ph.D)

Abstract

The increasing difficulties brought by climate change, environmental degradation, unethical business practices, and socio-economic inequalities make it imperative for higher education institutions to impart skills to their graduates for sustainable development. Although business education is of critical importance in shaping the entrepreneurial competencies and the business leaders of tomorrow, the content of business curricula in many developing countries, especially Nigeria, has been skewed towards mainstream business without enough emphasis on sustainability and ethical leadership of business. This paper explores the role of green entrepreneurship and ethical leadership in business education programmes as a key approach to supporting the United Nations Sustainable Development Goals (SDGs). A qualitative conceptual study design is used, with supporting evidence from academic literature, policy documents, curriculum frameworks and international reports analysed through thematic content analysis. Education for Sustainable Development (ESD) Framework and Transformational Leadership Theory are used to support the curriculum transformation for sustainability. The results indicate that teaching green entrepreneurship and ethical leadership in business education can improve the sustainable innovation ability, ethical decision-making ability, environmental responsibility of graduates, and creation ability of responsible enterprises. The paper suggests a conceptual framework for integrating the curriculum and concludes that there is a need for curriculum reform, experiential education, interdisciplinary approaches and industry collaboration to shift the paradigm of business education to become a driver of sustainable development and SDGs.
Keywords: Green Entrepreneurship, Ethical Leadership, Curriculum Integration, Sustainable Development Goals (SDGs).

Introduction

The world of business is changing in ways that are making sustainability an increasingly important consideration in business practice and education. Climate change, environmental degradation, depletion of natural resources, unemployment, social inequality and concerns about unethical business practices have raised questions about the way economic activities are conducted. Businesses are no longer judged solely by their ability to generate profit; increasing attention is being given to how they treat people, use resources, affect communities and respond to environmental challenges. The United Nations (2015), through the Sustainable Development Goals (SDGs), provides a global framework for addressing these interconnected economic, social and environmental concerns. This changing environment has implications for higher education, particularly programmes responsible for preparing future entrepreneurs, managers and business professionals. Education has an important role in preparing individuals to respond to these challenges. The Education for Sustainable Development (ESD) framework emphasizes the development of knowledge, skills, values and attitudes that enable learners to contribute to a more sustainable society (UNESCO, 2017). UNESCO (2020) further argues that achieving sustainable development requires education systems to move beyond knowledge transmission and provide learners with opportunities to think critically, collaborate, solve problems and take responsible action. Higher education therefore has a responsibility to ensure that graduates are prepared not only for the current world of work but also for the emerging economic, social and environmental realities in which they will live and work.

Business Education is particularly relevant to this discussion because of its close relationship with entrepreneurship, management, accounting, marketing and other areas through which individuals

participate in economic activities. Traditionally, the programme has focused strongly on equipping learners with vocational, entrepreneurial and business competencies for employment and self-reliance. These objectives remain important, especially in a country such as Nigeria where graduate unemployment and the need for enterprise development continue to receive considerable attention. However, the changing expectations of business suggest that competence in conventional business practices alone may no longer be sufficient. Graduates also need to understand how business decisions can contribute to or undermine environmental sustainability, social well-being and responsible economic development. One area through which Business Education can respond to this need is green entrepreneurship. Green entrepreneurship involves identifying and developing business opportunities that address environmental challenges while creating economic value. Higher education can help students look at environmental challenges from a different perspective by turning them into opportunities for innovation and enterprise. Leal Filho et al. (2025) emphasize that sustainable entrepreneurship education can equip students with the knowledge, skills and mindset needed to develop entrepreneurial responses to environmental, social and economic challenges. Similarly, Vargas-Merino et al. (2025) highlight the importance of integrating sustainable entrepreneurship into higher education curricula, particularly through experiential learning and the development of competencies for sustainable ventures. For Business Education students, this means that issues such as waste, pollution and inefficient use of resources can be treated not only as problems to be addressed but also as opportunities for developing useful products, services and business models that create economic value while responding to environmental needs.

However, the ability to establish a green enterprise does not by itself guarantee responsible business practice. The way such enterprises are managed and the decisions made by their leaders are equally important. Ethical leadership provides the complementary dimension by emphasising integrity, fairness, accountability and responsible conduct. Nwanzu and Babalola (2024)) explain ethical leadership in terms of appropriate personal conduct and the promotion of such conduct through communication, decision-making and relationships with others. This is particularly relevant to sustainable business because decisions about employees, customers, communities, environmental resources and business partners often involve ethical considerations. A business may describe itself as environmentally responsible while still engaging in unfair labour practices, misleading marketing or irresponsible resource use. Ethical leadership can therefore help ensure that sustainability-oriented business activities are pursued responsibly. The relationship between green entrepreneurship and ethical leadership also reflects the broader understanding of sustainable development. Belz and Binder (2017) explain that sustainable entrepreneurship involves identifying opportunities that address social and environmental problems while creating economic value. Integrating these ideas into Business Education can therefore help students develop a broader understanding of what it means to establish and manage a successful enterprise. The focus shifts from simply asking whether a business can make profit to considering whether it can create value in ways that are environmentally responsible and socially acceptable.

Business Education has the potential to contribute to the development of entrepreneurial and employability skills, but there is also a growing need for competencies that respond to the emerging green economy. Okereke, Onokpaunu and Ikonomwan (2019) identified green skills such as waste management, recycling, energy management and climate-related competencies as relevant to Business Education in Nigeria. Alao, Alao and Elijah (2023) similarly drew attention to the potential of green entrepreneurship in areas such as recycling, waste management, green products and agribusiness. These perspectives suggest that sustainability can be connected to the existing entrepreneurial orientation of Business Education rather than treated as an entirely separate field. The importance of this repositioning is further reinforced by the SDGs. Business Education can contribute directly or indirectly to several of the goals, particularly SDG 4 on quality education, SDG 8 on decent work and economic growth, SDG 9 on industry and innovation, SDG 12 on responsible consumption and production, and SDG 13 on climate action (United Nations, 2015). The contribution of the programme, however, depends largely on whether students acquire the knowledge, practical competencies and values required to translate these goals into responsible business activities. Simply mentioning sustainability or the SDGs in curriculum documents may have limited effect if students are not given opportunities to apply the ideas to real business and community problems.

It is against this background that this paper explores the integration of green entrepreneurship and ethical leadership into Business Education curricula as a pathway for strengthening the contribution of the programme to sustainable development in Nigeria. The paper reviews the concepts and their relationship with Business Education and the SDGs, examines the theoretical foundations supporting their integration, identifies areas in which they can be incorporated into existing Business Education

courses, and discusses the challenges and strategies associated with implementation. The paper ultimately argues that a Business Education curriculum that combines entrepreneurial capability with environmental responsibility and ethical leadership can better prepare graduates to create and lead enterprises that contribute meaningfully to sustainable development.

Business Education and Sustainable Development

Business Education is traditionally concerned with equipping learners with knowledge and skills for employment, entrepreneurship and effective participation in the world of business. In Nigeria, the programme has maintained a strong vocational and entrepreneurial orientation, with areas such as accounting, management, marketing, economics and office technology forming important components of its curriculum. However, the changing nature of business has created a need to broaden this orientation. Businesses are increasingly expected to consider not only profitability but also their effects on people, communities and the environment. The connection between Business Education and sustainable development can be understood within the broader purpose of Education for Sustainable Development (ESD). UNESCO (2017) maintains that education should help learners develop the knowledge, skills, values and attitudes needed to contribute to sustainable development. Similarly, UNESCO (2020) emphasises that sustainable development education should encourage learners to think critically, work collaboratively and take responsible action. This implies that business-related programmes should prepare students to understand the wider consequences of business decisions rather than focusing exclusively on economic returns.

Okereke, Onokpaunu and Ikonomwan (2019) identified green skills such as waste management, recycling, climate-related competencies and ecological consultancy as relevant to the Business Education curriculum. Alao, Alao and Elijah (2023) similarly argued that Nigerian Business Education needs greater attention to green entrepreneurship and identified areas such as recycling, waste management, green products and agribusiness as potential areas of sustainable enterprise. These studies suggest that sustainability does not require Business Education to abandon its established objectives; rather, existing business competencies can be applied to emerging environmental and social needs. From this perspective, the role of Business Education in sustainable development can be viewed through three broad dimensions: economic competence, social responsibility and environmental responsibility. The relationship is summarised in Table 1.

Table 1: Dimensions of Business Education for Sustainable Development

Dimension	Key emphasis	Expected student outcome
Economic competence	Entrepreneurship, innovation, productivity and viable enterprise	Ability to identify and develop sustainable business opportunities
Social responsibility	Ethics, fairness, inclusion, employee and community welfare	Ability to consider stakeholders when making business decisions
Environmental responsibility	Resource efficiency, waste reduction, recycling and climate awareness	Ability to minimise environmental harm through business activities
Integrated sustainability	Balancing economic, social and environmental considerations	Ability to create and manage enterprises that generate sustainable value

Source: Adapted from UNESCO (2017, 2020)

The table shows that sustainability can be incorporated into Business Education without weakening its business and vocational foundation. Instead, conventional competencies can be connected to broader questions of responsible enterprise and sustainable value creation. For example, entrepreneurship can incorporate green business opportunities, marketing can address responsible communication and sustainable consumption, while management can include ethical decision-making and stakeholder responsibility. This orientation is also consistent with the Sustainable Development Goals, particularly SDG 4 on quality education, SDG 8 on decent work and economic growth, SDG 9 on innovation, SDG 12 on responsible consumption and production, and SDG 13 on climate action (United Nations, 2015). Thus, strengthening the sustainability orientation of Business Education can

help the programme respond more directly to both the changing business environment and Nigeria's broader development needs.

Green Entrepreneurship

Green entrepreneurship has emerged as an important response to the growing concern about the environmental consequences of economic activities. Unlike conventional entrepreneurship, which may place greater emphasis on identifying profitable opportunities and creating economic value, green entrepreneurship gives deliberate attention to environmental sustainability while pursuing economic and social value. Nwanzu and Babalola (2024) describe sustainable entrepreneurship as entrepreneurial action directed at reducing environmental degradation, while AlHares (2025) associate sustainable entrepreneurship with innovative business activities that contribute to sustainable development. Green entrepreneurship can therefore be understood as the creation and development of businesses that respond to environmental challenges through products, services, processes or business models that generate value while reducing environmental harm. The concept is closely related to sustainable entrepreneurship, although the two terms are sometimes used interchangeably in the literature. Sustainable entrepreneurship has a broader focus that incorporates economic, social and environmental dimensions, whereas green entrepreneurship tends to place stronger emphasis on environmental concerns. Belz and Binder (2017) explain that sustainable entrepreneurs identify opportunities that address social and environmental problems while creating economic value. This suggests that green entrepreneurship is not simply about establishing businesses that are labelled "green"; it involves recognising environmental problems as opportunities for innovation and developing viable solutions around them.

The relevance of green entrepreneurship to education lies in the competencies required to identify and develop such opportunities. Students need to understand environmental problems, recognise market opportunities, think innovatively, assess risks, develop sustainable business models and consider the wider consequences of their entrepreneurial decisions. Rosario and Raimundo (2024), in their review of sustainable entrepreneurship education, found growing attention to sustainability competencies and experiential approaches that enable learners to connect entrepreneurial knowledge with real sustainability challenges. Vargas-Merino et al. (2025) similarly identified experiential learning and competency development as important elements of sustainable entrepreneurship education in higher education.

Okereke, Onokpaunu and Ikonomwan (2019) identified waste management, recycling, climate-related skills, energy management and other green competencies as relevant to Business Education. Alao, Alao and Elijah (2023) also noted that green entrepreneurship could provide Business Education students with opportunities in areas such as recycling, waste management, green products and agribusiness. These areas are particularly relevant in Nigeria, where environmental challenges can coexist with the need for employment and enterprise development. For Business Education, therefore, green entrepreneurship should not be presented simply as another form of entrepreneurship. It should be treated as an opportunity to reshape how students understand business opportunities. A student who sees waste only as an environmental problem may overlook its entrepreneurial potential, whereas one who understands green entrepreneurship can explore opportunities in recycling, waste recovery, reusable products and other forms of resource recovery. The same reasoning can be applied to renewable energy, sustainable agriculture, water management and environmentally responsible packaging. The major competencies associated with green entrepreneurship can be summarised as follows.

Table 2: Key Green Entrepreneurship Competencies for Business Education

Competency	What it involves	Possible Business Education application
Environmental awareness	Understanding environmental problems and their business implications	Identifying local environmental challenges as potential business opportunities
Opportunity recognition	Identifying market opportunities arising from environmental needs	Developing business ideas around recycling, renewable energy or sustainable products
Green innovation	Creating products, services or processes that reduce environmental harm	Designing environmentally friendly products and sustainable business models
Resource efficiency	Using materials, energy and other resources responsibly	Developing cost-effective and resource-efficient production processes
Sustainable business planning	Integrating environmental and social considerations into business decisions	Preparing business plans that include sustainability objectives

Risk and impact assessment	Considering the possible environmental and social consequences of business activities	Evaluating the sustainability of proposed business ventures
Collaboration and problem-solving	Working with others to develop solutions to sustainability challenges	Community projects, innovation challenges and industry-based assignments

Source: Adapted from Belz and Binder (2017), UNESCO (2017), Rosario and Raimundo (2024), and Vargas-Merino et al. (2025).

The table reinforces the view that green entrepreneurship requires more than general entrepreneurial ability. Students need to combine business knowledge with environmental awareness, innovation and responsible decision-making. This makes it particularly suitable for integration into Business Education because the programme already provides a foundation in entrepreneurship, management, marketing, accounting and other business-related competencies. Green entrepreneurship also has a direct relationship with the SDGs. Sustainable enterprises can contribute to SDG 8 by creating decent work and supporting sustainable economic activity; SDG 9 through innovation and sustainable enterprise; SDG 12 through responsible production and consumption; and SDG 13 through business responses to climate-related challenges (United Nations, 2015). Its contribution is therefore not restricted to environmental protection. When properly developed, green entrepreneurship can connect environmental responsibility with employment, innovation and economic opportunity.

However, the development of green entrepreneurship among Business Education students requires more than adding environmental topics to entrepreneurship courses. Students need opportunities to apply the concept to practical problems. This may include green business-plan competitions, recycling and waste-management projects, sustainable product development, visits to environmentally responsible enterprises, community-based projects and collaboration with industry. Such experiences can help students move from simply knowing about green entrepreneurship to seeing themselves as potential creators of sustainable solutions. In this regard, green entrepreneurship provides an important foundation for the curriculum integration proposed in this paper. It can help Business Education students develop the capacity to identify environmental challenges, convert them into viable opportunities and create enterprises that generate economic value while contributing to environmental and social well-being. Nevertheless, entrepreneurial competence alone may not be sufficient. The people who establish and manage such enterprises must also possess strong ethical values and the ability to make responsible decisions. This makes ethical leadership the next important concept in the discussion.

Ethical Leadership

Ethical leadership has become an important area of discussion in business and management because the behaviour of leaders can influence how organisations make decisions, treat stakeholders and respond to social responsibilities. Egbiki et al. (2024) describe ethical leadership in terms of appropriate personal conduct, the communication of ethical standards and the use of fair and principled decision-making. Their social learning perspective suggests that employees can learn from the behaviour of their leaders and are more likely to respond positively when leaders demonstrate ethical standards in their everyday actions. The relevance of ethical leadership to Business Education goes beyond teaching students the meaning of business ethics. Future entrepreneurs, managers and business educators will make decisions that affect employees, customers, investors, communities and the environment. They therefore need to develop the ability to recognise ethical issues, consider the interests of different stakeholders and make decisions that are consistent with principles of integrity, fairness and accountability. Ethical leadership is particularly relevant to the sustainability agenda because sustainable business practices require leaders to think beyond short-term organisational gains. Issues such as responsible use of resources, environmental compliance, employee welfare, consumer protection, truthful marketing and community responsibility all involve ethical choices. Recent literature has increasingly connected leadership ethics with organisational sustainability. For example, Tabaghdehi, Ayaz and Tatoglu (2026), in a systematic review of 95 studies, identified transparency, accountability and ethical decision-making as important elements through which ethical leadership can support corporate sustainability. For Business Education, this means that ethical leadership should be developed as a practical competence rather than treated only as a theoretical topic. Students should have opportunities to discuss realistic business dilemmas, examine the consequences of managerial decisions and practise making choices that balance organisational objectives with stakeholder interests. Case studies, role plays, simulations, debates and community-based projects can provide useful

avenues for developing such competence. The major dimensions of ethical leadership that are particularly relevant to Business Education can be summarised as follows.

Table 3: Ethical Leadership Dimensions Relevant to Business Education

Dimension	Meaning in practice	Implication for Business Education
Integrity	Acting consistently with honesty and sound moral principles	Students learn to value honesty in business transactions and reporting
Fairness	Treating people impartially and avoiding discrimination	Students develop sensitivity to fair treatment of employees, customers and partners
Accountability	Accepting responsibility for decisions and their consequences	Students learn to take responsibility for business and leadership decisions
Transparency	Communicating information openly and truthfully	Students understand the importance of honest reporting and responsible communication
Stakeholder responsibility	Considering the interests of employees, customers, communities and the environment	Students learn to evaluate business decisions from broader stakeholder perspectives
Ethical decision-making	Identifying ethical issues and choosing responsible courses of action	Students develop the capacity to handle ethical dilemmas in business situations

Source: Adapted from Tabaghdehi et al. (2026).

The dimensions in Table 3 also show why ethical leadership fits naturally into the proposed integration of green entrepreneurship and Business Education. A student may be able to identify an opportunity to establish a recycling business, for example, but ethical leadership determines how the business treats its workers, communicates with customers, handles waste, reports its activities and relates to the surrounding community. In this sense, ethical leadership provides an important value base for green entrepreneurship. This relationship is important to the present paper because green entrepreneurship without ethical leadership may focus narrowly on the environmental aspect of a business while overlooking issues such as labour practices, transparency, consumer protection and accountability. Conversely, ethical leadership without an understanding of sustainability may produce responsible leaders who are still insufficiently prepared to respond to environmental challenges. Bringing the two together therefore offers Business Education a more comprehensive approach to preparing graduates for responsible enterprise and leadership. Ethical leadership can consequently be positioned as one of the competencies needed to move Business Education towards the broader goals of sustainable development. When students learn to combine entrepreneurial initiative with integrity, accountability, fairness and concern for stakeholders, they are better positioned to create enterprises that generate economic value without losing sight of their social and environmental responsibilities.

Theoretical Foundations

This paper is anchored on the Education for Sustainable Development (ESD) framework and Transformational Leadership Theory**.** The ESD framework, advanced by UNESCO, emphasises education that equips learners with the knowledge, skills, values and attitudes needed to respond to sustainability challenges and take responsible action (UNESCO, 2017, 2020). Its underlying assumption is that education should not only provide knowledge but should also develop learners' capacity to think critically, solve complex problems, work with others and make responsible decisions. This makes the framework relevant to green entrepreneurship in Business Education, where students can be encouraged to identify environmental and social problems and develop innovative business solutions. Recent work continues to support the role of sustainability-oriented education in developing entrepreneurial competencies and preparing students for sustainable business practice (Rosario & Raimundo, 2024). The second theoretical foundation is Transformational Leadership Theory, propounded by Burns (1978) and further developed by Bass (1985). The theory assumes that leaders can influence followers by providing a compelling vision, encouraging new ways of thinking and motivating them to work towards shared goals. These assumptions are particularly relevant to preparing future business leaders who can encourage innovation and respond positively to changing sustainability demands.

The two perspectives complement each other in explaining the position of this paper. While the ESD framework focuses on developing the competencies and values needed to contribute to sustainable development**,** Transformational Leadership Theory focuses on the capacity to inspire

people and turn ideas into meaningful action. The paper also draws on the ethical dimension of leadership, particularly integrity, fairness, accountability and responsible decision-making. This is important because green entrepreneurship should not be concerned with environmental outcomes alone; the enterprises created and led by graduates should also operate responsibly towards employees, customers, communities and other stakeholders. Thus, the theoretical foundation suggests that Business Education should produce graduates who can recognise sustainability challenges, develop viable green business opportunities, inspire innovation and make responsible decisions. In this way, the combination of ESD and transformational leadership provides a sound basis for integrating green entrepreneurship and ethical leadership into Business Education as a means of preparing graduates to contribute to sustainable development and the SDGs.

Sustainable Development Goals and Business Education

The Sustainable Development Goals (SDGs) provide a useful framework for thinking about the contribution of education to economic, social and environmental development. Adopted by the United Nations in 2015, the 17 goals and their associated targets recognise that development cannot be sustained when economic progress is separated from social well-being and environmental protection (United Nations, 2015). For higher education institutions, this means that teaching and learning should contribute not only to graduates' employability but also to their ability to respond to the wider development challenges of their societies. The United Nations recognises higher education institutions as important contributors to the SDGs through teaching, research, community engagement, partnerships and institutional practices. Business Education has a particularly practical role in this regard. Its emphasis on entrepreneurship, management, accounting, marketing, office practice and other business competencies places the programme close to the activities through which economic and social value are created. For instance, SDG 4.4 calls for relevant skills for employment, decent work and entrepreneurship, while SDG 4.7 specifically calls for learners to acquire knowledge and skills for sustainable development. These targets are closely connected to the objectives of Business Education and provide a strong basis for incorporating sustainability into its curriculum.

Table 4: Linkages between Business Education and Selected SDGs

SDG	Relevant focus	Possible contribution of Business Education
SDG 4 – Quality Education	Relevant knowledge and skills for sustainable development, employment and entrepreneurship	Integrating green entrepreneurship, sustainability competencies and ethical leadership into teaching and learning
SDG 8 – Decent Work and Economic Growth	Productive employment, entrepreneurship and sustainable economic growth	Developing entrepreneurial, employability and business-management competencies for responsible enterprise creation
SDG 9 – Industry, Innovation and Infrastructure	Innovation, sustainable industries and resilient enterprises	Encouraging green innovation, sustainable business models and problem-solving
SDG 12 – Responsible Consumption and Production	Efficient use of resources and responsible production and consumption	Preparing students to develop and manage businesses that reduce waste and use resources responsibly
SDG 13 – Climate Action	Awareness, adaptation and action relating to climate change	Developing climate awareness and entrepreneurial responses to environmental challenges

Source: Adapted from United Nations (2015), UNESCO (2017, 2020), and relevant Nigerian Business Education literature.

The relationship shown in Table 4 suggests that the contribution of Business Education to the SDGs can occur at two levels. The first is through what students learn. Curriculum content can expose them to sustainable enterprise, responsible production, green innovation, climate-related business opportunities and ethical decision-making. The second is through what students are able to do with what they have learned. Practical experiences can help them transform these ideas into business plans, innovations, community projects and responsible enterprise practices. This distinction is important. Simply adding the names of the SDGs to a Business Education curriculum does not necessarily mean that the programme is contributing to sustainable development. The connection becomes meaningful when students acquire competencies that enable them to respond to real economic, social and

environmental problems. UNESCO's ESD framework similarly stresses the development of competencies and action rather than knowledge alone (UNESCO, 2017, 2020).

Nexus between Green Entrepreneurship and Ethical Leadership

Green entrepreneurship and ethical leadership address different but closely related aspects of responsible business practice. Green entrepreneurship focuses primarily on identifying and developing business opportunities that respond to environmental challenges, whereas ethical leadership focuses on the values and behaviours that guide people in making responsible decisions. The two concepts therefore complement each other. A business may be environmentally oriented, but the way it is managed can still involve unethical practices. Similarly, a leader may demonstrate strong ethical values but lack the knowledge or capacity to develop business responses to environmental challenges. Belz and Binder (2017) explain that sustainable entrepreneurs seek opportunities that address social and environmental problems while creating economic value. These perspectives suggest that entrepreneurial competence should be accompanied by an awareness of broader responsibilities. The connection between the two concepts is increasingly reflected in sustainability scholarship. Research on ethical leadership and corporate sustainability indicates that leadership qualities such as transparency, accountability and ethical decision-making can support sustainability-oriented organisational practices (Tabaghdehi et al., 2026). The implication of this to Business Education is that green entrepreneurship and ethical leadership should not be taught as unrelated ideas. Students who are expected to become entrepreneurs and business leaders need both the ability to recognise sustainability-related business opportunities and the values required to pursue those opportunities responsibly.

Integrating Green Entrepreneurship and Ethical Leadership into Business Education Curricula in Nigeria

Integrating sustainability into Business Education should go beyond adding isolated topics on climate change or environmental protection. The aim should be to connect sustainability with the business knowledge and skills students already acquire. This is consistent with UNESCO's (2020) position that Education for Sustainable Development requires changes in learning content, pedagogy and learning environments. It also reflects the growing emphasis on responsible management education, which encourages business-related programmes to prepare graduates who can create sustainable value for business and society. One practical approach is to integrate green entrepreneurship and ethical leadership across existing Business Education courses rather than treating them as entirely separate subjects. Entrepreneurship courses, for example, can expose students to green business opportunities and sustainable business models. Marketing can address responsible consumption and truthful environmental claims, while accounting can introduce students to the financial implications of sustainable business practices. Management courses can incorporate ethical leadership, stakeholder responsibility and responsible decision-making. Such integration would make sustainability part of students' broader business education rather than an isolated area of study.

Table 5: Proposed Areas for Integrating Green Entrepreneurship and Ethical Leadership

Business Education area	Suggested integration	Learning approach	Expected competency
Entrepreneurship	Green business opportunities, sustainable business models and eco-innovation	Business projects and green business-plan competitions	Green opportunity recognition and enterprise development
Management	Ethical leadership, accountability and stakeholder responsibility	Case studies, role play and leadership simulations	Ethical and responsible leadership
Marketing	Sustainable marketing, responsible consumption and green claims	Campaign development and case analysis	Responsible marketing decisions
Accounting	Sustainability-related costs, resource efficiency and responsible financial reporting	Practical exercises and business cases	Sustainability-conscious financial decision-making
Business Communication	Ethical communication, transparency and sustainability reporting	Presentations, reports and simulations	Transparent and responsible communication
Office Technology/Management	Paper reduction, digitalisation and environmentally responsible office practices	Practical projects and workplace observation	Resource-efficient workplace practices
Business Education practicum/field experience	Community and industry-based sustainability problems	Experiential and project-based learning	Application of sustainable business solutions

Source: Authors' conceptual synthesis informed by UNESCO (2017, 2020), and Rosario and Raimundo (2024).

Table 5 indicates that curriculum integration can take place at both the content and pedagogical levels. At the content level, sustainability and ethical leadership concepts can be embedded in existing courses. At the pedagogical level, students can be given opportunities to work on authentic problems through projects, case studies, simulations, business-plan competitions, community engagement and industry collaboration. This is important because sustainable entrepreneurship education literature increasingly emphasises experiential and collaborative learning as ways of developing sustainability competencies (Rosario & Raimundo, 2024; Vargas-Merino et al., 2025). Another important consideration is the preparation of Business Education lecturers. Curriculum integration is unlikely to produce meaningful results if lecturers themselves are not sufficiently familiar with green entrepreneurship, sustainability and ethical leadership. UNESCO (2020) identifies educator capacity as one of the key areas requiring attention in Education for Sustainable Development. Professional development, interdisciplinary collaboration and access to relevant teaching resources would therefore be necessary to support effective implementation. Industry collaboration should also form part of the process. Businesses that are adopting environmentally responsible practices can provide students with practical exposure to green technologies, sustainable production, ethical management and emerging business opportunities. Partnerships could include guest lectures, workplace visits, mentorship, internships, consultancy projects and joint innovation activities. Such collaboration would help reduce the gap between what students learn in the classroom and the sustainability challenges they encounter in the workplace.

Challenges to Integrating Green Entrepreneurship and Ethical Leadership into Business Education in Nigeria

Although the integration of green entrepreneurship and ethical leadership offers considerable opportunities for strengthening Business Education, its implementation may face a number of challenges. Curriculum reform is not achieved simply by introducing new topics; it requires appropriate resources, competent educators, institutional commitment and collaboration with relevant stakeholders. The following challenges are particularly important in the Nigerian context.

Table 6: Challenges and Possible Responses

Challenge	Likely implication	Possible response
Limited sustainability content in existing curricula	Students may have inadequate exposure to green enterprise and responsible leadership	Review curriculum content and embed sustainability across relevant courses
Limited lecturer capacity	Lecturers may lack current knowledge and practical experience in green entrepreneurship and sustainability	Provide continuous professional development and interdisciplinary training
Inadequate practical facilities and funding	Students may have limited opportunities for experiential sustainability projects	Provide institutional funding and establish partnerships with industry and development organisations
Predominantly theoretical teaching	Students may understand sustainability concepts without being able to apply them	Increase project-based, case-based and experiential learning
Weak university–industry collaboration	Limited exposure to actual sustainable business practices	Strengthen internships, workplace visits, mentorship and industry-based projects
Resistance to curriculum change	Established teaching practices may slow the adoption of new content and approaches	Involve lecturers and other stakeholders in curriculum review and implementation
Limited institutional sustainability culture	Classroom teaching may not be supported by institutional practices	Encourage tertiary institutions to model sustainable and ethical practices in their own operations

Source: Authors' synthesis based on UNESCO (2020), Okereke et al. (2019), Alao et al. (2023), and Vargas-Merino et al. (2025).

The challenges presented in Table 5 show that integrating green entrepreneurship and ethical leadership into Business Education requires more than simply revising course content. The most immediate concerns are the limited sustainability content in existing curricula and the preparedness of lecturers to handle these emerging areas (Okereke et al., 2019; Alao et al., 2023; UNESCO, 2020). The table also highlights the need for more practical learning, since students are unlikely to develop meaningful green entrepreneurial and ethical leadership competencies through lectures alone. Experiential learning, industry collaboration and interdisciplinary activities can provide opportunities for students to connect classroom knowledge with real-world challenges (Rosário & Raimundo, 2024;

Vargas-Merino et al., 2025). In addition, institutional practices and possible resistance to curriculum change may affect implementation. These challenges suggest that successful integration will require curriculum review, lecturer development, practical learning opportunities and strong institutional and industry support.

Strategies for Effective Integration

The integration of green entrepreneurship and ethical leadership into Business Education requires more than curriculum adjustment. It calls for changes in teaching practices, lecturer preparation, institutional support and relationships with the business community. Based on the issues discussed in the preceding sections, the following strategies are considered important.

Table 6: Strategies for Integrating Green Entrepreneurship and Ethical Leadership

Strategy	What it should involve	Expected outcome
Curriculum review	Embed green entrepreneurship, sustainability and ethical leadership across relevant Business Education courses	A curriculum that reflects contemporary business and sustainability needs
Lecturer capacity development	Workshops, seminars and professional development on sustainability, green enterprise and responsible leadership	Lecturers better prepared to teach emerging sustainability issues
Experiential learning	Green business projects, case studies, simulations, competitions and community-based assignments	Students develop practical sustainability and entrepreneurial competencies
Industry collaboration	Partnerships with sustainable businesses, NGOs and relevant professional organisations	Greater exposure to real-world sustainable business practices
Interdisciplinary learning	Collaboration between Business Education and environmental, agricultural, technology and management-related disciplines	More holistic understanding of sustainability challenges
Institutional modelling	Adoption of responsible waste management, energy efficiency, ethical procurement and transparent practices	Students experience sustainability as institutional practice, not only classroom theory
Policy and quality assurance	Inclusion of sustainability competencies in curriculum standards, programme review and assessment	Sustained institutional commitment to curriculum transformation

Source: Authors' synthesis based on UNESCO (2017, 2020), Rosario and Raimundo (2024), Vargas-Merino et al. (2025), and Nigerian Business Education literatures.

Conclusion

The changing nature of business and the growing pressure of environmental and social challenges make it increasingly important for Business Education to look beyond the traditional preparation of students for employment and conventional business activities. The discussion in this paper has shown that green entrepreneurship and ethical leadership provide useful pathways for repositioning Business Education towards sustainable development. Green entrepreneurship can help students recognise environmental challenges as opportunities for innovation, enterprise creation and employment, while ethical leadership can provide the values needed to ensure that such opportunities are pursued with integrity, fairness, accountability and concern for stakeholders. Their integration therefore offers a more balanced approach to preparing graduates who can create economic value without losing sight of social and environmental responsibilities. The paper also established that this integration is consistent with the Education for Sustainable Development framework and the broader objectives of the Sustainable Development Goals, particularly SDGs 4, 8, 9, 12 and 13. However, meaningful integration will require more than simply adding sustainability-related topics to existing courses. Curriculum review, lecturer capacity development, experiential learning, industry collaboration, interdisciplinary engagement and supportive institutional policies are necessary to translate the idea into practice.

Recommendations

Based on the discussions in this paper, the following recommendations are made:

1. Curriculum developers and regulatory bodies should ensure that green entrepreneurship, sustainable business practices and ethical leadership are reflected in entrepreneurship, management, marketing, accounting and other relevant areas of Business Education. The emphasis should be on integration rather than simply adding isolated topics.
2. Tertiary institutions should organise workshops, seminars and practical training that expose lecturers to green entrepreneurship, Education for Sustainable Development, ethical leadership and emerging sustainability practices. This would strengthen lecturers' capacity to translate these concepts into meaningful classroom experiences.
3. Students should be given opportunities to develop green business plans, undertake sustainability-related projects, participate in innovation challenges and solve community-based business problems. Such activities can help students move from understanding sustainability concepts to applying them.
4. Partnerships with environmentally responsible businesses, professional bodies, government agencies, non-governmental organisations and other stakeholders should be encouraged. These partnerships can provide students with mentoring, internships, workplace visits and practical exposure to green enterprise and ethical business practices.
5. Institutions should strengthen practices such as responsible waste management, efficient use of resources, transparent administration, ethical procurement and community engagement. When students see sustainability and ethical responsibility reflected in their learning environment, the principles are more likely to become part of their professional behaviour.

Abstract

The current worry of Nigeria's underemployment of its graduates has brought into focus the contents of polytechnic curriculum and the digital competency of graduates in a competitive labour market in Nigeria. This paper looks at the linkage between digital office skills and the employability of polytechnics graduates in Nigeria with particular emphasis on graduates of Office Technology and Management (OTM). The paper presents the theoretical framework of Human Capital Theory, and posits that the mismatch between skills learned at polytechnic and the skills required by the employers has been a factor influencing unemployment rate of OTM graduates. The paper draws on theoretical literature and practical research to determine the necessary digital competencies for OTM graduates to be effective in the present-day office, such as making and handling use of office software packages, data management, digital communication tools, social media skills, cyber security, and new technologies like cloud computing and project management software. The paper also addresses barriers to effective learning of digital skills such as lack of support on ICT resources for students, lack of ICT infrastructure, ICT literacy shortage of lecturers, and obsolescent curriculum. The paper recommends that the skills gap needs to be addressed from a multi-stakeholder perspective, through policy reform of the curriculum, support for lecturers in the development of their digital skills, strengthening the digital infrastructure, and strengthening the linkages between the industry and the institutions. Policy and Practice recommendations are given to assist polytechnic administrators, curriculum developers and policy makers to improve the employability of OTM graduates.

Keywords: Digital Competencies, Graduate Employability, Office Technology and Management, Skills Gap, Polytechnics, Nigeria

1. INTRODUCTION

1.1 Background to the Study

The world of work is changing in ways unprecedented by digitalising the way people work in the office and the abilities they need to excel at work. Digital technologies have entered the administrative space and new requirements have emerged for office workers who are equipped with traditional secretarial abilities alongside strong digital skills (Oyinloye et al., 2021). The problem of graduate unemployability has become a national worry in Nigeria, as employers have been complaining of the lack of skill by graduates of higher education institutions (Eze & Ononye, 2024).

Office Technology and Management (OTM) programmes offered in Nigerian polytechnic are training programme that produces graduates with technical, managerial and entrepreneurial skills required for effective operation in modern office environment. But, there is a growing dislocated between the skills gained by OTM graduates and the skills required in the digital era (Curriculum Relevance Study, 2026). The skills gap is experienced in the high unemployment

and underemployment rates of OTM graduates, where employers are increasingly seeking candidates who can demonstrate digital competencies (Olatunji, 2025).

Digitalisation of the workplace has been quickened in recent years, with the COVID-19 pandemic and the move to remote and hybrid work arrangements. The acquisition of digital skills like working with office software, data management, digital communication tools, and cybersecurity awareness are essential for office professionals (Nwaiwu & Nwokorie, 2026). Office Technology and Management graduates who don't have this skill set are at a disadvantage when entering the job market.

Explain the problem.State the problem.

Ideally, graduates of an Office Technology and Management programme from a Nigerian polytechnic should acquire a broad range of digital office skills that will enable them to be able to adapt well to the modern workplace. These abilities are crucial for office management positions, for the success of the organisation, and for career progression.

But, the current situation is different. Although technical training is a focus of OTM programmes, a significant challenge is the lack of development and measurement of digital skills among graduates. In recent studies, it has been observed that just a small proportion of OTM students possesses the competencies in the digital field, specifically in communication, teamwork, problem-solving, and adaptability, with unemployment and underemployment rates being extremely high among this group (Eze & Ononye, 2024).

An employer survey found that much of the surveyed employers were unhappy with the digital skills and professionalism of the graduates of OTM. Lack of good digital communication, lack of initiative when using office software and poor use of digital collaboration tools were all cited as common concerns that are hindering the employment and progression of these graduates in their career (Iheukwumere, 2025).

Moreover, observations in polytechnic institutions show a lack of addressing the digital competencies in the curriculum and methodologies used to teach them. Additionally, a lack of focus on hands-on learning, real-world scenarios, and industry-centered projects contributes to the gap between learning and the expectations of the workplace (Akudolu & Onwubuya, 2025).

1.3 Purpose of the Paper

The paper seeks to discuss the skills that are essential for the employability of the students of Office Technology and Management (OTM) in Nigeria's digital economy and outline steps towards bridging the gap between polytechnic education and the demands of the labour market. The aim of this paper is to:

i. Determine the digital office skills that OTM graduates need for employment in today's modern offices;
ii. Analyse the linkage between digital competence and graduate outcomes of employability; and
iii. Identify barriers that hinder the acquisition of digital skills in OTM programmes; and
iv. Make suggestions on how to improve digital competence and employability of OTM graduates.

2. CONCEPTUAL AND THEORETICAL FRAMEWORK

2.1 Conceptual Framework

2.1.1 Digital Office Competencies

Digital office competencies are the knowledge, skills and abilities needed to proficiently apply digital technologies in an office and administrative setting. These skills include proficient use of digital devices to access, evaluate, analyse, apply and synthesise data, and to use information and communication technologies to seek, understand, assess, create and communicate digital information (Dewi et al., 2021).

Research has found that a variety of digital office skills are needed for successful functioning of an OTM graduate in today's office, such as:

i. Technology Skills: Use a range of office technologies and equipment, effectively. This includes the ability to use computers, printers, scanner, and other office equipment (Oyinloye et al., 2021).
ii. Computer Skills: Knowledge of computer software applications such as word processing, spreadsheet, presentation, and database management. These are the skills that underpin computer literacy in the office (Iheukwumere, 2025).

iii. Information and Communication Skills: Skills to effectively use the internet for research, communication and information management. This comprises Web browsing, searching online and assessing online information (Oyinloye et al., 2021).
iv. Digital Communication Skills: Ability to communicate effectively through digital channels such as email, instant messaging, video conferencing and collaborative tools. In today's work environment, where remote and hybrid working arrangements are becoming increasingly common, these skills are becoming more and more relevant (Oyinloye et al., 2021).
v. Data Management Skills: To gather, organise, analyse and interpret data through digital means. This also involves mastery of spreadsheet applications, database management systems (Eze & Ononye, 2024; Adeshina, 2025).
vi. Social Media Literacy: Knowledge of social media and how it can be used in the professional and business world. This encompasses good communication, marketing and networking skills on social media (Nwaiwu & Nwokorie, 2026).
vii. Cybersecurity Awareness: Awareness of cybersecurity principles and practices to safeguard sensitive information. This includes understanding data security and privacy and safe online practices (Olatunji, 2025).
viii. Project Management Software Skills: This course covers the skills needed to manage office projects using project management software (Olatunji, 2025).
ix. Cloud Computing Skills: Knowledge of cloud platforms and services that allow for storage, collaboration, and document management (Olatunji, 2025).

2.1.2 Graduate Employability

Employability refers to various sets of skills that students need to acquire for successful employment upon graduation (Cronin et al., 2021). From the perspective of OTM graduates, employability means securing and sustaining jobs in office and administrative positions. Digital literacy has been recognised as an essential component to graduate employability (Curriculum Relevance Study, 2026) especially in the digital age.

In the literature, there is a clear link between the digital competence and employability. Numerous studies have proven that developing and improving digital literacy greatly enhances the employment opportunities and employment outcomes of higher education students (Dewi et al., 2021). The current knowledge-driven economy requires digital technologies to be understood and used – and engaged with – for success across a wide range of professional sectors and functional areas (Curriculum Relevance Study, 2026).

2.1.3 The Skills Gap

Skills gap relates to the difference between skills that graduates have and what employers require. Studies have revealed that OTM programmes in Nigerian polytechnics cannot cope with the technological revolutions found in automated offices because of the skills gap, which will eventually hinder job performance in the world of work (Assessment of Curriculum Improvement Needs, 2025). The skills gap comes in many shapes and forms, from weak knowledge of office software applications, poor digital communication abilities, to lack of understanding of new technologies.

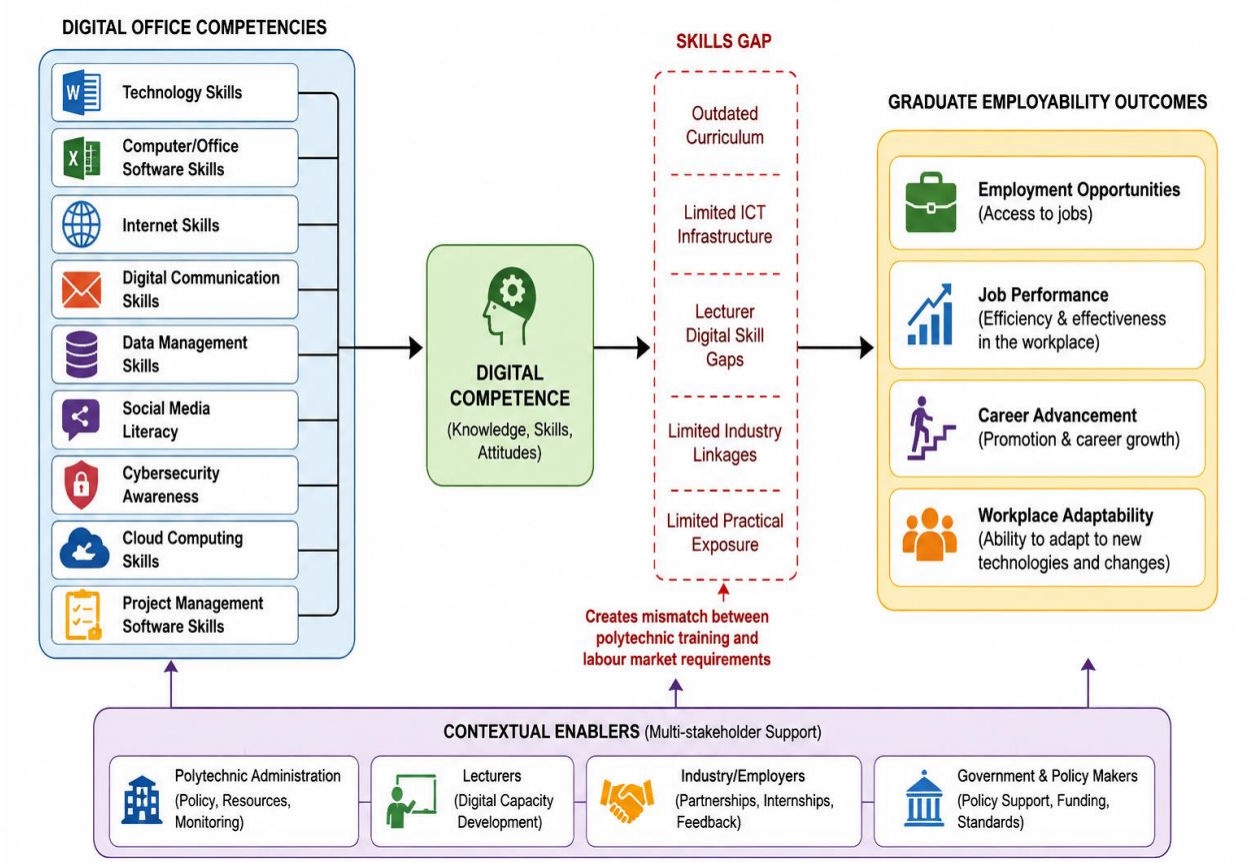

Figure 1: Conceptual framework linking digital office competencies to graduate employability
Source: adapted from Teo, T. 92029). developing a conceptual model to examine the impact of digital literacy on employability. education + training, 61(7/8), 804-821. https://doi.org/10.1108/ET-01-2019-0006

2.2 Theoretical Framework

The paper is based upon Human Capital Theory, this theory was propounded by Gary Becker (1962). The theory is that education and training are investments which can truly make people more productive. Proponents of this theory believe that more productive people can be expected to earn more money and to be more employable (Eze & Ononye, 2024).

Human capital theory is based on the belief that formal education is very instrumental and is crucial for enhancing the productive capacity of a population. In brief, human capitalists say that an educated population is a productive population. Human capital theory is made up of three: time, talent and energy (Eze & Ononye, 2024).

A Human Capital Theory perspective for this paper suggests that digital competence, which is considered as a form of human capital (i.e., education and training) and its relationships with employment outcomes. The reasons for this are that OTM graduates are more productive, and consequently more job-ready, if they have developed relevant digital competences as part of their educational programmes.

The theory is especially applicable to the study of the skills gap as it implies that education and training investments (including digital skills training) pay off in terms of increased productivity and employability. Embarrassment is the understatement of the moment when it's recognized that the polytechnics have failed to provide OTM graduates with necessary digital skills that have adverse effects on individual students as well as the economy.

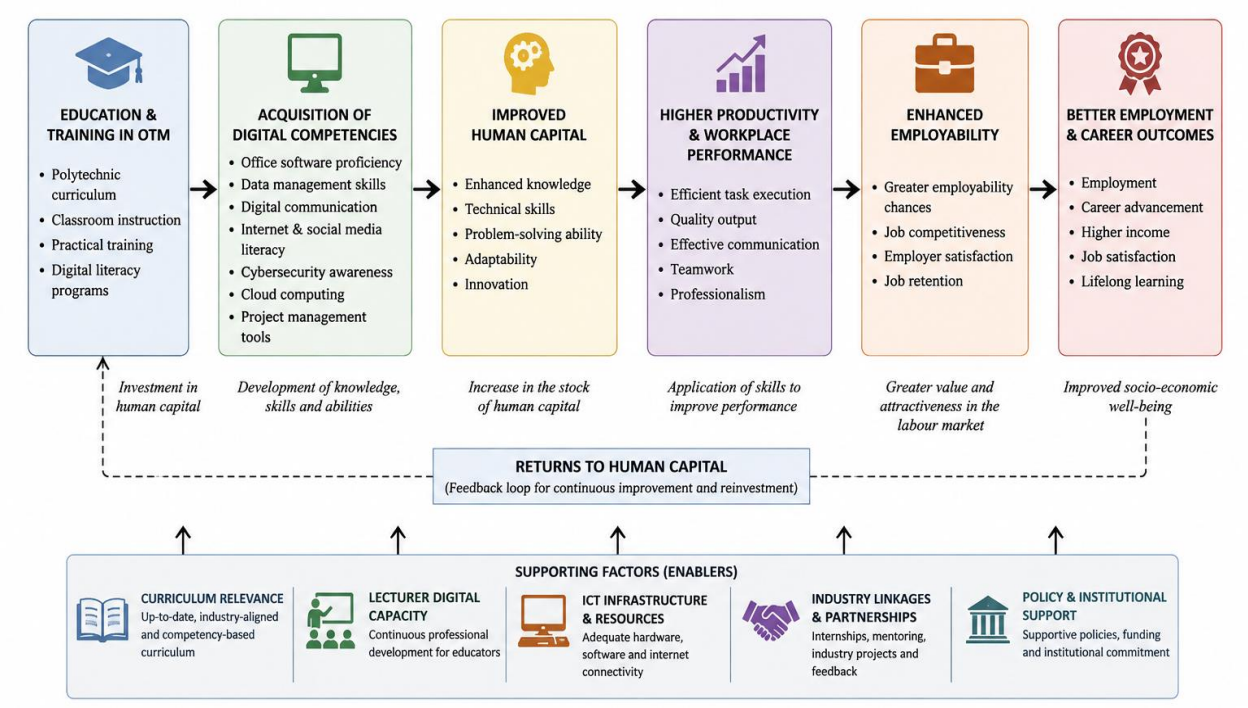

Figure 2: Human Capital Theory Framework for Digital Competence and Employability (Adapted from Becker, 1964; Schultz, 1961; and Ng, 2012)

3. LITERATURE REVIEW

3.1 Digital Skills Required by OTM Graduates

Researchers have pinpointed a series of digital competencies that are essential for OTM students to be successful in today's workplace. In Oyinloye, Asonibare and Oluwalola's (2021) study, the authors explored the skills needed in the office by OTM graduates and confirmed that OTM graduates need both hard and soft skills in the office. Hard skills that were identified were technology skills, internet skills, computer skills, presentation skills, and communication skills. The research found that in order for any graduate to be successful in the 21st century office, hard and soft skills had to be learned.

Olatunji (2025) assessed digital skills competence needed to empower and employ OTM students and found some essential digital skills such as skills in office software (MS Office Suite), data management, digital communication tools, social media literacy, and basic knowledge of cybersecurity practices. Another notable finding of the study was that skills in project management software and knowledge about cloud computing are becoming more relevant.

Adeshina (2025) examined the relationship between Information and Communication Technology skills and job opportunities of OTM graduates and concluded that OTM graduates have access to job opportunities in modern offices because of the skills acquired in the use of desktop publishing, word processing, database management and web surfing. The study determined that OTM graduates seeking employment should be able to have the following skills: networking skills, computer operations skills, web surfing skills, word processing skills and desktop publishing skills.

Iheukwumere (2025) studied the competencies of information and management technology needed for the globalised employability of OTM graduates and came up with the following major competencies required: Internet research, computer skills, data management, email and communication, word processing, spreadsheet management, data security and privacy, and file and document management. The study also revealed barriers that hinder OTM graduates in developing these competencies which are limited access to ICT resources, no ICT training for tutors, poor ICT infrastructure, digital literacy problem, technological obsolescence, and confidence and self-efficacy problem.

Nwaiwu and Nwokorie (2026) identified the emerging technologies needed in OTM programmes and concluded that the modern technologies; e-learning tools, digital marketing tools, online communication technologies are indispensable in enhancing digital skills competency in OTM and prepare the graduate for the modern office. The study also highlighted

the need for partnerships within the industry to review the OTM curriculum regularly to ensure it is relevant to the technological developments.

The curriculum is relevant and students are competent in using digital tools.

A great concern in Nigeria has been the relevance of polytechnic education to the needs of the labour market. A study by Curriculum Relevance Study (2026) looked at the relationship between curriculum relevance, digital competence and employability outcomes of university graduates in Nigeria, and the results showed that the perception of curriculum relevance was fairly aligned with the demands of the labour market with moderate level of employability outcomes among graduates while the digital competence among graduates was appreciable. Results showed that there are great relationships between the curriculum relevance and the employability outcomes, but also between digital competence and the employability outcomes. It stated that bolstering the development of curriculum responsiveness and improved digital competence development are key to improving employability of Nigerian graduates.

Akudolu and Onwubuya (2025) studied the extent to which Digital resources were used in the effective delivery of OTM courses and concluded that OTM lecturers lowly utilise Digital resources in the effective delivery of OTM courses to enhance students' acquisition of employability skills. The study found that the OTM lecturers were not able to make use of the digital resources in the best way to equip their students with the employability skills they require to be self-reliant.

According to Okoli and Okolo (2025), office application software skills required for effective implementation of Office Technology and Management Education curriculum were ascertained and it was found that business education lecturers highly needed the office application software skills required for effective implementation of the OTM curriculum. The study recommended constant training and re-training of lecturers on the use of office application software.

3.3 Challenges to Digital Skills Acquisition

There are multiple barriers to good acquisition of digital skills among OTM students. The major challenges identified by Iheukwumere (2025) are limited access to ICT resources, shortage of ICT trainings for tutors, inadequate ICT infrastructure, digital literacy gap, technological obsolescence and confidence and self-efficacy. These challenges hinder OTM graduates in gaining knowledge and management technology skills for globalised employability.

Assessment of Curriculum Improvement Needs (2025) revealed that OTM programme in polytechnics in Northern Nigeria cannot keep up with the technological revolution seen in automated offices due to the absence of the required competencies, and this will definitely affect the competence of the polytechnics graduates in the world of work. The study suggested that further improvement should be made in touch typing and communication technology at OTM level for the benefit of the students of the National Board for Technical Education (NBTE).

Studies on digital resources utilisation have also highlighted challenges related to access and utilisation. According to Odili et al. (2020), only a few of the digital resources found in the institutions in Nigeria are up to date and most of the higher learning institutions in Nigeria are without up to date e-libraries containing adequate digital resources. The authors claimed that such challenges hinder lecturers from effectively engaging digital resources in their teaching and research.

Students are expected to be able to recognize, explain, and justify the role of work-integrated learning in enhancing graduates' employability and success.

Work-integrated learning (WIL) is viewed as a key contributor to improving graduate employability. A study done in ScienceDirect (2024), examined how the relationship between work-integrated learning and graduate employability in Nigeria was mediated by digital literacy and moderated by life-career knowledge. The study revealed that students who have completed practical and real-time learning experiences in their WIL programs are more likely to be highly employable as they are exposed to a variety of skills that are valued in the workforce.

The study also revealed that the digital literacy is the intervening variable between work integrated learning and graduate employability. The knowledge of digital literacy is essential for using digital tools and technologies as well as critically analyzing the quantity of information that is available online and using digital platforms to communicate and collaborate effectively (Cetindamar-Kozanoglu & Abedin, 2020). Digital literacy is recognized as an important aspect to graduate employability, especially in the current digital era.

The study on the integration of emerging digital skills (2026) found that emerging digital skills are integrated moderately into the curriculum of business education with a low emphasis in practical skills use and digital entrepreneurship. However, the incorporation of new digital skills

had a strong and significant positive effect on the workforce readiness of graduates, in terms of employability, job performance, adaptability and confidence in using digital tools at work.

4. DISCUSSION

4.2 The Digital Competence of OTM Graduates' Attitude

The literature studied indicates medium level of Digital competence of the OTM graduates and there is a strong need to further enhance their competence in this field. Some graduates have knowledge of using simple office software applications and using digital communication tools, but many do not have the more advanced digital skills which are needed in the modern office. This was in line with the results of Curriculum Relevance Study (2026) which indicated moderate employability outcomes for graduates.

These skill deficits are especially noticeable in new technology fields like cloud computing and project management software to digital marketing tools. Nwaiwu and Nwokorie (2026) discovered these modern technologies are crucial in improving competency in digital skills among OTM and also for preparing graduates for the modern offices. But a large number of OTM programmes are not doing a good job in preparing students in these areas.

Employability and Digital Competence are tied together through the following relationship:
