The data collected were analysed using mean and standard deviation to answer the two research questions, while the hypotheses were tested using the Analysis of Covariance (ANCOVA) at 0.05 level of significance, with pretest scores serving as the covariate. The rejection or acceptance of null hypotheses was determined by comparing the p-value with the alpha value of 0.05. Therefore, the null hypothesis was rejected when the p-value was lower than or equal to the alpha level of 0.05 and accepted when the p-value was greater than the alpha level.

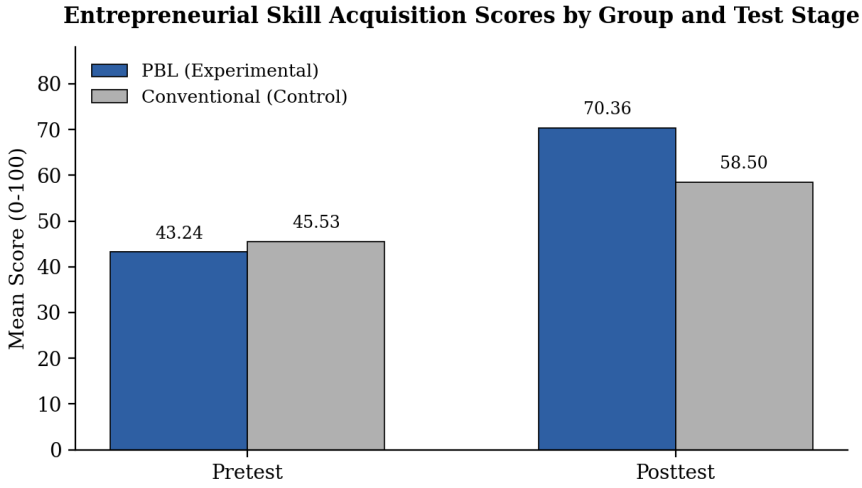
Results

The results from the data analysis done were presented in the tables below:

Research Question 1

What are the mean entrepreneurial skill acquisition scores of Business Education students taught using PBL and those taught using the conventional lecture method, before and after treatment? The results for answering research question 1 were presented in Table 1.

Table 1. Pretest and posttest mean entrepreneurial skill acquisition scores of Business Education students taught using PBL and those taught using the conventional lecture method



Group	N	Pretest ($\bar{X}$)	SD	Posttest ($\bar{X}$)	SD	Mean Gain
PBL (Exp.)	48	43.24	7.01	70.36	9.45	27.12
Conv. Mtd. (Control)	45	45.53	7.35	58.50	8.71	12.97

Exp. = Experimental Group; Conv. Mtd. = Conventional Lecture Method (Control)

The data in Table 1 showed that Business Education students in the experimental group who were taught using PBL had a pretest mean entrepreneurial skill acquisition score of 43.24 with a standard deviation of 7.01 and a posttest mean score of 70.36 with a standard deviation of 9.45, while those in the control group who were taught using the conventional lecture method had a pretest mean score of 45.53 with a standard deviation of 7.35 and a posttest mean score of 58.50 with a standard deviation of 8.71. The result further showed that the experimental group recorded a mean gain of 27.12, indicating a substantial improvement in entrepreneurial skill acquisition, while the control group recorded a mean gain of only 12.97. This showed that PBL had a considerable positive effect on entrepreneurial skill acquisition among the experimental group students, having recorded a markedly higher mean gain than the control group.

Figure 1

Entrepreneurial Skill Acquisition Scores by Group and Test Stage

A corresponding hypothesis that addressed the above research question is:

Hypothesis 1

There is no significant difference between the mean entrepreneurial skill acquisition scores of Business Education students taught using PBL and those taught using the conventional lecture method, after controlling for pretest scores.

Table 2. Analysis of Covariance (ANCOVA) on the mean entrepreneurial skill acquisition scores of Business Education students taught using PBL and those taught using the conventional lecture method

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Decision
Corrected Model	7806.96a	2	3903.48	117.21	.000	
Intercept	403.71	1	403.71	12.12	.001	
Pretest	4535.47	1	4535.47	136.19	.000	
Group	4515.70	1	4515.70	135.60	.000	Sig.
Error	2997.24	90	33.30			
Total	399161.64	93				
Corrected Total	10804.20	92				

Significant at 0.05 level of significance

Table 2 shows that a significant probability (p)-value of .000 was obtained for the Group factor, which is less than the 0.05 alpha level. This implies that the null hypothesis of no significant difference was rejected. Therefore, there was a significant difference between the mean entrepreneurial skill acquisition scores of Business Education students taught using PBL and those taught using the conventional lecture method, after controlling for pretest scores, in favour of the experimental group. PBL significantly improved entrepreneurial skill acquisition among students in the experimental group.

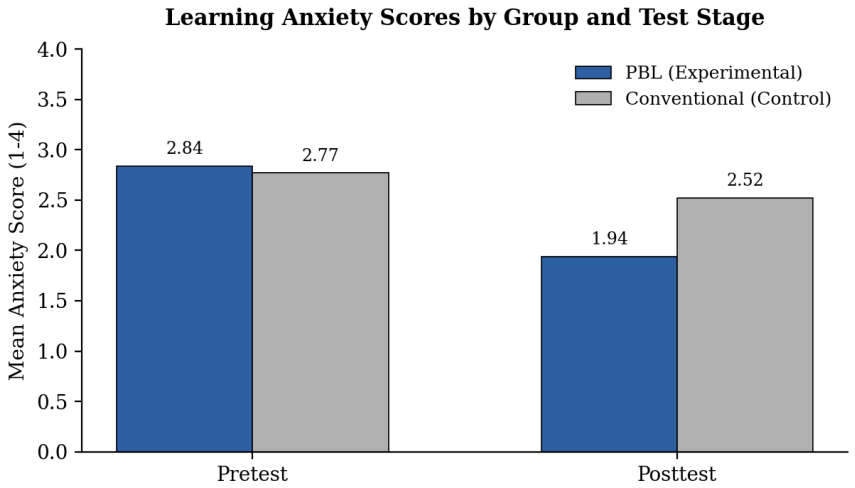
Research Question 2

What are the mean learning anxiety scores of Business Education students taught using PBL and those taught using the conventional lecture method, before and after treatment?

The results for answering research question 2 were presented in Table 3.

Table 3. Pretest and posttest mean learning anxiety scores of Business Education students taught using PBL and those taught using the conventional lecture method

Group	N	Pretest ($\bar{X}$)	SD	Posttest ($\bar{X}$)	SD	Mean Reduction
PBL (Exp.)	48	2.84	0.36	1.94	0.43	0.90



Group	N	Pretest ($\bar{X}$)	SD	Posttest ($\bar{X}$)	SD	Mean Reduction
Conv. Mtd. (Control)	45	2.77	0.43	2.52	0.44	0.25

Exp. = Experimental Group; Conv. Mtd. = Conventional Lecture Method (Control)

The data in Table 3 revealed that Business Education students in the experimental group who were taught using PBL had a pretest mean learning anxiety score of 2.84 with a standard deviation of 0.36 and a posttest mean score of 1.94 with a standard deviation of 0.43, while those in the control group who were taught using the conventional lecture method had a pretest mean score of 2.77 with a standard deviation of 0.43 and a posttest mean score of 2.52 with a standard deviation of 0.44. The experimental group recorded a mean reduction of 0.90 in learning anxiety, while the control group recorded a mean reduction of only 0.25. This showed that PBL had a considerable anxiety-reducing effect among the experimental group students, having recorded a markedly higher mean reduction than the control group.

Figure 2

Learning Anxiety Scores by Group and Test Stage

A corresponding hypothesis that addressed the above research question is:

Hypothesis 2

There is no significant difference between the mean learning anxiety scores of Business Education students taught using PBL and those taught using the conventional lecture method, after controlling for pretest scores.

Table 4. Analysis of Covariance (ANCOVA) on the mean learning anxiety scores of Business Education students taught using PBL and those taught using the conventional lecture method

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Decision
Corrected Model	21.92a	2	10.96	291.91	.000	
Intercept	0.10	1	0.10	2.53	.115	
Pretest	14.05	1	14.05	374.12	.000	
Group	9.77	1	9.77	260.32	.000	Sig.
Error	3.38	90	0.04			
Total	485.06	93				
Corrected Total	25.30	92				

Significant at 0.05 level of significance

The results in Table 4 showed that a significant probability (p)-value of .000 was obtained for the Group factor, which is less than the 0.05 alpha level. This implies that the null hypothesis of no significant difference was rejected. Therefore, there was a significant difference between the mean

learning anxiety scores of Business Education students taught using PBL and those taught using the conventional lecture method, after controlling for pretest scores, in favour of the experimental group. PBL significantly reduced learning anxiety among students in the experimental group.

Discussion of Findings

The results of this study provide valuable insights into the effectiveness of problem-based learning as an instructional approach for building entrepreneurial skill and easing learning anxiety among Business Education students in federal polytechnics in South-East Nigeria. The study's findings are crucial, especially when comparing the outcomes of the PBL group with those achieved through the conventional lecture method.

The study's results clearly demonstrated that PBL significantly improved entrepreneurial skill acquisition among the experimental group students, with the experimental group recording a markedly higher mean gain of 27.12 against the control group's 12.97. This finding is particularly important because it underscores the potential of PBL to address the persistent challenge of weak entrepreneurial competence among Business Education graduates in Nigerian polytechnics, where conventional lecture approaches have yielded limited practical results. The problem-first structure of PBL is requiring students to define, research, and propose solutions to authentic business problems such as planning a small enterprise or managing working capital that appears to have given students repeated, low-stakes practice at the very skills the ESAT was designed to measure, in a way that a lecture on the same topics cannot. This finding is consistent with Koçoğlu and Kanadlı (2025), who reported a consistently positive effect of PBL on learning outcomes across disciplines compared with conventional instruction, and with Ogbeba (2019), who similarly reported significantly higher achievement among students taught with PBL compared to those taught with the conventional method.

The finding also resonates with the concern raised in the entrepreneurship literature that weak practical entrepreneurial competence among Nigerian polytechnic and Business Education students is linked to instructional approaches that emphasise theory over authentic application (Alabi, 2025; Tong & Musa, 2023). The modest gain recorded by the control group (mean gain = 12.97) further affirms that the observed improvement in the experimental group was attributable to the PBL intervention rather than extraneous factors such as maturation, since both groups covered identical content over the same six-week period.

Another key finding of the study was that PBL significantly reduced learning anxiety among the experimental group students, who recorded a mean reduction of 0.90 compared with 0.25 for the control group. This finding extends the literature on subject-specific learning anxiety among Nigerian students, which has generally examined anxiety as an outcome linked to student characteristics or to an existing instructional context rather than as an outcome responsive to a change in teaching method (Oribhabor, 2020). It also lends empirical weight to the concern that a performance-driven, largely evaluative classroom culture feeds a quiet but consequential anxiety among Nigerian students (Edugist, 2026); the present finding suggests that this anxiety is not fixed, and that an instructional approach which distributes ownership of the learning process to students in small groups, rather than concentrating pressure on individual performance in front of a lecturer, can measurably reduce it.

The findings of this study have both theoretical and practical implications for teaching and learning. From a theoretical standpoint, the study lends support to Constructivist Learning Theory as an appropriate framework for entrepreneurship-related instruction in Business Education. By demonstrating that students who actively constructed solutions to authentic business problems in small groups outperformed and reported less anxiety than students who received the same content through direct transmission, the study affirms the constructivist premise that meaningful learning happens through engagement with realistic problems and social interaction rather than through passive reception of content (Mir, Alam & Modi, 2025). The findings also extend the constructivist theoretical synthesis for vocational and industry-bound learners, which argued that a properly designed problem-centred learning environment builds both practical competence and the ability to handle ill-structured real-world problems (Savaengkan & Chaijaroen, 2022): the present study shows that such an environment can also carry an affective benefit, easing anxiety alongside building skill, at least within the Business Education context studied.

From a practical standpoint, the study demonstrates that PBL is a feasible instructional strategy that Business Education lecturers in South-East Nigerian polytechnics can implement using locally relevant business problems and case scenarios, without requiring specialised equipment beyond what a typical entrepreneurship classroom already has. For teaching and learning, the significant improvement in entrepreneurial skill acquisition observed among the experimental group means that lecturers can rely less on theory-heavy lecturing and more on guided, problem-centred practice to build the competencies ND graduates need for self-employment, a direct practical benefit for the quality of

entrepreneurship instruction. As learning anxiety declines, students are also more likely to participate actively in class, take the risks that entrepreneurial thinking requires, and approach real business decisions after graduation with greater confidence.

For polytechnic management and curriculum planners, this study establishes PBL as an evidence-based instructional strategy validated for the Nigerian polytechnic Business Education context. The National Board for Technical Education and polytechnic management should incorporate structured PBL training into the continuing professional development curriculum for Business Education lecturers, particularly for entrepreneurship-related courses. Furthermore, assessment of entrepreneurship-related courses should include problem-solving and case-based tasks, in addition to conventional theory-based testing, so that assessment reinforces rather than undermines the competencies PBL is shown here to build.

Conclusion

In conclusion, the results of this study underscore the importance of problem-based learning in building entrepreneurial skill and reducing learning anxiety among Business Education students in federal polytechnics in South-East Nigeria. PBL not only produced a statistically significant improvement in entrepreneurial skill acquisition among the experimental group students but also produced a statistically significant reduction in their learning anxiety, affirming its utility as a strategy that addresses both the cognitive and affective dimensions of entrepreneurship-related learning. By incorporating PBL into the teaching of entrepreneurship-related courses, Business Education lecturers can better prepare ND graduates for self-employment, helping them overcome the practical skill gaps and business-related anxieties that a purely theoretical, lecture-based approach leaves unaddressed. Furthermore, the study's findings highlight the value of moving away from purely lecture-based instruction in favour of more student-centred, problem-driven approaches, which have been shown to be more effective in building the practical competence and confidence that self-reliant entrepreneurship demands.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Business Education lecturers in federal polytechnics in South-East Nigeria should be trained in the design and facilitation of problem-based learning as a core instructional strategy for entrepreneurship-related courses.
2. The National Board for Technical Education and polytechnic management should develop and disseminate guidelines that encourage the integration of PBL into the ND Business Education curriculum, with priority given to entrepreneurship-related courses.
3. Polytechnic management should ensure that Business Education departments are adequately equipped with the small-group learning spaces, time allocation, and instructional materials that effective PBL delivery requires.
4. Assessment of entrepreneurship-related courses should include problem-solving and case-based tasks, in addition to conventional theory-based testing, so that assessment reinforces the competencies PBL is designed to build.

Abstract

This study examined the influence of family, school, and environmental factors on student entrepreneurship development among Business Education students in universities in Delta State. The study was guided by four research questions and four hypotheses. A descriptive survey research design was adopted for the study. The population of the study consisted of 217 Business Education students, from which a sample size of 141 students was selected. Data were collected using a structured questionnaire titled Questionnaire on the Influence of Family, School and Environmental Factors on Student Entrepreneurship Development among Business Education Students in Universities in Delta State. The questionnaire consisted of 36 items covering family, school, and environmental factors and was structured on a five-point extent scale ranging from Very High Extent to Very Low Extent. Mean and standard deviation were used to answer the research questions, while Pearson Product Moment Correlation was used to test the hypotheses at the 0.05 level of significance. The findings revealed that family factors influence student entrepreneurship development to a high extent, with a grand mean of 3.49. School factors also influenced student entrepreneurship development to a high extent, with a grand mean of 3.47, while environmental factors recorded a high extent of influence with a grand mean of 3.46. The overall result indicated a high extent of combined influence of family, school, and environmental factors on student entrepreneurship development, with an overall grand mean of 3.56. The hypotheses tested showed significant relationships between family factors, school factors, environmental factors, their combined influence, and student entrepreneurship development. The study therefore concluded that family support, effective school-based entrepreneurship education, and a favourable entrepreneurial environment are important in promoting entrepreneurship development among Business Education students. It was recommended that families should provide encouragement and support for students' entrepreneurial interests, universities should strengthen practical entrepreneurship training and mentorship opportunities, and government and relevant stakeholders should create a supportive environment through improved access to finance, markets, technology, and entrepreneurship programmes.

Introduction

Entrepreneurship has emerged as a vital instrument for promoting economic growth, innovation, employment generation, and national development across the world. In Nigeria, the increasing rate of graduate unemployment has made entrepreneurship education an essential component of university education. Universities are therefore expected to equip students with the entrepreneurial knowledge, skills, attitudes, and competencies required for self-employment and wealth creation. However, the extent to which students develop entrepreneurial intentions is influenced by several factors, particularly their family background, school environment, and the broader socio-economic environment. This seminar examines these factors among Business Education students in universities in Delta State. The section presents the background to the study, statement of the problem, purpose of the study, research questions, research hypotheses, significance of the study, and scope of the study. Entrepreneurship has become one of the most important drivers of economic growth, innovation, and employment creation in both developed and developing economies. It refers to the process through which individuals identify opportunities, mobilize resources, and create value by establishing and managing new ventures. According to Shane and Venkataraman (2000), entrepreneurship is centered on the discovery and exploitation of opportunities to introduce new goods, services, or processes. In contemporary society, entrepreneurship is no longer viewed solely as business ownership but as a mindset characterized by creativity, innovation, risk-taking, and problem-solving abilities.

Globally, entrepreneurship has been recognized as a key strategy for addressing unemployment, especially among young people. Governments and educational institutions may have increasingly emphasized entrepreneurship development as a means of promoting self-reliance and reducing dependence on white-collar jobs. In this context, student entrepreneurship has gained significant attention. Student entrepreneurship refers to the involvement of students in entrepreneurial activities either during their academic studies or shortly after graduation. It reflects students' intention and ability to identify business opportunities and create ventures while still in school or after completing their studies.

Recent research shows that universities play a critical role in shaping students' entrepreneurial intentions through entrepreneurship education and supportive learning environments (Fayolle & Gailly, 2015). Entrepreneurship education is designed to equip students with the knowledge, skills, and attitudes required to recognize opportunities, develop business ideas, and manage ventures successfully. Nabi et al. (2017) emphasize that entrepreneurship education contributes significantly to enhancing students' entrepreneurial competencies, confidence, and intention to start businesses. As a result, higher institutions are increasingly being seen not just as centres of academic learning but also as incubators of entrepreneurial development. Business Education is a programme designed to prepare students for careers in business, teaching, administration, and self-employment. It integrates knowledge from accounting, marketing, office technology, management, and entrepreneurship. Through this combination, students are exposed to both theoretical and practical aspects of business operations. In Nigerian universities, Business Education is aimed at producing graduates who are not only employable but also capable of creating employment opportunities for themselves and others.

However, despite the inclusion of entrepreneurship-related courses in the curriculum, there remains a concern about the extent to which students translate this knowledge into actual entrepreneurial practice. The development of entrepreneurial attitudes among students is influenced by several interrelated factors, among which family, school, and environment are particularly significant. The family serves as the first social institution where individuals develop values, beliefs, and attitudes toward work and career choices. Parents who are entrepreneurs or engaged in business activities often serve as role models, influencing their children's perception of entrepreneurship as a viable career path. According to Carr and Sequeira (2007), family support, exposure to business activities, and parental encouragement significantly influence entrepreneurial intention among young people. Financial support from family members can also reduce the perceived risk associated with starting a business, thereby encouraging entrepreneurial engagement.

The school ecosystem, especially at the university level, is another major determinant of student entrepreneurship. Universities provide structured learning experiences through entrepreneurship courses, seminars, workshops, industrial training, and mentorship programmes. Entrepreneurshipeducation has been widely acknowledged as a key factor in shaping students' entrepreneurial intentions by enhancing their skills, knowledge, and self-confidence (Bae et al., 2014). A supportive academic environment that encourages innovation, creativity, and experiential learning significantly increases the likelihood of students developing entrepreneurial intentions. In addition, university-based entrepreneurship support systems such as business incubators, innovation hubs, and internship programmes expose students to real-life business experiences. Autio et al. (2014) note that perceived institutional support within universities positively influences students' entrepreneurial intentions and behavior.

Therefore, the effectiveness of entrepreneurship education depends not only on curriculum content but also on the learning environment and institutional support systems available to students. Beyond family and school, the broader environment also plays a crucial role in shaping student entrepreneurship. Environmental factors include peer influence, socio-economic conditions, availability of resources, access to funding, and exposure to entrepreneurial role models. Students who are exposed to entrepreneurial ecosystems are more likely to develop positive attitudes toward entrepreneurship. Conversely, environments characterized by unemployment, lack of support systems, and limited access to capital may discourage entrepreneurial intentions. Social networks and peer groups also influence students' perception of entrepreneurship, as individuals are often encouraged or discouraged based on the experiences of those around them. In the Nigerian context, especially in Delta State, unemployment among graduates has increased the urgency for entrepreneurship development in higher institutions.

Universities in Delta State have introduced Business Education and entrepreneurship-related programmes to equip students with entrepreneurial competencies. These programmes are intended to bridge the gap between academic knowledge and practical business skills. However,

evidence suggests that many graduates still struggle to translate entrepreneurial knowledge into successful ventures due to inadequate practical exposure, limited funding opportunities, and weak entrepreneurial ecosystems. Business Education as a discipline remains a strategic programme for fostering entrepreneurship among students. It prepares learners with competencies in teaching, business management, office administration, accounting, and marketing.

In addition, it exposes students to entrepreneurial thinking and innovation, which are essential for self-employment. Despite these advantages, the effectiveness of Business Education in producing active entrepreneurs is still debated, as many graduates prefer wage employment over entrepreneurship. Universities as institutions of learning are expected to serve as catalysts for entrepreneurship development. They are responsible for shaping students' intellectual abilities, professional skills, and entrepreneurial mindset. A university that integrates entrepreneurship into its teaching, research, and community engagement activities provides students with greater opportunities to develop entrepreneurial competencies. According to recent studies, universities that actively promote entrepreneurship through practical training, mentorship, and innovation support systems tend to produce graduates with stronger entrepreneurial intentions (Nabi et al., 2017). Entrepreneurship development among students is a multidimensional phenomenon influenced by family background, school environment, and broader environmental conditions.

Business Education programmes in universities, particularly in Delta State, play a vital role in preparing students for entrepreneurial careers. However, the extent to which these factors effectively shape students' entrepreneurial attitudes and intentions remains a critical issue that requires further investigation. Understanding these influences is essential for improving student entrepreneurship and promoting self-reliance among university graduates in Nigeria.

Statement of the Problem

Despite the growing emphasis on entrepreneurship education in Nigerian tertiary institutions, many graduates continue to show a strong preference for white-collar jobs rather than self-employment. This persistent orientation toward paid employment has contributed significantly to the rising rate of graduate unemployment in the country. In response to this challenge, entrepreneurship education has been introduced and integrated into the curricula of many higher institutions, including Business Education programmes in universities in Delta State. The intention is to equip students with the knowledge, skills, and mindset required to become self-reliant and job creators rather than job seekers. However, despite the implementation of entrepreneurship education programmes, the expected level of entrepreneurial engagement among students remains relatively low. Empirical observations and informal evidence suggest that many students complete entrepreneurship-related courses without translating the knowledge acquired into practical business ventures.

This situation raises serious concerns about the effectiveness of entrepreneurship education in achieving its intended objectives and suggests that other underlying factors may be influencing students' entrepreneurial intentions and behaviours. One of the key issues may be the influence of family background on students' entrepreneurial development. Family plays a crucial role in shaping an individual's career aspirations, values, and attitudes toward work. Factors such as parental occupation, level of education, financial status, and attitudes toward self-employment can either encourage or discourage entrepreneurial intentions. In many cases, students from families with little or no business experience may have limited exposure to entrepreneurial activities, mentorship, and financial support, thereby reducing their likelihood of engaging in entrepreneurship.

In addition, the school environment may not be sufficiently structured to promote strong entrepreneurial engagement among students. Although entrepreneurship is taught as an academic subject, the extent to which students are exposed to practical entrepreneurial experiences remains questionable. Challenges such as inadequate practical training, limited access to modern entrepreneurship facilities, lack of effective mentorship programmes, and insufficient collaboration with industry stakeholders may hinder students from fully developing entrepreneurial competencies and confidence. Furthermore, environmental factors outside the school system also play a significant role in shaping students' entrepreneurial intentions. The broader socio-economic environment, including issues such as economic instability, unemployment, limited access to start-up capital, inadequate infrastructure, and inconsistent government policies, may discourage students from considering entrepreneurship as a viable career option. These environmental constraints often make entrepreneurship appear risky and less attractive compared to conventional employment. McClelland's Achievement Motivation Theory (1961) emphasizes that individuals with a strong need for achievement are more likely to engage in entrepreneurial activities.

However, such motivation can be weakened or suppressed when individuals are exposed to unfavourableenvironmental conditions and lack adequate support systems. It is against this background that this study seeks to examine the factors influencing student entrepreneurship, with particular emphasis on the roles of family, school, and environmental factors among Business Education students in universities in Delta State. The study aims to provide a clearer understanding of how these factors interact to shape students' entrepreneurial intentions and behaviours, with a view to improving entrepreneurship education outcomes in the study area.

Purpose of the Study

The main purpose of this study is to examine the factors influencing student entrepreneurship, with particular emphasis on the roles of family, school, and environment among Business Education students in universities in Delta State.

Specifically, the study seeks to:

1. Determine the extent to which family background influences student entrepreneurship development among Business Education students in universities in Delta State.
2. Determine the extent to which the school ecosystem influences entrepreneurship development among Business Education students in universities in Delta State.
3. Determine the extent to which environmental factors influence student entrepreneurship development among Business Education students in universities in Delta State.
4. Determine the extent to which family background, school ecosystem, and environmental factors jointly influence student entrepreneurship development among Business Education students in universities in Delta State.

Research Questions

The following research questions guided the study:

1. To what extent does family background influence entrepreneurship development among Business Education students in universities in Delta State?
2. To what extent does school ecosystem influence entrepreneurship development among Business Education students in universities in Delta State?
3. To what extent does environment influence entrepreneurship development among Business Education students in universities in Delta State?
4. What is the combined effect of family, school, and environmental factors on student entrepreneurship development among Business Education students in universities in Delta State?

Hypotheses

The following null hypotheses were formulated to guide the study:

H_{01}: There is no significant relationship between family background and student entrepreneurship development among Business Education students in universities in Delta State.

H_{02}: The school ecosystem has no significant influence on student entrepreneurship development among Business Education students in universities in Delta State.

H_{03}: Environmental factors do not significantly affect student entrepreneurship development among Business Education students in universities in Delta State.

H_{04}: There is no significant combined effect of family, school, and environmental factors on student entrepreneurship development among Business Education students in universities in Delta State.

LITERATURE REVIEW

This section reviews related literature relevant to the study on Factors Influencing Student Entrepreneurship: The Role of Family, School, and Environment among Business Education Students in Universities in Delta State. The review is organized under the conceptual framework, theoretical framework, empirical review, and summary of the literature. It examines existing concepts, theories, and previous studies relating to entrepreneurship and the factors that influence entrepreneurial development among university students. The review is important because it provides a theoretical and empirical foundation for the study. It also helps to identify existing knowledge, establish gaps in previous studies, and justify the need for the present research. Entrepreneurship has become an important instrument for employment generation, poverty reduction, innovation, and national development. In Nigeria, the increasing rate of graduate unemployment has made entrepreneurship education a major strategy for promoting self-employment and economic self-reliance among university students (Adebayo, 2019). Consequently, universities are expected to equip students with entrepreneurial

knowledge, skills, attitudes, and competencies necessary for business creation and management. Student entrepreneurship has also attracted considerable attention among researchers and policymakers because students are regarded as future drivers of economic development and innovation. According to Nwafor and Ohaka (2021), entrepreneurial engagement among university students is influenced by several factors within and outside the educational environment. These factors may either encourage or discourage students from developing entrepreneurial intentions and participating in entrepreneurial activities.

Family factors have equally been identified as important determinants of entrepreneurial behaviour among students. Family background, parental occupation, financial support, and entrepreneurial exposure often shape students' perception and interest in entrepreneurship (Olowe, 2020). Students raised in entrepreneurial families are more likely to develop positive attitudes toward self-employment because of their early exposure to business activities and encouragement from parents or guardians. Similarly, school factors play significant roles in influencing entrepreneurship among students. Entrepreneurship education, quality of teaching, mentorship programmes, institutional support, and the availability of entrepreneurial facilities contribute to students' entrepreneurial development (Ezeani, 2022). Universities that provide practical entrepreneurial training and supportive learning environments are more likely to produce students with strong entrepreneurial intentions and capabilities. Environmental factors also influence student entrepreneurship. These include government policies, economic conditions, access to finance, technological advancement, societal values, and business opportunities within the environment. According to Ibrahim and Mohammed (2020), a favourable business environment motivates students to engage in entrepreneurial activities, whereas an unstable economic and social environment may discourage entrepreneurial participation.

Conceptual Framework

The conceptual framework explains the relationship between the independent variables and the dependent variable in the study. It provides a clear understanding of how family factors, school factors, and environmental factors are expected to influence student entrepreneurship among Business Education students in universities in Delta State. The independent variables in this study are family factors, school factors, and environmental factors, while the dependent variable is student entrepreneurship. It is assumed that when these factors are favourable, students are more likely to develop positive entrepreneurial intentions, attitudes, and behaviours. Conversely, when these factors are weak or unfavourable, entrepreneurial development among students may be negatively affected.

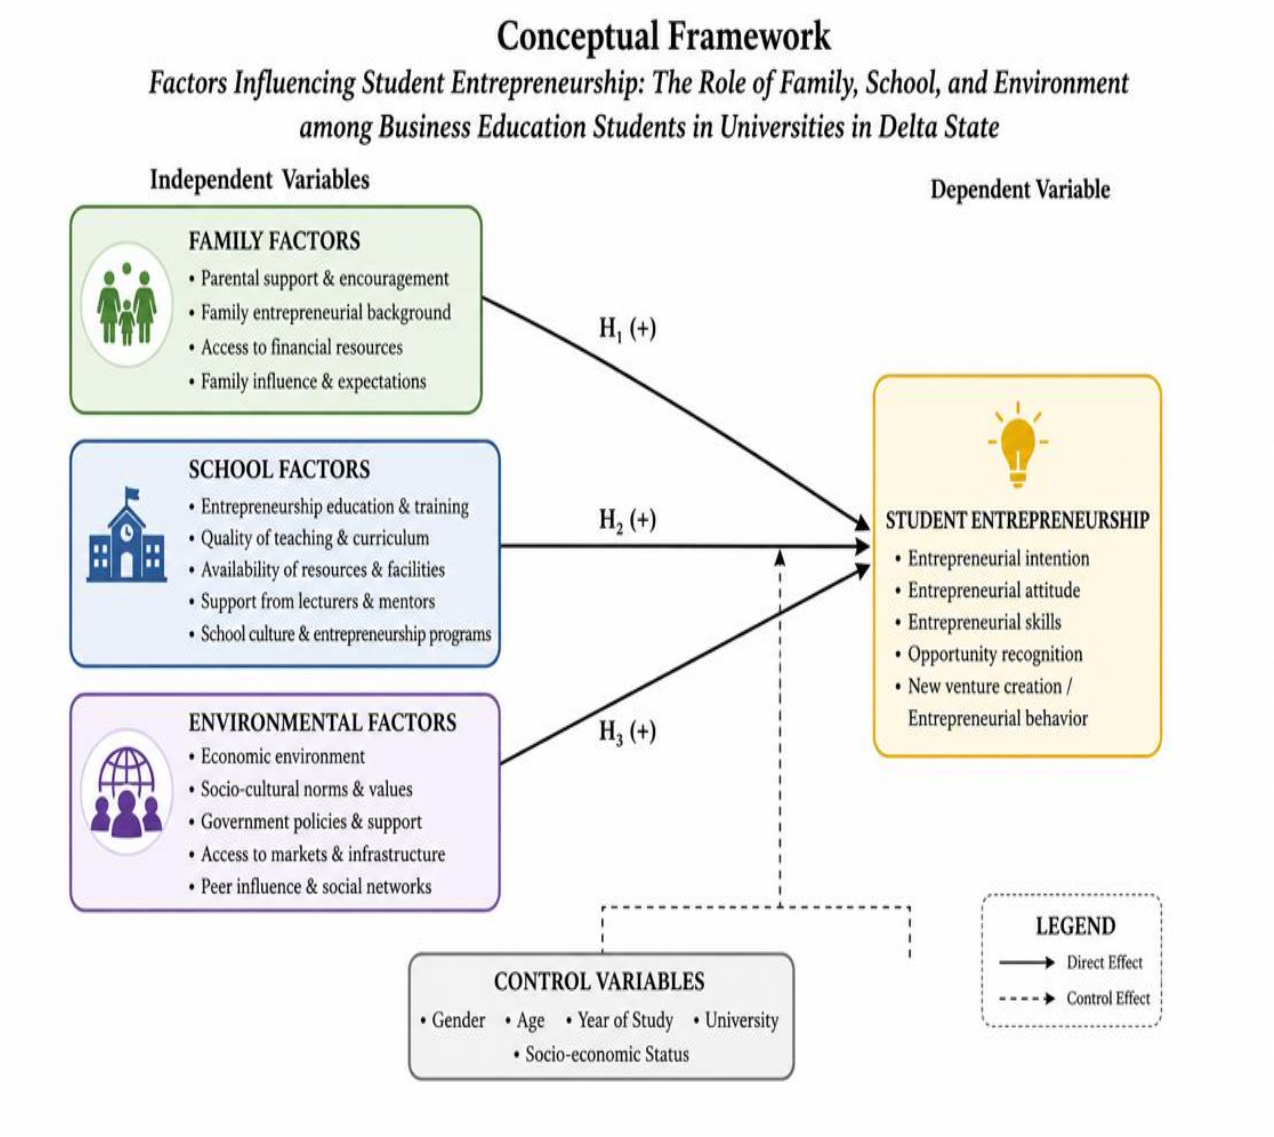

Fig. 1: Conceptual Model

The conceptual framework illustrates the presumed relationship between the independent variables (family factors, school factors, and environmental factors) and the dependent variable (student entrepreneurship) among Business Education students in universities in Delta State. The framework is based on the assumption that students' entrepreneurial development is shaped by influences from their family background, educational institutions, and the wider environment. It further recognizes that certain demographic characteristics may influence these relationships and therefore includes control variables to enhance the validity of the study.

The first independent variable is family factors, which comprise parental support and encouragement, family entrepreneurial background, access to financial resources, and family influence and expectations. The framework assumes that students who receive adequate emotional, financial, and motivational support from their families are more likely to develop favourable entrepreneurial intentions and behaviours. Likewise, students from entrepreneurial families are expected to acquire entrepreneurial knowledge, values, and experiences through observation and interaction, thereby increasing their willingness to engage in entrepreneurial activities. The arrow labelled H_1 (+) represents the hypothesized positive relationship between family factors and student entrepreneurship.

The second independent variable is school factors, which include entrepreneurship education and training, quality of teaching and curriculum, availability of learning resources and facilities, support from lecturers and mentors, and the existence of entrepreneurship programmes within the university. The framework posits that an enabling educational environment equips students with the knowledge, practical skills, confidence, and innovative mindset required to identify business opportunities and establish entrepreneurial ventures. Effective entrepreneurship education and institutional support are

therefore expected to positively influence entrepreneurial intentions, attitudes, and competencies among Business Education students. This relationship is represented by the arrow labelled H_2 (+).

The third independent variable is environmental factors, comprising the economic environment, socio-cultural norms and values, government policies and support, access to markets and infrastructure, as well as peer influence and social networks. The framework suggests that a supportive external environment provides students with favourable conditions for entrepreneurial development. Government incentives, access to finance and markets, technological advancement, and positive societal attitudes towards entrepreneurship encourage students to explore business opportunities and participate in entrepreneurial activities. Similarly, supportive peer networks and social interactions promote the exchange of entrepreneurial ideas and experiences. The arrow labelled H_3 (+) indicates the hypothesized positive influence of environmental factors on student entrepreneurship.

The dependent variable in the framework is student entrepreneurship, which is measured through entrepreneurial intention, entrepreneurial attitude, entrepreneurial skills, opportunity recognition, and new venture creation or entrepreneurial behaviour. These dimensions collectively represent the entrepreneurial outcomes that the study seeks to examine. Entrepreneurial intention reflects students' willingness to establish businesses, while entrepreneurial attitude refers to their perceptions and disposition towards entrepreneurship. Entrepreneurial skills encompass the competencies required to initiate and manage business ventures, whereas opportunity recognition involves the ability to identify viable business prospects. New venture creation or entrepreneurial behaviour represents the practical application of entrepreneurial knowledge through business start-up activities.

The framework also incorporates control variables, namely gender, age, year of study, university, and socio-economic status. These variables are included because they may influence students' entrepreneurial development independently of the main variables under investigation. Controlling for these demographic characteristics enables the study to isolate and accurately determine the effects of family, school, and environmental factors on student entrepreneurship. Overall, the conceptual framework proposes that family factors, school factors, and environmental factors exert direct and positive influences on student entrepreneurship among Business Education students in universities in Delta State. It further assumes that these relationships remain significant even after controlling for relevant demographic characteristics. Consequently, the framework provides the foundation for the formulation of the research questions and hypotheses, as well as the empirical investigation of the relationships among the study variables.

Student Entrepreneurship

Student entrepreneurship refers to the involvement of students in entrepreneurial activities while pursuing their academic programmes. It includes developing business ideas, identifying opportunities, and establishing small-scale ventures capable of generating income and creating value.According to Nabi et al. (2018), student entrepreneurship is the process through which students develop entrepreneurial intentions and engage in venture creation as a result of entrepreneurship education, personal motivation, and environmental influences.

Similarly, Nabi, Walmsley, and Holden (2020) explained that student entrepreneurship has become one of the major outcomes of higher education because universities increasingly integrate entrepreneurship into their academic programmes through training, mentorship, and practical learning. Shah and Soomro (2017) described student entrepreneurship as a mechanism that enables students to become job creators instead of job seekers. It allows students to apply classroom knowledge to real-life business situations while developing practical business skills. In Nigeria, student entrepreneurship has become increasingly important because of the high level of graduate unemployment. Ojeifo (2019) observed that entrepreneurship education provides students with self-employment skills capable of reducing dependence on scarce white-collar jobs. Student entrepreneurship also promotes innovation, creativity, resilience, and problem-solving abilities. Students who actively participate in entrepreneurial activities develop confidence, leadership skills, and business management competencies that prepare them for future careers.

Family Factors and Student Entrepreneurship

Family factors refer to the various influences within the home environment that shape students' attitudes, behaviours, and decisions toward entrepreneurship. These include parental occupation, family income, parental education, entrepreneurial exposure, family values, and emotional support. Bandura's (1986) Social Learning Theory explains that individuals learn behaviours by observing people around them. Students who grow up in entrepreneurial families often imitate their parents' business practices and develop stronger entrepreneurial interests. Fatoki (2010) found that students from business-oriented families usually possess stronger entrepreneurial intentions because they

receive mentorship, encouragement, and practical exposure from an early age. Carr and Sequeira (2007) further observed that parental role models significantly influence entrepreneurial self-confidence and students' willingness to establish businesses. Family financial support also contributes to entrepreneurship development. Students from financially stable families often have greater opportunities to invest in business ideas and participate in entrepreneurial activities. However, families that place greater value on white-collar employment than entrepreneurship may discourage students from considering self-employment as a career option. Therefore, family background remains one of the strongest determinants of entrepreneurial development among Business Education students.

School Factors and Student Entrepreneurship

School factors refer to the academic and institutional conditions within the university environment that influence students' entrepreneurial development. These factors include the quality of entrepreneurship education, teaching methods, availability of instructional resources, access to mentorship, institutional support systems, curriculum content, and exposure to practical business experiences. In the context of student entrepreneurship, the school environment plays a critical role in shaping students' knowledge, skills, attitudes, and intentions toward entrepreneurship.

According to Fayolle and Gailly (2015), entrepreneurship education within academic institutions significantly influences students' entrepreneurial intentions by increasing their awareness of business opportunities and improving their confidence in starting ventures. This implies that when entrepreneurship is properly integrated into the curriculum, students are more likely to develop positive attitudes toward self-employment. Similarly, Nabi et al. (2017) argued that entrepreneurship education is most effective when it combines theoretical instruction with experiential learning such as internships, business simulations, and practical projects. Such approaches enable students to acquire real-life business skills and better understand the challenges involved in entrepreneurship. Ezeugo and Ugwu (2020) observed that inadequate teaching facilities, lack of qualified entrepreneurship lecturers, and insufficient practical exposure negatively affect students' entrepreneurial development. According to the authors, students may graduate with theoretical knowledge but lack the practical competence required to establish successful businesses. Furthermore, institutional support within universities plays an important role in promoting entrepreneurship among students. Guerrero, Urbano and Fayolle (2016) explained that universities with entrepreneurship centres, business incubators, innovation hubs, and mentorship programmes produce graduates with stronger entrepreneurial intentions and greater confidence in business creation. In Nigeria, entrepreneurship education was introduced into university curricula to address graduate unemployment and promote self-reliance. According to Iwu et al. (2019), although the policy has recorded some achievements, its effectiveness differs across institutions due to variations in teaching quality, learning facilities, and implementation strategies. Therefore, school factors remain one of the major determinants of student entrepreneurship. Business Education students who receive quality entrepreneurship education, practical training, mentorship, and institutional support are more likely to develop entrepreneurial competencies and establish successful business ventures.

Environmental Factors and Student Entrepreneurship

Environmental factors refer to the external social, economic, cultural, technological, and political conditions that influence entrepreneurial intentions and activities among students. These factors include government policies, access to finance, business opportunities, infrastructural development, cultural values, peer influence, and economic stability. According to Krueger (2000), entrepreneurial intentions are largely influenced by individuals' perception of environmental opportunities. Students who believe that the environment supports entrepreneurship are more likely to consider self-employment as a viable career option. Autio, Keeley, Klofsten, and Ulfstedt (2014) also observed that supportive entrepreneurial ecosystems characterized by access to finance, mentorship, favourable government policies, and business infrastructure significantly increase entrepreneurial participation among young people. Government policies constitute another important environmental factor. Urbano and Alvarez (2016) noted that policies promoting entrepreneurship through grants, soft loans, business registration support, tax incentives, and youth empowerment programmes encourage entrepreneurial development among university graduates. Economic conditions equally influence entrepreneurial decisions. Akinwale and Okoye (2021) argued that high unemployment often motivates students to consider entrepreneurship as an alternative source of livelihood. However, poor economic conditions, inflation, and inadequate access to capital may discourage business start-ups. Technological advancement has further expanded entrepreneurial opportunities for students. Through digital technology, social media, and e-commerce platforms, students can establish and manage businesses with relatively low start-up costs. Iwu et al. (2019) maintained that technology has transformed entrepreneurship by creating new opportunities for

innovation and business expansion. Socio-cultural values also influence entrepreneurial behaviour. Shane (2003) explained that societies that encourage innovation, creativity, and business ownership tend to produce individuals with stronger entrepreneurial intentions than societies that emphasize paid employment.

Consequently, environmental factors significantly influence the entrepreneurial development of Business Education students. A supportive business environment increases students' confidence in entrepreneurship, while an unfavourable environment discourages entrepreneurial participation.

Theoretical Framework

This study is anchored on two theories that explain the development of entrepreneurial behaviour among students. These are:

Social Learning Theory by Albert Bandura (1977) and Entrepreneurial Intention Theory by Ajzen (1991) and Krueger (2000). The theories provide a framework for explaining how family background, school environment, and environmental conditions influence students' entrepreneurial intentions and behaviours.

Social Learning Theory (Bandura, 1977)

Social Learning Theory was developed by Albert Bandura in 1977. The theory explains that individuals acquire behaviours, attitudes, values, and skills through observation, imitation, and interaction with people within their environment. According to the theory, learning occurs not only through direct experience but also through observing the behaviour of others and the consequences of such behaviour. Bandura identified four major processes involved in observational learning: attention, retention, reproduction, and motivation. Individuals first observe a particular behaviour, retain the information in memory, reproduce the behaviour when necessary, and remain motivated if the observed behaviour produces positive outcomes. The theory is highly relevant to this study because students often develop entrepreneurial interests by observing entrepreneurs within their families, schools, and communities. Students whose parents or close relatives own businesses are more likely to develop entrepreneurial aspirations through continuous observation and participation in business activities. Similarly, lecturers, mentors, successful entrepreneurs, and entrepreneurship clubs within universities also serve as role models whose experiences encourage students to embrace entrepreneurship. Therefore, Social Learning Theory explains how family and school environments influence entrepreneurial behaviour among Business Education students in universities in Delta State through observation, imitation, and continuous interaction with entrepreneurial role models.

Entrepreneurial Intention Theory (Ajzen, 1991; Krueger, 2000)

Entrepreneurial Intention Theory is based on the assumption that entrepreneurship begins with intention before actual entrepreneurial behaviour occurs. The theory is closely linked to Ajzen's Theory of Planned Behaviour (1991) and was further applied to entrepreneurship by Krueger, Reilly, and Carsrud (2000). According to the theory, entrepreneurial intention is the strongest predictor of entrepreneurial behaviour. Before an individual starts a business, he or she must first develop the intention or willingness to become an entrepreneur. The theory explains that entrepreneurial intention is influenced by three major factors: Personal attitude toward entrepreneurship; Subjective norms (social influence from family, friends, and society); Perceived behavioural control (belief in one's ability to start and manage a business). Students who possess positive attitudes toward entrepreneurship, receive encouragement from significant people around them, and believe they have the required entrepreneurial skills are more likely to develop strong entrepreneurial intentions. School-related factors such as entrepreneurship education, practical training, and mentorship programmes improve students' confidence and perceived behavioural control. Likewise, supportive environmental conditions such as access to finance, favourable government policies, and business opportunities strengthen entrepreneurial intention by making entrepreneurship appear more achievable.

The theory is therefore relevant to this study because it explains how family, school, and environmental factors collectively shape entrepreneurial intentions, which eventually influence entrepreneurial behaviour among Business Education students in universities in Delta State.

METHODOLOGY

The study adopted a descriptive survey research design. The descriptive survey design was considered appropriate because it enables the researcher to collect information directly from respondents concerning their opinions, perceptions, and experiences on the factors influencing entrepreneurship among Business Education students in universities in Delta State. The design is suitable because it allows the collection of data from a representative sample without manipulating any of the variables under investigation. It also provides an effective means of describing existing conditions and examining relationships among variables.

Population of the Study

The population of the study comprised all 300 and 400 Level Business Education students in Delta State University (DELSU), Abraka, and the University of Delta (UNIDEL), Agbor. The total population consisted of 217 students, based on the official departmental records of the two universities. The population was considered appropriate because these students have been exposed to entrepreneurship education and possess adequate knowledge and experience to provide relevant information regarding the influence of family, school, and environmental factors on entrepreneurship among Business Education students in Delta State.

Sample and Sampling Technique

A sample size of 141 respondents was selected from the population of 217 Business Education students in Delta State University (DELSU), Abraka, and the University of Delta (UNIDEL), Agbor. The sample size was determined using Taro Yamane's (1967) formula at a 0.05 level of significance.

Therefore, the sample size for the study was 141 respondents. A simple random sampling technique was adopted in selecting the respondents. The technique gave every member of the population an equal opportunity of being selected, thereby ensuring fairness and adequate representation of the population.

Instrument for Data Collection

The instrument used for data collection was a structured questionnaire developed by the researcher titled: Factors Influencing Student Entrepreneurship Development Questionnaire (FISEDQ) The questionnaire consisted of two sections. Section A contained items on the demographic characteristics of the respondents. Section B contained items designed to obtain information on the influence of family, school, and environmental factors on student entrepreneurship. The questionnaire adopted a four-point Likert Scale with the following response options:Very High Extent (VHE) =5; High Extent (HE) = 4; Moderate Extent (ME) = 3; Low Extent(LE) = 2; Very Low Extent (VLE) = 1. The instrument was designed to generate information capable of answering the research questions and achieving the objectives of the study.

Validation of the Instrument

The research instrument was subjected to face and content validation by experts in Business Education and Measurement and Evaluation. The experts carefully examined the questionnaire to determine whether the items were relevant, clear, adequate, and capable of measuring the variables under investigation. Based on their observations and recommendations, necessary corrections and modifications were made to improve the clarity, appropriateness, and content of the instrument before the final draft was produced. This validation process ensured that the questionnaire adequately measured the factors influencing student entrepreneurship among Business Education students in universities in Delta State.

Reliability of the Instrument

The reliability of the instrument was established through a pilot study involving 20 Business Education students from the University of Benin (UNIBEN), Edo State, which is outside the area of the study. The use of respondents outside the study area ensured that those who participated in the pilot study did not form part of the actual respondents used for the main study. The responses obtained from the pilot study were analysed using the Cronbach Alpha reliability method to determine the internal consistency of the instrument. A reliability coefficient of 0.80 was obtained, indicating that the instrument possessed a high level of reliability and was therefore considered suitable for data collection.

Administration of the Instrument

The researcher personally administered the questionnaire to the respondents with the assistance of trained research assistants where necessary. Before administering the instrument, the purpose of the study was clearly explained to the respondents to enable them provide accurate and sincere responses. Participation in the study was voluntary, and respondents were assured that all information provided would be treated with strict confidentiality and used solely for academic purposes. The completed questionnaires were collected immediately after completion to ensure a high retrieval rate and reduce the possibility of loss or non-return.

Method of Data Analysis

The data collected from the respondents were analysed using mean and standard deviation to answer the research questions. A benchmark mean score of 3.00 was used for decision-making. Any questionnaire item with a mean score of 3.00 and above was regarded as high extent, while any item with a mean score below 3.00 was regarded as low extent. In addition, the hypotheses formulated for the study were be tested using the Pearson Product Moment Correlation Coefficient (PPMC) at a 0.05 level of significance. The choice of this statistical tool was based on its suitability for determining the relationship between the independent variables (family, school, and environmental factors) and the dependent variable (student entrepreneurship).

DATA PRESENTATION

A total of 141 copies of the questionnaire were administered and returned, representing a 100% retrieval rate. The mean and standard deviation were used to answer the research questions, while Pearson Product Moment Correlation (PPMC) was used to test the hypotheses at the 0.05 level of significance. The benchmark mean was 3.00.

Research Question 1

To what extent does family background influence entrepreneurship development among Business Education students in universities in Delta State?

Table 4.1: Family Factors and Student Entrepreneurship

S/N	Items	Mean	SD	Decision
1	My parents or guardians encourage me to consider self-employment as a career.	3.61	0.72	High Extent
2	My family motivates me to develop entrepreneurial skills.	3.38	0.81	High Extent
3	My family supports my business ideas.	3.45	0.78	High Extent
4	The financial condition of my family influences my entrepreneurial development.	3.54	0.75	High Extent
5	My parents encourage me to be creative and innovative.	3.49	0.80	High Extent
6	Having entrepreneurial family members inspires me to start a business.	3.42	0.77	High Extent
7	The values I learnt from my family encourage hard work and self-reliance.	3.57	0.74	High Extent
8	My family exposes me to business-related activities.	3.36	0.82	High Extent
9	My family encourages me to identify business opportunities.	3.51	0.76	High Extent
10	My family encourages me to solve problems creatively.	3.46	0.79	High Extent
11	The guidance I receive from my family strengthens my entrepreneurial interest.	3.55	0.73	High Extent
12	My family motivates me to achieve success through entrepreneurship.	3.58	0.75	High Extent
	Grand Mean	**3.49**	**0.77**	**High Extent**

The grand mean of 3.49, which is above the benchmark mean of 3.00, indicates that family background influences student entrepreneurship development to a High Extent. The highest-rated item was parental or guardian encouragement to consider self-employment as a career (Mean = 3.61), while the lowest-rated item was exposure to business-related activities (Mean = 3.36). This shows that parental encouragement, family support, values, guidance, financial condition, and entrepreneurial exposure all contribute to the entrepreneurial development of Business Education students.

Research Question 2

To what extent does the school ecosystem influence entrepreneurship development among Business Education students in universities in Delta State?

Table 4.2: School Factors and Student Entrepreneurship

S/N	Items	Mean	SD	Decision
13	Entrepreneurship courses improve my entrepreneurial knowledge.	3.58	0.71	High Extent
14	My lecturers encourage students to become entrepreneurs.	3.47	0.76	High Extent
15	The entrepreneurship curriculum equips me with practical business skills.	3.36	0.82	High Extent
16	The university provides opportunities for practical entrepreneurship training.	3.42	0.79	High Extent
17	Business seminars and workshops organised by the university improve my entrepreneurial competence.	3.49	0.75	High Extent
18	The school environment encourages creativity and innovation.	3.52	0.74	High Extent
19	My lecturers serve as role models for entrepreneurship.	3.45	0.78	High Extent
20	The university provides access to entrepreneurial	3.34	0.83	High Extent

	mentors.			
21	Group projects improve my entrepreneurial skills.	3.41	0.80	High Extent
22	The university provides opportunities to interact with successful entrepreneurs.	3.39	0.81	High Extent
23	Entrepreneurship education has increased my confidence to start a business.	3.57	0.72	High Extent
24	The school encourages students to develop innovative business ideas.	3.52	0.74	High Extent
	Grand Mean	**3.46**	**0.77**	**High Extent**

The grand mean of 3.46, which is above the benchmark mean of 3.00, indicates that the school ecosystem influences student entrepreneurship development to a High Extent. The highest-rated item was that entrepreneurship courses improve students' entrepreneurial knowledge (Mean = 3.58), while the lowest-rated item was access to entrepreneurial mentors (Mean = 3.34). The result indicates that entrepreneurship education, practical training, lecturers' encouragement, mentorship, seminars, workshops, and a supportive school environment contribute to students' entrepreneurial development.

Research Question 3

To what extent do environmental factors influence student entrepreneurship development among Business Education students in universities in Delta State?

Table 4.3: Environmental Factors and Student Entrepreneurship

S/N	Items	Mean	SD	Decision
25	Business opportunities within my environment encourage entrepreneurship.	3.31	0.84	High Extent
26	Access to finance influences my entrepreneurial development.	3.55	0.73	High Extent
27	Government entrepreneurship programmes encourage students to become entrepreneurs.	3.43	0.78	High Extent
28	The economic environment affects my entrepreneurial decisions.	3.48	0.76	High Extent
29	Access to modern technology supports entrepreneurship development.	3.51	0.75	High Extent
30	Internet access enhances my entrepreneurial learning.	3.47	0.77	High Extent
31	Successful entrepreneurs in my environment motivate me.	3.44	0.79	High Extent
32	Support from my community encourages entrepreneurial development.	3.39	0.81	High Extent
33	Government policies influence entrepreneurship development among students.	3.35	0.83	High Extent
34	Business networking opportunities improve entrepreneurial development.	3.46	0.78	High Extent
35	The availability of markets encourages entrepreneurial activities.	3.53	0.74	High Extent
36	The business environment motivates me to become an entrepreneur.	3.50	0.76	High Extent
	Grand Mean	**3.45**	**0.78**	**High Extent**

The grand mean of 3.45, which is above the benchmark mean of 3.00, indicates that environmental factors influence student entrepreneurship development to a High Extent. The highest-rated item was access to finance influencing entrepreneurial development (Mean = 3.55), while the lowest-rated item was the availability of business opportunities within the environment (Mean = 3.31). This indicates that access to finance, technology, markets, government programmes and policies, community support, networking opportunities, and the wider business environment are important to students' entrepreneurial development.

Research Question 4

What is the combined effect of family, school and environmental factors on student entrepreneurship development among Business Education students in universities in Delta State?

Table 4.4: Combined Influence of Family, School and Environmental Factors on Student Entrepreneurship

S/N	Factors	Mean	SD	Decision
1	Family and Student Entrepreneurship	3.49	0.77	High Extent

2	School and Student Entrepreneurship	3.46	0.77	High Extent
3	Environment and Student Entrepreneurship	3.45	0.78	High Extent
	Grand Mean	**3.47**	**0.77**	**High Extent**

The grand mean of 3.47, which is above the benchmark mean of 3.00, indicates a High Extent of combined influence of family, school and environmental factors on student entrepreneurship development. Family factors recorded the highest mean (3.49), followed by school factors (3.46), while environmental factors recorded 3.45. The result shows that the three factors collectively provide an important context for the entrepreneurial development of Business Education students.

Test of Hypotheses

The null hypotheses were tested using Pearson Product Moment Correlation (PPMC) at the 0.05 level of significance. The decision rule was to reject the null hypothesis when the significance value is less than 0.05; otherwise, the null hypothesis is not rejected.

Hypothesis One

Restated Null Hypothesis: There is no significant relationship between family background and student entrepreneurship development among Business Education students in universities in Delta State.
Decision Rule: Reject H_0 if Sig. < 0.05.

Table 4.5: Relationship between Family Background and Student Entrepreneurship

Variables	N	r-value	Sig.
Family Background vs Student Entrepreneurship	141	0.682	0.000

The correlation coefficient of 0.682 indicates a strong positive relationship between family background and student entrepreneurship development. Since the significance value of 0.000 is less than 0.05, the relationship is statistically significant. Therefore, the null hypothesis is rejected.

Hypothesis Two

Restated Null Hypothesis: The school ecosystem has no significant influence on student entrepreneurship development among Business Education students in universities in Delta State.
Decision Rule: Reject H_0 if Sig. < 0.05.

Table 4.6: Relationship between School Ecosystem and Student Entrepreneurship

Variables	N	r-value	Sig.
School Ecosystem vs Student Entrepreneurship	141	0.714	0.000

The correlation coefficient of 0.714 indicates a strong positive relationship between the school ecosystem and student entrepreneurship development. Since the significance value of 0.000 is less than 0.05, the relationship is statistically significant. Therefore, the null hypothesis is rejected.

Hypothesis Three

Restated Null Hypothesis: Environmental factors do not significantly affect student entrepreneurship development among Business Education students in universities in Delta State.
Decision Rule: Reject H_0 if Sig. < 0.05.

Table 4.7: Relationship between Environmental Factors and Student Entrepreneurship

Variables	N	r-value	Sig.
Environmental Factors vs Student Entrepreneurship	141	0.655	0.000

The correlation coefficient of 0.655 indicates a strong positive relationship between environmental factors and student entrepreneurship development. Since the significance value of 0.000 is less than 0.05, the relationship is statistically significant. Therefore, the null hypothesis is rejected.

Hypothesis Four

Restated Null Hypothesis: There is no significant combined effect of family, school and environmental factors on student entrepreneurship development among Business Education students in universities in Delta State.
Decision Rule: Reject H_0 if Sig. < 0.05.

Table 4.8: Combined Relationship between Family, School, Environmental Factors and Student Entrepreneurship

Variables	N	r-value	Sig.
Family, School and Environmental Factors vs Student Entrepreneurship	141	0.781	0.000

The correlation coefficient of 0.781 indicates a very strong positive relationship between the combined family, school and environmental factors and student entrepreneurship development. Since the

significance value of 0.000 is less than 0.05, the relationship is statistically significant. Therefore, the null hypothesis is rejected.

DISCUSSION

The result for Research Question One showed that family factors influence student entrepreneurship development to a high extent, with a grand mean of 3.49 and a standard deviation of 0.77. This indicates that parental encouragement, family motivation, support for business ideas, family financial condition, entrepreneurial exposure, family values, guidance, and motivation for success through entrepreneurship are important to the entrepreneurial development of Business Education students. The finding agrees with Adeyemo and Olanrewaju (2021), who found that parental encouragement, financial support, and entrepreneurial exposure significantly influenced students' willingness to engage in business activities. The present finding also agrees with their conclusion that students from entrepreneurial families demonstrated stronger entrepreneurial intentions. Similarly, the finding supports Okafor and Eze (2020), who reported that family support, parental occupation, and entrepreneurial exposure positively influenced students' entrepreneurial skills and business start-up decisions. The agreement may be explained by the fact that students who receive encouragement, support, exposure, and guidance from their families are more likely to develop confidence and interest in entrepreneurial activities. The present study, however, extends the earlier studies by examining family influence alongside school and environmental factors among Business Education students in universities in Delta State.

The result for Research Question Two revealed that school factors influence student entrepreneurship development to a high extent, with a grand mean of 3.46 and a standard deviation of 0.77. The finding indicates that entrepreneurship courses, lecturers' encouragement, practical training, seminars and workshops, school environment, lecturer role models, mentorship, group projects, interaction with successful entrepreneurs, entrepreneurship education, and encouragement to develop innovative business ideas contribute to students' entrepreneurial development. This finding agrees with Ibrahim and Yusuf (2022), who found that entrepreneurship education improved students' entrepreneurial mindset, creativity, innovation, and business management skills. Their finding that access to entrepreneurship centres and mentorship programmes increased students' confidence to start businesses also supports the present result. The finding is further consistent with Adebisi and Lawal (2019), who reported that practical entrepreneurship programmes, innovation hubs, and supportive lecturers were associated with stronger entrepreneurial competencies and business orientation among tertiary institution students. The agreement suggests that the university environment can provide knowledge, practical experience, mentorship, encouragement, and opportunities that help students develop entrepreneurial competence. The present study differs in scope from the earlier studies because it examines these school factors together with family and environmental factors among Business Education students in Delta State.

The result for Research Question Three showed that environmental factors influence student entrepreneurship development to a high extent, with a grand mean of 3.45 and a standard deviation of 0.78. The result indicates that business opportunities, access to finance, government entrepreneurship programmes, economic conditions, modern technology, internet access, successful entrepreneurs, community support, government policies, networking opportunities, availability of markets, and the general business environment are relevant to students' entrepreneurial development. This finding agrees with Mohammed and Salisu (2021), who found that favourable government policies, good infrastructure, access to finance, and positive peer influence encouraged entrepreneurial activities among young people. The result also supports Ezeani and Okeke (2023), who found that students operating within supportive social environments demonstrated stronger entrepreneurial motivation and greater willingness to establish businesses. The consistency between the present finding and these studies suggests that the wider environment can either provide opportunities and support or create conditions that affect students' participation in entrepreneurship. While the previous studies considered youths generally or university students within particular environmental contexts, the present study focuses specifically on Business Education students in universities in Delta State and considers environmental factors together with family and school factors.

The result for Research Question Four showed a grand mean of 3.47 and a standard deviation of 0.77, indicating a high extent of combined influence of family, school, and environmental factors on student entrepreneurship development. This finding is consistent with the general pattern of the empirical studies reviewed. Adeyemo and Olanrewaju (2021) and Okafor and Eze (2020) established the importance of family support and entrepreneurial exposure; Ibrahim and Yusuf (2022) and Adebisi and Lawal (2019) demonstrated the contribution of entrepreneurship education and institutional support; while Mohammed and Salisu (2021) and Ezeani and Okeke (2023) emphasized the importance

of government, economic, social, and environmental conditions. Taken together, these studies support the view that student entrepreneurship is influenced by multiple interacting conditions rather than by a single factor. The present finding therefore reinforces the purpose of the study by showing that family, school, and environmental factors collectively provide an important context for the entrepreneurial development of Business Education students in universities in Delta State.

CONCLUSION

The study concludes that entrepreneurship development among Business Education students depends on supportive family background, effective university entrepreneurship programmes and favourable environmental conditions. Improving these factors will enhance entrepreneurial intentions, self-employment and economic development.

RECOMMENDATIONS

Sequel to the findings and conclusion of the study, the following recommendations are made:

1. Parents and guardians should encourage students to develop entrepreneurial interests by providing moral support, guidance, and where possible, financial assistance for viable business ideas.
2. Universities should strengthen practical entrepreneurship education by providing entrepreneurship training, workshops, seminars, and opportunities for students to acquire hands-on business skills. Universities should establish and adequately equip entrepreneurship hubs where students can receive practical training, mentorship, and support in developing and implementing business ideas.
3. Government should provide accessible grants, low-interest loans, and other financial support schemes to enable students with viable business ideas to start and sustain small businesses.
4. Lecturers should provide regular mentorship and guidance to students and encourage them to identify and develop innovative business opportunities.
5. Students should actively participate in entrepreneurship programmes, workshops, seminars, and practical business activities provided by their institutions.
6. Financial institutions should develop student-friendly funding schemes that provide accessible financial support to students who intend to establish small-scale businesses.
7. Government agencies, private organisations, and other relevant stakeholders should create a conducive entrepreneurial environment by improving access to markets, technology, infrastructure, and business-support programmes.

Abstract

The study assessed the extent of Augmented Reality (AR) and Internet of Things (IoT) technology integration in Business Education programme for students' skill acquisition in universities in South-East Nigeria. Descriptive research design was adopted for the study. Two research questions and two null hypotheses guided the study. The population comprised 130 Business Education lecturers in Federal and State Universities in South-East Nigeria. A census approach was adopted because the population was small and manageable. Data were collected using a structured questionnaire titled *Extent of Augmented Reality (AR) and Internet of Things (IoT) Technology Integration Questionnaire (EAITIQ)*. The instrument consisted of 20 questionnaire items structured on a four-point rating scale of Very High Extent, High Extent, Low Extent, and Very Low Extent. The instrument was face validated by three experts, comprising two experts in Business Education and one expert in Measurement and Evaluation from Michael Okpara University of Agriculture, Umudike. The reliability of the instrument was established using the Cronbach Alpha method, which yielded an overall reliability coefficient of 0.84. Mean and standard deviation were used to answer the research questions, while the independent samples t-test was used to test the null hypotheses at the 0.05 level of significance. The findings revealed that Business Education lecturers integrated both AR and IoT technologies to a very low extent in Business Education programme for students' skill acquisition. The study also revealed no significant difference between the mean ratings of lecturers in Federal and State Universities on the extent of AR and IoT technology integration. The study concluded that the very low integration of AR and IoT technologies limits opportunities for students to acquire relevant digital and business skills. It was recommended that university management and relevant government agencies should provide adequate AR and IoT facilities and infrastructure to enhance effective technology integration and students' skill acquisition.

Keywords: Augmented Reality, Internet of Things, Business Education, Technology Integration, Skill Acquisition.

Introduction

Universities around the world play a vital role in national development by promoting research innovations, intellectual growth, and workforce development. Universities are also crucial in equipping the youths with relevant knowledge, skills, and competencies they need to succeed in the fast-paced global economy. Universities foster technological development, social and economic support, and societal change. In Nigeria, universities significantly influence the country's socio-economic and political developments. Nigerian universities contribute to employability and sustainable development by producing skilled graduates for diverse sectors of the economy. In a similar vein, Nigerian universities address regional challenges in governance, energy, education, health, and agriculture while producing new knowledge

through research and innovation. Additionally, Koko and Owen (2022) stated that through policy recommendations, technology transfer, and entrepreneurship education, universities support Nigeria's sustainable development by promoting self-reliance and reducing unemployment among youths and graduates. Universities also foster analytical and critical thinking abilities, preparing future leaders to address Nigeria's complex governance and development issues. Nigerian universities are mandated to prepare students for the Fourth Industrial Revolution.

The Federal Government of Nigeria has recognized the importance of equipping its young people with employable skills that meet the demands of the 21st-century labour market. In view of this, the Nigerian government has consistently promoted skill-oriented and entrepreneurship education in universities as part of its strategy for youth empowerment, graduate employability, and national economic development (Okolie et al., 2020). Practical applications, experiential learning, and real-world problem-solving are the main focuses of skill-oriented Business Education. As a follow-up to this policy direction, the Federal Republic of Nigeria (FRN, 2021), in the *National Policy on Education* (NPE), emphasized the provision of a practical, skill-oriented learning environment in Nigerian universities to equip graduates with relevant competencies for self-reliance, employment, and national development. In order to reduce youth unemployment and promote self-employment, the policy supports Business Education programmes that equip students with relevant skills. According to the policy, offering students high-quality Business Education training would increase their employability potential and capacity to create employment, which would support the growth of the national economy.

In Nigeria, Business Education is a crucial component of Vocational Education programme that equip young people with the knowledge and skills they need to work for themselves or for pay. As noted by Olatoye, Ojeyinka, and Ogunleke (2020), Business Education is the nation's life-supporting machine. This is because it equips students with the knowledge and abilities they need to succeed after graduation rather than roaming the streets and engaging in criminal activity out of idleness. Azubuike, Ukaiko and Oguguo (2023) described Business Education as a part of vocational education programme that equips students with the knowledge and skills necessary to think, speak, and act in ways that support the growth, effectiveness and efficiency of organizations. Ile and Edokpolor (2023) noted that Business Education is competency-based and intend to give students the skills they need to pursue entrepreneurship once they graduate. In the same vein, Emeasoba and Nwataral (2021) noted that Business Education at university level is concerned mainly with the development of relevant saleable skills and knowledge that would enable an individual to function effectively in the world of work. Business Education is a thorough skilled-based education programme that equips students with knowledge, abilities, and competencies necessary for roles as producers or consumers, thereby preparing them for a career in business.

The primary goal of Business Education programme is to prepare students for careers in business, whether as teachers, office workers, or entrepreneurs, by emphasizing the development of marketable skills. Okolie et al. (2020) observed that higher education, including Business Education programmes, should equip graduates with employability skills, critical thinking, and entrepreneurial competencies needed to contribute effectively to economic growth. This is why many specialized courses in Accounting, Entrepreneurship, Office Technology and Management (OTM), and Distributive Education are all part of the university's Business Education programme. By bridging the gap between academic learning and the demands of the real world workplace, Business Education provides a comprehensive approach to vocational preparation. Okolo (2024) opined that Business Education provides students with a theoretical framework for understanding business management and equips them with the knowledge, skills, and techniques required to become successful entrepreneurs. Business Education training goes above conventional office skills to covering entrepreneurial skills like identifying opportunities, developing business plans, managing finances, marketing products, and leading organizations effectively. It equips students with innovativeness, creativity, and self-awareness for the digital business environment.

Presently, traditional teaching methods are insufficient for developing 21st-century skills of university Business Education students. This necessitates the integration of emerging technologies. The integration of digital technologies into Business Education enables students to develop essential 21st-century competencies, including critical thinking, creativity, collaboration, communication, digital literacy, problem-solving, and lifelong learning skills required for success in modern workplaces (Anyanwu, Govender & Ngwenya, 2022). Skills are the abilities and knowledge that people gain through learning, practice and experience which allow them to perform activities efficiently (Proctor & Xiong, 2017). Skills refer to learned abilities that enable individuals to perform specific tasks effectively and can be developed and improved

through education, training, practice, and experience. Skills are the measure of effectiveness of workers' performance, an individual's ability to perform to the standards and level required by the organization. The task of Business Education lecturer is to help students acquire needed skills by integrating technology into their instructional processes.

Skill acquisition is the acquisition of knowledge and skills and having them readily available from memory to making sense of future problems and opportunities. It is the process through which individuals develop new competencies, abilities or proficiencies (Barinua & Olarewaju, 2022). Skill acquisition involves more than just learning information; it encompasses the application, refinement, and mastery of skills over time through practice, feedback, and experience. Skill acquisition is central to curricula that aim to prepare learners for real-world tasks and employment. It is both a learning process and an outcome**,** where learners progress through stages from initial understanding to proficiency and often automatic performance by engaging repeatedly with tasks and reflecting on feedback. Magill and Anderson (2023) emphasized that internal processes associated with practice or experience that lead to relatively permanent changes in an individual's capability for skilled movement. This process can be influenced by instructional support strategies, practice quality, and motivation. Contemporary frameworks highlight stages such as the cognitive (initial learning), associative (practice and refinement), and autonomous (fluent performance) phases, underscoring that skill acquisition is not instantaneous but develops through sustained engagement (International Labour Organization, (ILO), 2025).
In order to ensure that Business Education students are ready for the realities of the 21st-century labour market, universities offering Business Education programme are under pressure to adjust to technological trends. Accordingly, Business Education programmes in Nigerian universities are supposed to improve students' skill acquisition for success in the workplace by incorporating technology in addition to teaching theoretical knowledge. The reason for this is the increasing digital connectivity of the world. The widespread adoption of digital technologies has brought about a significant change in the nature of business operations and the skills that employers require. The digital transformation of business has made competencies such as digital literacy, ICT proficiency, e-commerce, digital business analysis, communication, and the use of emerging digital technologies indispensable for Business Education graduates seeking success in the modern workplace (Nwokike & Chukwuma, 2022). Technology integration into Business Education programmes is now mandatory rather than optional.

Technology is referred to as the use of conceptual knowledge to accomplish practical objectives, particularly in a repeatable manner. Technology encompasses both intangible (software) and tangible (machinery or utensils) tools. Science, engineering, and daily life all depend on technology. Egbulem et al. (2024) stated that technology is the practical application of scientific knowledge in a range of fields, including business, governance, and education. It contains tools and structures that increase output and effectiveness. Udeze and Adesola (2024) stated that technology is the use of digital tools and resources to improve student performance in learning environments. In a similar vein, Adedokun, Awung and Usadolo (2024) conceptualized technology as the digital transformation of practices and knowledge that affects the way education is given and received. Technology covers the preparedness and diffusion of digital developments in universities, highlighting its significance to preparing students for the Fourth Industrial Revolution. Coccia (2019) added that technology is the clever creation of new tools both conceptual and ideational for resolving difficult situations, and that it must be integrated into the teaching and learning of education.

The smooth integration of digital resources and technological know-how into education is known as integration. The focus is on using carefully chosen hardware and software to accomplish curriculum objectives. It connotes using technology to improve and assist the learning environment or achieve pedagogical goals. Lecturers in Business Education can integrate computers, smartphones, and virtual reality tools to help students learn. There are many opportunities for all Business Education students in classrooms with high technology integration. Ramorola (2018) asserted that the integration of technological resources, including web programs, hardware, software, and multimedia, to enhance teaching and learning is known as technology integration. It is a teaching tool used to present material from the current curriculum. Over time, the term has changed, originally emphasizing the use of different applications and the development of computer literacy. United Nations Educational, Scientific and Cultural Organization (UNESCO), 2024) stated that technology integration is now known as using technologies to learn, rather than learning to use technologies.

Technology integration is an essential teaching and learning instrument that fosters active learning and enhances students' critical thinking, creativity, and teamwork. It makes teaching and learning activities more effective by improving the skills of both lecturers and students. Since the quick development of computers and the internet has caused a paradigm shift in knowledge and pedagogy, a technology-integrated curriculum should serve as the foundation for a technology-integrated education (Ramorola, 2018). This change can be seen in interactive classrooms, where books are being replaced by mobile devices, overhead projectors are being replaced by smart boards, and conventional printers are being replaced by 3D printers. With interactive whiteboards, smart boards, and 3D printers that can not only print documents but also instruct, and produce, technological innovations are revolutionizing the classroom. In support, Edeh et al. (2020) maintained that the use of emerging technologies in education improves instructional delivery, promotes innovation and creativity, increases learners' engagement, and equips both educators and learners with digital problem-solving skills necessary for the 21st century. Social media platforms, networks, applications, the Internet, classroom procedures, and school management systems are all included in technology integration most comprehensive form. Nwokike and Chukwuma (2022) pointed out that in order to enhance teaching and learning outcomes and acquisition of 21st century skills, technology integration in Business Education makes use of resources such as artificial intelligence, mobile learning, accounting software, ERP tools, learning management systems, and computer-based simulations. In the same vein, Bond et al. (2020) reported that higher education institutions increasingly integrate digital technologies such as learning management systems (LMS), mobile learning, cloud-based platforms, and virtual learning environments to improve teaching, learning, collaboration, and student engagement. This study will focus on Augmented Reality (AR) technology and Internet of Things (IoT) technology in Business Education programme.

Augmented Reality (AR) holds great promise for creating more engaging, dynamic, and practical learning environments. By superimposing digital information onto the real world, augmented reality technology integration allows students to interact with virtual elements in their physical surroundings. Abdul-Salaam (2024) noted that augmented reality (AR) has the potential to enrich teaching and learning by creating more interactive and immersive learning experiences that can enhance students' engagement and motivation. Students can practice tasks like product design and customer service interactions by using AR visualizations in Business Education to make abstract concepts more tangible. These technologies provide personalized learning by accommodating varying learning styles and speeds. By doing away with the need for expensive equipment and real-world models, the increasing popularity of AR apps in Nigeria democratizes education and raises awareness of its potential (Amadi-Iwai & Omoni, 2024). Another powerful tool for integration in Business Education programme is the Internet of Things (IoT).

Presently, integrating the Internet of Things (IoT) into Business Education programme of Nigerian universities is another creative way to equip future business leaders (students studying Business Education) with skills they need to thrive in a world that is becoming more interconnected by the day. Internet of Things is a network of physical objects with sensors, software, and other technologies integrated to enable data collection and sharing. The IoT can be integrated into Business Education classrooms and smart campuses to enable distance learning, optimize course allocation, personalize learning, and create interactive learning environments. Similarly, security systems driven by IoT keep an eye on campuses and guarantee Business Education students' safety. Furthermore, IoT-related skills can be integrated into Business Education programmes to get students ready for the digital business world. The IoT examples include smart classrooms that use interactive whiteboards and tablets, and wearable technology to monitor students' stress levels and physical well-being.

Technology integration in Business Education programmes in Nigerian universities has become a crucial strategy for equipping students with the necessary skills for the workforce of the twenty-first century. Obviously, there are many advantages and noteworthy disadvantages to integrating technology into Business Education programmes. Even though technologies have the potential to completely transform Business Education, a number of problems seem to prevent their integration effectively. As noted by Umeano and Ifi (2019), integrating technology into Nigerian universities presents a number of difficulties including lack of staff training, insufficient funding, resistance to change, inflexible curricula, digital divide, and administrative and policy issues. Similar to this, Ezeabii, Ekoh and Okwor (2020) observed that some universities, including those in South East Nigeria, continue to employ traditional teaching methods that promote memorization despite the many advantages of integrating technologies in teaching and learning. Ezeabii et al. further noted that the instructional delivery is still teacher-centered rather than student-

centered. Following that, Ezeabii and Agomuo (2017) pointed out that it is unacceptable for some Business Education lecturers to not integrate technologies when instructing.

Universities are institutions of higher learning established to provide advanced teaching, research, and community service while producing skilled manpower for national development. They are responsible for equipping students with the knowledge, competencies, and practical skills required for professional practice, innovation, and lifelong learning. According to the National Universities Commission (NUC, 2023), universities are institutions authorized to offer undergraduate and postgraduate education, conduct research, promote innovation, and contribute to national development through teaching, research, and community service. Similarly, Alemu (2018) described universities as centres of higher learning where individuals are intellectually developed through systematic teaching and research in various disciplines.

In Nigeria, universities are broadly classified into Federal, State, and Private Universities based on ownership and administration. However, this study is limited to Federal and State Universities because they constitute the public university system, are funded by government, and operate under similar regulatory policies established by the National Universities Commission. Federal Universities are established and funded by the Federal Government of Nigeria, while State Universities are established and financed by individual state governments to meet the educational and manpower needs of their respective states. Both categories play a significant role in producing qualified graduates and implementing national educational policies, including the integration of technology into teaching and learning. Federal and State Universities are expected to provide adequate technological infrastructure, competent academic staff, and supportive learning environments that enable the effective integration of emerging technologies into Business Education programmes. Through the provision of digital learning resources, internet connectivity, virtual learning platforms, and other instructional technologies, these universities are expected to equip Business Education students with the practical and digital competencies required in the contemporary labour market.

These universities are expected to integrate emerging technologies such as Artificial Intelligence, Course Management Platforms, Mobile Learning, Virtual Reality, Augmented Reality, Internet of Things, and Adaptive Learning Technologies into instructional delivery to enhance Business Education students' acquisition of relevant employability and entrepreneurial skills. Therefore, the study focuses on determining the extent to which extent Augmented Reality (AR) and Internet of Things (IoT) technology is integrated in Business Education programme for students' skill acquisition.

Statement of the Problem

Technology is driving the modern global economy more and more, changing business operations, and the labour market's overall structure. Universities in particular are expected to provide students with industry-relevant technological skills in order to meet these changing demands. In order to improve students' employability and skill acquisition, technology integration into educational programmes particularly Business Education is essential in Nigeria. Students are better prepared for the realities of contemporary business environments through the integration of technology in Business Education programmes, which enhances critical thinking, creativity, and problem-solving abilities.

Despite the importance of technology, its integration in South-East Nigerian universities' Business Education programmes appears to be erratic and frequently insufficient. This might be because Business Education lecturers in the area have limited access to contemporary technologies and have gaps in their digital literacy. In support, Many Nigerian universities' curricula still mainly rely on conventional teaching techniques with little to no use of digital platforms, virtual simulations and industry-specific technologies. Students' capacity to learn digital skills that are necessary for succeeding in the job markets of the twenty-first century is restricted by this lack of technology integration. It appears that Business Education lecturers have limited ability to successfully integrate digital technologies into their teaching, even in cases where they are available.

As a consequence of inadequate integration of digital technologies in teaching, many graduates of Business Education are ill-equipped to meet employers' digital expectations which hinder their employability and opportunities for entrepreneurship. In a similar vein, graduates who are able to secure jobs in modern organizations are unable to carry out their office duties efficiently because they lack the necessary modern office skills. The problem of this study is on the level of technology integration in

Business Education programmes at Nigerian universities, particularly in the South East region, which if not addressed will bring the skills gap between graduates of Business Education programme and the demands of the changing digital economy. This will worsen unemployment rates in Nigeria and the South East region, and further lead to inherent youth social vices. In light of this, this study aims to investigate the extent of Augmented Reality (AR) and Internet of Things (IoT) technology integration in Business Education programme for students' skill acquisition in universities in South-East, Nigeria.

Purpose of the Study

The purpose of this study was to determine the extent of Augmented Reality (AR) and Internet of Things (IoT) technology integration in Business Education programme for students' skill acquisition in universities in South-East, Nigeria. Specifically, this study sought to determine the extent to which;

1. Augmented Reality (AR) technology is integrated into Business Education programme for students' skill acquisition in universities.
2. Internet of Things (IoT) technology is integrated into Business Education programme for students' skill acquisition in universities.

Research Questions

The following research questions guided this study;

1. To what extent is augmented reality (AR) technologies integrated in Business Education programme for students' skill acquisition in universities?
2. To what extent is internet of things (IoT) technologies integrated in Business Education programme for students' skill acquisition in universities?

Hypotheses

The following null hypotheses were formulated and be tested at 0.05 level of significance;

$H0_5$: Business Education lecturers in Federal and State Universities do not significantly differ in their mean ratings on the extent of integration of augmented reality (AR) technology in Business Education programme for students' skill acquisition in universities in South-East, Nigeria.

$H0_6$: There is no significant difference between the mean ratings of Federal and State Universities Business Education lecturers on the extent of integration of internet of things (IoT) technology in Business Education programme for students' skill acquisition in universities in South-East, Nigeria.

Methodology

A descriptive survey research design was adopted for this study. The design was considered appropriate because it enabled the researcher to collect data from Business Education lecturers on their perceived extent of Augmented Reality (AR) and Internet of Things (IoT) technology integration in Business Education programme for students' skill acquisition in universities in South-East, Nigeria. The study was conducted in Federal and State Universities in South-East Nigeria offering Business Education programmes**.** The population of the study comprised 130 Business Education lecturers, consisting **of** 88 lecturers from Federal Universities and 42 lecturers from State Universities offering Business Education programmes in South-East Nigeria. The population was obtained from the Academic Planning Units of the universities. A census sampling technique was adopted because the population was relatively small, manageable and accessible to the researcher and her research assistants. Therefore, the entire population of 130 Business Education lecturers was used for the study.The instrument for data collection was a researcher-developed structured questionnaire titled "Extent of Augmented Reality (AR) and Internet of Things (IoT) technology Integration Questionnaire (EAITIQ)." The instrument was structured into two sections, A and B. Section A elicited information on the respondents' demographic characteristics, particularly the ownership of the university, while Section B contained questionnaire items on the integration of emerging technologies in Business Education programme for students' skill acquisition. For the purpose of this study, Section B comprised 20 relevant items in two clusters**,** with 10 items measuring the extent of Augmented Reality (AR) technology integration and 10 items measuring the extent of Internet of Things (IoT) technology integration. The instrument was structured on a four-point rating scale of Very High Extent (VHE) = 4, High Extent (HE) = 3, Low Extent (LE) = 2, and Very Low Extent (VLE) = 1**.** The instrument was face validated by three experts, comprising two experts in Business Education and one expert in Measurement and Evaluation**,** all from Michael Okpara University of Agriculture, Umudike, Abia State**.** The copies of the questionnaire were accompanied by the research topic, purpose of the study, research questions and hypotheses. The experts examined the instrument in terms of the appropriateness of the language, content and coverage of the items and made necessary corrections and suggestions. Their observations and

recommendations were incorporated into the final version of the instrument to ensure that it adequately measured the constructs of the study. The reliability of the instrument was established using the Cronbach Alpha reliability method. Twenty copies of the questionnaire were administered to 20 Business Education lecturers from a university outside the study area but with similar characteristics. The reliability coefficients obtained for the different clusters ranged from 0.81 to 0.85, while an overall reliability coefficient of 0.84 was obtained. This indicated that the instrument possessed satisfactory internal consistency and was considered reliable for data collection. The researcher personally administered 130 copies of the questionnaire to the respondents with the assistance of two trained research assistants who were adequately briefed on the modalities for the administration and collection of the instrument. The questionnaires were administered directly to the respondents in their offices. On-the-spot completion was adopted, while respondents who could not complete the questionnaire immediately were revisited on an agreed date for retrieval. The exercise lasted for a period of two weeks. Out of the 130 copies administered, 127 copies representing 97% were successfully retrieved and used for data analysis**.** The data collected were analysed using mean and standard deviation to answer the research questions. The mean was used to determine the extent of technology integration, while standard deviation was used to determine the degree of homogeneity of the respondents' ratings. The decision on the questionnaire items was based on the real limits of numbers as follows**:** Very High Extent (VHE) = 3.50–4.00, High Extent (HE) = 2.50–3.49, Low Extent (LE) = 1.50–2.49, and Very Low Extent (VLE) = 1.00–1.49**.** The independent samples t-test was used to test the null hypotheses at the 0.05 level of significance. The null hypothesis was rejected where the calculated p-value was less than 0.05, indicating a statistically significant difference between the mean ratings of Business Education lecturers in Federal and State Universities. Where the p-value was greater than 0.05, the null hypothesis was not rejected.

Results

Research Question 1: To what extent are Augmented Reality (AR) technologies integrated in Business Education programme for students' skill acquisition in universities?

Table 1: Mean Analysis of ratings of Business Education lecturers in Federal and State Universities on the extent Augmented Reality technologies are integrated in Business Education programme for students' skill acquisition in universities.

10	AR-integrated e-commerce tools to he students acquire digital entrepreneurship skills	1.44	0.68	VLE	1.39	0.60	VLE
	Cluster mean	**1.38**	**0.64**	**VLE**	**1.32**	**0.65**	**VLE**

VL E= Very Low Extent

The data in Table 1 reveal that the mean ratings of Business Education lecturers in Federal and State Universities in all the items (1-10) ranged between 1.20 and 1.44 which fall within the real limit of number range of 1.00-1.49 indicating very low extent responses. The cluster mean of 1.38 and 1.32 for Business Education lecturers in Federal and State Universities respectively which equally fall within the real limit of number range of 1.00-1.49 indicated that Business Education lecturers agreed that they integrate Augmented Reality (AR) technologies to a very low extent in Business Education programme for students' skill acquisition in universities. The cluster standard deviation of 0.64 and 0.65 for Business Education lecturers in Federal and State Universities respectively showed that their mean responses were not far from the mean value.

Hypothesis 1: Business Education lecturers in Federal and State Universities do not significantly differ in their mean ratings on the extent of integration of Augmented Reality (AR) technologies in Business Education programme for students' skill acquisition in universities in South East Nigeria.

Table 2: t-test Analysis of mean ratings of Business Education lecturers in Federal and State Universities on the extent Augmented Reality technologies are integrated in Business Education programme for students' skill acquisition in universities.

University Lecturers	N	X	Sd	df	t-cal.	*p*-value	Remark
Federal	86	1.38	0.64	125	0.49	1.00	NS
State	41	1.32	0.65				

Results in Table 2 reveal a t-calculated value of 0.49 and *P*- value of 1.00 at degree of freedom (df) of 125. Since the *P*- value of 1.00 is greater than the alpha value of 0.05, the hypothesis of no significant difference was not rejected. Therefore, there is no significant difference between the mean ratings of Business Education lecturers in Federal and State universities on the extent Augmented Reality technologies are integrated in Business Education programme for students' skill acquisition in universities in South East Nigeria.

Research Question 2: To what extent are Internet of Things (IoT) technologies integrated in Business Education programme for students' skill acquisition in universities?

Table 3: Mean Analysis of ratings of Business Education lecturers in Federal and State Universities on the extent Internet of Things technologies are integrated in Business Education programme for students' skill acquisition in universities.

S/N	Internet of Things technologies integration f students' skill acquisition in universities. I do utilize:	Federal Universities (8 X	SD	Remark	State Universities (41) X	SD	Remark
11	Smart sensors to equip students with da collection skills	1.28	0.69	VLE	2.16	0.64	VLE
12	Smart boards/IoT-enabled classrooms to enable students acquire presentations skills	1.36	0.68	VLE	1.40	0.68	VLE
13	IoT-connected business simulators to equ students with ability to analyze business risk	1.34	0.70	VLE	1.39	0.69	VLE
14	Smart watches/fitness trackers to teach students task management skills	1.30	0.66	VLE	1.26	0.55	VLE
15	IoT-driven performance trackers to teac students skills in performance and se monitoring in business environment	1.21	0.61	VLE	1.28	0.58	VLE

16	IoT-powered feedback devices to help tra students on skills in feedback interpretation	1.42	0.61	VLE	1.29	0.71	VLE
17	Smart projectors/IoT-based presentation tools enable students acquire visual communicatic skills	1.34	0.72	VLE	1.36	0.54	VLE
18	IoT-Based security system such as biometr logins to teach students ethical use of technolo in business	1.42	0.65	VLE	1.35	0.63	VLE
19	IoT dashboards connected smart devices enable students acquire business intelligenc skills	1.39	0.67	VLE	1.21	0.62	VLE
20	IoT automated payments enable studen understand financial technology operations	1.32	0.58	VLE	1.30	0.57	VLE
	Mean Cluster	**1.34**	**0.66**	**VLE**	**1.31**	**0.62**	**VLE**

VLE=Very Low Extent

The result in Table 3 show that the mean ratings of Business Education lecturers in Federal and State Universities in all the items (11-0) ranged between 1.21 and 1.42 which fall within the real limit of number range of 1.00-1.49 indicating very low extent responses. The cluster mean of 1.34 and 1.31for Business Education lecturers in Federal and State Universities respectively which equally fall within the real limit of number range of 1.00-1.49 indicated that Business Education lecturers agreed that they integrate Internet of Things (IoT) technologies to a very low extent in Business Education programme for students' skill acquisition in universities. The cluster standard deviation of 0.66 and 0.62 for Business Education lecturers in Federal and State Universities respectively showed that their mean responses were not far from the mean value.

Hypothesis 6: There is no significant difference between the mean ratings of Business Education lecturers in Federal and State Universities on the extent of integration of Internet of Things (IoT) technologies in Business Education programme for students' skill acquisition in universities in South East Nigeria.

Table 4: t-test Analysis of mean ratings of Business Education lecturers in Federal and State Universities on the extent Internet of Things technologies are integrated in Business Education programme for students' skill acquisition in universities

University Lecturers	N	X	Sd	df	t-cal.	*p*-value	Remark
Federal	86	1.34	0.66	125	0.12	1.21	NS
State	41	1.31	0.62				

Data in Table 4 reveal a t-calculated value of 0.12 and *P*- value of 1.21 at degree of freedom (df) of 125. Since the *P*- value of 1.21 is greater than the alpha value of 0.05, the hypothesis of no significant difference was not rejected. Therefore, there is no significant difference between the mean ratings of Business Education lecturers in Federal and State universities on the extent Internet of Things (IoT) technologies are integrated in Business Education programme for students' skill acquisition in universities in South East Nigeria.

Discussion of Findings

It was found from the study that Business Education lecturers integrate Augmented Reality technologies to a very low extent in Business Education programme for students' skill acquisition in universities. The results in other words means that the extent Business Education lecturers integrate Augmented Reality technologies in Business Education instructions at Universities was to a very low extent. This implies that they do not use those technologies adequately in teaching Business Education that could enable them acquire some skills. The results specifically indicated that lecturers to a very low extent use Augmented technologies such as AR Mobile Apps such as JigSpace/AR Business Card to help students develop digital communication skills, to a very low extent use AR Training Simulations to enable students acquire conflict resolution skills in business environments, to a very low extent use Augmented Reality-based business simulations to teach students financial literacy skills and to a very low extent Augmented Reality-integrated e-commerce tools to help students acquire digital entrepreneurship skills among others. This implies a very low level of use of those Augmented Reality technologies which are not adequate to enable students acquire skills. It was further found from the study that there was no significant difference between the mean ratings of Business Education lecturers in Federal and State Universities on the extent Augmented Reality

(AR) technologies are integrated in Business Education programme for students' skill acquisition in universities in South East Nigeria. This implies that the extent of utilization of those technologies did not vary significantly across the university types. The results agreed with Wordu and Anim (2021) who found from a similar study that modern technologies were poorly integrated in teaching and learning Business Education programmes in tertiary institutions. The results further supported the findings from Sani, Kusada and Inde (2024) which showed among others that Augmented Reality technologies were poorly using technical subjects that have no impacts on the students. Augmented Reality technologies were integrated into Business Education programmes at a very low extent**,** with no significant difference between Federal and State Universities. This indicates the need for improved access, lecturer capacity and institutional support for effective AR integration and students' skill acquisition.

The results revealed that Business Education lecturers integrate Internet of Things (IoT) technologies to a very low extent in Business Education programme for students' skill acquisition in universities. This implies that Internet of Things (IoT) technologies are not adequately integrated in Business Education to enhance students' skill acquisitions. Specifically, Business Education lecturers agreed that they to a very low extent, integrate Internet of Things (IoT) technologies such as business simulators to equip students with ability to analyze business risk. They further agreed that they to a very low extent use Internet of Things (IoT) technologies such as IoT-driven performance trackers to teach students skills in performance and self-monitoring in business environment as well as IoT dashboards connected smart devices to enable students acquire business intelligence skills. The results also indicated that there was no significant difference between the mean ratings of Business Education lecturers in Federal and State Universities on the extent Internet of Things (IoT) technologies are integrated in Business Education programme for students' skill acquisition in universities in South East Nigeria. This implies that both lecturers of Business Education in federal and state universities were in agreement that there was a very low level of the integration of Internet of Things (IoT) technologies in Business Education programme for students' skill acquisition in universities in South East. The results aligned with Ayelaagbe (2024) who in a similar study found that the use of Internet of Things technologies in classrooms was very low with very low impacts on the undergraduate students. Similarly, the results supported Chukwu-Umahi and Okoli (2023) who reported from a similar study that the access and use of Internet of Things technologies such as Web.2.0 technologies in Business Education was very low. Internet of Things technologies were integrated into Business Education programmes at a very low extent, with no significant difference between Federal and State Universities. This suggests the need for greater provision of IoT facilities, training and support to enhance students' skill acquisition.

Conclusion

Based on the findings of the study, it was concluded that Business Education lecturers integrate Augmented Reality (AR) and Internet of Things (IoT) technologies to a very low extent in the Business Education programme for students' skill acquisition in universities in South-East Nigeria. The study established that the limited integration of these emerging technologies constrains opportunities for students to develop relevant digital, business, communication, financial literacy, performance monitoring, business intelligence and digital entrepreneurship skills required in contemporary work environments. The study further established that there was no significant difference between the mean ratings of lecturers in Federal and State Universities on the extent of integration of both AR and IoT technologies, indicating that the very low level of integration cuts across the two categories of universities. Therefore, improving the integration of AR and IoT technologies through adequate technological infrastructure, lecturer training, technical support, funding and curriculum enhancement is essential for strengthening instructional delivery and equipping Business Education students with relevant skills for the demands of the contemporary digital economy.

Recommendations

Based on the findings and conclusion, the following recommendations were made:

1. University management and relevant government agencies should provide adequate facilities, infrastructure and technical support for the integration of Augmented Reality (AR) technologies in Business Education programmes by providing appropriate AR devices, applications, reliable internet connectivity and other relevant digital resources. This will enable Business Education lecturers to effectively integrate AR technologies into teaching and provide students with

interactive learning experiences that can enhance their digital communication, conflict resolution, financial literacy and digital entrepreneurship skills.

2. University management and relevant stakeholders should provide adequate Internet of Things (IoT) facilities and organize regular capacity-building programmes for Business Education lecturers on the effective use of IoT technologies in teaching and learning **through** workshops, seminars, practical training and technical support. This will enable lecturers to effectively integrate IoT technologies such as business simulators, performance trackers and IoT dashboards into instruction and enhance students' acquisition of business risk analysis, performance monitoring, self-monitoring and business intelligence skills.

ENTREPRENEURSHIP EDUCATION IN THE DIGITAL ERA: ISSUES, CHALLENGES, OPPORTUNITIES AND STRATEGIES FOR TECHNOLOGY-ENABLED LEARNING IN NIGERIA

Usman Ladan Kurya, PhD & Asmau Salihu Yauri, PhD
Department of Entrepreneurship Education,
School of Business Education,
Federal College of Education (Technical), Gusau, Zamfara State, Nigeria
Correspondence: shehulkm64@gmail.com, 08068046160

Abstract

Entrepreneurship education is increasingly expected to prepare learners not only to start and manage ventures but also to identify opportunities, create value, solve problems, and operate within rapidly changing digital environments. The expansion of artificial intelligence (AI), digital platforms, data-driven technologies, virtual and augmented reality, mobile technologies, and generative AI is consequently creating new possibilities for the content, pedagogy, assessment, and organisation of entrepreneurship education. This paper examines these developments with particular attention to Nigeria and comparable developing-country contexts. It adopts a structured conceptual literature-review approach and thematically synthesises literature on entrepreneurship education, digital entrepreneurship, educational technology, experiential learning, and artificial intelligence in education. The analysis is guided by Human Capital Theory, Experiential Learning Theory, and the Technology Acceptance Model. The synthesis identifies five interconnected challenges: inadequate digital infrastructure and access, curriculum and competency misalignment, limited educators' digital capability and institutional readiness, assessment and academic-integrity challenges, and persistent digital inequality. Digital technologies also created opportunities for virtual incubation, simulation-based learning, technology-assisted venture development and AI-supported feedback and ideation, personalised learning, and global collaboration and digital market access. The paper proposes an integrated conceptual framework in which human capital, experiential pedagogy, meaningful technology acceptance, and enabling institutional conditions shape technology-enabled entrepreneurial learning. It argues that Nigerian institutions should pursue context-sensitive and inclusive digital transformation rather than technology adoption for its own sake, combining infrastructure and access initiatives with curriculum development, educator capacity building, authentic assessment, responsible AI governance, and stronger engagement with entrepreneurial and industry ecosystems.

Keywords: *Entrepreneurship Education; Digital Era; New technologies; Artificial Intelligence*; *Generative AI; Large Language Models*

1. Introduction

Entrepreneurship education has become an important component of contemporary education because it develops knowledge, skills, attitudes and capabilities that support opportunity recognition, problem solving, innovation, employability, and entrepreneurial action. From a Human Capital Theory perspective, education and training constitute investments that build productive knowledge and skills, while entrepreneurship research indicates that task-related knowledge and skills are particularly relevant to entrepreneurial success (Becker, 1964; Unger et al., 2011). Entrepreneurship education is therefore increasingly expected to move beyond the transmission of conventional business knowledge toward the development of competencies that learners can apply in changing economic environments.

The transformation of the entrepreneurial environment is closely associated with the growth of digital technologies. Digital platforms, online marketplaces, cloud services, mobile technologies, data analytics, and artificial intelligence have altered how opportunities are identified, products and services are developed, customers are reached, and value is created.

Nambisan (2017) argues that digital technologies transform the nature of entrepreneurial processes and outcomes by making entrepreneurial processes less bounded and by changing the landscape of entrepreneurial activities and, hence altering operational patterns. These changes necessitate transformation of entrepreneurship education. Entrepreneurship educators therefore face the dual challenge of developing entrepreneurial capabilities and creating learning environments in which learners can meaningfully and confidently engage with digital technologies.

The emergence of generative artificial intelligence (GenAI) since 2022 has added a further dimension to this transformation. Generative AI tools can support activities such as idea generation, business-

model development, feedback, scenario exploration, and the design of entrepreneurship teaching exercises (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024). However, the educational value of these tools depends on how they are incorporated into pedagogy rather than on the technology alone. Bell and Bell (2023) argue that GenAI has implications for entrepreneurship pedagogy, teaching practice, curriculum design, and assessment, while emphasizing the need for managed integration and the development of students' critical and reflective thinking.

The use of GenAI raises issues of responsible and ethical educational practice. In entrepreneurship education, these concerns are dealt with by AI governance and institutional guidance and human-centred approaches to adoption of digital technologies relating to privacy, human oversight, equity, safety, transparency, and the responsible use of generative AI (Miao & Holmes, 2023).

This paper therefore examines entrepreneurship education in the digital era, using Nigeria as the principal contextual reference while drawing comparative insights from wider educational and entrepreneurship literature. The purpose is to examine the conditions under which digital technologies can strengthen entrepreneurial learning and the institutional, pedagogical, infrastructural, and ethical barriers that may constrain such benefits. To achieve that, it brings together Human Capital Theory, Experiential Learning Theory, and the Technology Acceptance Model to provide complementary explanations of technology-enabled entrepreneurship education (Becker, 1964; Davis, 1989; Kolb, 1984). It also incorporates the digital-entrepreneurship perspective advanced by Nambisan (2017) and the human-capital evidence synthesized by Unger et al. (2011).

The paper makes three main contributions. First, it integrates Human Capital Theory, Experiential Learning Theory, and the Technology Acceptance Model into a common conceptual explanation of technology-enabled entrepreneurship education, while recognizing the distinct role of digital technologies in entrepreneurial processes (Becker, 1964; Davis, 1989; Kolb, 1984; Nambisan, 2017; Unger et al., 2011). Second, it consolidates major opportunities and constraints into a coherent analytical structure, with particular attention to the Nigerian context. Third, it extends the discussion to application of generative AI, large language models, and AI-assisted entrepreneurial learning considering recent scholarship (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024; Yu et al., 2025).

The paper is presented as a conceptual exploratory review rather than a completed systematic review. It consists of eleven parts. This section forms the first part which is followed by a review of entrepreneurship education in the digital era in Nigerian context as the second part. The third section delves into theoretical framework and the fourth explained the methodology used. While section five is devoted to challenges, section six highlighted the opportunities presented by digital technologies in teaching and learning entrepreneurship. Section seven concentrates on strategies for effective entrepreneurship education in the digital era, while section eight discusses the review. Whereas, section ten presents the integrated strategic framework, the second to last section explains the policy implications and conclusion forms the last section.

2.Entrepreneurship Education in the Digital Era

Entrepreneurship education is witnessing series of changes resulting from introduction of new digital technological devices and tools. These changes have profound effects on curriculum contents and delivery, entrepreneurial practices and operational patterns. These developments necessitate acquisition of required entrepreneurial competencies.

2.1. Transformation of Entrepreneurial Competencies

Digital transformation has unleashed changes that alter the knowledge, skills, and capabilities required for contemporary entrepreneurial activity. Consequently, entrepreneurship education curricula in higher education are undergoing a transformation from the traditional business school model to an interdisciplinary technology-rich model (Kazakeviciute et al., 2016; Rafiana, 2023). While the traditional entrepreneurship curricula commonly emphasise opportunity identification, business planning, marketing, accounting, finance, management, and venture development. These foundational competencies remain important; however, the increasing use of digital technologies has expanded the range of capabilities relevant to entrepreneurial processes. Currently, there is increasing focus on technology-enhanced entrepreneurship curricula, as advancements in educational technology have brought new inspiration and tools (Secundo et al., 2020, Udekwe & Iwu, 2024). As a result, entrepreneurship education increasingly needs to incorporate competencies relating to application of digital technological devices, tools, platforms for learners to acquire relevant skills and competencies to enable the practice of e-commerce, social-media marketing, data interpretation, online customer discovery, digital payments, remote collaboration, and the appropriate use of emerging technologies.

The introduction of GenAI in 2022 has brought in additional instructional pedagogies in teaching entrepreneurship education. For example, Yu et al. (2025), in a systematic review of 50 peer-reviewed articles published between 2019 and early 2025, identified four major areas of GenAI-enabled

entrepreneurship education: personalized and adaptive instruction, simulation-based entrepreneurial training, virtual incubation, technology-assisted venture development and AI-supported feedback and ideation. The implication of the current changes is not that technology training should replace foundational entrepreneurship knowledge. Rather, entrepreneurship curricula should combine established entrepreneurial competencies with technology-related capabilities that are relevant to contemporary entrepreneurial environments. Such an approach supports a broader competence model in which entrepreneurial judgement, opportunity recognition, problem solving, and value creation are complemented by appropriate technological skills and competencies (Nambisan, 2017). Technology should therefore be integrated into established entrepreneurial learning processes rather than treated as an independent educational objective. Students can use digital tools to investigate customer needs, analyse competitors, prototype products and services, analyse market information, communicate value propositions, and test aspects of business models. When these activities are deliberately designed around action, reflection, experimentation, and revision, technology can support experiential entrepreneurial learning (s). The central learning objective should remain the development of entrepreneurial capability and value-creation capacity, with digital technology functioning as an enabling resource rather than an end in itself.

2.2 Entrepreneurship Education in the Digital Era in Nigeria

Nigeria provides an important context for examining entrepreneurship education in the digital era because of its large and youthful population, expanding digital economy, and substantial entrepreneurial activity, alongside continuing challenges in digital infrastructure and access. Nigeria's digital transformation has created opportunities for greater participation in digitally enabled economic activities, but persistent gaps in connectivity, affordability, digital skills, and supporting infrastructure continue to affect the extent to which individuals and institutions can benefit from these opportunities (World Bank, 2019). These conditions have direct implications for entrepreneurship education because access to technology is closely connected to learners' opportunities to acquire and apply digital competencies.

The challenges associated with technology-enabled entrepreneurship education should therefore not be treated as merely technical problems. Differences in connectivity, affordability, device access, electricity, digital skills, and institutional capacity can influence who participates in technology-mediated learning, how consistently digital resources can be used, and the quality of learning experiences available to students. In Nigerian tertiary education, concerns about the practical orientation and functionality of entrepreneurship education also reinforce the need to connect curriculum content with the competencies required for meaningful entrepreneurial activity (Ereh et al., 2019). The effectiveness of entrepreneurship education in digital era depends not only on the availability of technologies but also on the capacity of institutions and educators to integrate those technologies into relevant learning activities.

The Nigerian situation also illustrates an important distinction between individual digital familiarity and institutional digital readiness. Young people may use smartphones, social-media platforms, and other digital services regularly, while educational institutions may continue to face limitations in providing reliable broadband, appropriate learning platforms, digital learning resources, simulation facilities, and systematic professional development for educators. The implications to entrepreneurship education is that digital transformation may occur alongside infrastructure deficits, affordability constraints, uneven digital skills, and institutional capacity limitations. However, regular use of consumer-oriented digital technologies should therefore not automatically be interpreted as evidence of the deeper digital competencies required for productive, ethical, and innovative entrepreneurship. From this perspective, entrepreneurship-education policy should distinguish between informal digital participation, functional digital competence, and institutionally supported digital entrepreneurial capability (Nambisan, 2017; World Bank, 2019).

A technology-enabled entrepreneurship-education strategy should therefore be designed around the conditions under which learners can meaningfully access, understand, evaluate, and apply digital technologies. Such an approach shifts attention from informal digital participation toward inclusive access, educator capacity, pedagogical integration, and the development of entrepreneurial and digital human capital to ensure functional digital competence, and institutionally supported digital entrepreneurial capability (Nambisan, 2017).

2.3 Curriculum, Pedagogy and Assessment

Other aspects of concern in the discourse of entrepreneurship education in the era of technology include: curriculum, pedagogy and assessment because curriculum transformation need to be accompanied by suited pedagogical transformation and appropriate assessment tools and procedures.

Assessment presents a related challenge because entrepreneurship education seeks to develop capabilities that may not be adequately captured by conventional examinations. Opportunity recognition, entrepreneurial judgement, creativity, problem solving, collaboration, experimentation, and the ability to learn from feedback may require assessment approaches that capture processes as well as final outputs. Project-based assessment, business-model portfolios, prototypes, venture pitches, customer-discovery reports, reflective journals, digital portfolios, and appropriately designed peer assessment can provide opportunities to evaluate different dimensions of entrepreneurial learning. These approaches are consistent with the broader emphasis on experiential and action-oriented entrepreneurship education (Kolb, 1984; Pittaway & Cope, 2007).

The increasing use of generative AI adds another dimension to assessment design. AI tools can assist learners in generating ideas, structuring information, producing drafts, and exploring alternative solutions, while also creating opportunities for educators to redesign learning activities and teaching exercises (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024). Consequently, assessment should increasingly require learners to demonstrate their own reasoning, judgement, reflection, decision-making, and application of knowledge rather than relying solely on polished written outputs. This does not necessarily require the exclusion of AI from assessment; instead, educators can make the use of AI explicit, require disclosure where appropriate, and assess how learners evaluate, adapt, challenge, and apply AI-generated material. Such an approach can help preserve the development of critical and reflective capabilities while recognising the emerging role of AI in entrepreneurial learning (Darnell & Gopalkrishnan, 2024; Miao & Holmes, 2023)

3.0 Theoretical Foundation/framework

Different theoretical explanations and assumptions are used in explaining entrepreneurial education and learning. Amongst the most prominent theories that have made significant contributions in understanding entrepreneurial learning are Human Capital Theory (HCT) and Experiential Learning Theory (ELT). Since the focus of the paper pertains to use of digital technology in entrepreneurship education, Technology Acceptance Model (TAM) developed by Davis (1989) is included to lay a sound theoretical foundation and framework for the paper.

3.1 Human Capital Theory

Human Capital Theory explains education and training as investments that develop knowledge and skills that can enhance productivity and economic value. Becker (1964) provided a foundational economic treatment of human capital, conceptualising education and training as investments that can generate productive returns. In entrepreneurship education, the theory provides a useful explanation of why investment in entrepreneurial knowledge, skills and attitudes matters.

From an HCT perspective, entrepreneurship curricula should therefore develop both foundational entrepreneurial competencies and technology-related competencies that are relevant to contemporary entrepreneurial activity (Becker, 1964; Unger et al., 2011).

3.2 Experiential Learning Theory

Experiential Learning Theory provides a pedagogical foundation for learning through experience, reflection, conceptualisation, and experimentation (Kolb, 1984). Entrepreneurship education is particularly compatible with experiential learning because entrepreneurial competence involves applying knowledge to uncertain and changing situations. Learners therefore benefit from opportunities to investigate problems, develop ideas, test assumptions, receive feedback, revise decisions, and reflect on consequences. Simulations, business projects, case studies, fieldwork, competitions, and venture-development activities can provide learning experiences that connect conceptual knowledge with entrepreneurial action.

Pittaway and Cope (2007) extend this perspective to entrepreneurship education by emphasizing the importance of experiential and collaborative approaches that enable learners to engage with situations resembling entrepreneurial practice. Such approaches can provide opportunities for action, interaction, reflection, and learning from consequences. The value of experiential entrepreneurship education therefore lies not simply in exposing learners to activities but in deliberately structuring activities so that experience is followed by reflection and conceptual learning (Kolb, 1984; Pittaway & Cope, 2007).

Digital technologies can extend opportunities for experiential learning beyond the physical classroom. Simulation platforms can expose students to business decisions in relatively controlled environments, while virtual environments can facilitate collaborative problem-solving. AI systems may also support iterative feedback, idea development, and scenario generation. However, these technologies should complement rather than automatically replace authentic entrepreneurial experiences. Because a simulated customer interaction, for example, does not necessarily provide the same learning experience as interacting with actual customers, suppliers, communities, or entrepreneurs. The pedagogical value of digital technology therefore depends on how it is embedded within learning

activities involving action, reflection, conceptual understanding, and further experimentation (Kolb, 1984; Pittaway & Cope, 2007).

3.3 Technology Acceptance Model

The Technology Acceptance Model (TAM), developed by Davis (1989), explains users' acceptance of information technology primarily through perceptions of perceived usefulness and perceived ease of use. The model is relevant to entrepreneurship education because the availability of a digital platform or application does not, by itself, guarantee meaningful adoption. Students and educators may be less likely to use technology when they perceive it as difficult to use or insufficiently useful for achieving their learning or teaching objectives (Davis, 1989).

In entrepreneurship education, perceived usefulness may relate to whether a technology helps learners generate and evaluate ideas, conduct research, communicate, collaborate, receive feedback, or complete entrepreneurial tasks. Perceived ease of use concerns the extent to which learners and educators perceive that technology can be used without excessive effort (Davis, 1989). Other contextual factors, such as affordability, connectivity, digital skills, and institutional support, may also influence actual use, particularly in resource-constrained educational environments.

TAM is particularly relevant to the adoption of generative AI in entrepreneurship education. GenAI applications may be perceived as useful when they support activities such as idea generation, business-model development, feedback, scenario exploration, or teaching exercises (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024).

3.4 Integration of the Three Theories

The three theories provide complementary but distinct explanations of technology-enabled entrepreneurship education. Human Capital Theory explains why education and training can develop knowledge, skills and attitudes that are relevant to productivity and entrepreneurial performance (Becker, 1964; Unger et al., 2011). Experiential Learning Theory explains how learners can develop and transform knowledge through experience, reflection, conceptualisation, and experimentation (Kolb, 1984), while entrepreneurship-education research highlights the importance of experiential and collaborative learning approaches (Pittaway & Cope, 2007). Technology Acceptance Model explains an important dimension of technology adoption by focusing on perceived usefulness and perceived ease of use (Davis, 1989). Nambisan's (2017) digital-entrepreneurship perspective complements these theories by explaining how digital technologies reshape entrepreneurial processes and opportunities. The resulting conceptual position is that technology does not automatically improve entrepreneurship education. Rather, effective digital entrepreneurship education depends on the interaction between human capability, experiential pedagogy, technology adoption, and the changing digital entrepreneurial environment. This integrated perspective places learners, educators, pedagogy, and institutional conditions not technology alone at the centre of digital transformation (Becker, 1964; Davis, 1989; Kolb, 1984; Nambisan, 2017; Unger et al., 2011).

4. Methodology

This paper adopts a structured conceptual literature-review approach to synthesise theoretical, conceptual, and empirical insights concerning entrepreneurship education and the role of digital technologies in contemporary entrepreneurial learning. The approach is considered appropriate because the purpose of the paper is to integrate perspectives from entrepreneurship education, application of new technologies such as generative AI in teaching and learning entrepreneurship, technology acceptance and adaptive learning. Accordingly, the review is interpretive and thematic rather than a systematic review or meta-analysis.

The literature was identified and organised around five broad domains: (1) entrepreneurship education; (2) digital entrepreneurship and digital transformation; (3) educational technology and experiential learning; (4) artificial intelligence, generative AI, and large language models in education; and (5) Nigerian and other developing-country contexts. These domains were selected to ensure that the conceptual discussion addressed both the theoretical foundations of entrepreneurship education and the contemporary technological environment in which entrepreneurial learning occurs.

The literature search and selection process was guided by relevance to the central focus of the paper. Search terms and combinations included “entrepreneurship education,” “digital entrepreneurship,” “digital transformation and entrepreneurship education,” “entrepreneurship education and artificial intelligence,” “generative AI and entrepreneurship education,” “large language models and education,” “experiential learning and entrepreneurship,” “digital divide and higher education,” and “Nigeria and digital entrepreneurship education.” Relevant scholarly publications and authoritative institutional sources were considered where they directly addressed entrepreneurship education, digital entrepreneurship, technology-enabled learning, experiential learning, entrepreneurship ecosystems, technology adoption and digital inclusion. However, PRISMA systematic-review flow chart and

screening process were not used. Instead, transparency in evidence-synthesis reporting advocated by Page et al. (2021) was adopted. That guided the selection of literature with conceptual relevance and scholarly credibility.

Foundational theoretical works were retained irrespective of publication year because their historical and theoretical significance is central to the framework of the paper. These include Becker's (1964) Human Capital Theory, Kolb's (1984) Experiential Learning Theory, and Davis's (1989) Technology Acceptance Model. Later theoretical and empirical contributions were selected where they extended or applied these perspectives to entrepreneurship, digital technologies, experiential entrepreneurship education, or generative AI. Nambisan (2017) was used to establish the digital-entrepreneurship perspective, Unger et al. (2011) to support the relationship between human capital and entrepreneurial success, and Pittaway and Cope (2007) to strengthen the experiential-learning perspective in entrepreneurship education.

Contemporary literature was given particular attention in relation to digital learning, artificial intelligence, generative AI, and technology-enabled entrepreneurship education because these areas are rapidly evolving. Bell and Bell (2023) and Darnell and Gopalkrishnan (2024) were considered in relation to the emerging application of generative AI to entrepreneurship education, while Yu et al. (2025) provides recent systematic-review evidence concerning the developing research base on GenAI in entrepreneurship education. Miao & Holmes, (2023) was considered specifically in relation to responsible, ethical, human-centred, and appropriate use of generative AI in education and research. Evidence from Nigeria was reported to provide contextual information concerning digital access, infrastructure, skills, curriculum, and the implementation environment.

5.0 Issues and Challenges of Entrepreneurship in Digital Era in Developing Country Context

Entrepreneurship education in the present dispensation of new technologies is facing several challenges in Nigeria. Some of the challenges frequently brought to fore in literature include the following.

5.1 Infrastructure, Connectivity, and Electricity

Reliable electricity, broadband connectivity, affordable data, and access to suitable digital devices are important enabling conditions for technology-supported education. Where these conditions are inadequate, participation in digital learning can become inconsistent and unequal. In Nigeria, persistent gaps in digital infrastructure, internet access, affordability, and electricity supply can constrain the capacity of learners and educational institutions to participate effectively in digitally mediated learning (World Bank, 2019). These constraints are particularly significant for entrepreneurship education because activities such as online market research, digital collaboration, e-commerce training, simulation, digital prototyping, and AI-assisted learning depend on sustained access to digital resources.

The infrastructure challenge consequently requires more than the provision of digital platforms. Effective technology-enabled entrepreneurship education requires attention to electricity supply, broadband availability, affordability, device access, institutional digital infrastructure, and the capacity of educators and learners to use available technologies productively. In developing-country contexts such as Nigeria, these enabling conditions should form part of entrepreneurship-education planning rather than being treated as separate technical concerns (World Bank, 2019).

5.2 Curriculum Misalignment

The literature has unveiled the potential mismatch between the pace of technological change and the processes through which entrepreneurship curricula are reviewed and updated. Digital technologies, platforms, and business models can evolve rapidly, creating new forms of entrepreneurial activity and altering how opportunities are identified, developed, and commercialised (Nambisan, 2017). A curriculum that treats digital commerce, online platforms, data-related capabilities, or artificial intelligence as peripheral rather than as components of contemporary entrepreneurial practice may therefore provide limited preparation for technology-mediated entrepreneurial environments.

Curriculum reform should consequently focus not simply on adding individual emerging technologies to existing course content but on developing adaptable entrepreneurial and digital competencies that learners can transfer across changing technological environments. Such an approach is consistent with the human-capital perspective, which emphasises the value of knowledge and skills that are relevant to productive activity (Becker, 1964; Unger et al., 2011).

5.3 Educator Capability and Institutional Resistance

Technology adoption in entrepreneurship education requires more than the availability of digital tools. It also depends on users' perceptions of the usefulness and ease of use of those technologies, as well as on the institutional conditions that enable educators to incorporate them into teaching practice (Davis, 1989). Faculty members may possess substantial knowledge of entrepreneurship but have limited

experience with artificial intelligence, digital simulations, learning-management systems, data tools, or virtual collaboration. Conversely, technically confident educators may require further preparation in entrepreneurship pedagogy and in the instructional application of digital technologies.

5.4 Assessment, Academic Integrity and Ethics

Generative AI introduces new challenges for assessment in entrepreneurship education. Students can use AI tools to support activities such as generating business ideas, developing written reports, preparing presentations, and producing drafts of business plans. The educational challenge is therefore not simply whether AI should be prohibited, but how assessment can continue to provide credible evidence of learners' knowledge, reasoning, judgement, and entrepreneurial capabilities in an environment where AI assistance is increasingly accessible (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024).

From ethical perspective, Generative AI systems can produce fluent and plausible outputs that may nevertheless contain factual inaccuracies, unsupported claims, or inappropriate recommendations (Bell & Bell, 2023; Miao & Holmes, 2023). The challenge is especially important in entrepreneurship education because students may use AI-generated information in activities involving market analysis, customer research, financial assumptions, business planning, or strategic decision-making which can lead to taking wrong decisions based on unauthentic data.

5.5 Digital Inequality and exclusion

Digital technology can create new opportunities for educational participation while also reproducing or intensifying existing inequalities. Differences in connectivity, device ownership or availability, affordability, digital skills, and access to advanced digital services can influence learners' ability to participate consistently in technology-enabled education. These challenges are particularly relevant in developing-country contexts, where digital infrastructure and affordability remain uneven (World Bank, 2019). Digital inclusion requires attention to both access to technology and the capabilities needed to use it productively (World Bank, 2019).

6. Opportunities Presented by New Technologies

The digital era promoted by the advert new technological devices, tools and skills have presented lot of opportunities that could enhance entrepreneurial technology enabled learning. These include personalized and adaptive instruction, simulation-based entrepreneurial training, incubation, mentoring, and networking beyond the physical boundaries via virtual entrepreneurship ecosystems promoting global collaboration and access to digital market, and the use of Artificial Intelligence and Generative AI aiding AI-Assisted Venture Creation etc. These have created additional opportunities for interaction, experimentation and mentoring for enhancing entrepreneurial learning.

6.1 Digital Incubation and Virtual Entrepreneurship Ecosystems

Digital technologies can extend entrepreneurship education, incubation, mentoring, and networking beyond the physical boundaries of an institution. Digital platforms can facilitate interaction among learners, mentors, entrepreneurs, industry professionals, and other members of entrepreneurial ecosystems. They can also provide opportunities for learners to encounter entrepreneurial practices, markets, and business models beyond their immediate geographical environment. This is consistent with the broader transformation of entrepreneurship through digital technologies, which can alter how entrepreneurial actors access resources, interact with stakeholders, and pursue opportunities (Nambisan, 2017).

From an experiential-learning perspective, digitally mediated interaction can provide additional opportunities for learners to engage with entrepreneurial actors, receive feedback, reflect on experiences, and revise their ideas. Such activities are most valuable when they are deliberately integrated into learning designs that connect experience with reflection and application (Kolb, 1984; Pittaway & Cope, 2007).

6.2 Simulation, Virtual Reality, and Experiential Learning

Simulation can provide a bridge between conceptual knowledge and entrepreneurial practice by allowing learners to make decisions and observe consequences in controlled environments. Depending on the design of the learning activity, students can engage with decisions relating to pricing, marketing, investment, production, resource allocation, and venture growth without immediately bearing the consequences of actual business failure. Virtual and augmented-reality environments may similarly provide opportunities to simulate customer interaction, product demonstration, retail environments, and other entrepreneurial situations.

These approaches are consistent with Experiential Learning Theory when learners are given opportunities to act, reflect on outcomes, develop conceptual understanding, and experiment with alternative decisions (Kolb, 1984). They are also compatible with the experiential and collaborative orientation of entrepreneurship education identified by Pittaway and Cope (2007).

6.3 Artificial Intelligence and Generative AI

Artificial intelligence can potentially support entrepreneurship education across several stages of the entrepreneurial learning process. During opportunity identification, learners can use AI tools to generate alternative problem statements, explore questions for customer discovery, and consider different interpretations of a potential opportunity. During ideation, AI can generate alternative concepts that learners can compare and critically evaluate. During business-model development, AI can assist learners in organising assumptions concerning customer segments, value propositions, channels, and revenue models. AI can also support communication activities by assisting with the drafting and revision of marketing messages and other entrepreneurial communications (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024).

In entrepreneurship education, GenAI creates opportunities for idea exploration, feedback, scenario development, and learning support. It also help learners to develop the ability to cross-examine, evaluate, verify, adapt, and critically challenge AI-generated outputs while retaining responsibility for entrepreneurial judgement and decisions. Responsible use should include attention to accuracy, transparency, privacy, bias, and human oversight (Miao & Holmes, 2023).

6.4 AI-Assisted Venture Creation and enterprise development

The emergence of AI-assisted venture-creation tools creates opportunities for learners to move more efficiently from an initial problem statement toward preliminary entrepreneurial outputs. AI can assist with activities such as developing value propositions, generating customer profiles, organising competitor information, describing potential prototypes, developing marketing concepts, and structuring preliminary financial assumptions (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024).

The potential benefit is not limited to production of business documents, but aids testing assumptions, gathering field evidence, interacting with customers, and revising proposed solutions. Entrepreneurship education should therefore maintain customer discovery, field evidence, experimentation, feedback, and reflection at the centre of venture-development activities. This preserves the experiential character of entrepreneurship education while allowing AI to function as an assistive resource rather than a substitute for entrepreneurial action (Kolb, 1984; Pittaway & Cope, 2007).

6.5 Personalised and Adaptive Learning

AI-enabled educational systems can potentially provide learners with differentiated explanations, examples, exercises, and feedback according to their learning needs and levels of readiness. Such capabilities may provide additional support for learners who require further practice while enabling more advanced learners to engage with increasingly complex entrepreneurial problems (Bell & Bell, 2023; Yu et al., 2025).

6.6 Global Collaboration and Digital Market Access

Digital technologies enable learners and entrepreneurs to interact across geographical boundaries and gain exposure to entrepreneurial problems, markets, networks, and business models beyond their immediate environments. Digital platforms can facilitate international collaboration, virtual teams, online entrepreneurial events, digital market research, and engagement with entrepreneurs and other stakeholders in different locations. Digital entrepreneurship can consequently expand the geographical scope within which entrepreneurial opportunities and resources can be explored (Nambisan, 2017).

For entrepreneurship education, these capabilities create opportunities for learners to work on cross-border projects, compare entrepreneurial ecosystems, investigate different customer environments, and collaborate with participants from diverse cultural and geographical contexts. Such experiences can broaden learners' understanding of markets and entrepreneurial environments while creating opportunities to develop communication, collaboration, and cross-cultural capabilities. Digital connectivity therefore creates opportunities for market exploration and collaboration, but entrepreneurial success still depends on the quality of entrepreneurial judgement and evidence-based action.

7. Strategies for Effective Entrepreneurship Education in the Digital Era

A good number of strategies are required to guide and ensure effective entrepreneurship education delivery in the digital era. The strategies below are considered very relevant for the prevalence of sound entrepreneurship education with promising learning outcomes.

7.1 Redesign the Curriculum around Entrepreneurial and Digital Competencies

Institutions should redesign entrepreneurship curricula around enduring entrepreneurial competencies while embedding digital capabilities that are relevant to contemporary entrepreneurial activity. Curriculum review should therefore be sufficiently responsive to major technological developments while maintaining a stable foundation of entrepreneurial knowledge and transferable competencies. This balance can reduce the risk of curricula becoming obsolete while avoiding excessive emphasis on individual technologies that may quickly change.

7.2 Build Educator Digital and AI Capability

Professional development should move beyond basic ICT skills toward digital pedagogy, technology integration, and AI literacy. Educators should be supported to design AI-assisted learning activities, evaluate AI-generated outputs, develop appropriate assessment strategies, facilitate critical reflection, and understand the limitations and responsible-use requirements associated with emerging technologies.

As generative AI becomes increasingly relevant to entrepreneurship education, educators need to understand how AI can support learning without replacing learner judgement, how AI-generated information should be evaluated, and how issues of privacy, transparency, equity, and human oversight should be addressed (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024; Miao & Holmes, 2023). Institutions can reinforce this process through communities of practice in which educators share teaching materials, cases, simulations, assessment approaches, and experiences with emerging technologies.

7.3 Adopt Authentic, Process-Based Assessment

Assessment should increasingly evaluate what learners can do, explain, justify, and reflect upon, rather than relying exclusively on conventional written examinations. Suitable approaches include venture projects, prototypes, customer-interview evidence, business-model experiments, digital portfolios, reflective journals, presentations, peer evaluation, and oral defense. Such approaches are consistent with experiential approaches to entrepreneurship education, in which learners engage in action, reflection, experimentation, and application (Kolb, 1984; Pittaway & Cope, 2007).

7.4 Establish Innovation and Incubation Hubs

More entrepreneurship centres and incubation hubs should be established to help connect classroom learning with entrepreneurial practice by providing opportunities for mentoring, experimentation, networking, prototyping, and engagement with entrepreneurs and industry. Such environments can complement classroom-based learning by providing experiences through which learners can apply concepts, receive feedback, and reflect on entrepreneurial decisions (Pittaway & Cope, 2007). As established in the literature, digital technologies can extend these ecosystems beyond physical institution. Virtual mentoring, online networking, digital collaboration, and technology-enabled incubation can connect learners with entrepreneurial actors and opportunities beyond their immediate geographical environment (Nambisan, 2017). Where resources are constrained, institutions can adopt incremental approaches, including shared digital laboratories, mobile-oriented tools, partnerships with existing technology hubs, and virtual mentoring rather than making expensive physical infrastructure a prerequisite for entrepreneurial learning.

7.5 Improve Infrastructure through Context-Sensitive Solutions

Infrastructure strategies should prioritise reliability, affordability, accessibility, and educational usefulness rather than technology acquisition alone. In resource-constrained environments such as Nigeria, institutions can consider campus connectivity improvements, device-support schemes, renewable or alternative power solutions, offline digital resources, mobile-oriented learning, and partnerships with telecommunications and technology providers. Also, blended and flexible approaches may provide practical alternatives where continuous high-speed connectivity cannot be guaranteed. Such approaches should, however, be designed around the actual learning requirements of entrepreneurship courses rather than adopted simply as a lower-cost substitute for conventional teaching.

7.6 Promote Inclusive Digital Entrepreneurship Education

Institutions should identify barriers that may affect learners' participation, including limited device access, connectivity constraints, affordability, accessibility requirements, and differences in digital capability to promote inclusive technology-enabled entrepreneurial learning. Therefore, digital learning resources should be accessible, mobile-compatible, and usable under conditions of intermittent connectivity.

Inclusive design should also take account of the relevance of learning materials to learners' contexts. Entrepreneurial examples, cases, problems, and projects can incorporate local communities, industries, markets, and business environments so that digital entrepreneurship education remains connected to learners' lived economic contexts. Where generative AI is used, institutions should also consider equity in access and the need for responsible and human-centred implementation (Miao & Holmes, 2023).

7.7 Establish Responsible AI Governance

Institutions should establish clear and adaptable AI-governance frameworks covering privacy, acceptable use, academic integrity, attribution, assessment, data protection, transparency, and human oversight. Policies should distinguish between legitimate educational assistance and the inappropriate substitution of AI-generated work for learners' own intellectual contribution. Students should be taught

to evaluate and verify AI-generated information, protect personal and confidential information, recognise potential bias and inaccuracies, and disclose meaningful use of AI where institutional policy requires it. Educators should similarly understand their responsibility for determining appropriate uses of AI within learning and assessment contexts (Miao & Holmes, 2023).

8. Discussion

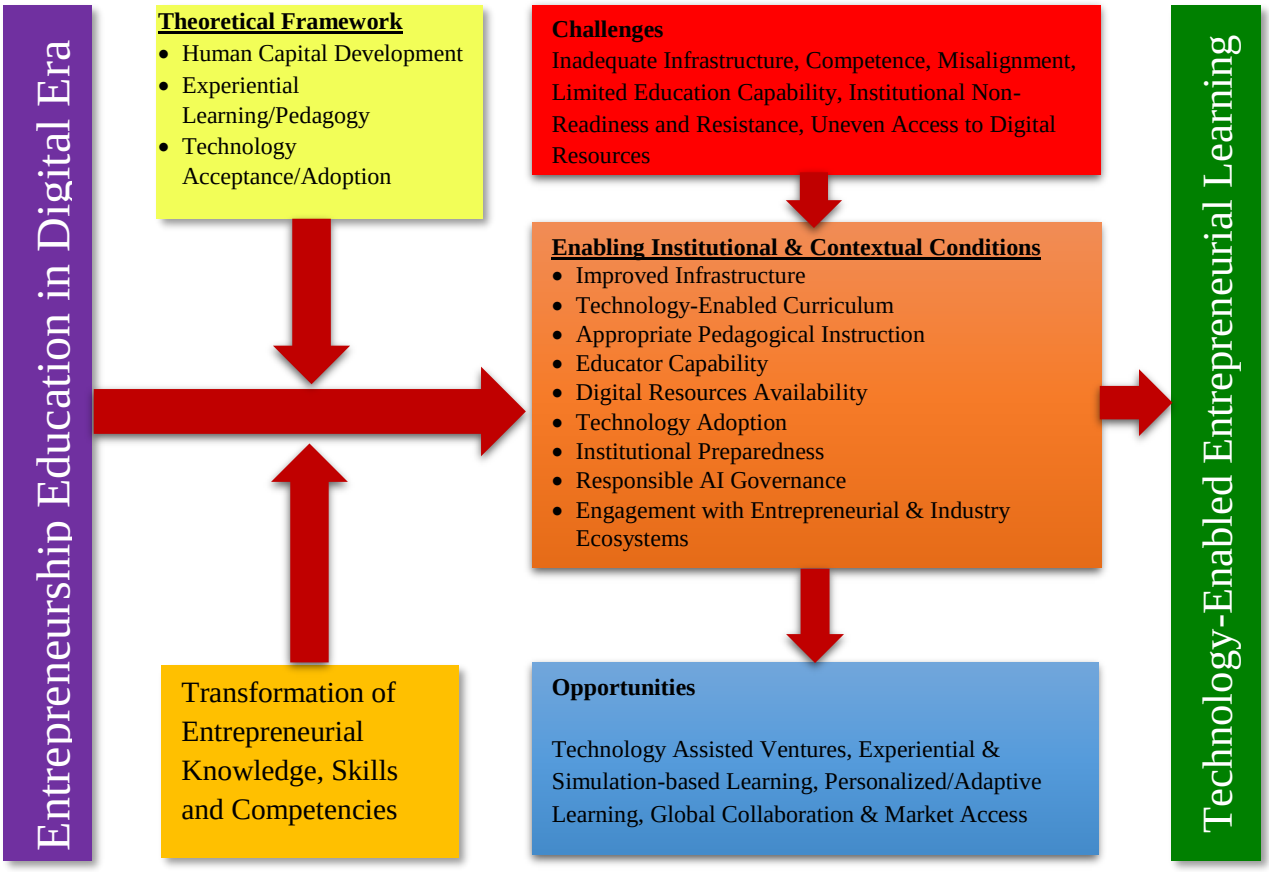
The synthesis suggests that the central issue is not whether entrepreneurship education should become digital, but how digital technologies can be integrated without displacing the experiential, human, and contextual character of entrepreneurial learning. The strongest rationale for technology integration is therefore not technological novelty itself, but the potential of digital tools to expand opportunities for experimentation, collaboration, feedback, networking, and engagement with entrepreneurial problems and markets. At the same time, the digital transformation of entrepreneurship should not be interpreted as inherently beneficial; its educational value depends on how technologies are embedded within entrepreneurial processes and learning environments (Nambisan, 2017; Kolb, 1984; Pittaway & Cope, 2007).

The theoretical integration reinforces this position. Human Capital Theory suggests that relevant knowledge and skills constitute capabilities that can support productive and entrepreneurial activity, making digital competencies increasingly relevant to contemporary entrepreneurial human capital development (Becker, 1964; Unger et al., 2011). Experiential Learning Theory indicates that entrepreneurial competence is developed through active engagement, reflection, conceptualisation, and experimentation rather than through passive consumption of information alone (Kolb, 1984; Pittaway & Cope, 2007). The Technology Acceptance Model adds an adoption perspective by emphasising the importance of perceived usefulness and perceived ease of use in technology acceptance (Davis, 1989). Taken together, these perspectives suggest that meaningful digital transformation requires alignment among human capability, experiential pedagogy, and technology adoption.

Generative AI makes this alignment particularly important. AI systems can aid with ideation, drafting, feedback, and other cognitive tasks, creating opportunities to support entrepreneurial learning. However, entrepreneurship educators need to design activities in which AI-generated outputs become objects of critique, comparison, verification, experimentation, and reflection. Students can be required to justify their assumptions, verify information, explain their decisions, and provide evidence obtained through engagement with real customers and other stakeholders. Such an approach preserves the learner's responsibility for entrepreneurial judgement while using AI as an assistive resource.

The Nigerian context reinforces the need for a phased, inclusive, and context-sensitive approach to digital entrepreneurial teaching and learning. Where institutions face constraints involving electricity, connectivity, affordability, and access to appropriate devices, technology-intensive models developed in high-resource environments may not be directly transferable. Digital strategies should therefore consider context-appropriate approaches such as mobile-oriented learning, blended delivery, shared digital facilities, alternative power solutions, virtual mentoring, locally relevant digital learning resources, and partnerships with technology and entrepreneurial organisations (World Bank, 2019). These approaches should be selected according to their educational value and sustainability rather than technological sophistication alone.

It is therefore suggested that digital transformation should be evaluated in terms of educational capability rather than technology acquisition. The presence of devices, platforms, or AI tools does not by itself demonstrate improved entrepreneurship education but appropriate digital technological application in teaching and learning entrepreneurship. It then requires meaningful evaluation that considers learners' ability to identify and evaluate opportunities, solve problems, experiment with ideas, use digital resources responsibly, communicate entrepreneurial value, and apply knowledge in authentic contexts.



The synthesis supports a human-centred model of digital entrepreneurship education. Technology should function as an enabling resource within a broader system involving capable educators, appropriately designed curricula, experiential pedagogy, equitable access, authentic assessment, supportive institutions, and responsible governance. This position avoids both technological determinism and technological resistance: digital technologies can expand entrepreneurial learning opportunities, but their educational contribution depends on the conditions under which they are introduced and used.

9. Integrated Conceptual Framework

The integrated conceptual framework proposed in this paper positions technology-enabled entrepreneurship education at the intersection of human capability, experiential learning, technology acceptance and transformation of entrepreneurial knowledge, skills and competencies. The process

can be facilitated or challenged to ensure effective technology-enabled entrepreneurial teaching and learning. Human capital development provides the capability foundation by developing knowledge, skills and attitudes that can support productive and entrepreneurial activity via the acquisition of entrepreneurial competencies as well as relevant digital and AI-related capabilities (Becker, 1964; Unger et al., 2011). Experiential Learning as a pedagogical mechanism avails an avenue through which these capabilities can be developed and applied. Whereas, Technology Acceptance enhances technology adoption emphasising the importance of its perceived usefulness and ease of use by both entrepreneurial educators and learners (Davis, 1989).

AN EMERGING PATTERN TOWARDS TECHNOLOGY-ENABLED ENTREPRENEURIAL LEARNING

NOTE: The Strategic framework refers to a deterministic "technology better entrepreneurship education & relationship". Instead, it proposes a conditional context and human-centered relationship in which technological resources contribute to entrepreneurial learning when they are supported by appropriate competencies, experiential pedagogy, meaningful adoption and enabling institutional conditions. As such, technological availability alone does not guarantee entrepreneurial education and learning effectiveness.

The framework therefore treats technology not as an independent force that automatically improves entrepreneurship education, but as an enabling resource whose educational value depends on human capability, pedagogical design, and meaningful adoption. In the context of technology-enabled entrepreneurship education, technologies can support and provide opportunities such as technology assisted venture creation, experiential & simulation-based learning, personalized/adaptive learning, global collaboration & market access and access to entrepreneurial networks (Nambisan, 2017). However, their effectiveness depends on whether learners and educators possess the capabilities required to use them and whether technology is embedded within appropriate experiential-learning activities (Kolb, 1984; Pittaway & Cope, 2007). This interpretation is consistent with the broader transformation of entrepreneurial activity through digital technologies while recognising that technological availability alone does not guarantee educational effectiveness (Nambisan, 2017).

10. Policy Implications

The policy challenge is to create an enabling environment in which digital technologies can strengthen rather than fragment entrepreneurship education. Government and key stakeholders in education sector should therefore prioritise affordable connectivity, reliable electricity, access to appropriate devices, and sustainable digital infrastructure. These conditions influence the capacity of learners and institutions to participate meaningfully in technology-enabled education, particularly in contexts where access to digital resources remains uneven (World Bank, 2019).

National and institutional policy should also support continuous curriculum development, educator professional development, entrepreneurship incubation, and collaboration between educational institutions and industry. Partnerships among educational institutions, technology companies, entrepreneurs, telecommunications providers, financial institutions, and innovation hubs can provide learners with access to current technologies, practical expertise, mentoring, and entrepreneurial networks.

AI policy requires particular attention because generative AI introduces opportunities as well as questions concerning privacy, transparency, equity, safety, academic integrity, and human responsibility. Institutions should develop clear, adaptable, and human-centred AI governance frameworks that define acceptable use, protect personal and confidential information, establish appropriate expectations for transparency and attribution, and maintain meaningful human oversight. Miao & Holmes, (2023) emphasises the importance of policy and institutional preparedness in responding to the educational implications of generative AI. Nigerian institutions can adapt these principles to their own regulatory, infrastructural, cultural, and educational conditions while ensuring that AI adoption remains subordinate to clearly defined educational objectives.

Finally, policy evaluation should move beyond counting devices distributed, internet connections established, or training sessions conducted. More meaningful evaluation should consider whether interventions are producing improvements in learners' entrepreneurial and digital capabilities, the quality of experiential learning and venture experimentation, educator capacity, participation by underserved learners, industry engagement, and responsible use of AI. Where data permits, longer-term indicators of entrepreneurial activity and outcomes may also be considered. Such an evaluation framework would provide a stronger basis for determining whether digital transformation is contributing to meaningful improvements in entrepreneurship education rather than merely increasing the presence of technology within educational institutions (Rideout & Gray, 2013).

11. Conclusion

Entrepreneurship education is in a period of digital technological innovations that are becoming increasingly relevant to entrepreneurial learning, teaching and practice. The paper stresses that effective technology-enabled entrepreneurship education can be understood through the interaction of human capital, experiential pedagogy, technology acceptance, and enabling institutional conditions that prevail digital platforms, generative AI tools and devices, large language models, simulations, virtual learning facilities and data-driven tools to create opportunities to extend learning activities, support experimentation, facilitate collaboration, and connect learners with entrepreneurial networks and resources. It concludes that availability of these technologies does not by itself establish that entrepreneurship education will become more effective. Their educational value depends on how they are integrated into curriculum, pedagogy, assessment, and institutional practice.

Digital transformation in Nigeria also needs to be context-sensitive and inclusive. Constraints involving connectivity, affordability, electricity, device access, educator capability and institutional readiness need to be addressed effectively because they influence the extent to which learners benefit from technology-enabled education. As such, policy and institutional strategies should not simply reproduce technology-intensive models developed in high-resource environments but should prioritise sustainable and accessible approaches that respond to local infrastructure, economic, institutional, and educational

conditions. Hence, the strategic priority should therefore be a context-sensitive digital transformation that connects curriculum, pedagogy, infrastructure, educator development, industry engagement, policy, and responsible AI use.

Abstract

The need for Business Education undergraduates to increasingly apply AI in learning entrepreneurial skills for self-reliance necessitated this research. This study investigated the application of Artificial Intelligence (AI) in learning entrepreneurial skills by Business Education undergraduates in Rivers State Universities. Three research questions guided the study, while three null hypotheses were tested at the 0.05 level of significance. The study adopted a descriptive survey research design. The population comprised 544 final-year (400-level) Business Education undergraduates in the 2025/2026 academic session from Ignatius Ajuru University of Education and Rivers State University. Since the population was manageable and accessible, a census sampling method was adopted. Data were collected using a researcher-developed 27-item structured questionnaire titled: Application of AI in Learning Entrepreneurial Skills by Business Education Undergraduates (AAILESBEU). The instrument was validated by three experts in the field of education and yielded Cronbach's alpha reliability coefficients of 0.81, 0.79 and 0.87 for the three clusters, with an overall reliability coefficient of 0.83. Out of the 544 questionnaires distributed, 531, representing 98%, were correctly completed and retrieved. Data were analyzed using mean, standard deviation and independent t-test with SPSS version 26.0. The findings revealed that undergraduates applied generative AI tools to a low extent, Reinforcement Learning (RL) AI tools to a very low extent, and adaptive learning AI tools to a low extent in learning entrepreneurial skills. The findings further revealed no significant difference between male and female undergraduates in their mean ratings on the application of generative AI, RL AI and adaptive learning AI tools. The study concluded that Business Education undergraduates were not adequately applying AI tools in learning entrepreneurial skills in Rivers State Universities. It was recommended, among other measures, that university management should provide adequate AI learning infrastructure and reliable internet facilities, while Business Education departments should organize regular practical training and integrate AI tools into entrepreneurial education.

Keywords: Artificial intelligence, adaptive learning, business education, entrepreneurial skills, generative AI, reinforcement learning

Introduction

The university is recognized as a higher education institution that promotes individuals' knowledge, creativity, and professional skills. In many countries, universities play various roles, such as developing youths' skills and supporting social growth. They also generate new knowledge, support digital advancements, and contribute to sustainable economic development (World Bank, 2025). In Nigeria, the main goal of universities is to train undergraduates on relevant employability skills needed for employment or self-employment (Ogbeide-Akugbe et al., 2024). With this goal in mind, Nigerian universities offer various academic programmes, including business education.

Business education serves as a vocational training programme that fosters self-reliance and workforce readiness among youths. Defined by Abraham-Ibe (2021) as a practical skills programme,

its aim is to equip individuals with employability skills for self-reliance. Okpala and Okeke-Ezeanyanwu (2025) stated that business education trains undergraduates in business skills, attitudes, and knowledge, contributing to economic growth. This aligns with the National Universities Commission's (NUC, 2022) objective outlined in the Core Curriculum and Minimum Academic Standards, focusing on producing competent business teachers and innovative entrepreneurs (Ukata & Agburuga, 2024). The curriculum includes specialized training in accounting, marketing, office technology and management (OTM), and entrepreneurship education, preparing undergraduates for future careers as educators, accountants, business managers, IT specialists, financial analysts, and entrepreneurs (Oludare et al., 2022).

In the evolving job market, Business Education must transition from merely teaching traditional office skills to fostering entrepreneurial skills. This training should encompass financial management, marketing, accounting, business law, creativity, leadership, communication and teamwork skills. Ikeanyionwu and Nzegwu (2024) emphasized the importance of equipping undergraduates with skills to identify opportunities, manage resources, and set up small-scale businesses. Additionally, practical training in business education, as noted by Alharbi et al. (2018), is essential in equipping students with entrepreneurial skills for job creation.

Skills are abilities cultivated through education, training, and experience. Skills involve inherent and external abilities gained from various educational programmes such as workshops and seminars. Entrepreneurial skills, on the other hand, are necessary for converting ideas into effective actions, enabling opportunity identification, decision-making, and resource allocation to meet entrepreneurial aims (European Union, 2020; Jain, 2024; Ukata & Okpokwasili, 2024). They are a blend of technical and non-technical capabilities relevant across diverse occupations. Agbor and Okonkwo (2026) opined that entrepreneurial skills extend beyond starting new businesses; they involve innovation, critical thinking, risk management, and adaptability, all of which are essential for navigating dynamic business environments. Entrepreneurial skills include critical thinking, risk-taking, self-motivation, resilience, communication, networking, and financial management (Banwo, 2020). Others include teamwork, leadership, customer service, analytical skills, problem-solving, time management, business branding, and stress management (Agogbua & Mgbatogu, 2022; Herrity, 2025; Jain, 2024).

In the digital economy, Business Education must integrate training in digital skills. Exposure to these skills can equip undergraduates with digital entrepreneurship skills for business success. The application of digital tools, particularly Artificial Intelligence (AI), is transforming teaching and learning while also addressing the challenges of access to quality education for undergraduates (UNESCO, 2025). AI, initially introduced by John McCarthy in 1956, merges human intelligence with machine capabilities. Russell and Norvig (2020) defined AI as technology enabling machines to replicate complex human skills; McKinsey Global Institute (2020) stated that AI embodies the simulation of human intellectual abilities. The European Commission's High-Level Expert Group on AI (2019) noted that AI systems exhibit intelligent behavior by assessing learning environments and acting autonomously to achieve specific learning goals.

Commonly used AI tools in Nigerian higher education include ChatGPT, Grammarly, QuillBot, and Snapchat AI for assignments, studying, idea generation, and information retrieval (Ngonso et al., 2025; Orok et al., 2024). AI tools also include Waymo and generative AI tools such as ChatGPT, Gemini, Chalkie, and AI art. Odoh et al. (2018) listed AI types as Expert Systems, Neural Networks, Robotics, Genetic Algorithms, and Natural Language Processing (NLP). Benhamou and Janin (2018) highlighted Machine Learning (ML), NLP, Computer Vision, Robotics, Expert Systems, Reinforcement Learning, Generative AI, and AI Ethics and Explainability. Dong et al. (2025) highlighted various AI applications such as intelligent tutoring systems, adaptive learning systems, automated tutors, virtual simulations, and generative AI.

Ifi et al. (2026) noted that these AI applications are widely regarded as transformative tools that have impacted how teaching and learning occur. This study specifically focused on Generative AI, Reinforcement Learning (RL), and adaptive learning AI tools and their application in learning entrepreneurial skills by business education undergraduates.

Generative AI learning tools, including ChatGPT, Bard, Claude AI, DALL·E, Chatsonic, and Midjourney, can be applied by Business Education undergraduates to abilities to brainstorm business ideas, identify target customers, draft business plans, and prepare financial projections. They can also be applied to learn abilities to generate creative business ideas based on one's interests and market needs, describe products, marketing strategies, manage social media to increase sales, and campaign for business using e-mail. Additionally, generative AI tools in learning support learning skills in creating visual business materials such as advertisements and website banners (Gbogbor, 2025). Pesovski et al. (2024) and Mulyani et al. (2025) disclosed that generative AI tools provide students with access to

relevant learning materials that promote active engagement and deeper understanding of business concepts. According to Ifi et al. (2026), generative AI improves students' learning problem-solving abilities by acting as a potent cognitive amplifier that quickly deconstructs problems, retrieves pertinent information from various domains, produces dozens of different solutions, runs simulations, and finds the best routes far faster than humans. Koedinger et al. (2025) stated that through guided exploration of AI-scaffolded solution spaces, students can take on far more difficult, real-world business challenges earlier in their growth, get instantaneous explanatory feedback on each step, and progressively integrate sophisticated heuristics.

Reinforcement Learning (RL) AI tools can enhance entrepreneurial skills development among Business Education undergraduates by providing interactive, risk-free business simulations, trial-and-error learning, repeated practice, and immediate personalised feedback. These tools enable undergraduates to learn at their own pace, monitor progress, solve business problems, and apply entrepreneurial knowledge in realistic business situations (Solórzano Solórzano et al., 2024). Similarly, Park et al. (2025) found that adoption of AI-supported reinforcement learning enhances students' creativity and problem-solving skills. In addition, business simulators, pitch-training bots, and market analytics platforms are RL AI tools that can provide opportunities for business education undergraduates to practice entrepreneurial activities and refine their business ideas through personalised feedback (Pastarmadzhieva & Angelova, 2025).

Adaptive learning AI tools in learning enable undergraduates to personalize learning content, identify skill lacking, get instant feedback, and adjust learning activities when progress is made. Intelligent Tutoring Systems (ITS), AI Learning Management Systems (LMS), AI student performance analytics, AI student management systems, and AI business simulation are common Adaptive learning AI tools that help undergraduates assess learning strengths to know the areas they need improvement. They also provide relevant learning resources and challenges that promote self-directed learning, critical thinking, creativity and innovative skills (Kangiwa et al., 2024; Isaac et al., 2025).AI learning platforms including Coursera, Udacity and edX customize course contents and recommend learning materials for individual students' learning needs (Almeida, 2020; Isaac et al., 2025). Also, the Newton Adaptive Learning Platform continuously assesses students' knowledge and creates personalised learning paths. Such platforms can improve students' learning achievement and motivation to learn entrepreneurial skills (Wogboroma & Simon, 2025).

The application of AI in education has been found to enhance the development of entrepreneurial skills among undergraduates by tailoring and streamlining the teaching and learning processes (Nwile et al., 2025; Odili & Ebiye, 2025; Omeh et al., 2025). The word "application" denotes the act of employing a material or idea. It encompasses the use of a concept, principle, skill, or tool to fulfil a particular goal. Russell and Norvig (2020) characterized application as the deployment of AI tools to customize learning, whereas Luckin et al. (2018) defined AI application as the employment of AI tools to aid teaching and learning (Ukata & Nmehielle, 2025; Ukata & Worgu, 2025). According to Obomeghie (2025); Al-Mosawi (2018), and Al-Noori & Al-Mosawi (2017), AI application in Nigerian universities faces challenges such as limited access to reliable internet, insufficient AI infrastructure and digital literacy, and the high expense of digital resources. Obomeghie (2025), Dwivedi et al. (2023), and Stokel-Walter (2023) identified data privacy issues, data breaches, academic dishonesty, AI plagiarism, superficial learning, and excessive reliance on AI as challenges affecting the adoption of AI tools among students.

In Rivers State, Nigeria, the Technology Acceptance Model (TAM) explains AI adoption in learning entrepreneurial skills in universities through perceived usefulness and ease of use, which influence students' willingness to adopt AI tools (Davis, 1989). AI self-efficacy strengthens confidence, persistence, and effective application of AI for learning skills (Wang & Li, 2024; Zhao et al., 2025).
Nevertheless, the advancements in the application of AI in public higher education in Nigeria remain limited (Ikedinachi, 2019). Similarly, Nwile et al. (2025) observed that AI has been widely embraced in other sectors, but its potential in learning among business education undergraduates has yet to be fully harnessed. In addition, Akalonu (2025) and Wogboroma and Simon (2025) found that more advanced AI learning tools were less frequently used for academic learning by Business Education graduates. The need for business education undergraduates to apply AI in improving the learning of entrepreneurial skills necessitated this research. Therefore, this study investigated the level of application of artificial intelligence (AI) by business education undergraduates in learning entrepreneurial skills in Rivers State Universities.

Statement of the Problem

Business Education is expected to equip its recipients with entrepreneurial skills necessary to generate jobs, become independent, and support economic growth upon graduation. However, since some undergraduates leave the university without having acquired sufficient entrepreneurial skills, unemployment among Business Education graduates is still a worrying situation. Because many graduates rely primarily on paid employment in an environment where white-collar jobs are scarce, this situation has become concerning to the government, parents, and the graduates themselves. The fact that small-scale enterprises frequently fail after a few months of opening is another evidence of the problem. Some recent Business Education graduates who want to start their own businesses may not possess the entrepreneurial skills required to organize, run, and manage them. Consequently, graduates may remain unemployed or underemployed, while parents bear additional financial burdens and the government faces increased pressure to provide employment opportunities for the graduates.

The continued unemployment among Business Education graduates, as well as the early failure of graduate-owned small enterprises, may reflect a gap between the entrepreneurial abilities that undergraduates are expected to learn in the university Business Education programme and the skills that they actually acquired. In order to address the issue of learning gaps and lack of entrepreneurial skills among graduating business education students, educational experts have called for undergraduates to increasingly apply digital technologies in their learning. Artificial intelligence (AI) is one such technology that can allow undergraduates to develop entrepreneurial abilities. Despite these prospects, the application of AI in learning entrepreneurial skills by Business Education undergraduates in Nigeria, especially Rivers State, seems to be low. This may be attributed to inadequate ICT infrastructure, poor internet access, a lack of digital skills among undergraduates, high cost of AI tools, and poor institutional support.

Additionally, the extent to which Business Education undergraduates in Nigeria, especially Rivers State universities, apply AI tools in learning entrepreneurial skills is not well known. If this gap continues, the goals of Business Education in promoting job creation may not be fully achieved. It is against this background that this study specifically determined (1) the level of application of generative AI tools in learning entrepreneurial skills by Business Education undergraduates in Rivers State Universities, (2) the level of application of reinforcement learning (RL) AI tools in learning entrepreneurial skills by Business Education undergraduates in Rivers State universities, (3) the level of application of adaptive learning AI tools in learning entrepreneurial skills by business education undergraduates in Rivers State universities.

Research Questions

The following research questions guided this study;

1. What is the extent of application of generative AI tools in learning entrepreneurial skills by Business Education undergraduates in Rivers State Universities?
2. To what extent do Business Education undergraduates apply reinforcement learning (RL) AI tools in learning entrepreneurial skills in Rivers State universities?
3. What is the extent of application of adaptive learning AI tools in learning entrepreneurial skills by Business Education undergraduates in Rivers State universities?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance;

H_{01}: There is no significant difference in the mean ratings of male and female Business Education undergraduates on the extent of application of generative AI tools in learning entrepreneurial skills in Rivers State Universities.

H_{02}: There is no significant difference in the mean ratings of male and female Business Education undergraduates on the extent of application of Reinforcement Learning (RL) AI tools in learning entrepreneurial skills in Rivers State Universities.

H_{03}: Male and female Business Education undergraduates do not differ significantly in their mean ratings on the extent of application of adaptive learning AI tools in learning entrepreneurial skills in Rivers State Universities.

Methods

The study adopted a descriptive survey research design. It was carried out in Rivers State, South-South, Nigeria. The population of the study comprised 554 final-year (400 level) Business Education undergraduates in the 2025/2026 academic session from Rivers State universities in Nigeria offering a Business Education programme. According to information from the Business Education departments of various universities as of 17th August, 2026 showed that Ignatius Ajuru University of Education has 444 final-year undergraduates, and Rivers State University (RSU) has 110 final-year undergraduates. The entire population of 544 final-year Business Education undergraduates was manageable and accessible to the researcher; therefore, the census sampling method was used. The

instrument for data collection was a structured questionnaire developed by the researcher and titled "Application of AI in Learning Entrepreneurial Skills by Business Education Undergraduates (AAILESBEU)". The instrument has two sections: A and B. Section A contained demographic data of the respondents, such as gender, while Section B was divided into three clusters, B1 to B3. Section B1 contained 9 items on the application of generative AI tools in learning entrepreneurial skills, Section B2 had 9 items on the application of reinforcement learning (RL) AI tools in learning entrepreneurial skills, and Section B3 had 9 items on the application of adaptive learning AI tools in learning entrepreneurial skills. The questionnaire items were structured on five points rating scale of Very High Extent (VHE) – 5, High Extent (HE) – 4, Moderate Extent (ME) – 3, Low Extent (LE) – 2 and Very Low Extent (VLE) – 1. The face and content validity of the instrument were determined by three experts. Two experts were from Business Education and one from Measurement and Evaluation.

The reliability of the instrument was established using the pilot testing method on 20 final-year business education undergraduates at Delta State University, Abraka, who were not part of the study population. Data collected were analyzed through the Cronbach alpha formula, which yielded reliability coefficients of 0.81, 0.79 and 0.87 for clusters B1 to B3, respectively, with an overall coefficient index of 0.83 obtained. The researcher, with the help of three research assistants, distributed copies of the questionnaire to the respondents in their universities. The research assistants were adequately briefed on the modalities for administration and retrieval of the questionnaires. Out of the 544 copies distributed, 531 (98%) were correctly filled and returned, which were used for data analysis. Data were analyzed using statistical mean, standard deviation and independent t-test. The mean was used to answer the research questions, and standard deviation for determining the homogeneity of the respondents' mean responses. The null hypotheses were tested using a t-test at the 0.05 level of significance with the aid of SPSS Version 26.0. The null hypothesis was rejected where the p-value is less than or equal to 0.05; otherwise, it was not rejected

Result, Analysis and Discussion

Table 1: Respondents' Mean Ratings and Standard Deviation on the Extent of Application of Generative AI Tools in Learning Entrepreneurial Skills by Business Education Undergraduates *(N = 531)*

S/N	Application of Generative AI Tools I use…	$\bar{X}$	SD	Remarks
1	ChatGPT to learn the ability to generate new business ideas	2.57	0.69	Moderate Extent
2	ChatGPT to learn the ability to identify business opportunities in my environment	2.38	0.67	Low Extent
3	Google Gemini to learn how to study customer needs and market trends	2.16	0.65	Low Extent
4	Google Gemini to learn how to prepare a simple business plan	3.69	0.70	High Extent
5	Claude AI to learn the ability to develop and improve business products or services	1.75	0.66	Low Extent
6	Claude AI to learn skills in developing marketing strategies for a business	1.59	0.64	Low Extent
7	Chatsonic to learn he ability to communicate with customers and respond to their needs	3.45	0.70	Moderate Extent
8	Chatsonic to learn the ability to make better decisions when faced with business problems	2.10	0.67	Low Extent
9	Microsoft Copilot to learn how to prepare budgets and manage business finances	1.49	0.62	Very Low Extent
	Cluster Mean	**2.35**		**Low Extent**

Table 1 shows that, out of the AI tools listed for application in learning entrepreneurial skills, business education undergraduates rated item 4 to a high extent with a mean score of 3.69. Items 1 and 7 were rated to a moderate extent with mean scores of 2.57 and 3.45; items 2, 3, 5, 6, 7 and 8 were rated to a low extent with mean scores ranging from 1.59 to 2.38, while item 9 was rated to a very low extent with a mean score of 1.49. The cluster mean score of 2.35 indicates that, on the whole, business education undergraduates apply generative AI learning tools to a low extent in learning

entrepreneurial skills in Rivers State universities. The standard deviation values, ranging from 0.62 to 0.70, indicate that the respondents had relatively similar responses.

Table 2: Respondents' Mean Ratings and Standard Deviation on the Extent of Application of Reinforcement Learning (RL) AI Tools in Learning Entrepreneurial Skills by Business Education Undergraduates (N = 531)

S/N	Application of Reinforcement Learning (RL) AI Tools I use...	$\bar{X}$	SD	Remarks
1	Business simulation AI tools to learn skills in starting and running a small business	1.67	0.66	Low Extent
2	Business simulation AI tools to learn how to make business decisions through trial and error.	2.46	0.68	Low Extent
3	AI Sales Training Bots to learn the ability to sell products and respond to customers	1.46	0.62	Very Low Extent
4	AI Marketing Simulation Tools to learn skills in promoting products	1.51	0.65	Low extent
5	Pitch-training AI tools to learn how to present my business ideas to customers or investors	1.37	0.60	Very Low Extent
6	Pitch-training AI tools to improve skills in generating business ideas based on feedback from the AI tool	1.36	0.59	Very Low Extent
7	Market-analytics AI tools to learn the ability to identify customer needs	1.57	0.67	Low Extent
8	AI Financial Simulation Tools to learn skills in preparing business budgets	1.30	0.59	Very Low Extent
9	AI Negotiation Training Tools to learn the ability to negotiate with customers	1.40	0.62	Very Low Extent
	Cluster Mean	**1.57**		**Low Extent**

Table 2 shows that out of the nine Reinforcement Learning (RL) AI tools listed for application in learning entrepreneurial skills, item 2 was rated as low extent with a mean score of 2.46. Items 1, 4 and 7 were also rated at a low extent, with mean scores ranging from 1.51 to 1.67. Items 3, 5, 6, 8 and 9 were rated at a very low extent, with mean scores ranging from 1.30 to 1.46. The cluster mean score is 1.57**,** indicating that, on the whole, business education undergraduates apply Reinforcement Learning (RL) AI tools to a very low extent in learning entrepreneurial skills in Rivers State universities. The standard deviation values, ranging from 0.59 to 0.68**,** indicate that the respondents had relatively similar responses.

Table 3: Respondents' Mean Ratings and Standard Deviation on the Level of Application of Adaptive AI Learning Tools in Learning Entrepreneurial Skills by Business Education Undergraduates (N = 531)

S/N	Adaptive Learning AI Tool I use...	$\bar{X}$	SD	Remarks
1	Intelligent Tutoring Systems (ITS) to learn skills in identifying business opportunities	3.51	0.71	High Extent
2	Intelligent Tutoring Systems (ITS) to learn the ability to develop new business ideas	2.55	0.67	Moderate Extent
3	AI-powered Learning Management Systems (LMS) to learn the ability to prepare a simple business plan	2.50	0.68	

				Moderate Extent
4	AI-powered Learning Management Systems (LMS) to learn how to manage the resources of a business	2.61	0.70	Moderate Extent
5	AI Student Performance Analytics to identify the entrepreneurial skills I need to improve	2.19	0.65	Low Extent
6	AI Student Performance Analytics to receive feedback on my performance in entrepreneurial activities	2.41	0.65	Low Extent
7	AI-powered Personalised Learning Platforms to learn financial management skills at my own learning pace	1.58	0.63	Low Extent
8	Adaptive Business Simulation Tools to learn skills in making decisions when running a business	1.45	0.66	Low Extent
9	Adaptive Assessment Tools to test my knowledge of entrepreneurial skills and identify areas where I need improvement	1.87	0.67	Low Extent
	Cluster mean	**2.30**		**Low Extent**

Table 3 shows that out of the nine adaptive learning AI tools listed for application in learning entrepreneurial skills, item 1 was rated high extent with a mean score of 3.51. Items 2, 3 and 4 were rated at a moderate extent, with mean scores ranging from 2.50 to 2.61, while items 5, 6, 7, 8 and 9 were rated at a low extent, with mean scores ranging from 1.45 to 2.41. The cluster mean score of 2.30 indicates that, on the whole, business education undergraduates apply adaptive learning AI tools to a low extent in learning entrepreneurial skills in Rivers State universities. The standard deviation values, ranging from 0.63 to 0.71, indicate that the respondents had relatively similar responses.

Table 4: Summary of t-Test Analysis of the Significant Difference in the Mean Ratings between Male and Female Business Education Undergraduates in the Extent of Application of Generative AI Tools in Learning Entrepreneurial Skills

Gender	N	$\bar{X}$	SD	df	t-value	P-value	Decision
Male	219	2.38	0.69				
				529	0.90	0.37	Not Significant
Female	312	2 32	0.67				

Table 4 shows that the t-value of 0.90 at 529 degrees of freedom with a p-value of 0.37, which is greater than the alpha value of 0.05 (0.37 > 0.05). Since the p-value is greater than the significance level, the null hypothesis is therefore not rejected. This means that there is no significant difference in the mean ratings of male and female Business Education undergraduates on the extent of application of generative AI tools in learning entrepreneurial skills in Rivers State Universities.

Table 5: Summary of t-Test Analysis of the Significant Difference in the Mean Ratings between Male and Female Business Education Undergraduates in the Extent of Application of Reinforcement Learning (RL) AI tools in Learning Entrepreneurial Skills

Gender	N	$\bar{X}$	SD	df	t-value	P-value	Decision
Male	219	1.60	0.67				
				529	1.10	0.27	Not Significant
Female	312	1 53	0.65				

Table 5 shows that the t-value of 1.10 at 529 degrees of freedom with a p-value of 0.27, which is greater than the alpha value of 0.05 (0.27 > 0.05). Since the p-value is greater than the significance level, the null hypothesis is therefore not rejected. This means that there is no significant difference in the mean ratings of male and female Business Education undergraduates on the level of application of Reinforcement Learning (RL) AI tools in learning entrepreneurial skills in Rivers State Universities.

Table 6: Summary of t-Test Analysis of the Significant Difference in the Mean Ratings between Male and Female Business Education Undergraduates in the Extent of Application of Adaptive Learning) AI Tools in Learning Entrepreneurial Skills

Gender	N	X̄	SD	df	t-value	P-value	Decision
Male	219	2.32	0.68				
				529	0.62	0.54	Not Significant
Female	312	2 28	0.66				

Table 6 shows that the t-value of 0.62 at 529 degrees of freedom with a p-value of 0.54, which is greater than the alpha value of 0.05 (0.54 > 0.05). Since the p-value is greater than the significance level, the null hypothesis is therefore not rejected. This means that male and female Business Education undergraduates do not differ significantly in their mean ratings on the extent of application of adaptive learning AI tools in learning entrepreneurial skills in Rivers State Universities.

Discussion of Findings

Findings of the study revealed that Business Education undergraduates apply generative AI learning tools to a low extent in learning entrepreneurial skills in Rivers State universities. This finding agrees with that of Obomeghie (2025), which reported that the use of AI tools in enhancing learning by higher education students was low. Similarly, Ikedinachi (2019) earlier found that the extent of application of AI in Nigerian public universities was low. In addition, Nwile et al. (2025) observed that AI has been widely embraced in other sectors, but its potential in learning among Business Education undergraduates has yet to be fully harnessed. Obomeghie (2025) attributed the low application of AI in learning employability skills (entrepreneurial skills inclusive) to challenges facing university education in Nigeria such as limited technological access and reliable internet, insufficient AI infrastructure and digital literacy, and the high cost of digital resources (Ukata & Amadi, 2025). Findings of the study also revealed that there was no significant difference in the mean ratings of male and female Business Education undergraduates on the extent of application of generative AI tools in learning entrepreneurial skills in Rivers State Universities. In support, Ifi et al. (2026) found no significant gender differences in perceptions of AI's application and influence on business education skill acquisition.

Findings of the study also revealed that Business Education undergraduates apply Reinforcement Learning (RL) AI tools to a very low extent in learning entrepreneurial skills in Rivers State universities. The findings of this study are in line with those of Akalonu (2025), which found that more advanced AI learning tools were less frequently used for academic learning by business education students. Okonkwo et al. (2025) reported that AI learning tools were very lowly integrated into the teaching and learning of Business Education courses. It was also found that there was no significant difference in the mean ratings of male and female Business Education undergraduates on the extent of application of Reinforcement Learning (RL) AI tools in learning entrepreneurial skills in Rivers State Universities. This finding implies that the usage of AI in Business Education is becoming more technology-driven than gender-dependent, with students of both genders having equal access to and application of AI learning tools. This finding aligns with that of Eze-Desy and Emeasoba (2025), which reported no gender differences in the extent of integration of AI tools in teaching and learning of OTM courses.

Findings of the study revealed that Business Education undergraduates apply adaptive learning AI tools to a low extent in learning entrepreneurial skills in Rivers State universities. This finding concurs with that of Wogboroma and Simon (2025), which found that AI learning tools were applied to a low extent by undergraduates in learning business education skills. Okah (2025) reported low application of AI tools in teaching and learning of business education courses. Atah et al. (2-25) likewise observed a low level of application of adaptive learning tools in teaching and learning of Business Education content. Dwivedi et al. (2023) and Stokel-Walter (2024) attributed this low level of application to data privacy issues, academic dishonesty, AI plagiarism, and excessive reliance on AI among undergraduates. The finding also revealed that male and female Business Education undergraduates do not differ significantly in their mean ratings on the level of application of adaptive learning AI tools in learning entrepreneurial skills in Rivers State Universities. In agreement, Atah et al. (2025) found that gender was a significant factor in the extent of application of AI adaptive learning tools in business education programmes.

Conclusion

The need for Business Education undergraduates to apply artificial intelligence (AI) in learning entrepreneurial skills has become necessary because of the changing nature of the business environment driven by digital technologies. The findings of this study revealed that Business Education undergraduates either lowly or very lowly apply generative AI, Reinforcement Learning (RL) AI, or adaptive learning AI tools in learning entrepreneurial skills in Rivers State universities.

Based on these findings, the research concludes that Business Education undergraduates are not adequately applying AI in learning entrepreneurial skills in Rivers State Universities.

Recommendations

Based on the findings and conclusion of this study, the following recommendations are made:

1. Management of Rivers State universities should provide adequate AI learning infrastructure and reliable internet facilities for Business Education departments. This will encourage undergraduates in the programme to move from the low application of generative AI tools to more regular and purposeful use in learning entrepreneurial skills.
2. The Heads of Department (HoDs) of Business Education in Rivers State universities should organize regular practical training on AI tools for undergraduates**.** Such training should focus on how students can apply generative AI tools responsibly to improve the learning of entrepreneurial skills rather than using AI merely to obtain ready-made answers.
3. The HoDs of business education in Rivers State universities should incorporate Reinforcement Learning (RL) AI tools into entrepreneurial education**.** This will enable business Educators to use RL AI tools in teaching entrepreneurship-related courses to expose undergraduates to more advanced RL AI tools and address the very low level of RL AI application identified in the study.
4. The HoDs of Business Education departments in Rivers State universities should introduce structured adaptive learning activities into entrepreneurial skills courses. This will enable business education lecturers to use adaptive AI tools to provide undergraduates with personalized business learning tasks based on their individual learning needs and performance. This could improve the low application of adaptive learning AI tools reported by the study.
5. Administrators of Rivers State Universities should establish clear guidelines for the responsible and gender inclusive application of AI in the Business Education programme. The guidelines should also address AI plagiarism, academic dishonesty, data privacy and excessive dependence on AI while encouraging undergraduates to apply adaptive learning AI platforms as learning support tools rather than a replacement for creative thinking.

Federal College of Education, Isu- Ebonyi State

Abstract

This study is on influence of digitalization of information in the promotion of entrepreneurship competencies among graduates in Enugu State. Three purposes of study and three corresponding research questions were used for the study. The study was carried out using a descriptive survey design. The population of the study comprised of one thousand, four hundred (1,400) students during 2025/2026 academic session. Eighty (380) students from ESCET and one thousand twenty (10,20) students from FCOEE. Simple random sampling procedure was adopted for the study. A sample of 200 Business Education students was used for the study. This constitutes twenty-five per cent of the entire population of Business Education graduates. The instrument for data collection was a researcher developed structured questionnaire titled "entrepreneurship competencies of graduates of business education from Colleges of Education in Enugu State Questionnaire (ECGBECEESQ). Data revealed that there are positive influence information and communication Technology competencies, digitalized human resources management competencies and digitalized opportunity recognition competencies in the promotion of entrepreneurship competencies in Enugu State. From the findings, it was recommended that school authorities should create a forum/platform for students to be engaged practically on entrepreneurship in order to boost their creativity and innovation abilities and that business education graduates with entrepreneurship competencies should be financed and adequately supported by the government in order to establish them and make them more beneficial to the society.

Keywords: Digitalization of Information, Entrepreneurship competencies, Graduates

Introduction

Digitalization of information refers to the process of converting analog or physical information into digital formats, making it easily accessible, stored, processed, and transmitted electronically. Digitalization of information can boost internet access for timely decision-making for information availability. Digitally literate collaborators are more efficient because they easily identify essential data/information/patterns and use them effectively. In a world where new information is constantly being published and consumed, having this capability is vital. Workers with digitalization of information skills can also connect and collaborate more effectively. These skills can also prevent generation gaps in a diverse workforce with up to five generations working together (Drew, 2022).

Due to SMEs' significant influence on a nation's economy, it is necessary to increase their performance. The first thing to understand is the factors that can hinder the performance of SMEs. A number of digital competence frameworks have been developed by both international agencies and companies as it is increasingly recognized as a central element of the skills organizations required for growth and productivity. Heitin, (2016) established that the extant literature on digitalization of information , skills and competencies is rich in definitions and classifications, but there is still no consensus on the larger themes and subsumed themes categories. (Entrepreneurship Study/Development Centers, ESCs, 2016).

An entrepreneur is defined as a person who has an. inclination to foresee uncertain events in pursuit of profit rather than bringing about a change in the economy. The Government through the compulsory regulatory bodies (Industrial training Fund (ITF), Tertiary Education Trust Fund (TETFund) has made it compulsory on every undergraduate student to offer entrepreneurial course as a step towards stimulating active and productive activities in the country. Akpotowoh, Watchman and Ogeibiri (2016) contended that the entrepreneur is believed to possess some traits which includes; boldness, confidence, personal leadership and force. The Federal Government of Nigeria recently directed all Federal and State Universities to establish Entrepreneurship Study/Development Centers (ESCs, 2016) at each of the institutions. This centre is to be funded by Tertiary Educational Trust Fund (TETFUND). Entrepreneurship is a creative process of organizing, managing an enterprise and assuming the risk

involved in the enterprise. However, both the societies at large as well as researchers have attempted to create the true conditions for the existence of entrepreneur. Entrepreneurs have taken advantage of the available competencies in the society or their environmental domain in other to create or develop new products or services, thus adding value to society while equally maximizing profits.

Casson (2021) defined entrepreneurship competencies as situations in which new goods, services, raw materials, markets and organizing methods can be introduced through the formation of new means, ends, or means-ends relationships. These situations do not need to change the terms of economic exchange to be entrepreneurial competencies, but only need to have the potential to alter the terms of economic exchange. In addition, unlike optimizing or satisfying decisions, in which the ends that the decision maker is trying to achieve and the means that the decision maker will employ are given, entrepreneurial decisions are creative decisions. That is, the entrepreneur constructs the means, the ends, or both. The creation of new means-ends frameworks in entrepreneurial decision making is a crucial part of the difference between entrepreneurial competencies and situations in which profit can be generated by optimizing within previously established means-ends frameworks (Kirzner, 2017). Thus, while non-entrepreneurial decisions maximize scarce resources across previously developed means and ends, entrepreneurial decisions involve the creation or identification of new ends and means (Gaglio & Katz, 2018) previously undetected or unutilized by market participants.

The global technological advancement and the Nigeria current economic trends have called for proper acquisition of ICT skills for entrepreneurship development among graduates. The federal government has mandated all training institutions of higher learning to integrate into the programmes of study, entrepreneurship education that will equip students Olorunmolu (2018) with appropriate entrepreneurial skills. Proper acquisition of these skills by the students will enable them establish their own businesses, become self-reliant and excel in the modern business world after graduation.

Prospective entrepreneurs should be well exposed and adequately equipped with ICT entrepreneurial skills to be successful, since information and communication technology is now revolutionalizing the business world. According to the Federal Republic of Nigeria in the National Policy on Information Technology (2017), ICT include any equipment or interconnected system or subsystem or equipment that is used in automatic acquisition, storage, manipulation, management, control and reception/ communication of data or information.

The past few decades, significance of entrepreneurial competencies has been amplified due to the strategic role played by the entrepreneur of a business enterprise. Entrepreneurial competencies are the individual characteristics including attitude and behaviour, which allows the entrepreneur to achieve business performance (Endi, Surachman, Armanu and Djumilah, 2016). In particular entrepreneurial competencies include entrepreneurial traits, motives, self-image, attitude, behaviour, skills, and knowledge (Boyatzis, 2016). Shane, Locke and Collins, (2016) posited that Competencies can be learned from the input (antecedent of competence), processes (task or behaviour that lead to competence), or result (achieving a standard of competence in the field of functional) .

In Nigeria, different fields of study at the tertiary institutions such as Business Education programme strives to improve and motivate individual skills and orientations with the primary aim of achieving standard skills that will help to improve general well-being in the workforce or labour market (Boyatzis, 2016). Human resource professionals are one-of-a-kind. They have a certain set of skills that only Human Resources (HR) professionals have, which is what makes them so special. Okechukwu (2019), Opined that human resource or sees the following areas: Organization: One of the most important human resource management skills you must have to successfully work in HR is organization. Everyone who works in HR must be well-organized, must have strong time management and be personally efficient in order to succeed. Singh (2018) defines opportunity recognition as perceiving the possibility for new profit potential through founding and forming of new venture and significant improvement of an existing venture. This definition emphasizes that the act of opportunity recognition is not a one-time activity of an entrepreneur; instead, it is a perpetual process that encompasses perception, discovery and creation (Singh 2017). De Koning (2016) defines opportunity recognition as the specific eureka experience when suddenly an idea crystallizes and as an evolution of initial idea into full blown business concepts. The difference between the two definitions is that the former emphasizes on opportunity recognition as the activity in the originating phase of the venture, where as the later definition calls it as ongoing activity of the entrepreneur. Eckhardt and Shane (2016) define opportunity recognition as situations in which new goods, services, raw materials, markets and organizing methods can be introduced through the formation of new means, ends or means-ends relationship. From the above definitions, it is clear that there is an interrelationship between innovation and opportunity recognition.

The issue of unemployment has become a common issue among graduates. This is because, many graduates no longer believe that they have the ability to create job for themselves before getting paid jobs. This has a correlation with entrepreneurship education given to them while in school. From outset, Nigeria before the advent of colonial rule, unemployment was a rare phenomenon because the people were highly entrepreneurial and productively engaged. This entrepreneurial engagement is prevalent in Yoruba land of Western Nigeria , Hausa land of the Northern Nigeria , and among Igbo people of Eastern. Nigeria. This was achieved through encouragement of communal wealth creation and productive use of human resources, thus forestalling unemployment. However, the emergence of formal administration in Nigeria introduced formal education which enabled people to have the opportunity of being employed in the civil service after graduation. As such, the system destroyed self-reliance and entrepreneurial skills of Nigerian graduates as they became permanently dependent on the colonial masters. This has led to massive unemployment and craze in the contemporary times for ready-made Jobs . In the circumstances therefore, this study evaluated the influence of digitalization of information in the promotion of entrepreneurship competencies among graduates in Enugu State

The main objective of this study was to determine the influence of digitalization of information in the promotion of entrepreneurship competencies among graduates in Enugu State.

Specifically, the study sought to determine the;

1. Influence of Information and communication Technology competencies in the promotion of entrepreneurship competencies among Graduates in Enugu State.
2. Influence of digitalized human resources management in the promotion of entrepreneurship competencies among Graduates in Enugu State.
3. Digitalized opportunity recognition in the promotion of entrepreneurship competencies among Graduates in Enugu State.

Research Questions

The following research questions will guide the study;

1. What are the influence of Information and communication Technology in the promotion of entrepreneurship competencies among Graduates in Enugu State?
2. What is the influence of digitalized human resources management in the promotion of entrepreneurship competencies among Graduates in Enugu State?
3. What is the influence of digitalized opportunity recognition in the promotion of entrepreneurship competencies among Graduates in Enugu State?

Method

This study adopted a descriptive survey research design. According to Nworgu (2015), a descriptive survey research design is an effective means of collecting data from a large number of sources and takes a short time. It has been discovered that data collected from such source is to a very large extent accurate and precise. This study was conducted in public Colleges of Education in Enugu State . It is imperative to stress that all the students in Federal College of Education Eha-Amufu (FCOEE) and Enugu State College of Education (Technical), Enugu (ESCET) were studied. The reason for choosing FCOEE and ESCET was because the Colleges were the only public owned Colleges of Education in the state. The population of this study consisted of one thousand, four hundred (1,400) students during 2023/2024 academic session . Eighty (380) students from ESCET and one thousand twenty (10,20) students from FCOEE. A sample of 200 Business Education students was used for the study. This constitutes twenty-five per cent of the entire population of Business Education students. This sample was adjudged representative of the population based on the suggestions by Nwana in Ejifugha (2018), which stipulated that if the population is a few hundreds, the sample size should be forty (40%) – fifty (50%), if the population comprises many hundreds, twenty (20%) of the population should be considered appropriate for the sample and if the population runs into thousands, two to five (2-5%) of the population should be deemed appropriate for the study.

The instrument used for the collection of data was a structured questionnaire developed by the researcher. The title of the questionnaire was entrepreneurship competencies of graduates of business education from Colleges of Education in Enugu State Questionnaire (ECGBECEESQ). It has two sections contained information of the demographic data of the respondents while section “B” contained items on entrepreneurship competencies of graduates of business education from Colleges of Education in Enugu State. The instrument has 15 items. Four point rating scale viz strongly Agree (4)points, Agree (3 points), Disagree (2 points), Strongly Disagree (1 point) were used by determine the level of agreement of the respondents on the questionnaire items.

The research instrument received face validity through the judgment of three experts, one from measurement and evaluation Department, ESCET, two from Department of Educational Management, faculty of Education, Enugu State University of Science and Technology, Enugu. The experts were given copies of the drafted. The experts' inputs, corrections and suggestions along side with the supervisor's comments were used to design the final drafts of the questionnaire.

The researcher administered the instrument to the respondents with the help of three (3) research assistants whom assisted in the administration of the instrument or research assistants in the sampled schools. Two hundred copies of the questionnaire were administered and all the 200 copies of questionnaire were collected back through the help of research assistants (students) in the Colleges. Meanwhile, 100% of the questionnaire was returned and used for the study. Mean statistics was used for data analysis.

Results

Research Question 1: What are the influence of Information and communication Technology in the promotion of entrepreneurship competencies among Graduates in Enugu State?

Table 1:

Mean Response on ICT Competencies Acquired by Business Education Graduates.

S/n	Items: the following were the ICT competencies in promotion of entrepreneurship competencies .	SA	A	D	SD	N	∑fx	X Mean	Decision
1	It promotes using word processing software	110	60	20	10	200	670	3.30	Agreed
2	It promotes using excel/spread sheet	100	70	20	10	200	660	3.30	Agreed
3	It promotes using database system	10	20	70	100	200	340	1.70	Disagreed
4	It promotes application of graphic information	5	10	65	120	200	300	1.50	Disagreed
5	It helps in organizing of digital information	90	80	16	14	200	646	3.20	Agreed
	Grand Mean							2.60	Agreed

From the computed mean in table 1: was found that the of items 1,2 and 5 were above the bench mark of 2.50 hence respondents agreed that ICT competence helps in promotion of entrepreneurship competencies. It was found that the mean of item the above bench mark of 2.50 hence respondents agreed ICT competence promotes the use of modern gadgets, items 3 and 4 recorded mean rating below the bench mark of 2.50 hence respondent disagreed that competencies sought by the two items on Business Education graduates were not okay. The grand mean of the table made a mean rating above the bench mark the interpretation of this was that the competencies sought by the five items from the graduates of Business Education graduates were posed by them, the decision of the grand mean.

Research Question 2: What is the influence of digitalized human resources management in the promotion of entrepreneurship competencies among Graduates in Enugu State?

Table 2: Mean response score on digitalized human resources competencies acquired by Business Education Graduates.

S/n	Items: the following are the influence of digitalized human resources management in the promotion of entrepreneurship competencies	SA	A	D	SD	N	EFX	X Mean	Remark
6	Using digital facilities promotes planning of Business ventures	120	55	20	5	200	690	3.50	Agreed
7	Using digital facilities promotes organization of physical and material resources	100	60	30	10	200	650	3.30	Agreed
8	Using digital facilities promotes effective control of both human	40	40	50	70	200	450	2.20	Disagreed

	material and financial resources in the enterprise								
9	Using digital facilities increases credibility in supervising the operation in the business	20	10	70	100	200	350	1.80	Disagreed
10	Using digital facilities improves evaluating capacity and decision making in a business ventures	130	40	20	10	200	690	3.50	Agreed
	Grand Mean							2.86	Agreed

From the computed mean in table 2: was found that the of items 6,7, and 10 were above the bench mark of 2.50 hence respondents agreed that using digital facilities promotes human resources competencies by Business Education graduates it was found that the mean of item the above bench mark of 2.50 hence respondents agreed that using digital facilities in human resources competencies by Business Education graduated on the other hand, items 8 and 9 recorded mean rating below the bench mark of 2.50 hence respondent disagreed that human resources competencies does not promote entrepreneurship competencies . The grand mean of the table made a mean rating above the bench mark the interpretation of this was that the competencies sought by the five items from the graduates of Business Education graduates were posed by them, the decision of the grand mean.

Research Question 3: What is the influence of digitalized opportunity recognition in the promotion of entrepreneurship competencies among Graduates in Enugu State? .

S/n	Items	SA	A	D	SD	N	EFX	X mean	Remark
11	It facilitates using digital facilities in organize and carry out projects, keeping an eye on time, personnel and financial resources	100	75	20	5	200	670	3.40	Agreed
12	It promotes being Goal-oriented	120	60	15	5	200	695	3.50	Agreed
13	It promotes eloquence to speak the language of the various departments and of the customers, suppliers and partners	110	75	10	5	200	680	3.40	Agreed
14	Multilanguage: Ideas richness, creativity and innovation are not familiar with any linguistic boundaries using digitalized technology	20	15	55	110	200	345	1.70	Disagreed
15	It promotes Learning: The professionalism of an innovation manager consists of dealing with something new	90	70	30	10	200	640	3.20	Agreed
	Grand Mean							3.04	

From the computed mean in table 2: was found that the of items 11,12, 13 and 15 were above the bench mark of 2.50 hence respondents agreed that opportunity recognition competencies acquired by business education graduates it was found that the mean of item the above bench mark of 2.50 hence respondents agreed that opportunity recognition competencies acquired by business education graduates, on the other hand, items 14 recorded mean rating below the bench mark of 2.50 hence respondent disagreed that opportunity recognition competencies acquired by business education graduates were not okay. The grand mean of the table made a mean rating above the bench mark the interpretation of this was that the competencies sought by the five items from the graduates of Business Education graduates were posed by them, the decision of the grand mean.

Discussion of Findings

The data analyzed in table 1 on the ICT competencies acquired by Business Education Graduates from Colleges of Education shows that use word processing software, use excel/spread sheet, the finding is expected and not surprising because Tangri (2019) asserted that ICT facilities improves business education graduates competencies. Okechukwu (2018) had earlier opined that

resource professionals in organizations should posses a set of skills, this agreement can be attributed to the fact Oppong's (2015) study was conducted in an academic setting among students of higher institutions which had similar features with the settings of this study, though the educational levels differed. Thus, the consonance was valid.

The researcher through the data obtained, in table 2 on digitalized human resources competencies acquired by Business Education Graduates from Colleges of Education in Enugu State. The study revealed that Plan Business ventures, organize physical and material resources and plan business Ventures are human resources competencies required by business education graduates. This is in line with the work of Dahintein (2019), Grover and Mangle (2016) reported that human resources competencies are very important in the development of every young business education graduate for self development and actualization.

The researcher through the data obtained, in table 3, on opportunity recognition competencies acquired by business education graduates. Organize and carry out projects, be goal-oriented, ideas richness, creativity and innovation and the professionalism of an innovation manager consists of dealing with something. However, the finding was in consonance with that of Timmerman (2016) who stated that business education graduates are likely to survive when they have valuable opportunity recognition competencies in the labour market.

This chapter consists of the following: Summary, Conclusion and Recommendation for improvements.

Conclusion

Entrepreneurship competencies are basic necessities of starting new organizations or revitalizing mature organizations, particularly new businesses generally in response to\ identified competencies. The issue of ICT development as one of the frontline of modern businesses in the world is highly required so as to boost graduates understanding in the business world. Moreover, the study laid emphasis on resource management skills of staying organized, skill of emotional intelligence, negotiation and others. Opportunity recognition aimed to review the perceived competencies , recognize competencies and innovation in the business world. The study also stressed on the issue of innovational competencies such as organizing and carrying out projects, .Multilanguage deals richness, creative and innovation are not familiar. All these are competencies required by business education graduates in colleges of Education. All stake holders regulatory body lecturers and students should therefore be guided accordingly.

Recommendations

In View of the results gathered from this study, the following are the recommendations given which will be useful in understanding the influence of digitalized information in the promotion of entrepreneurship competencies of graduates of business education in Enugu State.

1. School authorities should create a forum/platform for students to be engaged practically on entrepreneurship in order to boost their creativity and innovation abilities.
2. Business education graduates with entrepreneurship competencies should be financed and adequately supported by the government in order to establish them and make them more beneficial to the society.
3. Government should provide more digitalized opportunities for youths in order to pave way for international competition among young graduates in Nigeria.

Abstract

The study evaluated business educators' perceptions on the adoption of smart pedagogy in teaching Business Education Courses in universities in Cross River State. Two specific purpose, research questions and hypotheses respectively guided the study. Descriptive survey research design was adopted for the study. The population comprised sixty-six (66) business educators. Census sampling technique was adopted since the population size was manageable. The instrument used for data collection was a structured questionnaire titled "Business Educators' Perceptions on Smart Pedagogy Questionnaire (BEPSPQ)". The instrument was subjected to face and content validation by three experts: two from the Department of Business Education and one from Measurement and Evaluation. The instrument was further tested for reliability using Cronbach Alpha coefficient. The reliability coefficients obtained were 0.86 for PU and 0.84 for PEOU, with an overall reliability of 0.85. Mean and Standard Deviation were used to answer the research questions. Independent samples t-test was used to test for significant differences at 0.05 level of significance. Findings indicated that business educators to a very high extent recognize the usefulness of smart pedagogy in teaching Business Education courses but their perceived easy to use smart pedagogy was very low. Gender was not a barrier to recognizing the usefulness of smart pedagogy. Also, there was no significant difference in business educators in federal and state owned universities on the perceived ease of use of smart pedagogy for teaching Business Education courses. The absence of significant differences by gender and ownership implies that the problem is systemic. Both male/female and Federal/State lecturers face the same barriers, so interventions must be uniform across all groups. It was recommended among others that Government, NUC, and TETFund should prioritize stable power supply, high-speed internet, smart classrooms, and on-campus ICT support in both Federal and State Universities to reduce difficulty in using smart pedagogy.

Introduction

Business Education is a vocational programme saddled with the responsibility of producing graduates at various levels who can manage modern offices, run digital enterprises, and perform effectively in the digital economy. Adie et al. (2026) conceived Business Education as an academic programme concerned with the teaching and learning of the fundamentals, theories and processes of business to help recipients at all levels acquire requisite vocational knowledge, skills, experiences, ethics and attitudes needed to be successful in teaching, business, office and life generally. Business Education courses are designed to equip students with skills for office administration, entrepreneurship, and business operations. Business Educators are lecturers and teachers in Colleges of Education, Polytechnics, and Universities who teach Business Education courses such as Office Practice,

Entrepreneurship, Accounting, Marketing, and ICT in Business. These courses now require delivery methods that mirror real business environments. This makes the adoption of smart pedagogy critical for Business Education.

The word "smart" refers to intelligence in decisions, penalization (in learning and teaching), transparency, and adaptivity in smart education Badshah et al. (2023). Smart education in this context provides a digital environment to facilitate learners, parents, teachers, and administrators to enhance learner engagement and motivation (Zhi-Ting et al. in Badshah et al., 2023). The 21st Century has witness an increased emergence in technology-rich learning environments. Peng et al. (2019) elucidated that a smart learning environment adopt smart devices and intelligent technologies to effectively promote the development of personalized learning and adaptive learning. Lee and Lee (2024) argued that smart teachers are supposed to be 'adaptive' to survive by proving themselves as 'compatible', especially in a smart learning environment where smart pedagogy is imperative.

The 21st century workplace is defined by rapid technological change, Artificial Intelligence (AI), cloud computing, and data-driven decision making. In line with this, the education sector globally is shifting from traditional teacher-centred methods to Smart Pedagogy (SP). Li and Tak-Ming Wong (2021) confirmed the increased global attention given to SP from diverse disciplines and contexts of application. SP is an intelligent, technology-enhanced teaching approach that uses AI, Internet of Things (IoT), big data analytics, mobile learning, gamification, and adaptive learning platforms to deliver personalized and interactive instruction (Zhu et al., 2023). SP is a method of teaching in a smart learning environment. It involves the use of smart classrooms, AI-driven feedback, virtual business simulations, LMS with learning analytics, chatbots for student support, and collaborative cloud platforms (Hwang & Chien, 2022). In Business Education, smart pedagogy can be applied through: Virtual Business Simulations for entrepreneurship and marketing courses; AI Chatbots and LMS Analytics for office practice and record management; Cloud-based Collaborative Tools like Google Workspace and Microsoft 365 for team projects and Gamified Learning Platforms for accounting and taxation drills (Hwang & Chien, 2022).

The success of any educational innovation depends largely on the perceptions of the teachers who are to implement it. Reyes et al. (2021) averred that teachers' perceptions are beliefs which are self-generating and often unchallenged. Perceptions here means the opinions, beliefs, attitudes, and understanding that business educators have toward a new teaching approach heavily driven by technology. Theoretically, the perceptions of business educators in this study is anchored on Davis (1989) Technology Acceptance Model (TAM), which presented two key factors that determine whether educators will adopt a new technology: Perceived Usefulness [PU] and Perceived Ease of Use [PEOU].

From TAM perspective, Perceived Usefulness is how useful a technology is to the users or potential users (Davis, 1989). Contextually, it is the degree to which a business educator believes that using smart pedagogy will enhance students' learning outcomes, engagement, and job readiness. When educators view smart pedagogy as useful, they are more likely to integrate it into teaching. Recent studies show growing recognition of PU. Onyemaechi and Adeyemi (2024) found that 78% of business educators in Southeast Nigeria agreed that smart pedagogy makes Business Education courses more practical and industry-relevant. Students taught with simulations and LMS were rated as having better digital communication and problem-solving skills. Similarly, Eze and Obi (2022) reported that business educators perceived smart classroom tools as useful for teaching entrepreneurship because they allow students to test business ideas virtually without financial risk. This suggest that smart pedagogy bridges the gap between school and workplace.

There are empirical evidences that educators' willingness to adopt smart technology for teaching depends on its usefulness. Onyemaechi and Adeyemi (2024) surveyed 210 business educators in Southeast Nigeria. Using a 4-point scale, they found a grand mean of 3.12, indicating high perceived usefulness. Respondents agreed that smart pedagogy improves student engagement, assessment, and preparation for digital offices. The study recommended TETFund training for all business educators. In Ghana, Mensah and Boateng (2023) studied 180 vocational educators. They found that PU was the strongest predictor of intention to use smart tools in teaching. Educators who saw smart pedagogy as useful for improving employability were 2.4 times more likely to adopt it. Zhu et al. (2023) in a meta-analysis of 45 studies across Asia concluded that teachers' PU of smart education was consistently high when it was linked to measurable student outcomes. However, PU alone does not guarantee adoption. Some educators may see the value but still not use it because of their Perceived Ease of Use.

Perceived Ease of Use refers to the degree to which a business educator believes that using smart pedagogy will be free from mental and technical effort (Al-Emran et al., 2023). This suggest that if a tool is perceived as complicated, time-consuming, or requiring too much training, adoption will be low even if it is useful. Bello and Suleiman (2023) found that PEOU was a major barrier among NCE business educators in North-Central Nigeria. 63% of respondents cited poor internet, epileptic power supply, and lack of technical support as reasons they found smart pedagogy difficult to use. Adamu and Yusuf (2024) also reported that senior business educators with over 15 years of experience had significantly lower PEOU than younger lecturers. The authors concluded that digital literacy training is needed to improve confidence. Ibrahim and Musa (2023) added that even when colleges have smart boards and LMS, lack of institutional support makes PEOU low. A situation were lecturers spend personal money on data and repairs, makes the adoption process stressful. Therefore, for smart pedagogy to be adopted, both PU and PEOU must be high.

In Nigeria, the National Commission for Colleges of Education (NCCE, 2022) and National Universities Commission (NUC, 2020) have revised the Business Education curriculum to include digital and entrepreneurial skills. TETFund has also invested in ICT infrastructure in many tertiary institutions. Despite this, classroom observation and literature show that many Business Educators still rely on lecture method and chalkboard (Omeje & Ugwuanyi, 2023). Several studies suggest that this low adoption may be linked to educators' perceptions. In a study, Onyemaechi and Adeyemi (2024) found that many business educators in South-East Nigeria have positive perceptions of the usefulness of smart pedagogy but doubt their ability to use it due to poor training. Perceived ease of use can also be low among business educators because of unstable power, internet and unavailability of modern instructional facilities. Educators cannot teach with facilities that are not available.

Empirical studies also provided evidences to show that lecturers' gender and type of the institution ownership can influence their perceived use and ease of technology. Dai et al. (2023) revealed that teachers and students had a positive attitude towards the smart learning environment, and gender, age, grade, subject category and other variables had limited impact on spatial preference. Specifically, in terms of teachers' gender variables, the study found no significant difference between male and female teachers in the satisfaction of smart learning environment. The finding was consistent with Omeje and Ugwuanyi (2023) who found no significant gender difference in perceptions of digital teaching tools among business educators. Both male and female lecturers had similar PU but females reported slightly lower PEOU due to less access to tech training. Contrarily, Danko et al. (2020) found that gender positively correlates with ICT use and that particular ICT tools and their pedagogical uses are more frequent among female teachers whereas males scored higher for certain ICT-related attitudes. This implies that gender may be viewed as a predictor of certain types of and attitudes to ICT use in tertiary instructions. This was amplified by Guillén-Gámez and Rodríguez-Fernández (2022) that female teachers have a more positive attitude towards the educational use of ICT than male teachers.

On the aspect of institution ownership, Nwachukwu and Ezeani (2022) compared Federal and State college business educators in South-East Nigeria. They found no significant difference in PU but a significant difference in PEOU. Federal college lecturers reported higher PEOU due to better ICT facilities. Without understanding how Business Education lecturers perceive smart pedagogy in terms of usefulness and ease of use, efforts by government to digitize teaching may be unproductive. It is against this background that this study sought to evaluate Business Educators' Perceptions on the Adoption of Smart Pedagogy in Teaching Business Education Courses, with specific focus on Perceived Usefulness and Perceived Ease of Use based on gender and ownership.

Statement of the Problem

The digital economy demands that Business Education graduates possess skills in virtual collaboration, e-commerce, data analytics, and digital marketing (World Economic Forum, 2024). To produce Business Education graduates to meet the demands of digital workplace, teaching of Business Education courses must also become digital, intelligent, and adaptive. Smart pedagogy offers this possibility. Without understanding how business educators perceive smart pedagogy in terms of usefulness and ease of use, efforts by government to digitize teaching may be unproductive. Many classrooms still lack interactive tools, and teaching is still largely theoretical. This creates a mismatch between what is taught and what industry requires, leading to graduate unemployment and poor job performance. This problem may not be only about infrastructure. Teacher perception is a critical factor.

TAM postulated by Davis (1989) confirmed that even when technology is available, educators may not adopt it if they do not perceive it as useful or easy to use.

Recent studies in Nigeria present mixed findings. Eze and Obi (2022) found that business educators perceived smart pedagogy as useful for improving students' entrepreneurial skills. In contrast, Adamu and Yusuf (2024) reported that many lecturers in State colleges perceived it as too difficult and time-consuming to implement. This inconsistency creates a research gap. No recent study has specifically examined Business Educators' Perceptions of Smart Pedagogy sufficiently using the TAM framework, focusing on both Perceived Usefulness and Perceived Ease of Use across tertiary institutions in Cross River State. Therefore, this study seeks to answer: What are Business Educators' perceptions on the adoption of smart pedagogy in teaching Business Education courses in terms of Perceived Usefulness and Perceived Ease of Use? Addressing this will provide data for policy makers and management of the tertiary institutions in the state to design appropriate training and support.

Purpose of the Study

The main purpose of this study was to evaluate Business Educators' Perceptions on the Adoption of Smart Pedagogy in Teaching Business Education Courses universities in Cross River State. Specifically, the study sought to:

1. Assess business educators' Perceived Usefulness of smart pedagogy for improving teaching Business Education courses.
2. Ascertain business educators' Perceived Ease of Use of smart pedagogy in teaching Business Education courses.

Research Questions

The following research questions guided the study:

1. To what extent do business educators perceive smart pedagogy as useful for teaching Business Education courses?
2. To what extent do business educators perceive smart pedagogy as easy to use in teaching Business Education courses?

Research Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

Ho1: There is no significant difference in male and female business educators on the perceived usefulness of smart pedagogy for teaching Business Education courses.

Ho2: There is no significant difference in business educators in federal and state owned universities on the perceived ease of use of smart pedagogy for teaching Business Education courses.

Methodology

Descriptive survey research design was adopted for the study. The population comprised sixty-six (66) business educators (males 38 and females 28) in three universities offering Business Education programme in Cross River State: University of Calabar (Unical), University of Cross River State (Uncross) and University of Education and Entrepreneurship (EEU). Census sampling technique was adopted since the population size was manageable. The instrument used for data collection was a structured questionnaire titled "Business Educators' Perceptions on Smart Pedagogy Questionnaire (BEPSPQ)". The questionnaire was developed by the researcher based on TAM constructs and reviewed literature. The questionnaire had two sections: Section A: Demographic data of respondents such as Gender and Institution ownership. Section B: consisted of 20 items on a 4-point Likert scale measuring: Perceived Usefulness (PU) - 10 items. Perceived Ease of Use (PEOU) - 10 items. The rating was as follows: Very High Extent (SA) = 4, High Extent (A) = 3, Low Extent e (D) = 2 and Very Low Extent (SD) = 1. The benchmark mean for acceptance was 2.50. The instrument was subjected to face and content validation by three experts: two from the Department of Business Education and one from Measurement and Evaluation. The experts assessed the relevance, clarity, and adequacy of the

items in measuring the constructs. Their corrections and suggestions were incorporated to produce the final draft. To determine the reliability of BEPSPQ, a pilot test was conducted on 20 Business Educators in two universities in Ebonyi State which is outside the study area. Data collected were tested for reliability using Cronbach Alpha coefficient. The reliability coefficients obtained were 0.86 for PU and 0.84 for PEOU, with an overall reliability of 0.85. This shows that the instrument is reliable. 66 copies of the instrument were administered to the respondents with the help of three research assistants. 58 copies out of the 66 were successfully retrieved. Data collected were analysed using both descriptive and inferential statistics. Mean and Standard Deviation were used to answer the research questions. Independent samples t-test was used to test for significant differences at 0.05 level of significance. All analyses were done using SPSS Version 25.0. The decision rule was based on p-value < 0.05 to reject the null hypothesis.

Results

Research Question One

To what extent do business educators perceived smart pedagogy as useful for teaching Business Education courses?

The descriptive analysis summary on the perceived smart pedagogy as useful in teaching business education courses is presented in table 1.

Table 1: ***Descriptive Analysis Summary on the Perceived Smart Pedagogy as Useful in Teaching Business Education Courses***

S/N	Perceived Usefulness of Smart Pedagogy	Mean	SD	DECISION
1	Smart pedagogy makes Business Education courses more practical	3.59	0.49	Very High Ext
2	The use of smart pedagogy improves students' understanding of complex business concepts	3.58	0.49	Very High Ext
3	Smart pedagogy tools enhance students' digital skills for the workplace relevant	3.55	0.50	Very High Ext
4	Smart pedagogy increases students' engagement in Business Education classes	3.52	0.57	Very High Ext
5	Using smart pedagogy enables educators to provide more personalized feedback to students	3.57	0.50	Very High Ext
6	Smart pedagogy helps students develop problem-solving skills needed in the digital economy	3.62	0.49	Very High Ext
7	Smart pedagogy makes assessment in Business Education more efficient	3.52	0.50	Very High Ext
8	Smart pedagogy prepares Business Education graduates to meet the demands of Industry 4.0	3.64	0.48	Very High Ext
9	Smart pedagogy improves collaboration among students through virtual tools	3.47	0.50	High Extent
10	Smart pedagogy will improve the quality of teaching and learning in Business Education	3.71	0.46	Very High Ext
	Grand Mean	**3.56**		**Very High Ext**

Table 1 shows that in response to research question one, all the related items except item 9 responses indicated very high extent of pedagogy usefulness. The grand mean value of 3.56 reveals that business educators, to a very high extent, perceived smart pedagogy as useful for the teaching of Business Education courses in universities in Cross River State.

Research Question Two

To what extent do business educators perceived smart pedagogy as easy to use in teaching Business Education courses?

The descriptive analysis summary on the perceived smart pedagogy as easy to use in teaching business education courses is presented in Table 2

Table 2: ***Descriptive Analysis Summary on the Perceived Smart Pedagogy as Easy to Use in Teaching Business Education Courses***

S/N	Perceived Ease of Use of Smart Pedagogy	Mean	SD	DECISION
11	I find it easy to learn how to use smart pedagogy tools for teaching	2.62	0.85	High Extent
12	I find it easy to integrate smart pedagogy tools into my Business Education lessons	2.17	0.76	Very low Extent
13	Using smart pedagogy tools does not require too much mental effort from me	2.24	0.73	Very low Extent
14	I have the technical skills needed to use smart pedagogy tools effectively	2.17	0.63	Very low Extent
15	My college provides adequate technical support when I have problems with smart pedagogy tools	2.40	0.67	Very low Extent
16	Internet connectivity and power supply in my college make it easy to use smart pedagogy	2.29	0.68	Very low Extent
17	I can easily access training materials to improve my smart pedagogy skills	2.72	0.72	High Extent
18	Smart pedagogy tools are user-friendly and do not require complex procedures	2.38	0.59	Very low Extent
19	I can easily adapt smart pedagogy to different Business Education courses like Accounting, Marketing and Office Practice	2.36	0.67	Very low Extent
20	I find smart pedagogy easy to use in my daily teaching activities	2.47	0.75	Very low Extent
	Grand Mean	**2.38**		**Very low Extent**

Table 2 shows that in response to research question two, all the related items except items 11 and 17 indicates very low extent because the respective mean scores which are between 2.17 and 2.47 are less than the midpoint value of 2.50. Items 11 and 17 with mean scores 2.62 and 2.72 are of high extent because they are greater than the midpoint value. The grand mean score of 2.38 is also less than the midpoint. This indicates that business educators, to a very low extent perceived smart pedagogy as easy to use in teaching Business Education courses

Hypothesis One

There is no significant difference in male and female business educators on the perceived usefulness of smart pedagogy for teaching Business Education courses.

The t-test analysis on male and female business educators' Perceived Usefulness of smart pedagogy is presented in Table 3.

Table 3: ***t-test Analysis on male and female business educators' Perceived Usefulness of smart pedagogy for teaching Business Education courses***

Item	Gender	N=58	Mean	Std.	t-value	P-value	Decision
1	Male	35	3.57	0.50	0.28	0.78	Not sig
	Female	23	3.61	0.50			
2	Male	35	3.57	0.50	0.27	0.78	Not sig
	Female	23	3.61	0.50			
3	Male	35	3.60	0.50	0.93	0.37	Not sig
	Female	23	3.47	0.51			
4	Male	35	3.63	0.55	1.88	0.07	Not sig
	Female	23	3.35	0.57			
5	Male	35	3.57	0.50	0.05	0.96	Not sig
	Female	23	3.57	0.51			
6	Male	35	3.71	0.46	1.83	0.07	Not sig
	Female	23	3.48	0.51			
7	Male	35	3.57	0.50	1.01	0.32	Not sig
	Female	23	3.43	0.51			
8	Male	35	3.69	0.47	0.93	0.36	Not sig

	Female	23	3.57	0.51			
9	Male	35	3.51	0.51	0.91	0.38	Not sig
	Female	23	3.39	0.50			
10	Male	35	3.71	0.45	0.15	0.88	Not sig
	Female	23	3.70	0.47			

Table 3 reveals that in regard to hypothesis one, all the related items are not significant because their respective calculated t-values are less than the critical t-value of 2.00 at a degree of freedom (DF) of 56. More so, all the p-values are greater than the alpha significant value of 0.05. Based on this, null hypothesis one is accepted. Therefore, there is no significant difference in male and female business educators on the perceived usefulness of smart pedagogy for teaching Business Education courses.

Hypothesis Two

There is no significant difference in business educators in federal and state owned universities on the perceived ease of use of smart pedagogy for teaching Business Education courses.

Table 4: *t-test Analysis on Business Educators' Perceived Ease of Use of Smart Pedagogy for Teaching Business Education Courses*

Item	Ownership	N=58	Mean	Std.	t-value	P-value	Decision
11	Federal	28	2.61	0.88	0.12	0.91	Not Sig
	State	30	2.63	0.85			
12	Federal	28	2.29	0.81	1.08	0.29	Not Sig
	State	30	2.07	0.74			
13	Federal	28	2.32	0.61	0.80	0.43	Not Sig
	State	30	2.17	0.83			
14	Federal	28	2.21	0.57	0.49	0.63	Not Sig
	State	30	2.13	0.68			
15	Federal	28	2.43	0.63	0.35	0.73	Not Sig
	State	30	2.37	0.72			
16	Federal	28	2.29	0.66	0.08	0.94	Not Sig
	State	30	2.30	0.70			
17	Federal	28	2.79	0.74	0.63	0.53	Not Sig
	State	30	2.67	0.71			
18	Federal	28	2.32	0.61	0.72	0.47	Not Sig
	State	30	2.43	0.56			
19	Federal	28	2.32	0.61	0.45	0.66	Not Sig
	State	30	2.40	0.72			
20	Federal	28	2.57	0.74	1.03	0.31	Not Sig
	State	30	2.37	0.76			

Table 4 indicates that in regard to hypothesis two, all the related items are not significant because their respective calculated t-values are less than the critical t-value of 2.00 at a degree of freedom (DF) of 56. Furthermore, all the p-values are greater than the alpha significant value of 0.05. Based on this, null hypothesis two is accepted. Therefore, there is no significant difference in business educators in federal and state owned universities on the perceived ease of use of smart pedagogy for teaching Business Education courses.

DISCUSSION

Finding revealed that business educators, to a very high extent, perceived smart pedagogy as useful for the teaching of Business Education courses in universities in Cross River State (mean = 3.56). This means that business educators believes that using smart pedagogy will enhance students' learning outcomes, engagement, and job readiness. Smart pedagogy make teaching more engaging, data-informed, and aligned with workplace skills required in digital-driven economy. Unlike traditional pedagogy, smart pedagogy adapts to students' learning pace, provides real-time feedback, and simulates real-world business environments. The finding is consistent with Zhu et al. (2023) that teachers' PU of smart education was consistently high when it was linked to measurable students' outcomes. When educators view smart pedagogy as useful, they are more likely to integrate it into teaching. In Nigeria context, the finding is in line with Onyemaechi and Adeyemi (2024) that 78% of business educators in South-East Nigeria agreed that smart pedagogy makes Business Education courses more practical and industry-relevant.

Finding further revealed that there is no significant difference in male and female business educators on the perceived usefulness of smart pedagogy for teaching Business Education courses. This finding implies that gender does not influence how business educators view the value of smart pedagogy in teaching Business Education courses. Both male and female lecturers agree that smart pedagogy tools such as LMS, AI-driven business simulations, learning analytics, and cloud collaboration platforms are useful for making instruction practical, improving students' digital skills, and aligning teaching in line with industry demands. The finding further suggest a positive development for gender equity in Cross River State Universities. It means that advocacy for smart pedagogy adoption does not need to be gender-segregated. TETFund, NUC and University management can organize one capacity-building program for all business educators because both groups already recognize the usefulness.

The finding aligns with Onyemaechi and Adeyemi (2024) who found no significant gender difference in perceived usefulness of smart pedagogy among business educators in South-East Nigeria. They attributed this to equal exposure to professional development and the fact that digital competence is now a requirement for promotion for both sexes. The finding also agrees with Mensah and Boateng (2023) in Ghana who reported that gender did not predict vocational educators' perceived usefulness of smart learning tools. The authors stated that usefulness is judged by impact on students' employability, and both male and female educators share this goal. From TAM perspective (Davis, 1989), Perceived Usefulness is driven more by job relevance than by personal characteristics. Since both male and female business educators teach the same NUC approved courses and are evaluated by the same standards, they are likely to have similar beliefs about what improves teaching effectiveness.

Finding indicated that business educators, to a very low extent perceived smart pedagogy as easy to use in teaching Business Education courses (mean = 2.38). In simple terms the easy of business educators to use smart pedagogy is very low. The finding suggest that if a tool is perceived as complicated, time-consuming, or requiring too much training, adoption will be low even if it is useful. The finding is in line with Bello and Suleiman (2023) who found that PEOU was a major barrier among NCE business educators in North-Central Nigeria. As 63% of the respondents cited poor internet, epileptic power supply, and lack of technical support as reasons they found smart pedagogy difficult to use.

Finding further indicated that there is no significant difference in business educators in federal and state owned universities on the perceived ease of use of smart pedagogy for teaching Business Education courses. The finding implies that both Federal and State University business educators in Cross River State have similar very low extent of perceptions regarding the use of smart pedagogy tools in teaching Business Education courses.

This finding aligns with Onyemaechi and Adeyemi (2024) who reported no significant difference in perceived ease of use of smart pedagogy between Federal and State tertiary institutions in South-East Nigeria. They attributed this to nationwide ICT training programmes that cut across institutional ownership. It is also supported by Nwachukwu and Ezeani (2022) who found that Federal and State college business educators in Southeast Nigeria had similar levels of ease in using digital tools. Institutional support from TETFund and the curriculum demand to prepare students for digital workplace may have helped to level the playing field. Furthermore, the finding aligns with Al-Emran et al. (2023) that when facilitating conditions such as training and basic infrastructure are provided, institutional ownership becomes a weak predictor of PEOU.

The finding however, contradicts Adamu and Yusuf (2024) and Bello and Suleiman (2023) who reported a significant difference in PEOU between Federal and State institutions in North-Central Nigeria. They linked the difference to poor funding in State institutions. The difference may be due to location and timing. The present study in Cross River State was conducted in 2026, a period when State Universities have received increased attention through state government and TETFund matching grants. From TAM viewpoint, Perceived Ease of Use is influenced by external variables known as "facilitating conditions" such as availability of infrastructure, training, and technical support. The non-significant result suggests that both Federal and State Universities in Cross River State experience similar facilitating conditions, hence similar PEOU.

Conclusion

Business educators in universities in Cross River State recognize the value of smart pedagogy in making Business Education teaching more practical, engaging, and aligned with digital workplace requirements. Both male and female educators share this positive perception, indicating that gender is not a barrier to recognizing the benefits of smart pedagogy. However, their perceived easy to use smart pedagogy was very low. This perceptions was common to business educators in both Federal and State Universities in Cross River State. This implies that while educators recognize the value of smart pedagogy, they do not feel confident or supported enough to use it easily, irrespective of gender or institutional ownership. This could be linked institutional support factors such as infrastructure, power, internet, and continuous training rather than personal or ownership characteristics. Therefore, efforts to promote smart pedagogy should continue to be implemented uniformly across both Federal and State Universities. The focus should now shift to sustaining infrastructure, regular training, and technical support to maintain this equity and improve overall PEOU for all business educators in the state.

Recommendations

Based on the findings and conclusion of this study, the following recommendations are made:

1. Promotion and appraisal criteria should include evidence of smart pedagogy integration to motivate educators to move from high usefulness perception to actual classroom use.
2. University management should provide licensed software, LMS access, AI tools, and business simulation platforms so lecturers can practice and integrate smart pedagogy without personal cost burden. They should also organize regular hands-on training, workshops, and micro-credential programmes on smart pedagogy tools for all business educators to improve technical competence and ease of use.
3. Government, NUC, and TETFund should prioritize stable power supply, high-speed internet, smart classrooms, and on-campus ICT support in both Federal and State Universities to reduce difficulty in using smart pedagogy.

Implication of the Findings

The high perceived usefulness shows educators are willing to adopt smart pedagogy. The low perceived ease of use shows they lack the enabling environment, which may lead to frustration and abandonment of the innovation. If ease of use remains very low, actual adoption will be poor. This will produce Business Education graduates without required digital and 21st-century skills, defeating the purpose of the National Digital Economy Policy. Furthermore, the absence of significant differences by gender and ownership implies that the problem is systemic. Both male/female and Federal/State lecturers face the same barriers, so interventions must be uniform across all groups. In general, the findings implies that business educators value smart pedagogy but find it too difficult to use. In other words, they expressed willingness to use without ability. This can be fixed through infrastructure and training, and adoption will follow.

INNOVATIVE PEDAGOGIES AND ENTREPRENEURIAL BEHAVIOUR OF BUSINESS EDUCATION STUDENTS IN COLLEGES OF EDUCATION IN BENUE STATE

Dr. Enyi L. A
Department of Business Education
Benue State College of Education, Oju
Enyilarry1970@gmail.com
07069454162

Abstract

The increasing complexity of the global economy, digital transformation, unemployment challenges, and the growth of innovation-driven enterprises have necessitated a rethinking of entrepreneurship education in Nigeria. This study explores the effect of innovative pedagogies on entrepreneurial behaviour of Business Education students in Colleges of Education in Benue State. It specifically examines the effect of experiential learning pedagogy, project-based learning, and technology-enhanced learning on entrepreneurial behaviour among Business Education students. The study adopted a descriptive survey design. The population of the study comprised two hundred and twenty-eight (228) final-year students and twenty-three (23) lecturers at College of Education, Oju and College of Education, Katsina-Ala. The study employed a census sampling approach, and the entire population was sampled. A structured questionnaire was used to collect data from the respondents and findings indicated that experiential learning pedagogy, project-based learning, and technology-enhanced learning significantly affect the entrepreneurial behaviour of Business Education students. The study concluded that integrating innovative pedagogies into entrepreneurship education can significantly contribute to youth empowerment, digital transformation, employment generation, and sustainable economic development. The study recommended amongst others the need for regular training programmes to be organized for Business Education lecturers to improve their capacity to implement innovative pedagogies effectively and to keep pace with emerging technological trends in entrepreneurship education.

Keywords: *Innovative Pedagogies, Entrepreneurship Education, Experiential Learning, Technology-enhanced learning, Entrepreneurial Behaviour, Project-Based Learning.*

Introduction

Entrepreneurship education has been recognized globally to equip students with innovative competencies to identify and act on new business opportunities for personal and national development. The growing complexity of the global economy, digital transformation, unemployment challenges, and the rise of innovation-driven enterprises have necessitated a rethinking of entrepreneurship education amongst nations (World Economic Forum (2023). The primary objective of entrepreneurship education is to equip learners with knowledge, skills, attitudes, and competencies required for successful entrepreneurial activities. In Nigeria, the rising unemployment, technological disruption, economic instability, and growing demand for entrepreneurial competencies have intensified the need for effective entrepreneurship education. Universities, colleges of education, polytechnics, and vocational institutions are expected not only to produce job seekers but also entrepreneurs who can identify opportunities and create value in dynamic economic environments (Alao & Alao, 2022).

The dynamic nature of today's business environment demands a shift from conventional teaching methods to more innovative pedagogical approaches in entrepreneurship education. Traditional lectures and theoretical coursework are increasingly being supplemented by methods that emphasize hands-on experience, creative problem-solving, and collaborative learning (Amesi & Ademiluyi, 2024). Traditional teacher-centered pedagogies are increasingly unable to produce graduates with the entrepreneurial competencies required for the Fourth Industrial Revolution. Innovative pedagogies are experiential approaches to imparting knowledge, skills, attitudes, and values in learners. These instructional strategies expose and engage students in active learning for all-round development in the three domains of learning, cognitive, affective, and psychomotor. The features of innovative pedagogies

include systematic learning process, handling real-life situation, display of skills, self-monitoring assessment, and learners-centred instructional approaches (Spilbergs, Mavlutova & Lesinskis, 2026).

The contemporary digital economy demands educational practices that foster active learning, creativity, collaboration, adaptability, and innovation. Innovative pedagogies have consequently gained prominence as transformative approaches capable of enhancing entrepreneurship education outcomes. These pedagogies emphasize learner-centeredness, experiential engagement, practical application of knowledge, and real-world problem-solving. Innovative pedagogical approaches in entrepreneurship education are transforming how students learn and develop entrepreneurial skills (Boubker, Arroud & Ouajdouni, 2021). By incorporating experiential learning, design thinking, collaborative models, and technology integration, educators can provide a more effective and engaging learning experience. This study examines innovative pedagogies and entrepreneurship education in Nigeria with particular emphasis on the various dimensions of innovative pedagogies and their implications for entrepreneurial behaviour amongst business education students in Benue State, Nigeria.

Statement of the Problem

Entrepreneurs cannot succeed without the requisite skill and knowledge on how to start and manage entrepreneurial activities. The growing rate of unemployment among the youth in African countries, despite the presence of entrepreneurial opportunities to exploit, points towards inadequacy of skill and knowledge in starting and managing entrepreneurial activities in African countries. In Nigeria, there is increase in number of unemployed graduates, and in addressing the problem, the government through the Ministry of Education has put effort of changing the graduates' behaviour to venture into entrepreneurship as opposed to seeking formal employment. However, most graduates are desperately moving from one office to another seeking for job opportunities hence end up joining the growing numbers of unemployed, frustrated and discouraged graduates (Nwosu, 2021). Also, many educational institutions continue to rely heavily on conventional pedagogical approaches characterized by lecture-dominated instruction, rote memorization, and examination-focused learning in teaching entrepreneurship. Such approaches often fail to develop enterprise skills, innovation capacity, problem-solving abilities, and entrepreneurial mindsets. This study is carried out to investigate the effect of innovative pedagogies on entrepreneurial behaviour amongst Business Education students in Benue State, Nigeria. To achieve this objective, the study examines the effect of experiential learning pedagogy, project-based learning, and technology-enhanced learning on entrepreneurial behaviour among Business Education students.

Research Hypotheses

The study is guided by the following hypotheses:

1. There is no significant effect of experiential learning pedagogy on entrepreneurial behaviour among Business Education students
2. There is no significant effect of problem-based learning on entrepreneurial behaviour among Business Education students
3. There is no significant effect of technology-enhanced learning on entrepreneurial behaviour among Business Education students

Literature Review

Entrepreneurship Education

Entrepreneurship education refers to the process of developing learners' entrepreneurial knowledge, skills, competencies, attitudes, and behaviors necessary for identifying opportunities, taking calculated risks, creating business ventures, and generating sustainable value (Bell, 2021). Entrepreneurship education extends beyond teaching students how to start businesses. It encompasses the cultivation of creativity, innovation, resilience, leadership, opportunity recognition, resource mobilization, and strategic thinking. The goal is to enable learners to become productive contributors to economic development (Neck, Greene & Brush, 2018).

In Nigeria, entrepreneurship education has become a compulsory component of higher education curricula due to concerns about graduate unemployment and the need for economic diversification. Entrepreneurship education is offered to students to boost their entrepreneurial spirit and behaviour through effective training. Learners are therefore equipped with the knowledge and skills required for setting up and running a business (Alao & Alao, 2022). Entrepreneurship education inculcates entrepreneurial behaviour in learners that enables them to confront situations in creative and innovative

ways. The ultimate aims of entrepreneurship programs are to produce graduates with entrepreneurial behaviour who are self-employed, catalysts for economic growth, create employment opportunities, be able to identify and exploit opportunities, and inculcate the spirit of resilience through the curriculum (Boubker, Arroud, & Ouajdouni, 2021).

Innovative Pedagogies

Innovative pedagogies refer to contemporary teaching and learning approaches that move beyond traditional teacher-centered instruction to promote active participation, critical inquiry, collaboration, creativity, and practical application of knowledge (Yusuf & Dansu, 2022). These pedagogies leverage technology, experiential activities, problem-solving exercises, and real-world experiences to enhance learning outcomes. They place learners at the center of the educational process while educators function as facilitators, mentors, coaches, and guides (Chhabra et al., 2021). Within entrepreneurship education, innovative pedagogies seek to cultivate entrepreneurial competencies through authentic experiences that mirror real business environments and entrepreneurial challenges (Añonuevo, 2024). Entrepreneurial pedagogy in higher education institutions in the world emphasizes the realization of students' cognitive, affective and psychomotor skills. Such skills when fully realized are likely to enhance the student's innovative capability and creative thinking (Carpenter & Wilson, 2022). Therefore, entrepreneurial pedagogy is paramount because it promotes creativity and enhances learners' innovative capacity.

Entrepreneurial Behaviour

Entrepreneurial behaviour is a set of key behaviours individuals exhibit that help them navigate the business world and achieve success based on business performance (Bell, 2021). Entrepreneurial behaviour refers to the attitudes, actions, decisions, and competencies that enable individuals to identify opportunities, create value, assume risks, and organize resources to establish or grow a business venture. Entrepreneurial behaviour is also defined as the process through which individuals recognize opportunities, mobilize resources, and undertake innovative activities to create economic and social value (Amesi & Ademiluyi, 2024). These behaviours include Such behaviours include creativity, proactiveness, opportunity recognition, self-confidence, risk-taking propensity, problem-solving ability, innovativeness, and persistence.

Theoretical Framework

This study is anchored on the Experiential Learning Theory developed by Kolb (1984). The theory posits that learning occurs through experience, reflection, conceptualization, and experimentation. It explains that learning is a continuous process whereby knowledge is created through the transformation of experience. According to Kolb, effective learning occurs when learners actively engage in experiences, reflect on those experiences, conceptualize new ideas, and apply those ideas in real-life situations. The theory emphasizes "learning by doing" rather than passive acquisition of knowledge through traditional lecture-based instruction. The theory provides a strong theoretical basis for innovative pedagogies, which emphasize learner-centered, interactive, and practice-oriented approaches to teaching and learning. It supports entrepreneurship education by emphasizing hands-on experiences that allow learners to develop entrepreneurial competencies through practice.

The theory explains how innovative pedagogies can transform entrepreneurship education from a predominantly theoretical exercise into a practical and engaging process that develops entrepreneurial competencies. By creating opportunities for hands-on learning, innovative pedagogies enhance entrepreneurship education and promote entrepreneurial behaviour among students, enabling them to become innovative, opportunity-driven, and self-reliant contributors to economic development. This approach helps bridge the gap between classroom learning and entrepreneurial practice, making entrepreneurship education more effective in preparing students for self-employment and enterprise development.

Effect of Experiential Learning Pedagogy on Entrepreneurial Behaviour

Experiential learning focuses on learning by doing. Experiential Learning Pedagogy is based on the principle that students learn most effectively through direct experience, reflection, and application of knowledge. In entrepreneurship education, experiential learning involves activities such as business simulations, internships, industrial attachments, fieldwork, mentoring programs, business plan competitions, and venture creation exercises. Students gain firsthand exposure to business realities and learn how to apply theoretical concepts in practical situations (Yusuf & Dansu, 2022). Empirical evidence suggests that experiential learning pedagogy significantly enhances entrepreneurial

behaviour among students by promoting practical engagement, entrepreneurial self-efficacy, opportunity recognition, and innovation.

A study by Motta and Galina (2023) showed that experiential learning approaches have a positive influence on students' entrepreneurial intentions, skills development, and entrepreneurial competencies. Also, Taneja, Kiran, and Bose (2024) examined 669 students enrolled in entrepreneurship programmes and found that experiential learning positively influenced entrepreneurial intention both directly and indirectly through entrepreneurial self-efficacy. Their findings revealed that students who actively participated in experiential entrepreneurship activities demonstrated higher confidence in their entrepreneurial capabilities and a stronger inclination toward entrepreneurial action. A study by Añonuevo (2024) on entrepreneurship students found a significant relationship between experiential learning approaches and entrepreneurial competencies. The research established that experiential learning significantly improved students' practical entrepreneurial performance and competency development, indicating that experiential activities are instrumental in cultivating entrepreneurial behaviours such as initiative, creativity, and problem-solving.

Effect of Project-Based Learning on Entrepreneurial Behaviour

Project-Based Learning (PBL) is an instructional approach in which students acquire knowledge and skills by working on authentic projects designed to solve real-world problems. In entrepreneurship education, students may be required to design products, develop business plans, conduct market research, establish mini-enterprises, or create innovative solutions to community challenges. Project-Based Learning (PBL) has been widely recognized as an effective pedagogical approach for developing entrepreneurial behaviour among students. Through project execution, students engage in real-world problem-solving, collaborative learning, innovation, and venture creation activities that mirror entrepreneurial practice (Taneja, Kiran & Bose, 2024).

A study by Jaenudin (2024) investigated the effectiveness of project-based learning in entrepreneurship education among university students and found a statistically significant improvement in entrepreneurial intentions among students exposed to PBL compared to those taught using conventional methods. The experimental group achieved substantially higher entrepreneurial intention scores, demonstrating that project-based activities stimulate entrepreneurial thinking and action. Similarly, Yulastri et al. (2023) in their research reported that project-based entrepreneurial learning contributed positively to entrepreneurship readiness by enhancing entrepreneurial literacy, self-efficacy, and entrepreneurial passion. A recent study by Suharto et al. (2025), found that project-based learning significantly improved entrepreneurial involvement and entrepreneurial competencies among economics education students. The researchers concluded that active engagement in project development encourages entrepreneurial awareness, innovation, and independent decision-making, all of which are critical dimensions of entrepreneurial behaviour.

Effect of Technology-Enhanced Learning on Entrepreneurial Behaviour

Technology-Enhanced Learning (TEL) refers to the integration of digital technologies into teaching and learning processes to improve learning outcomes. It includes e-learning platforms, virtual simulations, online collaboration tools, artificial intelligence applications, digital entrepreneurship platforms, mobile learning applications, and social media-based learning environments. Technology-enhanced learning positively affects entrepreneurial behaviour by providing students with access to vast sources of information, emerging business opportunities, and global entrepreneurial networks. Digital platforms expose Business Education students to innovative business models and contemporary entrepreneurial practices.

A study by Hammoda (2024) revealed that educational technologies positively influenced entrepreneurial competencies, particularly initiative-taking, motivation and perseverance, financial literacy, and entrepreneurial thinking. The study reported that digital simulations, games, and technology-supported learning environments effectively strengthen entrepreneurial skills and behaviours among students. A recent quasi-experimental study involving 819 students conducted by Spilbergs, Mavlutova, and Lesinskis (2026) reported that the use of AI-based digital entrepreneurship tools significantly increased students' entrepreneurial intentions compared to traditional instructional methods. These studies clearly demonstrated that technology-supported learning environments improve students' entrepreneurial motivation, creativity, entrepreneurial attitudes, and willingness to start businesses.

Methodology

The study adopted a descriptive survey design. The population of the study comprised two hundred and fifty-one (251) final-year students and lecturers in the Department of Business Education in the College of Education, Oju, Benue State, and the College of Education, Katsina-Ala, Benue State. The population includes two hundred and twenty-eight (228) final-year students and twenty-three (23) lecturers of the institutions. A census sampling approach was adopted, and the entire population of 251 was used for the study as the sample size. A structured questionnaire was used as the instrument of data collection. The internal consistency of the instrument was determined using Cronbach's alpha correlation coefficient, and it yielded an average index of 0.90. The statistical tools used to analyse the research questions data were the mean, percentages, and standard deviation, while regression was used to test the research hypotheses.

Results and Discussion

4.1 Descriptive Analysis of Variables

The study examined the influence of experiential learning pedagogy, problem-based learning, and technology-enhanced learning on entrepreneurial behaviour among Business Education students. Responses were measured on a 5-point Likert scale where 1 = Strongly Disagree and 5 = Strongly Agree.

Table 1: Mean and Standard Deviation of Study Variables (N = 251)

Variable	Mean	Standard Deviation	Interpretation
Experiential Learning Pedagogy	4.18	0.67	High
Problem-Based Learning	4.05	0.71	High
Technology-Enhanced Learning	4.12	0.69	High
Entrepreneurial Behaviour	4.23	0.63	High

Source: Field Survey, 2026.

The results in Table 1 indicate that Business Education students reported a high level of exposure to innovative pedagogies. Experiential Learning Pedagogy recorded the highest mean score (M = 4.18, SD = 0.67), suggesting that students frequently engage in hands-on activities, simulations, practical exercises, and real-world entrepreneurial experiences.

Technology-Enhanced Learning also recorded a high mean score (M = 4.12, SD = 0.69), indicating that digital tools, online learning platforms, and technological resources are considerably integrated into entrepreneurship instruction. Also, Problem-Based Learning obtained a mean score of 4.05 (SD = 0.71), suggesting that students are regularly exposed to learning tasks that require problem identification, critical thinking, and solution development.

Entrepreneurial Behaviour recorded the highest overall mean score (M = 4.23, SD = 0.63), indicating that students generally exhibit entrepreneurial characteristics such as creativity, opportunity recognition, innovation, initiative, and risk-taking tendencies.

Multiple Regression Analysis

To determine the effects of Experiential Learning Pedagogy, Problem-Based Learning, and Technology-Enhanced Learning on Entrepreneurial Behaviour among Business Education students, multiple regression analysis was conducted.

Model Summary

Table 2: Regression Model Summary

Statistic	Value
R	0.789
R^2	0.623
Adjusted R^2	0.618
Standard Error of Estimate	0.391

Source: Field Survey, 2026.

The regression model yielded a multiple correlation coefficient (R) of 0.789, indicating a strong positive relationship between the three predictor variables and entrepreneurial behaviour. The coefficient of determination (R^2 = 0.623) shows that approximately 62.3% of the variation in entrepreneurial behaviour among Business Education students is jointly explained by experiential learning pedagogy, problem-based learning, and technology-enhanced learning. The remaining 37.7% may be attributed to other factors not included in the model such as personality traits, socio-economic background, entrepreneurial mindset, institutional support, and environmental influences. The adjusted R^2 value of 0.618 confirms that the model has good explanatory power and can be generalized to the wider population.

Table 3: Analysis of Variance (ANOVA)

Source	Sum of Squares	df	Mean Square	F	Sig.
Regression	61.842	3	20.614	134.85	.000
Residual	37.742	247	0.153		
Total	99.584	250			

Source: Field Survey, 2026.

The ANOVA result produced an F-value of 134.85 with a significance value of $p < 0.001$. Since the p-value is less than 0.05, the regression model is statistically significant. This indicates that the independent variables collectively exert a significant influence on entrepreneurial behaviour among Business Education students. This implies that, the overall regression model is suitable for predicting entrepreneurial behaviour.

Table 4: Multiple Regression Coefficients

Variables	B	Std. Error	Beta (β)	t-value	Sig.	Decision
Constant	0.782	0.184	-	4.251	.000	
Experiential Learning Pedagogy	0.342	0.051	0.361	6.710	.000	**Rejected**
Problem-Based Learning	0.268	0.047	0.283	5.702	.000	**Rejected**
Technology-Enhanced Learning	0.311	0.049	0.327	6.352	.000	**Rejected**

Source: Field Survey, 2026.

Regression Equation

$$EB = 0.782 + 0.342(ELP) + 0.268(PBL) + 0.311(TEL)$$

Where:

EB = Entrepreneurial Behaviour

ELP = Experiential Learning Pedagogy

PBL = Problem-Based Learning

TEL = Technology-Enhanced Learning

The result shows that a one-unit increase in experiential learning pedagogy will lead to approximately 0.342 unit increase in entrepreneurial behaviour. This suggests that students exposed to practical entrepreneurial activities, simulations, internships, and experiential exercises tend to demonstrate higher entrepreneurial behaviour. Also, the positive beta coefficient indicates that increased participation in problem-solving activities significantly enhances entrepreneurial behaviour. Students become more innovative, proactive, analytical, and capable of identifying business opportunities when exposed to problem-based learning environments. In addition, technology-enhanced learning significantly predicts entrepreneurial behaviour. Increased use of digital tools, online platforms, business simulations, artificial intelligence applications, and virtual entrepreneurial activities improves students' creativity, innovation, opportunity recognition, and entrepreneurial competence.

Hypothesis Testing

Hypothesis One

There is no significant effect of experiential learning pedagogy on entrepreneurial behaviour among Business Education students.

The regression result shows that β = 0.361, t = 6.71 and p = 0.000. Since p < 0.05, the null hypothesis is rejected. This implies that there is a significant positive effect of experiential learning pedagogy on entrepreneurial behaviour among Business Education students. This finding suggests that students who participate in practical entrepreneurial activities such as business simulations, internships, industrial attachments, mentorship programmes, and venture creation exercises are more likely to develop entrepreneurial characteristics including creativity, opportunity recognition, self-confidence, innovation, and risk-taking ability.

The finding supports the principles of Kolb's Experiential Learning Theory, which posits that knowledge is acquired through concrete experiences, reflection, conceptualization, and experimentation. The finding is consistent with the study by Motta and Galina (2023), which found that experiential learning approaches positively influence entrepreneurial intentions, entrepreneurial competencies, and skills development among students. It also corroborates the findings of Taneja, Kiran, and Bose (2024), who reported that experiential learning significantly enhances entrepreneurial intention through entrepreneurial self-efficacy. ne of the most effective approaches for fostering entrepreneurial behaviour among students.

Hypothesis Two

There is no significant effect of problem-based learning on entrepreneurial behaviour among Business Education students.

The regression result shows β = 0.283, t = 5.70, and p = 0.000. Since p < 0.05, the null hypothesis is rejected. The result indicates that there is a significant positive effect of problem-based learning on entrepreneurial behaviour among Business Education students. This finding implies that students who engage in authentic projects involving product design, business plan preparation, market research, enterprise creation, and community problem-solving are more likely to develop entrepreneurial capabilities. The result agrees with Jaenudin (2024), who found that students exposed to project-based

learning demonstrated significantly higher entrepreneurial intentions than those taught through conventional instructional methods. The finding is also supported by Yulastri et al. (2023), who reported that project-based entrepreneurial learning enhances entrepreneurial literacy, entrepreneurial passion, self-efficacy, and entrepreneurship readiness among university students. Similarly, Suharto et al. (2025) found that project-based learning significantly improves entrepreneurial involvement and entrepreneurial competencies among economics education students.

Hypothesis Three

There is no significant effect of technology-enhanced learning on entrepreneurial behaviour among Business Education students.

The regression result shows that $\beta = 0.327$, $t = 6.35$, and $p = 0.000$. Since $p < 0.05$, the null hypothesis is rejected, implying that there is a significant positive effect of technology-enhanced learning on entrepreneurial behaviour among Business Education students. This indicates that the integration of digital technologies such as online learning platforms, virtual business simulations, social media tools, digital entrepreneurship applications, artificial intelligence platforms, and collaborative learning technologies contributes significantly to the development of entrepreneurial competencies. This finding aligns with Hammoda (2024), who found that educational technologies positively influence entrepreneurial competencies, particularly initiative-taking, perseverance, entrepreneurial thinking, and financial literacy. The result is further supported by Spilbergs, Mavlutova, and Lesinskis (2026), who reported that AI-based digital entrepreneurship tools significantly increase students' entrepreneurial intentions and entrepreneurial readiness.

Conclusion and Recommendations

The study investigated how innovative pedagogical approaches significantly contribute to the development of entrepreneurial behaviour among Business Education students. The study concludes that experiential learning pedagogy promotes entrepreneurial behaviour by providing students with practical experiences that enhance entrepreneurial competencies, self-confidence, creativity, problem-solving abilities, and opportunity recognition. Project-based learning develops entrepreneurial behaviour by engaging students in real-life projects that encourage innovation, initiative, collaboration, leadership, and business decision-making. Technology-enhanced learning facilitates entrepreneurial behaviour by exposing students to digital tools, entrepreneurial networks, virtual business environments, and innovative learning opportunities.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are made:

1. Business Education lecturers should adopt experiential learning strategies such as internships, business simulations, mentorship programmes, industrial attachments, field visits, and venture creation activities to provide students with practical entrepreneurial experiences.
2. Higher institutions should integrate project-based learning into entrepreneurship courses by encouraging students to develop business plans, conduct market research, establish mini-enterprises, and solve real-world business problems as part of their academic requirements.
3. Higher institutions should invest in technology-enhanced learning resources including virtual business simulations, e-learning platforms, entrepreneurship software, artificial intelligence tools, and digital collaboration platforms to improve entrepreneurial learning outcomes.
4. Curriculum developers should redesign Business Education curricula to incorporate innovative pedagogical approaches that emphasize practical engagement, creativity, innovation, and entrepreneurial problem-solving rather than excessive reliance on theoretical instruction.
5. Regular training programmes should be organized for Business Education lecturers to improve their capacity to implement innovative pedagogies effectively and to keep pace with emerging technological trends in entrepreneurship education.

Abstract

The study examined perceived entrepreneurial skill needed by business educators for impartation of business skills in students in Ebonyi State. Three research questions were raised to guide the study and three research hypotheses were formulated for the study. The study adopted descriptive survey research design. The population of the study comprised 50 business education lecturers in all tertiary institutions in Ebonyi State The whole population was used because it was not too large for the researcher to handle. The instrument used was a structured questionnaire which was validated by two experts from Business Education and one expert in measurement and evaluation from Kwara State University, Molete. Reliability of the study was determined using Crombach Alpha which yielded a co-efficient value of 0.88. Data collected were analyzed using mean and standard deviation and the *null hypotheses were tested with t-test at 0.05 level of significance. Findings of the study revealed that inadequate funding, laboratories, computer, limited access to internet facilities and a host of others are the challenges to business education. It was also revealed that business education has a lot of skills for sustainable development. The study therefore recommended among others that, the government at both federal and state levels should ensure adequate release of funds for the procurement of training facilities for practical teaching of business education courses in tertiary institutions and that the curriculum planners should review business education curriculum to enable the students acquire the required skills for the world of work and to establish their own businesses.*

Keywords: Business Education, Sustainable Development, Business Education Skills.

Introduction

Business education is a branch of vocational education that involves teaching the skills and operations of the business industry. This field of education occurs at multiple levels, including secondary and higher education institutes. Education in business has many forms, mainly occurring within a classroom of a school. According to Azubuike (2025), business education is a specialized field of study which provides knowledge, skills, and training in business operations, management, finance and marketing. It also aims to prepare individuals for careers in the private and public sectors. Business education is offered at secondary and higher education levels, focusing on both theoretical foundations and practical skills like leadership and accounting. The importance of business education can never be over stressed. According to Onah (2025), business education equips individuals with foundational knowledge, technical skills, and ethical awareness in fields like accounting, marketing, and management, fostering both self-employment and workforce readiness. Its core objectives are to foster entrepreneurial acumen, enhance employability, promote economic understanding, and prepare individuals for leadership in a globalized business environment.

In line with the above, the Federal Republic of Nigeria in section 6, sub-section 49 of the National Policy on Education (2014) indicated that objectives of business education include to:

i. provide the business knowledge and vocational skills necessary for industrial, commercial and economic development.
ii. provide trained manpower in applied technology and commerce, particularly at subprofessional grades.
iii. provide people who can apply scientific knowledge to the improvement and solution of economic and environmental problems for the use and convenience of man.

iv. enable our young men and women to have an intelligent understanding of the increasing complexity of technology.

Furthermore, Aina (2024) posited that the objectives of Business Education broadly include:

i. contribute to goal attainment of the total educational programme.
ii. provide basic and business knowledge for all students
iii. develop their economic understanding, personal consumer competency and personal-use competency; and
iv. provide vocational skills for persons preparing for a business occupation, i.e. business competency.

Business education programme has many components, as there are many different areas of the business industry as a whole. An education in business varies greatly in its curriculum and popularity around the world. It can be said that business education is closely linked to entrepreneurship education. Entrepreneurship education is a structured learning process aimed at equipping individuals with the knowledge, skills, and mindset necessary to identify, evaluate, and act on business opportunities. It promotes innovation, creativity, calculated risk-taking, and the ability to turn ideas into value-creating actions, often fostering self-reliance and venture creation. According to Onyia (2022) entrepreneurship education focuses on the development of skills or attributes that enable the realization of opportunity. Entrepreneurship education provides formalized training to develop an entrepreneurial mindset, skills, and knowledge, encouraging innovation and economic self-reliance. Entrepreneurship education is aimed at transforming students into proactive, job creators by teaching business planning, creativity, and risk management from primary through higher education. It focuses on both theoretical knowledge and practical application, including experiential learning and skill acquisition for starting businesses. However, for the actualisation of the aims and objectives of entrepreneurial skills inherent in business education programme, business educators have vital roles to play.

A business educator is a qualified professional who teaches, administrates, and facilitates learning in business-related subjects, including accounting, finance, marketing, and management. Operating in secondary schools, colleges, and universities, they bridge the gap between academic theory and practical business skills, often utilizing simulation, mentorship, and computer-assisted instruction to prepare students for the workforce. Business educators play prominent role in preparing students to become responsible citizens, capable of making the astute economic decisions that will benefit their personal and professional lives. Business education teachers introduce students to the basics of personal finance, the decision-making techniques needed to be wise consumers, the economic principles of an increasingly international marketplace and the processes by which businesses operate. Hence it can be said that business educators have the responsibilities of imparting key entrepreneurial skills such as management skills, accounting skills and marketing skills for sustainable employability and job creation.

Management is an act of planning, organizing, and controlling the business activities and leading of people in order to achieve organization goals. It is the process of harnessing the diverse resources material, finance, people and time in a manner as to achieve what the organization sets to achieve. Management is a process of planning, organizing, leading and controlling all activities of the organization in pursuit of pre-determined objectives. In the view of Ogbuanya, Nweke and Ugwoke (2017), management functions include all efforts towards: planning, organizing, leading or motivating, coordinating and controlling. While management skills are soft and hard attributes including communication, decision-making, planning, and leadership which are essential for directing teams, solving problems, and achieving organizational goals. Key skills include motivating staff, delegating tasks, managing conflict, and adapting to changing environments. These abilities are categorized into technical, conceptual, and human/interpersonal skills, which are crucial for driving organizational success. Business educators have the role of impacting management skills among business education students for employability and job creation after graduation.

Apart from management skills, accounting skills is another entrepreneurial skill required to be imparted in students for employability and job creation after graduation. Accounting is the systematic recording of financial transaction. It is a service activity, the function of which is identifying, measuring, recording and communicating quantitative information, primarily financial in nature, about economic entities. While accounting skills are technical and workplace abilities used to manage financial transactions, analyze data, and produce accurate financial reports. They combine knowledge of accounting principles (e.g., GAAP), software proficiency (e.g., Excel, QuickBooks), and soft skills like attention to detail. These skills ensure compliance, tax accuracy, and financial stability. Akpotowoh, Watchman and Ogeibiri (2016) identified some of the accounting and financial skills required by entrepreneurs in business related areas for successful operation of business enterprises to include:

knowledge of accounts; knowledge of costing; ability to interpret financial statements; ability to acquire the skill of preparing financial statements; ability to understand payroll and various deductions; ability to know gross and net profits; ability to know sources of funds; ability to know how to obtain loans, a knowledge of Federal, state and local government levies, taxes and regulations and knowledge of factors involved in decision to grant loan by financial houses. Other accounting skills required by an entrepreneur are: ability to process accounts receivable and accounts payable, ability to process inventories, ability to post ledgers and extract the trial balance, ability to prepare daily cash reports, ability to keep debtors ledgers, ability to prepare bank reconciliation statements, ability to keep sales and purchases records and ability to calculate depreciation. Hence it is the role of business educators to inculcate accounting skills in students of business education for entrepreneurial development after graduation.

Furthermore, marketing skills is required business education students for employability and entrepreneurial development after graduation. Marketing is the strategic process of identifying, anticipating, and satisfying customer needs to build brand value and facilitate sales. It involves comprehensive research, promotion, pricing, and distribution, going beyond mere advertising to create lasting customer relationships and generate revenue (Nwankwo, 2022). Key activities range from digital campaigns to market analysis. Marketing skills are a blend of technical (hard) and interpersonal (soft) abilities used to promote products, build brand awareness, and engage audiences. Key skills include data analysis, SEO/SEM (Search Engine Optimization) and SEM (Search Engine Marketing), social media management, content creation, and strategic planning. These skills enable marketers to understand consumer behaviour and drive business growth. Marketing skills is required by business education students for entrepreneurial development after graduation.

From the foregoing, Business Educators have the responsibilities of inculcating management skills, accounting and marketing skills in students of business education for sustainable entrepreneurial development. Sustainable development refers to the development that meets the needs of me present without compromising the ability of future generations to meet their needs (Data Revolution World, 2020). Ekezie (2022) stated that sustainable development is a holistic approach to growth that meets present needs without compromising the ability of future generations to meet theirs. It balances environmental, social, and economic pillars often called people, planet, and prosperity to improve quality of life while maintaining natural systems. Imparting entrepreneurial skills in students of business education is curial to sustainable employability and job creation

However, despite the inherent entrepreneurial skills in business education programme in tertiary institutions, the rate of graduates' unemployment from this noble programme has become a source of worry to the graduates themselves, parents, relations and of course, the governments. This has become an economic, political and social problem in Nigeria. Unemployment of graduates (including business education) has become one of the most topical and thorny issues in contemporary Nigeria. The unemployment situation has changed from previous position marked by prolonged period of unemployment and misemployment, to one in which graduates of tertiary institutions have to normally wait for a long time before getting a first job – if at all. This case has become worse in Ebonyi state as there is scare of industries and markets for graduate employment. Based on this high rate of graduate unemployment, the zeal for tertiary education among youths is gradually being eroded because of the discouraging wave of graduate unemployment. Creating market-relevant educational training opportunities that will provide undergraduate students with the skills necessary to become more employable is crucial to increasing employment and strengthening economic growth. It based on this that the paper examines perceived entrepreneurial skill needed by business educators for impartation of business skills in students in Ebonyi State

Statement of the Problem

The general aim of business education programme in tertiary institutions in Nigeria is to enable the recipient to develop skills for business and entrepreneurial development. Business education programme has the potential of equipping its recipients with managerial, accounting and marketing skills needed for entrepreneurial development. However, it is unfortunate note that it appears that most graduates of business education have not acquired these needed skills for entrepreneurial development after graduation. Most of business education graduates do not seem to possess the required skills for self employment. If this is the cases, it means that business educators in most of the tertiary institutions do not have the needed skills for impartation. It is based on this that the study examines this that the paper examines perceived entrepreneurial skill needed by business educators for impartation of business skills in students in Ebonyi State.

Purpose of the Study

The main purpose of the study is to examine the perceived entrepreneurial skill needed by business educators for impartation of business skills in students in Ebonyi State. Specifically, the study seeks to;

1. Find out the perceived managerial skills needed by Business Education lecturers for impartation of sustainable development in in Ebonyi state
2. Examine the perceived accounting skills needed by Business Education lecturers for implantation of sustainable development in Tertiary institutions in Ebonyi State
3. Ascertain the perceived marketing skills needed by Business Education lecturers for implantation of sustainable development in Tertiary institutions in Ebonyi State

Research Questions

The following question was raised to guide the study.

1. What are the managerial skills needed by Business Education lecturers for impartation of sustainable development in Ebonyi state?
2. What are the accounting skills needed by Business Education lecturers for implantation of sustainable development in Tertiary institutions in Ebonyi State?
3. To what extent are the marketing skills needed by Business Education lecturers for implantation of sustainable development in Tertiary institutions in Ebonyi State?

Research Hypotheses

The following null hypotheses were formulated and tested at 0.05 level of significance:

H01: There is no significant difference in the mean responses of male and female business education lecturers on the extent of managerial skills needed for impartation of sustainable development in Tertiary institutions in Ebonyi State.

H02: There is no significant difference in the mean responses of years of experience business education lecturers on the extent of accounting skills needed for impartation of sustainable development in Tertiary institutions in Ebonyi State.

H03: There is no significant difference in the mean responses of male and female lecturers of business education on the extent of marketing skills needed for impartation of sustainable development in Tertiary institutions in Ebonyi State.

Methods

The study adopted descriptive survey research design which involved gathering data through the use of questionnaire. The study adopted descriptive survey research design. The population of the study consisted of 50 business education lecturers in the public tertiary institutions in Ebonyi State. The whole population was used because it was not too large for the researchers to handle. The research instrument was titled: Entrepreneurship Education as a Tool for Sustainable Development Questionnaire (EETSDQ). The instrument was face and content validity by two experts from Business Education department in Ebonyi State University. The study utilized a validated four point scale questionnaire with a reliability of 0.78. Cronbach Alpha reliability coefficient was used to test the reliability of the instrument and a coefficient of 0.78 was obtained. The researchers with the help of two research assistants administered and collected the instrument from the respondents. The data collected for the study were analyzed using the mean and standard deviation to answer the research questions and z-test statistics to test the hypotheses at 0.05 level of significance. Any item with a mean rating of 2.50 or above was regarded as accepted while mean rating less than 2.50 was regarded as not accepted. For the hypotheses, any item with t-calculated value greater than critical value was rejected, otherwise the hypothesis of no significant difference was accepted.

Results

Research Question 1: What are the perceived managerial skills needed by Business Education lecturers for impartation of sustainable development in Tertiary institutions in Ebonyi State?

Table 1: Responses mean ratings on the perceived managerial skills needed by business education lecturers in Tertiary institutions in Ebonyi State N =50

S/N	Skills to	X	SD	Remarks
1.	Identify profitable bisiness	3.63	0.57	Agreed
2.	Undertake basic step in starting a business	3.56	0.71	Agreed
3.	Organise business plans and activities	3.51	0.61	Agreed
4.	Take appropriate decision when necessary	3.47	0.75	Agreed
5	Implement plans for good attainment towards poverty reduction	3.40	0.80	Agreed
	Cluster Mean/Standard Deviation	3.36	**0.63**	**Agreed**

Table 1 shows the mean responses of business education lecturers in colleges of education on managerial skills as a tools for sustainable development in tertiary institutions in Ebonyi State. Item by item analysis revealed that all nine items had the mean scores that ranged from 3.41 to 3.67. The mean scores are indications that these are managerial skills needed by business education lecturers for sustainable development in Ebonyi state.

Research Question 2: what are the perceived accounting skills needed by Business Education lecturers for implantation of sustainable development in Tertiary institutions in Ebonyi State?

Table 2: Responses mean ratings on the accounting skills needed by business education lecturers for sustainable development N =50

S/N	Accounting skills	$\bar{x}$	SD	Remarks
1.	Provide accounting information useful for decision making	3.67	0.67	Agreed
2.	Prepare financial statement in accordance with accounting standard	3.41	0.91	Agreed
3.	Interpret financial statement	3.54	0.61	Agreed
4.	Analyse financial data	3.47	0.75	Agreed
5.	Identify sources of capital to start business	3.44	0.80	Agreed
6.	Ability to determine the gross profit	3.40	0.66	Agreed
7.	Ability to determine net profit	3.33	0.81	Agreed
8.	Ability to know source of funds	3.26	0.76	Agreed
9	Ability to prepare Statement of owner‘s equity	3.41	0.67	Agreed
	Cluster Mean/Standard Deviation	3.46	**0.56**	**Agreed**

Table 2 shows the mean responses of business education lecturers in colleges of education on the relevance of entrepreneurship education as a tools for sustainable development in tertiary institutions in Ebonyi State. Item by item analysis revealed that all nine items had the mean scores that ranged from 3.41 to 3.67. The mean scores are indications that these are accounting skills needed by business education lecturers for sustainable development in Ebonyi state.

Research Question 3: To what extent are the perceived marketing skills needed by Business Education lecturers for implantation of sustainable development in Tertiary institutions in Ebonyi State?

Table 3: Responses mean ratings on the marketing skills needed by business education lecturers in tertiary institutions in Ebonyi State. N=50.

S/N	Items	X	SD	Remarks
15.	Knowledge of seasonal fluctuation of goods	3.87	0.24	Agreed
16.	Ability to determine the extent to which products will sell	3.74	0.16	Agreed
17.	Familiarity with various aspects of sales and salesmanship	3.53	0.31	Agreed
18.	Ability to budget	3.48	0.21	Agreed
19.	Ability to forecast	3.60	0.33	Agreed
20	Ability to determine current trends in sales of products	3.64	0.15	Agreed

Cluster Mean/Standard Deviation	3.64	0.23	Agreed

Table 3 shows the mean responses of business education lecturers on marketing skills for sustainable development in Ebonyi state. The results revealed that all the items had the mean scores that ranged from 3.48 to 3.87. The mean scores are indications that possible means of acquiring marketing skills needed by Business Education lecturers in tertiary institutions in Ebonyi State.

Hypotheses

Hypothesis 1: There is no significant difference in the mean responses of male and female business education lecturers on the extent of managerial skills needed for sustainable development in Tertiary institutions in Ebonyi State.

Table 4: Summary of z-test result analysis of male and female business education lecturers in colleges of education in Ebonyi State on accounting skills needed as a tools in a changing world.

Variable	N	X	SD	DF	t-cal	t-crit	Decision
Male	36	3.36	**0.63**				Not
				107	1.49	1.96	Rejected
Female	14	**3.63**	**0.68**				

From table 4, the calculated Z-value of 1.49 is less than the Z-critical value of 1.96 at 38 degree of freedom and at 0.05 level of significance. This indicates that the null hypothesis will not be rejected. It therefore shows that the null hypothesis which states that the mean ratings of male and female Business education lecturers in Ebonyi state colleges of education do not differ significantly on the accounting skills needed for sustainable development.

Hypothesis 2: There is no significant difference in the mean responses of years of experience business education lecturers on the extent of accounting skills needed for impartation of sustainable development in Tertiary institutions in Ebonyi State.

Table 5: Summary of z-test result analysis of business educators in tertiary institutions in Ebonyi State on accounting skills needed as a tools in a changing world.

Variable	N	X	SD	DF	Z.cal	Z.crit	Decision
1-5 yrs	36	3.42	0.63				Not
		3		38	1.29	1.96	Rejected
10-20 yrs	14	**3.53**	**0.78**				

From table 5, the calculated Z-value of 1.29 is less than the Z-critical value of 1.96 at 38 degrees of freedom and at 0.05 level of significance. This indicates that the null hypothesis will not be rejected. It therefore shows that the null hypothesis which states that the mean ratings of years of experience Business education lecturers in Ebonyi state colleges of education do not differ significantly on the accounting skills needed for sustainable development.

Hypothesis 3: There is no significant difference in the mean responses of male and female students of business education on the extent of marketing skills needed for sustainable development in Tertiary institutions in Ebonyi State.

Table 6: Summary of t-test result analysis of male and female business education lecturers in colleges of education in Ebonyi State on the use of marketing skills needed for sustainable development.

Variable	N	X	SD	DF	Z.cal	Z.crit	Decision
Male	36	4.23	0.78				Not
				38	1.60	1.96	Rejected
Female	14	3.99	0.64				

From table 6, the calculated Z-value of 1.60 at degree of freedom of 107 and at 0.05 level of significance is lower than the critical value of 1.96. This indicates that the null hypothesis will not be rejected. It therefore shows that the null hypothesis which states that the mean ratings of male and female Business educators in tertiary institutions in Ebonyi State do not differ significantly on the marketing skills needed as a tools in a changing world in colleges of education will be upheld.

Discussion of Findings

The findings in research question one showed perceived managerial skills needed by Business Education lecturers for impartation of sustainable development in in Ebonyi state. The results from the study showed that all the items had the ratings between 3.41 to 3.67 which were above 2.5 the benchmark for acceptance. This was in line with Usoro (2016) sees managerial skills as a process by which the productive potentials of the company is used to satisfy individual and social needs of all kinds. Therefore, He further concluded that present of managerial skill will enable the business education lecturers to exhibit strategies that will improve productivity of young ones in order to promote sustainable development. The result in Table 4 revealed that male business education lecturer in colleges of education did not differ significantly from female business education in colleges of education on the managerial skills needed for sustainable development. This means that the gender does not affect the entrepreneurship education as a toolfor sustainable development in Ebonyi state.

Findings of the study in the research question two agreed that there are accounting skills needed by business education lecturers in the tertiary institutions in Ebonyi State with mean ratings ranged from 2.71 to 3.73 will help in promoting sustainable development. This agreed with the views of Obunadike (2015); Ezeani, Ifeonye, Metalu and Ezemoyih (2012) that business education lecturers should have knowledge of accounts, knowledge of costing, ability to interpret financial statements, ability to acquire the skill of preparing financial statements, ability to determine net profit and ability to know source of funds are some of the basic skills in delivery of business education in tertiary institutions in Ebonyi State. Similarly, Akpotowoh, Watchman and Ogeibiri (2016) also argued that this situation would be necessary to produce competent personnel that are useful for unemployment eradication and sustainable development.

The result in Table 5 revealed that business education lecturer in rural area did not differ significantly from business educators in urban area on the accounting skills needed by Business education lecturer for sustainable development. This means that the institution type does not affect the entrepreneurship education for sustainable development in Ebonyi state. The findings of the study on research question three also agreed that there marketing skills needed by business education lecturers in tertiary institutions in Ebonyi State with mostly mean scores ranged from 3.48 to 3.87 would help in promoting sustainable development. This is in line with the findings of Idris and Mbudai (2016) who asserted that the marketing skills for the effective delivery of business education would help in promoting marketing skill for sustainable development.

Results in Table 6, revealed that male and female business education lecturers in colleges of education did not differ significantly on the process of apply marketing skills needed by business education lecturers in tertiary institutions in Ebonyi State essentials, such as Knowledge of seasonal fluctuation of goods, ability to determine current trends in sales of product, familiarity with various aspects of sales and salesmanship and many more.

Conclusion

As far as the formal sector is concerned, the average products of Nigeria educational programme are basically unemployable because they lack the skills needed by employers of labour. This situation has resulted in the ever increasing army of unemployed youths on the streets of our urban areas and villages with the consequent rise in crime waive in our society today. A situation like this does not create room for sustainable development in any society. In Ebonyi state and Nigeria in general, entrepreneurship education is a veritable tool for bridging the unemployment gap. This is because business education equips youth and adults with relevant skills and competencies that enable them contribute meaningfully to the sustainable economic development of their areas as competent employees, entrepreneurs, employers, producers and informed consumers of goods and services.

Recommendations

1. Business Educators should teach students various business managerial methods which will enable them to start profitable businesses from the scratch
2. Business educators should equipped students with modern accounting skills for preparing financial statements of accounts, this while enable them to have basic financial literacy knowledge for business development
3. Qualified and competent Business Educators should be employed to handle the teaching of marketing skills in tertiary institution.

Abstract

This study examined the utilization of digital marketing tools for employability skills among business education undergraduates in public universities in Kwara State, Nigeria. The study specifically focused on the influence of content marketing tools, and paid advertisement platforms on students' employability skills. A descriptive survey research design was adopted, and data were collected from 285 business education undergraduates selected using appropriate sampling techniques. A structured questionnaire was used as the instrument for data collection, and data were analyzed using descriptive statistics, Pearson Product-Moment Correlation (r), and Analysis of Variance (ANOVA). The findings revealed a significant positive relationship between the utilization of content marketing tools and the employability skills of business education undergraduates. Results further showed that paid advertisement platforms was moderately utilized and contributed positively to employability skills, though access and formal training varied across institutions. Significant differences were found in the utilization of paid advertisement tools based on school type, while no significant difference was observed in the influence of content marketing tools on employability across institutions. Overall, the study established that digital marketing tool utilization plays a crucial role in enhancing employability-related competencies such as digital literacy, communication skills, creativity, and job readiness. The study concluded that effective integration of digital marketing tools into business education curricula is essential for improving graduate employability. It is therefore recommended that curriculum enhancement, increased practical training, improved digital infrastructure, and stronger industry academic collaboration be implemented to equip students with relevant digital marketing skills for the modern labor market.

Key Words: Digital Marketing Tools, Employability Skills, Business Education

INTRODUCTION

In the current swiftly changing digital environment, digital marketing has emerged as a crucial instrument for enterprises globally. As dependence on the internet, social media platforms, and online marketing strategies increases, digital marketing has transformed organisational interactions with customers, augmented brand visibility, and stimulated sales. In the 21st century, digital marketing has become a revolutionary influence in the business environment. The emergence of the internet and the widespread use of digital devices have profoundly transformed the methods by which firms engage with customers, enhance brand interaction, and oversee client relationships. Digital marketing is characterised as a mechanism that provides real-time personalisation, predictive analytics, and seamless cross-channel integration. Platforms like Jasper and ChatGPT have become integral to content generation, allowing marketers to provide customised communications on a large scale. Simultaneously, sophisticated analytics platforms such as Tableau and Databox enable teams to make precise, data-driven decisions. The Adroitte (2025) report states that automation and personalisation are no longer optional; they are crucial for maintaining competitiveness in a saturated digital environment.

Digital marketing tools comprise a collection of methods and technology enabling firms to promote their products and services in the digital realm (Yevseitseva et al., 2022). This assortment includes content management systems, social media platforms, search engine optimisation (SEO), email marketing, and data analytics (Chaffey & Ellis-Chadwick, 2019). Digital marketing strategies emphasise the creation, distribution, and engagement with content across various digital media to target a certain audience (Ekoh-Nweke, 2024). These digital marketing technologies facilitate firms in

efficiently reaching their customers, acquiring useful insights, and adapting to shifts in consumer behaviour.

Fundamentally, digital marketing tools in 2025 emphasise intelligence, adaptability, and customer-centricity rather than mere execution. AI-driven chatbots, dynamic email sequences, and immersive social commerce platforms empower brands to cultivate more profound connections with their audiences. The Tech Thinker (2025) emphasises that the future of digital marketing is in the integration of creativity and technology to achieve genuine, quantifiable results.

Consequently, digital marketing has become essential to every contemporary corporate strategy. Digital marketing is an endeavour by marketers and businesses to provide their products directly to consumers using various social media platforms (Adiyono, et al., 2021). Financial Times (2021) characterised digital marketing as a segment of marketing that use the internet and various online digital technologies, including desktop computers, mobile phones (SMS and MMS), and other digital media and platforms, to promote products and services.

Digital marketing encompasses any marketing and promotional endeavours executed through electronic devices or the internet. It is a comprehensive strategy aimed at promoting products, services, or brands across various digita l platforms and technology. Digital marketing utilises the internet, mobile devices, social media, search engines, emails, and other digital platforms to interact with target audiences, engage them, and stimulate desired activities, such as purchases or enquiries (Lee & Lim, 2021). It pertains to the utilisation of digital channels, platforms, and technology to market items, services, or brands to consumers. This methodology includes various online strategies designed to attract and engage prospective customers, increase website traffic, generate leads, and ultimately improve sales and revenue (Isibor et al., 2025) in the evaluation of effective content marketing tactics that elevate online engagement and sales for digital brands. A primary advantage of digital marketing is its capacity to target particular demographics or audience segments with tailored messaging (Eze et al., 2022). This is accomplished by data analytics, user behaviour monitoring, and segmentation techniques.

Digital marketing has progressed through successive changes in customer behaviour, platform functionalities, and algorithmic regulation. This document presents a synthesised review of two principal kinds of tools: content marketing tools, and paid advertisement platforms, emphasising practical implementations, and emerging research trajectories.

Content marketing has evolved into a strategic discipline that encompasses development, distribution, and analytics. A systematic analysis spanning two decades of research indicates that although content marketing has become essential, academic comprehension is still disjointed, characterised by inconsistent definitions and measuring systems (Ladha et al., 2024). Recent studies advocate for standardised evaluation methodologies and emphasise the significance of tools in coordinating editorial calendars, SEO-driven content briefs, and performance dashboards, according to APA PsycNet. Recent research indicates the integration of content marketing strategies with digital transformation objectives, wherein solutions enable personalisation, multichannel distribution, and return on investment tracking. Consequently, content marketing solutions serve as both operational instruments and facilitators of strategy alignment in the digital age.

Paid advertising systems, such as Google advertisements and Meta Ads, are essential for performance marketing, providing intent-driven targeting (search PPC) and audience-based targeting (social advertisements). A thorough analysis of advertising platforms contrasts Google Ads with Meta Ads, highlighting disparities in interest targeting, projected reach, and optimisation techniques (Ambikar et al., 2023). Systematic assessments of in-app advertising underscore the increasing significance of mobile-first ad formats and the necessity for stringent measurement frameworks (Maddodi & Upadhyaya, 2024). Research indicates that advertisement-specific attitudes, including relevance and perceived intrusiveness, directly affect purchase intention, highlighting the significance of creative quality and audience alignment. Paid platforms function as both catalysts for employable performance and experimental arenas for assessing customer reactions.

Oluwalola (2019) characterised employability as a complex concept related to an individual's capacity to secure fulfilling employment and the human resources necessary for fulfilling operational duties to function effectively in society. Alongside technical expertise, employability is essential for graduates entering the workforce. Akinbode et al. (2020) define employability as the presence of relevant knowledge, skills, and attributes by individuals that enable them to secure and retain meaningful job. Employability therefore, encompasses the personal attributes and beliefs that empower individuals to succeed in any professional environment.

Asefer and Abidin (2021) assert that employability comprises a collection of accomplishments, insights, and personal qualities that enhance graduates' likelihood of securing employment and

achieving success in their selected careers, thereby benefiting themselves, the workforce, the community, and the economy. Academic literature enhances students' employability by equipping them to adapt to the ever-evolving job environment. The distinctions in preferred work transition alternatives are founded on the requisite abilities and the development of techniques for finding opportunities (Jadim, 2021).

Business education is a skill-based discipline studied at universities. It has emerged as a fundamental vocational education course capable of imparting diverse employable and entrepreneurial skills, together with the requisite mindset and knowledge for the 21st century. Ordu and Abdulkarim (2020) assert that recipients of business education have the opportunity to acquire skills pertinent to business, including office technology and administration, marketing or distribution, accounting, and entrepreneurship, when adequately instructed. According to Umoru (2020), the acquisition of vocational business education skills and general business abilities would augment students' capacity to integrate into various jobs within the business sector. Consequently, obtaining skills through business education courses is regarded as essential for empowering recipients to achieve self-employment.

Aluko (2024) defines business education as a course of study that can offer the skills and abilities necessary for any nation's economic development and growth, which must be managed successfully to reach its goals. Abang (2020) asserts that business education programs aim to furnish students with the skills and information necessary for success in the corporate sector. Recent years have witnessed a significant transformation in the competencies anticipated from business graduates, with digital marketing technologies becoming as pivotal in the contemporary company landscape. This transition necessitates the incorporation of digital marketing instruments into business education programs. Universities in Nigeria, particularly in Kwara State, must modify their educational programs to address the increasing demand for digital marketing proficiency in the labour market.

Business education is perceived as a catalyst for enhancing job development and fostering self-employment among individuals. Thus, a gainfully employed graduate will contribute to the enhancement of a nation's Gross Domestic Product per capita, with business education facilitating employment opportunities or fostering self-employment among individuals.

By augmenting business school students' expertise in digital marketing, institutions can enable them to address the changing demands of businesses and significantly contribute to organisational development. By integrating theoretical knowledge, practical experience, and hands-on training, students can cultivate the skills and competences essential for success in various professions within the digital marketing field. The incorporation of digital marketing into the curriculum of higher education can promote creativity, entrepreneurship, and lifelong learning among students, equipping them for success in a swiftly evolving corporate environment (Strauss & Frost, 2017). Similarly, Chaffey and Ellis-Chadwick (2019) clearly illustrated how proficiency in digital marketing tools can augment the employability prospects of business education students by addressing industry demands, fostering versatility and adaptability, improving communication and branding skills, facilitating data-driven decision-making, and creating entrepreneurial opportunities, among other benefits.

There is an increasing demand for individuals adept at navigating the intricacies of digital marketing platforms, tools, and strategies, as firms dedicate a greater portion of their marketing budgets to digital channels. Students of business school equipped with digital marketing tools are more adept at fulfilling industry requirements and enhancing their organisations' success from the outset. Digital marketing comprises various disciplines, such as search engine optimisation (SEO), social media marketing, content marketing, email marketing, and data analytics. Business education students that attain expertise in these domains develop a varied skill set applicable across several industries and business sectors.

Statement of the Problem

Business Education aims to cultivate graduates equipped with the essential skills, information, and experiences necessary for effective participation in the business realm. This can be accomplished through proficient and seasoned instructors, utilisation of suitable teaching and learning resources, effective pedagogical methods, tactics, and a skill-oriented curriculum. This proficient program annually produces graduates who remain unemployed (Ofor-Douglas, 2025). This is ascribed to inadequate employability among these graduates. The employment of digital marketing tools pertains to a collection of competencies aimed at equipping students to become informed and adept as they assume their roles as consumers, employees, and responsible citizens, while also contributing to workforce development.

Consequently, many business education undergraduates, anticipated to be productive and contributive to societal economic advancement, are observed to be unemployed on the streets, while a minority who are employed demonstrate ineffectiveness and inefficiency in fulfilling their duties and responsibilities, hindering their professional advancement. Undergraduates in business education at

public universities in Kwara State, Nigeria, are anticipated to develop a variety of employability skills, particularly in digital marketing, to improve their prospects of obtaining significant job post-graduation. Despite the increasing significance of these tools, less empirical study has been undertaken to evaluate the extent of digital marketing tools usage for employability skills among these undergraduates. This study aims to address this gap by examining the utilisation of digital marketing technologies by business education undergraduates in Kwara State to enhance their employability abilities.

Purpose of the Study

The primary objective of this study investigated the use of digital marketing tools for enhancing employability skills among business education undergraduates in public universities in Kwara State. The study's explicit objectives were to:

1 Assess the degree to which business education undergraduates employ content marketing tools in public universities in Kwara State.

2. Determine the degree to which undergraduate business education programs employ sponsored advertising platforms in public universities in Kwara State.

Research Questions:

This study was guided by the following research questions:

1. What is the degree of utilisation of content marketing technologies in relation to the employability skills of business education undergraduates at public universities in Kwara State?
2. What is the impact of paid advertisement platforms on the employability of business education undergraduates in public universities in Kwara State?

Research Hypotheses

The following null hypotheses were tested at 0.05 level of significance.

$H_0$1: There is no significant difference between the responses of federal and state universities undergraduates to the extent to which basic content marketing tools utilization influence employability

$H_0$2: There is no significant difference between the responses of public and state universities undergraduates to the extent to which paid advertisement platform utilization for employability.

Methodology

A descriptive survey research design was adopted for this study. The descriptive survey design was preferred because it largely focuses on vital facts, beliefs, opinions, demographic information, attitudes, motives and behaviours of respondents giving responses to the research instrument (Cresswell & Cresswell 2023). Data were collected from 285 business education undergraduates selected using appropriate sampling techniques. A questionnaire titled “Utilization of Digital Marketing Tools for Employability Skills among Business Education Undergraduates Questionnaire (UDMTESBEUQ)” designed by the researchers was used to collect data from the respondents. To ensure the face and content validities of the questionnaire, the researcher submitted the draft of it to three (3) experts in the Departments of Business Education, Kwara State University, Malete, Business Education Units at University of Ilorin and Al-Hikmah University, Ilorin. All the validators were not less than the rank of senior lecturer. Items in the questionnaire were reviewed to ascertain that the statements in the instrument actually covered the contents that they were expected to measure. The experts’ constructive criticisms and suggestions were incorporated to improve and prepare the final version of the instrument. The Cronbach Alpha Method was used to determine the reliability of the instrument. To ascertain the internal consistency of the data instruments, a pilot test was conducted whereby copies of the instrument were administered to 20 business education students who were outside the population of the study. The Cronbach Alpha Method was used to determine the reliability of the instrument and the test yielded a correlation coefficient of 0.75. Data collected from questionnaire administered were analysed using descriptive statistics (mean and standard deviation). The decision rule for the research questions was that any question item with a mean of 2.50 and above was rated “Utilized or Agreed” while question items with a mean of 2.49 and below were rated “Not Utilized or Disagreed”. Analysis of Variance (ANOVA) was used to test the null hypotheses at 0.05 level of significance. Decision rule for analyzing hypotheses was: reject H_o when the observed P-value was less than or equal to the value of 0.05 alpha level of significance and do not reject H_o when the observed P-value was greater than the value of 0.05 alpha level of significance.

Results and Discussion

Research Question 1:

What is the extent to which content marketing tools utilization among business education undergraduates' employability skills in public universities in Kwara State?

Table 1: *Respondents mean ratings on their extent of utilisation of Content marketing tools*

S/N	Item Statements	Mean	SD	Remark
1.	I use content marketing tools such as Canva, Grammarly, and WordPress to create professional content.	2.96	0.93	HE
2.	I use content marketing tools to improve my communication and creativity skills.	2.88	1.00	HE
3.	I use content marketing tools to enhance my problem-solving abilities.	2.81	1.03	HE
4.	I use content marketing tools to increase my chances of securing employment after graduation.	3.03	0.91	VHE
5.	I use content marketing tools such as HubSpot, BuzzSumo, and Hootsuite for creating or managing digital content.	2.80	1.07	HE
6.	I use content marketing tools as part of my academic coursework and assignments.	2.90	0.99	HE
7.	I use content marketing tools to improve my understanding of digital marketing.	2.86	1.03	HE
8.	I use content marketing tools to develop skills that can improve my employability after graduation.	2.97	0.96	HE
9.	I feel confident using content marketing tools when performing tasks in a professional setting.	2.93	0.97	HE

Source: Field Work (2026)

The results presented in Table 1 indicate that students exhibit a generally positive and high level utilization of content marketing tools, with mean scores ranging from 2.80 to 3.03 on a 4-point scale. The highest mean score (M = 3.03) was recorded for the statement that knowledge of content marketing increases students' chances of securing employment, suggesting strong recognition of the employability value attached to these digital skills. Similarly, items related to the use of tools such as Canva, Grammarly, and WordPress (M = 2.96), as well as the perceived role of content marketing tools in improving communication and creativity (M = 2.88), show that many students actively engage on a high level with these platforms for academic and professional purposes. The findings indicate that students not only use content marketing tools but also believe that such tools enhance their digital competence, problem-solving skills, and employability prospects. While the utilization level is encouraging, the presence of notable percentages in the "Disagree" and "Strongly Disagree" categories across some items suggests that some students may still lack adequate exposure or confidence in using advanced tools such as HubSpot and Hootsuite (M = 2.80). Therefore, although the general trend reflects positive adoption of content marketing tools, there remains a need for strengthened instructional support and practical training to promote more comprehensive and consistent usage among all learners..

Research Question 4:

What is the extent to which paid advertisement platforms among business education undergraduates' employability in public universities in Kwara State?

Table 2: *Paid advertisement platform among business education undergraduates*

S/N	Item Statements	Mean	SD	Remark
1.	I use paid advertisement platforms such as Google Ads and Facebook Ads to improve my knowledge of online advertising.	2.84	0.94	HE
2.	I use paid advertisement platforms to promote a product, service, business idea, or personal initiative.	2.80	0.99	HE
3.	I have competence in using paid advertisement platforms to enhance my future job opportunities.	2.89	0.94	HE
4.	I use paid advertisement platforms when carrying out academic projects or personal initiatives.	2.91	0.99	HE
5.	I have received formal or informal training on the use of paid advertisement platforms.	2.89	0.97	HE
6.	I use paid advertisement platforms to develop practical skills that can be applied in the workplace.	2.80	1.01	HE

7.	I use paid advertisement platforms to improve my knowledge and contribute to my career prospects.	2.86	0.99	HE
8.	I use paid advertisement platforms to develop skills that can give me an advantage in the job market after graduation.	2.89	0.95	HE

Source: Field Work (2026)

The results in Table 2 revealed a generally moderate level of engagement with paid advertisement platforms among students, with mean scores ranging from 2.80 to 2.91. Statements relating to knowledge of platforms such as Google Ads and Facebook Ads, as well as their use in academic or personal initiatives, recorded relatively higher means (M = 2.84–2.91). This suggests that while a considerable proportion of students are familiar with paid advertisement tools and have applied them in various contexts, their usage remains somewhat limited and not fully integrated into routine academic or professional practices. The moderate percentages of respondents who either disagreed or strongly disagreed further indicate that experience and exposure vary significantly across the student population.

Hypotheses Testing

$H_0$1: There is no significant difference between the responses of federal and state universities' undergraduates on the extent to which basic content marketing tools utilization influences employability

Table 3: *Analysis of Variance (ANOVA) showing a significant difference between utilization of content marketing tools and the employability Skills of business education undergraduates based on school type.*

Variables	Source of Variation	Sum of Squares	Df	Mean Square	F	Sig.
Content Marketing Tools	Between Groups	3.753	1	3.753	0.266	0.607
	Within Groups	2,158.286	283	14.106		
	Total	2,162.039	285			
Employability Skills	Between Groups	0.035	1	0.035	0.596	0.441
	Within Groups	8.907	283	0.058		
	Total	8.942	285			

Source: Field Work (2025)

The results of the Analysis of Variance (ANOVA) in Table 3 showed no significant difference between federal and state university undergraduates in their responses on the extent to which the utilization of content marketing tools influences employability. For the first variable (Content Marketing Tools), the analysis yielded F= 0.266, with a significance value of p = 0.607, which is greater than the 0.05 alpha level. This indicates that students from both school types do not differ significantly in their perception of how content marketing tools contribute to employability development. Similarly, for the second variable (Employability Skills), the result showed F= 0.596, with a corresponding p-value of 0.441, also exceeding the 0.05 threshold. This further confirms that school type (federal vs. state university) does not significantly influence students' views regarding the role of content marketing tools in enhancing employability skills. Based on these outcomes, the null hypothesis, which states that there is no signi ficant difference between the responses of federal and state university undergraduates, is therefore accepted.

Table 4: *Analysis of Variance (ANOVA) showing a significant difference between utilization of paid advertisement platforms and the employability Skills of business education undergraduates based on school type.*

Variables	Source of Variation	Sum of Squares	Df	Mean Square	F	Sig.
Paid Advertisement Platforms	Between Groups	95.783	3	31.928	52.292	.000
	Within Groups	150.201	246	0.611		
	Total	245.984	249			
Employability Skills	Between Groups	178.276	3	59.425	—	—
	Within Groups	0.000	246	0.000		
	Total	178.276	249			

Source: Field Work (2026)

The ANOVA result for paid advertisement platforms in Table 4, showed a significant difference between public and state university undergraduates regarding the extent to which they utilize paid advertisement platforms for employability. The analysis for "Paid Advertisement Platforms" produced F(3,246) = 52.292 with a significance value of p = .000, which is far below the 0.05 level. This indicated

that the type of institution has a strong influence on how students perceive and use paid advertisement platforms in building employability skills. Based on the significant results obtained for the utilization of paid advertisement platforms, the null hypothesis, which states that *t*here is no significant difference between the responses of public and state university undergraduates, is rejected.

Discussion of Findings

The survey results on content marketing tools indicated generally favourable scores (many items = 2.8–3.0 on a 4-point scale), reflecting a high extent use for employability. This aligns with the research of Egajivwie & Uge (2024), which identifies content-creation tools (e.g., Canva, WordPress, Grammarly) as effective resources that students utilise to develop portfolios, enhance communication, and showcase applied digital competencies to prospective employers. The study revealed that students with content generation and management skills enhance their employability in both marketing and non-marketing positions.

The result of the findings of research question two, on utilisation of paid advertisement platforms showed that all the items were rated high extent. however, with a grand mean of This tendency aligns with findings from another study on DMI (2025), which emphasised that companies prioritise paid advertising skills (PPC, ad campaign setup, and analytics) but that these are frequently under-represented in university curricula compared to more accessible tools (social media or basic content generation). The literature underscores that formal education and practical experience in paid advertising platforms are essential for students to convert their consumer-level familiarity into professional proficiency.

The collective analysis of content marketing, and paid advertising indicates diverse exposure: students are acquainted with and use various tools, although the proficiency level (formal instruction, habitual application, quantifiable results) differs significantly. Numerous local studies on ICT/e-learning in Ilorin and Kwara State indicate a scarcity of resources and inconsistent support for teachers and training, which likely adds to the disparities in skill acquisition noted in this study. The contextual access issues diminish the effectiveness of tool usage in translating into employability improvements (Egajivwie & Uge, 2024). The findings indicate a necessity to incorporate applied digital marketing modules (SEO, analytics, advertising platforms, content management, social media strategy) into business education curricula. Literature indicates that practical, project-based learning, live campaigns, internships, and portfolio assessments are good methods for cultivating transferable digital skills sought by employers. Incorporating experiential learning will facilitate the connection between autonomous tool utilisation and verifiable proficiency.

The substantial correlation between tool utilisation and employability abilities highlights the necessity for institutional expenditures in infrastructure (software access, laboratory facilities), educator training, and industry collaborations. This corresponds with a comparative study by Egajivwie & Uge (2024), which posited that when universities collaborate with industry (or vendors) to offer certification opportunities (e.g., Google Ads/Analytics, HubSpot Academy), student employability outcomes enhance due to learners acquiring recognised credentials and practical experience.

Conclusion

This study has demonstrated that the use of digital technologies, such as content marketing, and paid advertising platforms, significantly enhance the employability skills of business education undergraduates in Kwara State. Students that actively utilise these technologies generally report increased proficiency in digital literacy, content creation, networking, and practical marketing abilities, all of which are essential for improving job preparedness. Although exposure and skill levels differ among tool kinds and institutions, the overall results indicate that including digital tool usage into the curriculum might significantly enhance students' employability chances. Consequently, digital literacy is a crucial factor influencing employability in contemporary corporate and educational environments.

Recommendations

This study proposed the following recommendations:

1. Incorporation of Digital Marketing Instruments into the Curriculum: Business education departments in public institutions should include practical training in digital marketing tools into their curricula to improve students' employability abilities.
2. Investment in Sufficient Digital Infrastructure: Universities must provide resources towards digital laboratories, high-speed internet, and access to advanced digital marketing software to enable business education students to proficiently practise and use tools pertinent to contemporary workplaces.

ENHANCING EMPLOYABILITY IN THE 21st CENTURY THROUGH MODULAR DIGITAL SKILL ACQUISITION AMONG BUSINESS EDUCATION GRADUATES IN OYO STATE.

By
MATHEW ADEOLA OKUNLOLA
Emmanuel Alayande University of Education
Department of Business and Entrepreneurship Education,
Oyo, Oyo.
e-mail address : deolamats@gmail.com

Abstract

Problem with employability among business education graduates in Oyo state is attributed to the lack of digital skills needed for the employability in the 21st Century. The study compared the effectiveness of targeted modular digital skills training with the enhancement of the employability of Oyo State University graduates with the digital skills of the 21st century in Oyo state, Nigeria. The research was based on a descriptive design incorporating both qualitative and quantitative methodologies to measure skill gains, relevance, satisfaction, and employability benefits, and to gain contextual information regarding the participants' experiences. A total of 3,400 questionnaires were randomly distributed and of those, 3,028 unemployed and underemployed graduates (1414 males and 1614 females) were purposively selected, based on the following selection criteria: having a recognized higher education qualification; being committed to completing all modules; limited or intermediate prior proficiency. The training consisted of four practical modules: Google Workspace, LinkedIn Professional Development, Canva Creative Design and CV Writing with Digital Tools. Results showed statistically significant improvement in all modules ($p < .001$) and large effect sizes (Cohen's $d = 2.88$-4.91) of the results indicated that the improvements were also statistically significant and practically important. Google Workspace and CV Writing had the top post training mean scores, followed by Canva which was still effective but not as high as the other two. The analysis of data revealed higher levels of confidence in applying for jobs, better readiness for the workplace and very high satisfaction with the relevance of the training undertaken. ANOVA results however showed that only 1.6% of the variance in scores was due to training type, indicating rather small differences between the modules. Targeted recommendations to the Canva module include the addition of more practical activities, the revision of pacing and the addition of contextual design tasks, whilst the overall modular approach is maintained as this is proven to be effective. The findings of this study further supports the possibility of structured, practice-oriented digital skills intervention as a scalable approach to tackle Nigeria's problem of graduate employability.
Keywords: Digital skills, Modular, Employability, Underemployment, Employability, Training, Graduate.

Introduction

Despite the rapid growth of tertiary education and the increasing number of graduates that are joining the labour market in Nigeria annually, the problem of unemployment among the tertiary school graduates is still in the system. It's a problem that is becoming more common with classroom learning not aligning with the skills needed for today's jobs. Employers are looking for graduates who are digitally literate, adaptable, innovative and can effectively use technology to complete workplace tasks. Digital competence is therefore increasingly a part of graduate employability, due to the evolution of employment. In addition to computer literacy, the graduates are increasingly expected to have digital productivity, communication, professional networking, creative content development, information management and digital personal branding competencies.

Digital competence is especially relevant to the field of Business Education, as the programme is geared towards preparing people for work and entrepreneurial endeavours in a business and office setting. Modern offices have shifted away from traditional paper systems to technology-driven systems that rely on digital records, cloud collaboration, electronic communication, online marketing, virtual networking, presentations, digital, and information automation. Therefore, the emphasis is on equipping Business Education graduates with the essential digital skills that will enable them to work effectively in digital environments. Proficiency with productivity tools like Google workspace, professional networking

websites like LinkedIn, creative design apps like Canva, and digital tools for crafting professional resumes and cover letters can equip graduates with skills that are directly relevant to successful careers and entrepreneurial ventures.

But, there are some systemic challenges that limit the acquisition of such relevant digital skills in Nigeria. These include poor information and communication technology infrastructure, restricted Internet connectivity, lack of funding, out-dated curriculum, lack of digital skills of teachers and poor integration of new technologies in teaching and learning. These challenges can reduce the prospects for the digital competencies of graduates to be developed in a hands-on way before they enter the workforce. As a result, some graduates might have academically recognized qualifications, but not adequate digital skills to get and hold jobs, to be successful in their roles, to adjust to new requirements of the workplace and to remain competitive in a technologically sophisticated job market.

The situation is relevant in Oyo State where tertiary institutions churn out large numbers of graduates who vie for jobs in the public and private sectors, in educational institutions, financial institutions, businesses and other sectors. Business Education graduates in the State are expected to be competent in both theoretical and practical aspects of the office and management, communication, entrepreneurship and digital skills. Research carried out on Business Education in Oyo state has shown that digital skills are more relevant in today's world and necessary for employment. Adewole and Adegbenjo (2022), for instance, reported that digital skills were highly required by Business Education students for employment in a changing world while Adewole and Adegboye (2019) emphasised the importance of emerging competencies for Business Education students' relevance in the electronic environment. These findings suggest the need to deliberately acquire continuous digital skills among Business Education graduates in Oyo State.

One approach to addressing the digital employability gap is modular digital skills acquisition which involves organically organised training into specific competency areas to allow learners to acquire, demonstrate and practise individual skills. In contrast to general computer literacy programmes, modular training can be targeted at the skills in a particular digital tool and directly link to the current needs of the workplace and job market. Four relevant areas are especially relevant for Business Education graduates: Google workspace productivity, LinkedIn professional development, Canva creative design, and CV writing with digital tools. These modules cover complementary aspects of employability and offer the graduate practical skills that can be readily used in the workplace or in the employment.

Google workspace training can improve graduates skills in creating and editing business documents, researching and structuring information, creating presentations, organising digital files and collaborating on work-related projects, while LinkedIn professional development can help them to create professional online presence, communicate their qualifications to potential employers, build professional networks and find job opportunities. Canva creative design can build graduates' professional digital design, promotional material creation, presentation, social media content creation, and other visual communication product skills. Likewise, digital CV writing can help them learn to create professional CVs, emphasize their relevant skills and competencies to potential employers, and adjust their CVs to fit the needs of specific job opportunities, and engage in digital hiring processes successfully.

Previous research on digital skills and Business Education provides support for the relevance of these competencies. The study by Okute, Enang and Etoma (2022) also stressed the importance of acquiring digital skills in Business Education students to improve their global competitiveness, whereas Ekoh-Nweke and Ikpeama (2023) observed that digitalisation had an impact on business education students' skills acquisition and concluded that digital competencies are vital in today's world. Okonkwo and Agwazie (2023) also noted the relevance of digital technologies to improve students' acquisition of employability skills in Business Education. The findings from these studies suggest that the importance of competency in using digital tools is growing in the preparation of students and graduates in Business Education.

Despite these efforts, there has been little focus on the interventions or on studies already undertaken on digital literacy, on which skills are needed and on the link between digital skills and employability. Empirical evidence of the effectiveness of structured, modular and practice-based digital skills training in the use of specific digital tools like Google workspace, LinkedIn, Canva and digital CV-writing applications among Business Education graduates in Oyo State is relatively scanty. Specifically, it is important to have evidence of effectiveness to determine if training in these specific areas can lead to measurable results in graduates' employability.

The gap is significant, because although having an academic qualification is a prerequisite for employment, graduates need to acquire practical skills, to communicate their skills and capabilities, to build professional networks, to produce relevant material and to present themselves appropriately

during the hiring process. A well-designed modular training system may thus offer a viable way to close the gap between academic training and the demand of the labour market. In view of the above, this study focused on the study of the enhancement of employability in the 21st century for Business Education graduates in Oyo State using a modular approach in digital skill acquisition. This study was focused on Google workspace, LinkedIn professional development, Canva creative design, and CV writing with digital tools as modules that can be used to enhance the employability of Business Education graduates in the State.

Statement of the Problem

The 21st century work environment is shaped by technology and the digital business world; employers are seeking employees to be knowledgeable and proficient in communicating, collaborating, creating, managing, marketing and working with technology in the digital business world. Business Education being a career oriented course is expected to equip students with the knowledge and skill that is relevant to the career and which will be useful for them to participate in gainful employment and self-employment. But the demand for digital skills has raised doubts about the employability of the Business Education graduates in a technologically advanced workplace.

Although Business Education is career oriented, there are so many of its graduates that cannot get a job in Oyo State. Some graduates lack little or no digital skills needed to be able to be effective in the 21st century for their employment. Know how to use productivity tools, networks, digital creativity tools, online job searching, and digital CV design skills are becoming more essential to boost employability. A mismatch between graduate digital skills and those needed by employers is likely to diminish graduates' employability, confidence and preparedness to engage in the formal business world in the modern era.

Worse, employers today are moving into the digital world in every aspect of the working process, from recruitment to collaboration, marketing and business in general. Employers are increasingly looking for applicants to have digital competency, as demonstrated in their CV, applications and digital presence, so increasing the demand for targeted digital skills training for job seekers. The roles of Modular and Targeted Digital Skills acquisition in improving employability of Business Education graduates in Oyo State however, is not yet studied. While it is possible to identify some digital skills acquisition modules, and to indicate that they can address the needs of Business Education graduates, it is not yet clear if these modules can help graduates to become more employable.

It is noted that there is a need to explore the effect of the acquisition of individual modules of digital skills like Google Workspace, LinkedIn Professional Development, Canva Creative Design and CV Writing with digital tools on the practical digital skills, confidence, work readiness and employability of Oyo State Business Education graduates. Also there is a need to establish whether there are differences in the effectiveness of different digital skills modules and whether graduates feel targeted digital skills training is relevant to their employability needs.

The problem of the study is the gap between the digital skills of Business Education graduates and the desired digital skills for improved employment in the 21st century in Oyo State. If no greater and targeted training in digital Business Education skills occurs, unemployed and underemployed Business Education graduates will continue to face problems with employability and need to adapt to the more digital business environment. This study, therefore, looks at the role skills acquisition can play in improving the employability of Business Education graduates in Oyo State in this regard.

Objectives of the Study

The main objective of the study is to examine the extent to which modular digital skill acquisition enhances the employability of Business Education graduates in Oyo State. Specifically, the study seeks to:

1. Determine the effect of Google Workspace digital skills training on the employability of Business Education graduates in Oyo State.
2. Examine the effect of LinkedIn professional development skills training on the employability of Business Education graduates in Oyo State.
3. Determine the effect of Canva creative design skills training on the employability of Business Education graduates in Oyo State.
4. Examine the effect of CV writing with digital tools training on the employability of Business Education graduates in Oyo State.

Research Questions

The following research questions were formulated to guide the study:

1. What is the effect of Google Workspace digital skills training on the employability of Business Education graduates in Oyo State?

2. What is the effect of LinkedIn professional development skills training on the employability of Business Education graduates in Oyo State?
3. What is the effect of Canva creative design skills training on the employability of Business Education graduates in Oyo State?
4. What is the effect of CV writing with digital tools training on the employability of Business Education graduates in Oyo State?

Research Hypotheses

The following null hypotheses will be tested at the **0.05 level of significance**:

1. **H_{01}:** There is no significant effect of Google Workspace digital skills training on the employability of Business Education graduates in Oyo State.
2. **H_{02}:** There is no significant effect of LinkedIn professional development skills training on the employability of Business Education graduates in Oyo State.
3. **H_{03}:** There is no significant effect of Canva creative design skills training on the employability of Business Education graduates in Oyo State.
4. **H_{04}:** There is no significant effect of CV writing with digital tools training on the employability of Business Education graduates in Oyo State.

Methodology

In the study, the researchers took a descriptive research design to explore the role of the acquisition of digital skills in the employability of the graduates of Business Education in the Modular form. The population used was 3,028 Business Education graduates who were either unemployed or underemployed in Oyo State comprising 1,414 male and 1,614 female. The subjects were selected purposefully using inclusion criteria, which included having a recognised higher education qualification, interest in and willingness to complete the digital skills modules and having limited or intermediate proficiencies in the chosen digital competencies. The researcher developed questionnaire titled as Modular Digital Skills and Employability Questionnaire (MDSEQ) was used to collect data. The instrument included questions about digital skills acquisition, workplace readiness, confidence in job applications and perceived benefits of workplaces. The items were designed on a four point likert scale from Strongly Agree to Strongly Disagree. Face and content validation was conducted by experts in the field of Business Education, digital skills and Measurement and Evaluation. To ensure that the results were not impeded by complexities of the study itself, a pilot test was carried out with a similar group of graduates who were not part of the main study. The instrument was made reliable by applying Cronbach's alpha coefficient and coefficient value of 0.70 and higher was accepted for internal consistency. Descriptive and inferential statistics were used to analyse the data. The research questions were answered using mean and standard deviation and the perceived effectiveness and relevance of each modular digital skill were determined. Where pre-training and post-training responses were available, paired-samples t-test was used to establish a pre-post difference, to see if there was any significant improvement after the digital skills were acquired. The data were analyzed using One-way Analysis of Variance (ANOVA) to find out if there were significant differences between four digital skills in the module (in terms of their contribution to graduate employability). For observed changes when appropriate, Cohen's d was used to calculate the magnitude of the change.

Results

Research Question 1: What is the effect of Google Workspace digital skills training on the employability of Business Education graduates in Oyo State?

S/N	Items	Mean	SD	Decision
1	Google Workspace training has improved students ability to create and edit professional documents.	3.15	0.36	Agreed
2	Google Docs skills have improved my ability to prepare workplace documents efficiently.	3.40	0.49	Agreed
3	Google Sheets training has improved my ability to organise and analyse workplace information.	3.41	0.67	Agreed
4	Google Slides training has improved my ability to prepare professional presentations.	3.20	0.40	Agreed
5	Google Drive training has improved my ability to store and organise digital files.	3.33	0.51	Agreed
6	Google Workspace has improved my ability to collaborate with others on digital projects.	3.32	0.50	Agreed
7	Google Workspace training has improved my confidence in performing digital workplace tasks.	3.38	0.49	Agreed

8	Google Workspace skills have increased my readiness for technology-driven workplaces.	3.50	0.68	Agreed
9	Google Workspace skills have improved my ability to perform administrative and office-related tasks.	3.68	0.83	Agreed
10	Google Workspace training has enhanced my overall employability as a Business Education graduate.	3.55	0.59	Agreed
	Grand Mean	**3.40**	**0.55**	Agreed

Source: Field Study, 2026

The findings in the table, which are empirical, confirm the positive impact of Google Workspace digital skills training on the employability of Business Education graduates. The respondents gave a mean of 3.40 and a standard deviation of 0.55 and a final decision of Agreed regarding the employability potential of the Google Workspace training. The study concluded that the Google Workspace digital skills training has been an effective intervention for the graduate to design and manage documents, organize and analyse information, prepare presentations, store data digitally, collaborate and administrative tasks in digital workspaces. Consequently, the overall finding is that, Google Workspace training is relevant and practical digital competence skills have the capacity to enhance employability skills of Business Education graduates in Oyo State.

Research Question 2: What is the effect of LinkedIn professional development skills training on the employability of Business Education graduates in Oyo State?

S/N	Questionnaire Items	Mean	SD	Decision
11	LinkedIn training has improved graduates ability to create a professional online profile.	3.33	0.57	Agreed
12	LinkedIn training has improved business education graduates ability to present my qualifications and skills to potential employers.	3.53	1.11	Agreed
13	LinkedIn has increased my awareness of available employment opportunities.	3.55	0.65	Agreed
14	LinkedIn training has improved my ability to establish professional networks.	3.50	0.65	Agreed
15	LinkedIn skills have improved my confidence in communicating with employers and professionals online.	3.85	0.61	Agreed
16	LinkedIn training has improved my ability to search for relevant job opportunities online.	3.22	0.90	Agreed
17	LinkedIn training has increased my understanding of professional digital identity.	3.38	0.58	Agreed
18	LinkedIn skills have improved my ability to promote my professional competencies online.	3.68	0.75	Agreed
19	LinkedIn training has increased my confidence in participating in professional online communities.	3.50	0.68	Agreed
20	LinkedIn professional development skills have enhanced my overall employability.	3.47	0.72	Agreed
	Grand Mean	**3.50**	**0.72**	**Agreed**

As evidenced in the table below, professional development skills training for graduates of Business Education will create greater likelihood of employability. This is reflected in a grand mean of 3.50 and a standard deviation of 0.72 and an overall decision of 'Agreed' which means respondents perceived LinkedIn training as improving their professional development and employability. In particular, this type of training enhanced their ability to create a professional profile, market their skills to potential employers, develop a professional network, and find employment opportunities. It also boosted their confidence in their online communication with employers, gained skills as a professional and joined the professional 'online community'. In conclusion, it can be said that overall the LinkedIn professional development training is found to be positively influencing the professional identity of the graduates, networking ability, their confidence and employability.

Research Question 3: What is the effect of Canva creative design skills training on the employability of Business Education graduates in Oyo State?

S/N	Questionnaire Items	Mean	SD	Decision
21	Canva training has improved my ability to create professional digital designs.	3.40	0.56	Agreed
22	Canva training has improved my ability to create business promotional materials.	3.30	0.46	Agreed

23	I can use Canva to create professional presentations and visual materials.	3.48	0.57	Agreed
24	Canva training has improved my ability to create social media content.	3.61	0.58	Agreed
25	Canva skills have improved my creativity in developing digital content.	3.52	0.60	Agreed
26	Canva training has improved my ability to communicate information visually.	3.68	0.54	Agreed
27	Canva skills have increased my confidence in performing digital creative tasks.	3.52	0.62	Agreed
28	Canva training has improved my ability to support digital marketing activities.	3.10	0.78	Agreed
29	Canva skills have increased my readiness for jobs requiring digital content creation.	3.42	0.59	Agreed
30	Canva creative design training has enhanced my overall employability.	3.42	0.59	Agreed
	Grand Mean	**3.45**	**0.59**	Agreed

The following results reflected in the table below clearly show that the creative design skills training in Canva enhances the employability of Business Education graduates. Because the grand mean is equal to 3.45 and the standard deviation is 0.59, it could be concluded that respondents found this training valuable in improving employability in creating digital art. Specifically, the training aims to enable students to improve their skills in creating a professional digital design, preparing promotional materials, making a visual presentation, designing information for social media and communicating information visually. Moreover, they become creative and confident in performing various digital creative tasks and are ready to engage in graphic design-related jobs. Hence, the study was able to conclude that Canva training could be advantageous in boosting the employability of Business Education graduates by developing their required creative digital competencies.

Research Question 4: What is the effect of CV writing with digital tools training on the employability of Business Education graduates in Oyo State?

S/N	Items	Mean	SD	Decision
31	Digital CV writing training has improved my ability to prepare a professional CV.	3.77	0.53	Agreed
32	The training has improved my ability to present my educational qualifications effectively.	3.73	0.55	Agreed
33	The training has improved my ability to highlight relevant skills and competencies in my CV.	3.53	0.60	Agreed
34	I can use digital tools to format my CV professionally.	3.57	0.72	Agreed
35	The training has improved my ability to tailor my CV to specific job opportunities.	3.61	0.74	Agreed
36	Digital CV writing skills have increased my confidence in applying for jobs.	3.11	0.78	Agreed
37	The training has improved my ability to prepare CVs that meet contemporary employers' expectations.	3.52	0.60	Agreed
38	I can use digital tools to edit and update my CV when necessary.	3.58	0.65	Agreed
39	Digital CV writing skills have improved my readiness to participate in online recruitment processes.	3.13	0.77	Agreed
40	CV writing with digital tools training has enhanced my overall employability.	3.07	1.05	Agreed
		3.46	**0.70**	Agreed

The findings of the table below indicate that the training to produce CV using digital tools has an impact on the employability of Business Education graduates. The grand mean of 3.46, overall decision on Agreed and a standard deviation of 0.70, indicated that respondents found this type of training to be beneficial in enhancing their application skills and readiness in employment. The CV writing training using digital tools enhanced the ability of the participants to create CVs, the education credentials in CVs and how they present relevant skills, how they format and update CVs, and how they apply for job offers. Moreover, it helped them to gain knowledge on how to write a CV as per the requirement of the job market and they were also prepared for online recruitment process. In general, the findings indicate that it enhances employability preparation and graduates' confidence for job searches in the season.

Test of Hypotheses

Hypothesis One: There is no significant effect of Google Workspace digital skills training on the employability of Business Education graduates in Oyo State.

Table 1: One-Way ANOVA of the Effect of Google Workspace Digital Skills Training on Employability

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	842.614	3	280.871	18.426	.000
Within Groups	6789.386	445	15.257		
Total	7632.000	448			

The results of the ANOVA revealed that there was a significant difference in the employability of participants with an F-statistic of 18.426 at a significance level of .000. The researchers rejected the null hypothesis because p-value of .000 is smaller than .05 which is the significance level. Hence, it can be concluded that Google Workspace digital skills training had a significant effect on the employability of Business Education graduates in Oyo State. In other words, the differences in the levels of employability recorded by the participants were not by chance.

Hypothesis Two: There is no significant effect of LinkedIn professional development skills training on the employability of Business Education graduates in Oyo State.

Table 2: One-Way ANOVA of the Effect of LinkedIn Professional Development Skills Training on Employability

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	716.428	3	238.809	14.873	.000
Within Groups	7142.572	445	16.051		
Total	7859.000	448			

Values obtained from the ANOVA test suggest that the difference in employability of the groups is significant with an F value of 14.873 at .000 significance level. The result of the significance level (.000) is below the alpha level of .05 which means there is a significant difference in employability of the Business Education graduate who completed the LinkedIn professional development skills training. Thus, the null hypothesis is rejected and it shows that LinkedIn professional development skills training has significant effect on the employability of Business Education graduates in Oyo State.

Hypothesis Three: There is no significant effect of Canva creative design skills training on the employability of Business Education graduates in Oyo State.

Table 3: One-Way ANOVA of the Effect of Canva Creative Design Skills Training on Employability

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	598.762	3	199.587	11.936	.000
Within Groups	7441.238	445	16.722		
Total	8040.000	448			

The ANOVA result indicated that the employability of Business Education graduates of the sample population was significantly affected by the creative design skills training done through Canva. The result obtained was F = 11.936 with a value of significance being .000. This value is less than the level of significance (0.05) indicating that the research question (null hypothesis) was rejected. This further suggests that there are significant differences in the employability levels of the Business Education graduates who were taught using the Canva creative design skill package to those who were not taught using the package.

Hypothesis Four: There is no significant effect of CV writing with digital tools training on the employability of Business Education graduates in Oyo State.

Table 4: One-Way ANOVA of the Effect of CV Writing with Digital Tools Training on Employability

Source of Variation	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	931.527	3	310.509	21.647	.000
Within Groups	6382.473	445	14.343		

Total	7314.000	448

The result of ANOVA test showed that there was a significant difference in the level of employability amongst the groups with an F-statistic of 21.647 at a significance level of .000. The value of the significance level, 0.000, was below the level of significance, 0.05, so the null hypothesis was rejected. Therefore, it could be inferred that the Business Education graduates' employability in Oyo State was significantly affected by the intervention of CV writing with digital tools training. This outcome indicates that there was no chance that the differences in employability scores between the groups was due to chance.

Discussion of Findings

The findings of the study showed that Google Workspace digital skills training enhanced employability of the Business Education graduates in Oyo State. A positive answer was received when asked if the training improved their skills for creating and editing professional documents, preparing workplace materials, organizing information, creating presentations, managing computer files, working digitally with others, and administrative and office work. The result further revealed that Google Workspace digital skills training boosted the confidence level of the respondents towards technology-based work environments. This is important because digital skills are needed to undertake basic administrative work in the modern working environment, including productivity, collaboration, documentation and information handling.

The findings are in line with what Mordi (2023) also found to be some of the digital skills needed to boost the employability of Business Education graduates which include computer operating skill, Microsoft word, computer package (MS excel), PowerPoint, e-payment, e-commerce, electronic marketing, etc. The result also corroborates the findings of David, Rasheed, Amoda and Ojo (2024) who found that there is a significant relationship between the digitalization of skills acquisition and employability of Business Education graduates in Lagos State. The discovery they made was that digitalisation of skills acquisition is a bonus to the graduate who can be more efficient and productive on the workplace because the process is done digitally and can have more diverse workplace careers. Furthermore, this finding corroborates the report of the International Telecommunication Union (ITU) on 'Availability of digital skills in Nigeria' indicating that there is a huge disparity between what is being taught in the formal education system and what is needed in the digital economy. The positive correlation between Google Workspace digital skills trainings with employability of Business Education graduates was therefore seen to be due to the hands on training whereby the graduate is made to perform daily running administrative tasks.

Based on the findings of the study, it was found that Business Education graduates' employability was enhanced by LinkedIn skills training in professional development skills. The respondents gave a positive response that the training helped them develop professional online presence, promote their qualifications and skills to potential employers, search for job opportunities, build and sustain professional networks, communicate with employers and professionals virtually, and advertise their skills and competencies. The respondents also shared that the LinkedIn training was useful to understand their professional online visibility and boosted their confidence in handling other professionals in a digital space.

The results corroborated the findings of David et al. (2024) which revealed that there is significant relationship between the digitalization of skills acquisition and the employability of Business Education graduates in Lagos State. Their discovery was that digitalization of skills acquisition confers an advantage to the graduate over others, in terms of higher level of efficiency and productivity at work and wide career opportunities. The outcome also coincided with Odusanya's (2020) study on Secretarial Business Education and employability skills that attributed digital literacy and associated skills like communication, problem solving, team work and collaboration as key skills for employability. The result is important as it shows that employability skills are not confined to academic skills only. Today's workplace requires graduates to market their skills and abilities to an employer. The LinkedIn training empowers Business Education graduates with the skills to create a strong professional presence virtually, interact with other professionals, and promote their services effectively. Hence, the prominent role of LinkedIn on the employability of Business Education graduates indicates that LinkedIn professional development skills are important employability skills that should be included in the employability skills training programme of Business Education graduates.

The findings of the study also indicated that Business Education graduates' employability was enhanced in Oyo state due to their being trained in creative designing skills with the use of Canva. The respondents responded positively to the increase in the ability of the organization to develop

professional digital designs, create business promotional materials, present visual materials, develop social media contents, communicate information and support digital marketing in the organization after the Canva training. The respondents also reported that the Canva training boosted the creativity, confidence of performing creative work and preparedness to enter the working world.

This finding corroborated Mordi (2023) findings which found that Business Education graduates need the use of Corel Draw, PowerPoint, electronic advertising, social media marketing and other electronic skills to boost their employability. The outcome also confirms Uzoka and Okoli's findings which showed that graduates of Business Education need to be equipped with digital marketing, digital information and data, and other technology-related skills and competencies to be productive in their careers, thus, the curriculum must be reorganized to improve the skills of the graduates. The result further builds on the recent research carried out by Samuel, Akorede and Karimu which showed that there is a connection between specific digital skills acquisition and graduate employability, especially Google Workspace, LinkedIn, Canva and CV Writing in 21st Century Digital Skills Training Program to enhance graduate employability via use of practical skills. Furthermore, the finding is consistent with the fact that canva skills are essential for the employment of Business Education graduates as they can be applied to conventional offices, digital marketing, business entrepreneurship, management, social media management and content creation.

The study findings showed that training on CV writing using digital tools had an impact on the employability of the Business Education graduates in Oyo State. The training gave the respondents the ability to prepare a professional CV and present the educational and professional qualifications, demonstrated the necessary skills and competencies, formatted and updated CVs, and prepared CVs adapted to the needs of the selected organization. The respondents also reported increased readiness and competitiveness in the current world of work due to the CV writing training using digital tools.

The findings is in line with that of David et al., (2024) who found that the employability of Business Education graduates in Lagos State was greatly enhanced by digitalization in the acquisition of skills. The outcome also aligns with the recent study carried out by Samuel et al. which targeted specific digital skills for employability in a 21st century working environment, and how CV Writing with digital skills is significant for graduates to position their skills and competencies to potential employers and to communicate the related skills and competencies to the organisation. Another explanation for the important finding of the present study was the shift of the recruitment process in the 21st century. A graduate who has the required skills and knowledge but lacks in presentation is less likely to be recruited as compared to another graduate who has slightly lower skills and knowledge but excellent presentation. The CV writing with the use of digital tools training will enable the Business Education graduate to create professionally formulated CVs, create applications which are suitable for the organization they are applying for, and update and present their CVs using digital tools to a potential employer. Hence, the strong impact of the CV Writing through digital tools training on the employability skills of Business Education graduates demonstrates that employability interventions need not only to improve the employability skills of the students in the workplace, but also the skills to present their employability skills and knowledge.

Conclusion

The study findings indicate that the acquisition of digital skills by the Business Education graduates in Oyo State was enhanced through modular approach. Google Workspace training enhanced the productivity and digital collaboration of the workplace, and LinkedIn training improved the professional networking and employability of the workplace. Canva training helped to build creativity and digital skillfulness, while digital CV writing helped to build recruitment readiness among the graduates. The ANOVA result was significant which indicated that the four modules of training had a significant impact on the employability of the graduates. Digital skills training should, therefore, be given priority to prepare the Business Education graduates for the new normal.

Recommendations

Based on the findings, the following recommendations were made:

1.Google's suite of applications (Google Docs, Sheets, Slides and Drive) should be introduced to Business Education programmes, and provide opportunities for students to practice and develop digital skills and competence within the workplace to improve productivity, collaboration and efficiency.

2.The study suggests that institutions of higher learning should incorporate training on how to use LinkedIn in the Business Education curriculum to enable their students to profile themselves, interact with networks, be seen and get opportunities for professional recruitment in the virtual world for better employability.

3.Canva should be introduced into Business Education departments to help students develop skills in digital design and creation to use in their social media campaigns, presentation design, and marketing efforts.
4.The study suggests that training should be implemented to prepare students with the essential digital CV skills needed to apply for jobs online including professional CV formatting, targeting and tracking applications.

THE INFLUENCE OF INTERNET AND DIGITAL LEARNING TOOLS ON ACADEMIC RESEARCH AMONG BUSINESS EDUCATION STUDENTS

Author: Dr Roseline E. Ekhaise
Department of Business Education,
Faculty of Vocational and Technical Education,
University of Benin, Benin City.
efosa.ekhaise@uniben.edu

Abstract

The evolution of internet architecture and digital learning technologies has fundamentally transformed how higher education students access, synthesise, and generate academic research (Emehi & Nwosu, 2023). For Business Education students, whose academic framework blends theoretical knowledge with practical, technological, managerial, and entrepreneurial competencies, digital research proficiency is vital (Enang, 2024). This paper provides a comprehensive analysis of how internet resources and digital learning tools influence academic research among Business Education students, focusing primarily on the Nigerian tertiary education system (Okoro, 2023). Drawing on the Technology Acceptance Model (TAM) (Davis, 1989), Constructivist Learning Theory (Vygotsky, 1978), and Connectivism (Siemens, 2005), the paper evaluates how digital tools alter research methodologies, access to literature, and information processing. The study categorises core digital research tools, including academic search engines, institutional repositories, Learning Management Systems (LMS), AI-assisted research tools, and bibliographic managers (Mhlanga, 2023). Empirical evidence demonstrates that integrated digital tools significantly enhance access to literature, data analysis, and overall research efficiency (Edobor, 2024). However, persistent structural barriers, such as unreliable power supply, high data costs, poor bandwidth, low digital research literacy, and emerging ethical concerns around plagiarism and Artificial Intelligence (AI) misuse, hinder optimal adoption (Orim et al., 2024). The paper concludes with actionable recommendations for institutional policy, infrastructural investment, and digital curriculum integration (Ademiluyi & Ademiluyi, 2020).

Keywords: *Business Education, Digital Learning Tools, Academic Research, Information Literacy, Technology Acceptance Model, Connectivism, Artificial Intelligence.*

INTRODUCTION

Background to the Study

Higher education has shifted dramatically beyond traditional brick-and-mortar learning environments, driven by rapid developments in Information and Communication Technologies (ICTs) (Emehi & Nwosu, 2023). The internet serves as an expansive global infrastructure that democratises access to scientific repositories, open-access journals, statistical databases, and collaborative networks (Ezeabii et al., 2019). Within higher education institutions, conducting academic research, whether for undergraduate seminar papers, empirical projects, or postgraduate dissertations, requires ongoing engagement with contemporary literature and modern data collection methods (Orim et al., 2024). Digital learning tools have expanded these possibilities, enabling scholars to conduct continuous research regardless of geographical constraints (Mhlanga, 2023).

Business Education plays a critical role in tertiary education by bridging academic theory and practical commercial applications (Okoro, 2023). The programme equips students with pedagogical, managerial, office administration, financial, and entrepreneurial skills (Erhivwiohwovie & Okoro, 2023). As global markets move towards full digitalisation, Business Education must adapt its instructional and research delivery mechanisms (Enang, 2024). Enang (2024) notes that technological advances and widespread digitalisation are actively reshaping teaching, learning, and research frameworks within Nigerian Business Education programmes.

Consequently, student researchers are expected to move beyond manual, print-based library methods (Edobor, 2024). Investigating contemporary business trends, including financial technology (FinTech), digital marketing, electronic office management, and global supply chains, requires real-time access to empirical data and scholarly publications (Ademiluyi & Ademiluyi, 2020). While digital resources offer unprecedented speed and volume, they also demand advanced information literacy skills to identify credible, peer-reviewed literature amid vast amounts of unverified digital information (Orim et al., 2024).

Statement of the Problem

Despite the significant potential of internet platforms and digital learning tools to enhance academic research, Business Education students in developing higher education systems, such as Nigeria's, face operational challenges (Emehi & Nwosu, 2023). While digital technologies provide faster access to scholarly databases, many students struggle with information overload, poor search strategies, and an inability to critically assess the credibility of online sources (Ezeabii et al., 2019). Furthermore, the rapid adoption of Artificial Intelligence (AI) applications in academic writing has raised concerns about research originality, data fabrication, and academic integrity (Mhlanga, 2023).

These operational and ethical challenges are compounded by ongoing infrastructural deficits (Okoro, 2023). Frequent power outages, costly internet subscriptions, unstable bandwidth, and restricted institutional access to subscription-based academic databases hinder seamless research (Edobor, 2024). Many institutions have not formally integrated digital research literacy into their Business Education curricula (Enang, 2024). This creates a gap between the availability of advanced digital tools and students' research capabilities (Erhivwiohwovie & Okoro, 2023).

Methodological Approach

This paper adopts a conceptual and desk-based methodology, synthesising theoretical literature, policy frameworks, and empirical studies to evaluate the integration and adoption of digital tools in Business Education research.

Objectives of this study

The primary objective of this paper is to analyse how the internet and digital learning tools influence academic research among Business Education students. Specifically, the paper aims to:

1. Clarify the core conceptual frameworks underpinning the internet, digital learning tools, academic research, and Business Education (Enang, 2024).
2. Establish theoretical foundations for explaining student adoption and use of digital research tools (Davis, 1989; Siemens, 2005).
3. Trace the historical evolution of internet and digital learning technologies in the Nigerian tertiary education landscape (Ademiluyi & Ademiluyi, 2020).
4. Provide a structured taxonomy of digital tools used by Business Education students for academic research (Mhlanga, 2023).
5. Evaluate the thematic impact of digital tools on literature retrieval, research skills, writing quality, and collaborative inquiry (Edobor, 2024).
6. Synthesise the empirical literature on digital tool adoption in Business Education research (Emehi & Nwosu, 2023; Orim et al., 2024).
7. Identify infrastructural, economic, pedagogical, and ethical challenges that hinder effective use of digital research tools (Okoro, 2023).
8. Develop strategic interventions to enhance digital research capacity among students and tertiary institutions (Ezeabii et al., 2019).

Scope and Delimitation

This paper examines the deployment and impact of internet resources and digital learning technologies in academic research processes among Business Education students (Enang, 2024). The analytical scope encompasses tertiary institutions, with a primary focus on the Nigerian higher education system, while integrating relevant global perspectives (Emehi & Nwosu, 2023). The technologies examined include search engines, digital libraries, Learning Management Systems (LMS), video conferencing

applications, AI-driven writing and data platforms, and bibliographic management tools (Mhlanga, 2023; Okoro, 2023).

CONCEPTUAL AND THEORETICAL FRAMEWORK

Conceptual Clarifications

The Concept of the Internet in Education

The internet is a global network of interconnected computer systems that use standardised communication protocols to share data and services (Emehi & Nwosu, 2023). In higher education, the internet serves as a core virtual environment for knowledge dissemination, scholarly communication, and information retrieval (Orim et al., 2024). It removes geographical barriers, enabling scholars to access global digital libraries, institutional repositories, and peer-reviewed journals instantly (Edobor, 2024). In Business Education, the internet bridges classroom instruction and real-world commercial practice, providing access to current financial market trends, corporate reports, and academic research (Enang, 2024).

Digital Learning Tools

Digital learning tools comprise software applications, digital platforms, hardware devices, and virtual networks designed to facilitate learning, data retrieval, communication, and knowledge creation (Okoro, 2023). These tools include hardware such as laptops and smartphones, as well as software platforms such as digital libraries, Learning Management Systems (e.g., Moodle, Canvas), collaborative suites, and specialised statistical packages (Erhivwiohwovie & Okoro, 2023). Rather than merely serving as instructional accessories, digital tools fundamentally alter the research process by offering dynamic ways to organise, analyse, and communicate scholarly findings (Mhlanga, 2023).

Academic Research

Academic research is a systematic, empirical, and controlled investigation intended to generate new knowledge, evaluate theoretical propositions, or solve practical problems (Ezeabii et al., 2019). The academic research process involves identifying problems, reviewing the literature, formulating theories, designing methods, collecting data, conducting statistical analyses, and presenting findings objectively (Ademiluyi & Ademiluyi, 2020). In tertiary institutions, researchers assess competencies through seminar papers, capstone projects, dissertations, and peer-reviewed publications (Orim et al., 2024).

Nature and Philosophy of Business Education

Business Education is a specialised, multidisciplinary academic field that equips learners with pedagogical skills, business acumen, administrative and technological competencies, and entrepreneurial mindsets (Enang, 2024). The philosophy of Business Education centres on utility and adaptability, preparing graduates for employment in commerce, administration, teaching, or self-directed entrepreneurship (Okoro, 2023). As modern business operations rely heavily on automated systems, cloud computing, and global digital communication, Business Education integrates information technology (Emehi & Nwosu, 2023).

Theoretical Framework

Technology Acceptance Model (TAM)

This study is grounded in the Technology Acceptance Model, developed by Davis (1989). The Technology Acceptance Model holds that an individual's adoption and use of a technology are primarily driven by two cognitive variables: Perceived Usefulness (PU) and Perceived Ease of Use (PEOU).

- **Perceived Usefulness (PU):** The degree to which a student believes that utilising a specific digital tool (e.g., Google Scholar, Mendeley) will enhance their research productivity and academic performance (Davis, 1989; Okoro, 2023).
- **Perceived Ease of Use (PEOU):** The degree to which a student expects the target technology to be free of cognitive or technical effort (Davis, 1989; Emehi & Nwosu, 2023).

Applied to Business Education research, TAM suggests that students are more likely to integrate digital libraries, reference managers, and statistical software into their research workflows when they perceive these tools as easy to navigate and useful for improving the quality of their academic work (Edobor, 2024).

Constructivist Learning Theory

This paper also drew on the foundational work of Jean Piaget and Lev Vygotsky (1978). Constructivism holds that learners actively construct knowledge rather than passively receiving information from instructors or textbooks. In a digital research environment, Business Education students apply constructivist principles by gathering diverse digital materials, critically evaluating conflicting empirical findings, synthesising complex data, and formulating independent academic arguments (Orim et al., 2024). Digital research tools serve as cognitive scaffolds, helping students transition from passive readers to active academic investigators (Enang, 2024).

Connectivism Theory

The paper also addresses Connectivism, formulated by Siemens (2005) for the digital age. Connectivism conceptualises learning as a process occurring within non-human, networked environments. Connectivism emphasises that knowledge resides across distributed digital networks and that the ability to establish and navigate connections between information nodes (e.g., databases, research networks, online communities) is critical (Siemens, 2005). For Business Education researchers, connectivist frameworks explain how information sharing across social academic networks (e.g., ResearchGate), virtual research groups, and digital repositories facilitates real-time research collaboration and continuous learning (Ademiluyi & Ademiluyi, 2020; Mhlanga, 2023).

EVOLUTION OF INTERNET AND DIGITAL LEARNING IN NIGERIAN HIGHER EDUCATION

The history of internet connectivity and digital learning in Nigerian tertiary education moves through four main phases:

1. **The Print-Bound Era (Pre-2000):** Academic research relied heavily on physical university libraries, print books, hardcopy journal volumes, and manual card catalogues (Emehi & Nwosu, 2023). Data collection was limited to printed questionnaires, and researchers conducted statistical analyses manually or using early standalone desktop statistical software (Okoro, 2023).
2. **Early Infrastructure Expansion and Web 2.0 Integration (2000–2019):** National ICT policies and campus network installations (e.g., VSAT connections) increased the adoption of digital tools (Ademiluyi & Ademiluyi, 2020). Off-campus cybercafés and subsequent campus Wi-Fi installations expanded students' access to search engines, basic institutional repositories, and digital journal archives (Ezeabii et al., 2019). During this period, basic electronic learning tools began to supplement classroom instruction (Erhivwiohwovie & Okoro, 2023).
3. **The COVID-19 Pandemic Acceleration (2020–2021):** The disruption of on-campus activities accelerated the adoption of digital tools across Nigerian universities and colleges of education (Enang, 2024). Institutions turned to Learning Management Systems (Google Classroom, Moodle) and video conferencing tools (Zoom, Microsoft Teams) to maintain academic schedules (Orim et al., 2024). This forced shift required students and faculty to adopt remote data collection methods, digital survey tools, and virtual research defence (Mhlanga, 2023).
4. **The Intelligent and Integrated Era (Post-2022):** Modern academic research in Nigerian Business Education increasingly utilises smart search engines, open-access research repositories, cloud storage, collaborative editing platforms, and Artificial Intelligence research assistants (Edobor, 2024; Mhlanga, 2023). Research workflows have shifted towards automated literature search systems, digital referencing, and cloud-based data management (Enang, 2024).

TAXONOMY AND APPLICATION OF DIGITAL RESEARCH TOOLS

Business Education students utilise a diverse ecosystem of digital tools throughout the academic research lifecycle (Emehi & Nwosu, 2023; Okoro, 2023).

Category	Primary Examples	Specific Research Applications
Search Engines & Databases (Edobor, 2024)	Google Scholar, Scopus, Web of Science, ScienceDirect, SSRN	Keyword searches, Boolean operator filtering, accessing open-access research, identifying citation counts.

Category	Primary Examples	Specific Research Applications
Digital Libraries & Repositories (Enang, 2024)	JSTOR, Research4Life, Institutional Repositories, DOAJ	Retrieving peer-reviewed articles, dissertations, historical economic data, and technical manuals.
Learning Management Systems (Okoro, 2023)	Moodle, Google Classroom, Canvas, Blackboard	Accessing faculty reading lists, downloading research guidelines, submitting drafts, receiving supervisor feedback.
Video Conferencing & Collaboration (Ademiluyi, 2020)	Zoom, Google Meet, Microsoft Teams, Google Workspace	Remote supervisor consultations, virtual focus groups, collaborative writing, live presentation defences.
AI & Intelligent Tools (Mhlanga, 2023)	ChatGPT, Elicit, Consensus, Scite.ai, Grammarly	Topic brainstorming, literature summarising, identifying research gaps, draft proofreading, language refinement.
Reference Management (Edobor, 2024)	Zotero, Mendeley, EndNote, MS Word Manager	Direct citation extraction, auto-generating bibliographies in APA/Chicago formats, organising PDF libraries.
Data Collection & Statistics (Emehi, 2023)	Google Forms, KoboToolbox, SPSS, SmartPLS, R	Web-based survey distribution, automated data coding, quantitative analysis, qualitative thematic coding.

THEMATIC ANALYSIS: INFLUENCE OF DIGITAL TOOLS ON ACADEMIC RESEARCH

Enhancing Access to Scholarly Information and Literature

Digital research tools have broadened access to international academic literature (Emehi & Nwosu, 2023). Previously, Business Education students were limited to physical holdings in their local institutional libraries, which often featured outdated textbooks and incomplete journal volumes (Enang, 2024). Today, academic search engines and open-access repositories let students search millions of peer-reviewed articles, theoretical reviews, and government white papers worldwide (Okoro, 2023). Building on empirical findings from Edobor (2024), continuous internet access significantly improves final-year undergraduate research output by enabling students to cite current global and local empirical literature.

Streamlining Literature Review and Information Retrieval

The literature review underpins academic research by defining the current boundaries of knowledge and highlighting empirical gaps (Orim et al., 2024). Digital tools optimise this phase through advanced search syntax, Boolean operators (AND, OR, NOT), and automated recommendation algorithms (Edobor, 2024). Rather than manually searching physical card catalogues, students can quickly filter literature by publication year, citation frequency, and methodology (Ezeabii et al., 2019). As demonstrated in empirical studies by Orim et al. (2024), systematic internet browsing directly improves information synthesis and theoretical alignment in student seminar presentations.

Developing Academic Writing and Methodology Skills

Exposure to high-quality digital journals helps students observe standardised academic writing styles, methodological designs, and formal data reporting formats (Erhivwiohwovie & Okoro, 2023). Software platforms like Grammarly help non-native English writers refine sentence structure and tone, while reference tools enforce style manual compliance (e.g., APA 7th Edition) (Ademiluyi & Ademiluyi, 2020). Furthermore, AI tools facilitate structural organisation and language polishing (Mhlanga, 2023). In line with Mhlanga (2023), digital writing tools and intelligent language tools improve student paper organisation and draft revision speed when used responsibly.

Transforming Data Collection and Statistical Analysis

Digital survey technologies (e.g., Google Forms, Kobo Toolbox) have transformed field research methodologies (Emehi & Nwosu, 2023). Business Education students investigating consumer behaviour, corporate office automation, or entrepreneurship can instantly distribute cloud-based questionnaires to geographically dispersed target populations (Okoro, 2023). This significantly reduces printing and field expenses (Erhivwiohwovie & Okoro, 2023). Furthermore, converting digital survey responses directly into statistical packages (SPSS, SmartPLS) reduces manual data-entry errors and speeds statistical testing (e.g., ANOVA, Multiple Regression, Structural Equation Modelling) (Edobor, 2024). **Facilitating Academic Collaboration and Knowledge Networks**

Cloud workspace suites, video platforms, and academic networking sites (ResearchGate, Academia.edu) transform academic research from an isolated task into a collaborative effort (Siemens, 2005; Ezeabii et al., 2019). Student research teams can co-author literature reviews in real time via Google Docs, discuss data interpretation via Google Meet, and share PDF repositories via Mendeley Shared Groups (Enang, 2024). As Ademiluyi and Ademiluyi (2020) highlight, informal academic communication channels on platforms such as WhatsApp facilitate peer review, information sharing, and resource exchange among student researchers.

Research Efficiency and Time Management

Digital research tools reduce the time required to complete academic projects (Orim et al., 2024). Tasks that once took weeks, such as locating physical journal volumes, copying citations, mailing paper questionnaires, and computing descriptive statistics by hand, can now be completed in hours or days (Emehi & Nwosu, 2023). Automated reference management tools generate complete bibliographies in seconds, freeing cognitive capacity for critical data analysis, discussion formulation, and theoretical interpretation (Edobor, 2024).

EMPIRICAL REVIEW OF RELATED STUDIES

- **Edobor (2024)** examined the impact of internet accessibility on the final-year research execution of Business Education students at the University of Benin. Using a descriptive survey design, the study found a strong positive correlation between reliable, high-speed campus internet access and the methodological quality of undergraduate research projects.
- **Emehi and Nwosu (2023)** evaluated the relationship between e-learning technologies and academic performance among 250 final-year Business Education students across public universities in South-South Nigeria. Their empirical findings confirmed that access to digital libraries, search engines (Google Search), and video conferencing tools significantly enhanced learning outcomes and research skills.
- **Orim et al. (2024)** investigated the utilisation of electronic learning resources at the University of Calabar. Analysing data from 145 Business Education students, the study found that structured internet browsing and electronic mail communication with research supervisors significantly improved research completion rates and academic output.
- **Mhlanga (2023)** examined the integration of Artificial Intelligence tools in higher education writing and research. Findings showed that while students perceived AI tools as beneficial for structuring ideas and accelerating literature synthesis, significant concerns emerged regarding technical skill gaps, originality flags, and potential academic dishonesty.
- **Okoro (2023)** assessed e-learning's contribution to students' academic performance and long-term workplace employability across tertiary institutions in Delta State (N = 937). The study concluded that practical digital research competencies developed during undergraduate research directly enhanced graduates' digital literacy in modern office and corporate settings.
- **Enang (2024)** conducted a conceptual analysis of digitalisation in Nigerian Business Education, concluding that integrating digital infrastructure is essential to prevent academic obsolescence in modern business administration and educational delivery.

CHALLENGES AFFECTING DIGITAL TOOL ADOPTION IN RESEARCH

Infrastructure and Economic Deficits

- **Unreliable Power and Network Infrastructure:** Persistent electric grid instability and inconsistent mobile broadband bandwidth interrupt digital research activities, rendering live virtual consultations and continuous cloud synchronisation difficult (Emehi & Nwosu, 2023; Okoro, 2023).
- **High Cost of Internet Data and Hardware:** High mobile data tariffs present a financial burden for self-funded students (Edobor, 2024). Furthermore, many students rely on low-end smartphones rather than laptops, limiting their ability to run complex data collection platforms, statistical packages (SPSS, R), and citation software (Ezeabii et al., 2019).

Digital Literacy Gaps and Information Overload

- **Deficient Advanced Research Skills:** Many students have basic social media and web-browsing skills but lack advanced digital research literacy (Ademiluyi & Ademiluyi, 2020). They often struggle to construct complex Boolean search strings, navigate index databases, or configure reference management software (Orim et al., 2024).
- **Information Overload and Low Source Evaluation:** Search engine queries can return millions of hits, leading to cognitive fatigue (Erhivwiohwovie & Okoro, 2023). Without critical source evaluation skills, students often fail to distinguish peer-reviewed literature from predatory journals, unverified blogs, or fake news sites (Enang, 2024).

Ethical Integrity and AI Over-Reliance

- **Plagiarism and Unattributed Copying:** The ease of copying digital text encourages improper cutting-and-pasting without proper citation (Ezeabii et al., 2019).
- **Over-Reliance on Generative AI:** Relying heavily on generative AI (e.g., ChatGPT) to write research sections can reduce independent critical thinking and lead to inaccurate citations or unverified data (Mhlanga, 2023). Mhlanga (2023) notes that uncontrolled AI use can compromise research originality and academic rigour.

STRATEGIC INTERVENTIONS AND RECOMMENDATIONS

Institutional and Infrastructural Interventions

- **Provision of Campus Broadband and Solar Power:** Universities and tertiary institutions should prioritise high-speed campus Wi-Fi networks and install alternative energy solutions (e.g., solar power infrastructure) in library digital hubs and departmental laboratories (Edobor, 2024; Okoro, 2023).
- **Expansion of Digital Library Subscriptions:** Academic libraries must maintain institutional subscriptions to reputable database consortia (e.g., JSTOR, EBSCOhost, Scopus) and ensure remote access for students via secure VPN authentication (Emehi & Nwosu, 2023; Enang, 2024).

Curriculum and Pedagogical Strategies

- **Integration of Embedded Digital Research Modules:** Business Education departments should embed digital research literacy directly into their core research methodology courses (Ademiluyi & Ademiluyi, 2020; Orim et al., 2024). Practical training should cover Boolean search syntax, open-access retrieval, navigation of bibliographic managers (Zotero/Mendeley), and operation of data analysis software.
- **Implementation of Ethical AI Guidelines and Disclosure Policies:** Higher education policy authorities (such as the NUC and NCCE in Nigeria) should establish clear frameworks for the use of AI in academic research (Mhlanga, 2023). Institutions should mandate explicit AI-usage disclosure statements, outline permissible boundaries for AI assistance, and use AI-detection and plagiarism tools to maintain academic compliance.

Student-Centered and Research Practices

- **Emphasis on Authentic Assessment Methods:** Research supervisors should design research assignments that include fieldwork, critical analysis, and a live oral defence (Ezeabii et al., 2019; Orim et al., 2024). This ensures that digital tools serve as research aids rather than substitutes for critical inquiry.
- **Continuous Skill Acquisition:** Business Education students should proactively pursue ongoing self-development in advanced ICT and data analytics skills, recognising digital literacy as a core requirement for both academic success and modern career mobility (Enang, 2024; Okoro, 2023).

CONCLUSION AND FUTURE DIRECTIONS

Conclusion

The internet and digital learning tools have transformed academic research among Business Education students, shifting the research landscape from static, print-bound processes to a dynamic, interconnected digital environment (Emehi & Nwosu, 2023). These tools significantly improve access to current literature, streamline data collection and statistical analysis, accelerate writing workflows, and facilitate collaborative inquiry (Edobor, 2024; Orim et al., 2024). As Business Education aligns directly with modern, technology-driven commercial environments, building digital research competence is essential for both academic success and long-term professional relevance (Enang, 2024).

However, the educational potential of these tools remains constrained by infrastructural deficits, high data tariffs, low digital research literacy, and emerging ethical concerns about AI over-reliance and academic dishonesty (Mhlanga, 2023; Okoro, 2023). Addressing these challenges requires a coordinated effort: institutions must invest in infrastructure and subscription access, departments must integrate practical digital literacy into the curriculum, and students must commit to ethical, self-directed research practices (Ezeabii et al., 2019).

DIGITAL TOOLS AND BUSINESS EDUCATION DELIVERY: IMPLICATIONS FOR STUDENTS' ENTREPRENEURIAL INTENTION IN TERTIARY INSTITUTIONS IN AKWA IBOM STATE

Anietie Bello INYANG (PhD) and Jeremiah Peter IWEH (PhD)
Department of Business Education
School of Vocational and Technical Education
Akwa Ibom State College of Education, Afaha Nsit
anietienng@gmail.com
iwehjerry@gmail.com

Abstract

This ~~e~~ study was conducted to determine the extent to which digital tools in Business Education delivery influence students' entrepreneurial intentions in tertiary institutions in Akwa Ibom State. Two research questions and two null hypotheses guided the study. Descriptive survey research design was adopted for the study. The population comprised 522 final year Business Education students from tertiary institutions offering Business Education in Akwa Ibom State. A sample of 227 final year Business Education students were drawn from the population using simple random sampling technique, determined using Taro Yamane formula. An instrument titled "Digital Tools and Business Education Delivery for Students' Entrepreneurial Intention Questionnaire (DTBEDSEIQ)" was used for data collection. The instrument was validated by experts in Business Education, and Tests and Measurement Departments. Cronbach's alpha was used to determine the reliability coefficient of 0.78. The data collected were analysed using simple linear regression to answer the research questions and test the null hypothesis at 0.05 significant level. The results of the findings showed that the extent to which learning management systems and video conferencing in Business Education influence students' entrepreneurial intentions in tertiary institutions in Akwa Ibom State is very low. The results further showed that there was significant extent of influences of learning management systems and video conferencing in Business Education delivery on students' entrepreneurial intentions. Based on the findings, it was concluded that digital tools in Business Education delivery have very low influences on students' entrepreneurial intentions. It was recommended among others that tertiary institutions should integrate learning management systems with other pedagogical strategies to deliver Business Education to enhance students' entrepreneurial intentions.

Keywords: *Business Education Delivery, Digital Tools, Students' Entrepreneurial Intention.*

Introduction

The rapidly evolving digital tools in the 21st century has basically restructured pedagogical models across tertiary institutions globally, Nigeria inclusive. Business Education, as an integrated field of vocational training, aims to equip students with functional practical skills, pedagogical competence, and entrepreneurial capabilities necessary for self-reliance and economic development. In the past decades, Business Education delivery relied heavily on traditional teacher-centred methodologies, including lecture-based instruction and physical textbook exercises. However, the introduction of digital tools demands a transition from the traditional teaching methods to technology-mediated delivery methods that mimic contemporary business environments. Digital technologies have brought changes to the nature and scope of education especially in Business Education (BE).

BE is a discipline that is focused on the study and understanding of business practices and principles. BE programme seeks to equip individuals with a comprehensive understanding of economic principles, thereby enhancing their standard of living and contributing to the overall advancement of the business system. Abeng (2018) posited that BE constitutes a vital component of general education, focussing on the dissemination of business acumen and knowledge essential for both personal and national advancement. According to Okute et al (2022), the delivery of BE content is essential in a digital economy, necessitating the transmission of a diverse array of digital skills to its recipients. BE is a critical course in fostering students' entrepreneurial intentions and capabilities, particularly in emerging economies upon effective delivery through digital tools. Entrepreneurial intention (EI), according to Akeredolu et al (2025), is an individual's conscious state of mind that directs personal attention and actions toward self-employment as a career option. Entrepreneurial intention refers to the cognitive state that directs an individual's attention and behaviour toward starting a business. In the Nigerian context, structural challenges such as poverty, inadequate business infrastructure, and limited access

to capital reduce the translation of entrepreneurial intention into action (Akanbi et al., 2022). Empirical studies have found that BE students' entrepreneurial intention is influenced by digital tools.

Digital tools in BE encompass a wide range of hardware, software, online platforms, and interactive media designed to facilitate teaching, learning, and skill acquisition. Akeredolu et al (2025) found that digital tools and technology adoption significantly strengthen the relationship between BE and entrepreneurial intention by improving students' engagement, experiential learning, and exposure to modern entrepreneurial practices. Okeke and Nwokolo, (2020) stated that digital tools enhance students participation and motivation in business courses. Eze and Ogbonna, (2019) posited that students using online platforms performed significantly better than their peers. Obi and Chukwu, (2022) stated that social media was found to be an effective means of communication and resource sharing among students. The digital tools used in this study are Learning Management System (LMS) and Video Conferencing (VC).

Learning Management System (LMS) is an online software systems that are used to support various instructional, learning and assessment activities, and are central elements of many tertiary institutions course delivery systems (Turnbull et al., 2022). Masibigiri et al (2026) stated that LMS platform provides an important information utility for online-based instruction by structuring activities with course content, communication, and assessment of student achievement related to the learning experience achieved. The application of LMS in BE has transformed teaching and learning. Madu and Ahmed (2024) posited that LMSs are tools that encourage the management of educational courses. Mahzum et al. (2024) found that LMS utilisation significantly enhances students' GPA by enabling efficient time management and flexible learning schedules.

Another digital tool considered in this study is Video Conferencing Tool (VCT) which, according to Madu and Ahmed (2024) allows users who are geographically distant from each other to connect and interact through the internet. Emehi and Nwosu (2023) stressed that VC is a key technological innovation that is rocking the education sector currently. Peter (2021) defined VC as a collaborative communication tool that allows several individuals or groups to communicate in real time across distances using the data network to transfer packets of learning contents containing audio and video using the voice network. According to Emehi and Nwosu (2023), VC allows people to be linked without coming together physically. The application is also used to send messages such as announcements and lecture slides as well as other lecture materials to the students and other participants in the class (Bosu, 2019). Emehi and Nwosu further stated that the use of digital library, VC and Google search engine have positive influence on the learning of BE in public universities in South-South, Nigeria.

In tertiary institutions in Akwa Ibom State, digital tools are gradually reshaping the teaching and learning experience of BE students. Ezeabii (2026) stated that what was once a predominantly lecture-driven, face-to-face model is giving way to more flexible, interactive, and student-centred approaches. Despite the recognised benefits of integrating digital tools in BE, the extent to which these technologies influence students' entrepreneurial intentions in Akwa Ibom State requires empirical investigation. While access to digital tools can enhance market awareness, idea generation, and business venture confidence, structural barriers like inadequate digital infrastructure, low institutional support, and lack of digital skill persist. This development requires significant digital competence, on the part of both lecturers and students. Therefore, the study sought to determine the extent to which digital tools in BE delivery influence students' entrepreneurial intentions in tertiary institutions in Akwa Ibom State. Specifically, the study determined:

1. The extent to which learning management system in business education delivery influence students' entrepreneurial intentions in tertiary institutions in Akwa Ibom State.
2. The extent to which video conferencing in business education delivery influence students' entrepreneurial intentions in tertiary institutions in Akwa Ibom State.

Statement of the Problem

The primary objective of BE in tertiary institutions is to equip graduates with functional skills to establish and manage enterprises, thereby curbing youth unemployment and restiveness. However, a significant proportion of graduates of BE programmes in Akwa Ibom State continue to enter the labour market seeking scarce white-collar jobs rather than creating employment opportunities. A major contributing factor is the reliance on conventional, theoretical instructional methods that fail to mirror the technology-driven business environment of the 21st century to foster robust entrepreneurial intentions among students. Many graduates of BE progrmmes from our tertiary institutions in the state lack the digital entrepreneurial confidence, hands-on e-business competence, and technical risk-taking drive required to start and manage technology-enabled ventures. Although digital tools like LMS and VC are known to enhance practical learning, it remains uncertain how effectively these tools are integrated into daily

BE programme instructions and whether their adoption directly elevates students' intention to start a business. Furthermore, empirical investigations revealed a depth in literature as none of the empirical studies was conducted in the study area and no specific study looked at the influence of LMS and VC in BE delivery on students' entrepreneurial intentions in tertiary institutions in the state. As a result, there remain a contextual literature gap. Thus, this study was intended to fill this gap by investigating the extent to which digital tools in BE delivery influence students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

Research Questions

The following research questions were raised to guide the study:

1. What is the extent to which learning management system in business education delivery influence students' entrepreneurial intention in tertiary institutions in Akwa Ibom State?
2. To what extent does video conferencing in business education delivery influence students' entrepreneurial intention in tertiary institutions in Akwa Ibom State?

Null Hypotheses

The following null hypotheses were formulated and tested at 0.05 level of significance:

1. There is no significant extent of influence of learning management system in business education delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.
2. There is no significant extent of influence of video conferencing in business education delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

Method

The study was conducted in Akwa Ibom State. Descriptive survey research design was adopted for the study. The population comprised 522 final year BE students from the two tertiary institutions in Akwa Ibom State (University of Uyo and College of Education, Afaha Nsit). A sample of 227 final year BE students were drawn from the population using simple random sampling technique which was determined using Taro Yamane formula. An instrument titled "Digital Tools and Business Education Delivery for Students' Entrepreneurial Intention Questionnaire (DTBEDSEIQ)" was used for data collection. The instrument was validated by three experts in BE, and Tests and Measurement Departments. Cronbach's alpha was used to determine the reliability coefficient of 0.78 which was high enough to justify the instrument for use. The data collected were analysed using simple linear regression statistics to answer the research questions and test the null hypothesis at 0.05 significant level.

Results

Research Question 1

What is the extent to which learning management system in Business Education delivery influence students' entrepreneurial intention in tertiary institutions in Akwa Ibom State?

Table 1: Regression analysis for extent of influence of learning management system in Business Education on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State

n=227

Model	R	R^2	Adjusted R^2	Std. Error of Estimate
1	.327[a]	.107	.103	.39992

Source: Field Survey, 2026

Table 1 showed the summary of the regression test for how LMS in BE influences students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. The results showed the coefficient of determinant (R^2) value of .107. This means that 10.7% is the overall contribution of LMS to students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. Therefore, the extent to which LMS in BE influences students' entrepreneurial intention in tertiary institutions in Akwa Ibom State is very low.

Research Question 2

To what extent does video conferencing in Business Education delivery influence students' entrepreneurial intention in tertiary institutions in Akwa Ibom State?

Table 2: Regression analysis for extent of influence of video conferencing in business education on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State

n=227

Model	R	R^2	Adjusted R^2	Std. Error of Estimate
1	.396[a]	.157	.153	.76552

Source: Field Survey, 2026

The analysis in Table 2 presents the summary of the regression test on how VC in BE delivery influences students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. The results revealed the coefficient of determinant (R^2) value of .157. This implies that 15.7% is the overall contribution of VC in BE delivery to students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. Hence, the extent to which VC in BE influence students' entrepreneurial intention in tertiary institutions in Akwa Ibom State is very low.

Null Hypothesis 1

There is no significant extent of influence of learning management system in business education delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

Table 3: Regression analysis of the extent of influence of learning management system in business education delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

n=227

Model		Sum of Squares	Df	Mean Square	F	Sig.	Decision
1	Regression	4.314	1	4.314	26.970	.000[a]	Sig.
	Residual	35.986	225	.160			
	Total	40.300	226				

Significant at .000 (p<.05) (Source: Field Work (2026)

The result in Table 3 revealed that the computed F-value was 26.970 with degrees of freedom of 1 and 225 at the p-value of .000. Since the probability value was less than the level of significance (p< .05), the result was statistically significant. Hence, the null hypothesis was rejected. This implies that there is a significant extent of influence of LMS in BE delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

Null Hypothesis 2

There is no significant extent of influence of video conferencing in business education delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

Table 4: Regression analysis of the extent of influence of video conferencing in business education delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

n=227

Model		Sum of Squares	Df	Mean Square	F	Sig.	Decision
1	Regression	24.534	1	24.534	41.866	.000[a]	Sig.
	Residual	131.853	225	.586			
	Total	156.388	226				

Significant at .000 (p<.05) (Source: Field Work (2026)

The result in Table 4 showed that the computed F-value was 41.866 with degrees of freedom of 1 and 225 at the p-value of .000. Since the probability value was less than the level of significance (p< .05), the result was rejected. Therefore, there is significant extent of influence of VC in BE delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State.

Discussion of Findings

The findings of this study were discussed based on research questions and hypotheses tested. The result of the analysis in Table1 revealed that the extent to which LMS in BE influences students'

entrepreneurial intention in tertiary institutions in Akwa Ibom State is very low. The corresponding hypothesis in Table 3 further showed that there is a significant extent of influence of LMS in BE delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. The findings of this study was in consonance with the findings of Masibigiri et al (2026) who found that there is a positive relationship between the use of LMS and the academic performance of students. Mahzum et al. (2024) found that LMS utilisation significantly enhances students' GPA by enabling efficient time management and flexible learning schedules. The result showed that while the extent of influence of LMS in BE delivery on students' entrepreneurial intention is statistically significant, the extent of influence is very low. This means that although there is an influence, LMS is not a major predictor of BE delivery and EI, other factors likely account for most of the variations.

The result presented in Table 2 revealed that the extent to which VC in BE influences students' entrepreneurial intention in tertiary institutions in Akwa Ibom State is very low. The corresponding hypothesis in Table 4 also showed that there is a significant extent of influence of VC in BE delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. This finding agreed with the findings of Emehi and Nwosu (2023) who found that the use of digital library, VC and Google search engine have positive influence on the learning of BE in public universities in South-South, Nigeria. The hypothesis was significant, meaning that VC in BE delivery does influence students' entrepreneurial intention. However, the extent of influence is very low. This suggests that while VC contributes to students' entrepreneurial intention, 84.6% of the variations in students' entrepreneurial intention was explained by other factors.

Conclusion

Based on the findings of the study, it was concluded that digital tools in BE delivery have very low influence on students' entrepreneurial intention. The findings showed that there was a significant extent of influence of LMS and VC in BE delivery on students' entrepreneurial intention in tertiary institutions in Akwa Ibom State. On the whole, it could further be said that although there are influences, digital tools are not the major predictor of BE delivery and EI, other factors likely account for most of the variations.

Recommendations

Based on the findings of the study, the following recommendations are offered:

1. Tertiary institutions should integrate LMS with other pedagogical strategies to deliver BE for students' entrepreneurial intention
2. Management of tertiary institutions should invest in training lecturers and students on effective utilisation of VC to maximise its impacts on BE delivery for students' entrepreneurial intention.

RECRUITMENT AND SELECTION PRACTICES AND TEACHER JOB PERFORMANCE IN PUBLIC SECONDARY SCHOOLS IN EDO STATE

Author: Dr Roseline E. Ekhaise
Department of Business Education,
Faculty of Vocational and Technical Education,
University of Benin, Benin City.

Abstract

This empirical study examined the relationship between recruitment and selection practices—specifically recruitment criteria, interview processes, and merit-based selection—and teacher job performance in public secondary schools in Edo State. The study was anchored in Human Capital Theory and Signalling Theory. A descriptive survey design was adopted. The population comprised 3,200 public secondary school teachers across Edo State, from which the study selected a sample of 343 teachers using proportional stratified random sampling. Data were collected using a validated 4-point Likert scale questionnaire titled the Recruitment Practices and Teacher Performance Questionnaire (RPTPQ). The instrument showed high internal consistency across all subscales, with alphas ranging from .82 to .89. Descriptive statistics (means and standard deviations) were used to address the four research questions, while multiple linear regression tested the null hypotheses at the .05 level of significance. Findings revealed that merit-based selection (β = .412, p < .05), interview processes (β = .315, p < .05), and recruitment criteria (β = .142, p < .05) all had statistically significant positive effects on teacher job performance. Together, these predictors explained 51.0% of the variance in teacher performance (R^2 = .510, F = 113.12, p < .001). It was concluded that structured, transparent, and merit-driven hiring directly enhances classroom effectiveness and teacher output. Recommendations include enforcing strict meritocracy, institutionalising practical micro-teaching sessions alongside Computer-Based Testing (CBT), and expanding digital credential verification across Edo State public schools.

Introduction

1.1 Background to the Study

Education is universally recognised as one of the most powerful instruments for national development, social transformation, and economic growth (Darling-Hammond, 2017; UNESCO, 2021; World Bank, 2020). It equips individuals with the knowledge, values, technical competencies, and analytical skills necessary to foster human capital accumulation and technological advancement (Becker, 1964; Schultz, 1961). Within the Nigerian educational structure, secondary education occupies a pivotal position (Peretomode, 2014). It serves as the primary bridge between foundational basic education and tertiary institutions while preparing youth for direct participation in the labour force and civil society (Mkumbo, 2021; Peretomode, 2014).

Public secondary schools are responsible for providing equitable, accessible, and high-quality instruction to adolescents from diverse socio-economic backgrounds (OECD, 2019; World Bank, 2020). However, a secondary school's institutional success depends fundamentally on the quality of its teaching staff (Darling-Hammond, 2017; Kasozi, 2020). Teachers are the operational backbone of the educational system (Mkumbo, 2021). They are directly responsible for curriculum implementation, classroom management, student assessment, character formation, and preparing candidates for external assessments such as the West African Senior School Certificate Examination (WASSCE) and the National Examinations Council (NECO) assessments (Edo State Ministry of Education, 2025; Peretomode, 2014). Consequently, teacher job performance—defined as the execution of professional instructional duties in ways that optimise student learning outcomes—serves as the main determinant of educational standards and institutional efficacy (Darling-Hammond, 2017; Faisal et al., 2023; Schmidt & Hunter, 1998).

Despite teachers' crucial role, educational institutions across Sub-Saharan Africa, including Nigeria, face persistent concerns about declining instructional effectiveness and suboptimal student academic performance (Mkumbo, 2021; World Bank, 2020). In Edo State, public secondary schools have experienced systemic challenges, including poor instructional delivery, weak classroom management, examination irregularities, and waning professional ethics (Edo State Ministry of Education, 2025).

Organisational scholars and policy analysts increasingly trace these instructional deficiencies to human resource entry points, specifically weak recruitment and selection practices (Armstrong & Taylor, 2020; Dessler, 2019; Musah & Abdulai, 2021).

Recruitment is the systematic process of seeking and attracting qualified candidates for existing or anticipated vacancies, whereas selection involves evaluating candidates to hire those most likely to succeed in the role (Armstrong & Taylor, 2020; Dessler, 2019). In ideal administrative frameworks, entry into the teaching profession relies on rigorous recruitment criteria (such as possession of an NCE, B.Ed., B.Sc.Ed., PGDE, and TRCN licensing), multi-stage interview processes (including Computer-Based Tests, oral panels, and micro-teaching sessions), and merit-based selection principles (Kasozi, 2020; Musah & Abdulai, 2021; Peretomode, 2014).

In Edo State, the state government has instituted institutional reforms—most notably the EdoBEST (Edo Basic Education Transformation) and EdoSTAR (Edo Supporting Teachers to Achieve Results) initiatives—aimed at improving teacher recruitment, digital attendance tracking, pedagogical supervision, and professional development (Edo State Ministry of Education, 2025). Nevertheless, empirical evidence suggests that recruitment processes in certain public secondary schools remain vulnerable to non-merit factors, including political interference, nepotism, favouritism, and inadequate screening procedures (Edo State Ministry of Education, 2025; Peretomode, 2014). When recruitment prioritises personal connections or subjective preferences over verified competencies, unqualified or under-motivated personnel enter the teaching cadre (Dessler, 2019; Mkumbo, 2021). This directly compromises classroom delivery, classroom management, and overall academic performance (Darling-Hammond, 2017; Kasozi, 2020).

To investigate this dynamic systematically, this study evaluates how recruitment criteria, interview processes, and merit-based selection influence teacher job performance in public secondary schools in Edo State.

1.2 Statement of the Problem

The persistent decline in students' academic achievement in public secondary schools across Edo State has raised serious empirical concern among educational researchers, administrators, and policy stakeholders (Edo State Ministry of Education, 2025; Peretomode, 2014). Observers frequently highlight widespread instructional deficiencies, including poor lesson planning, ineffective classroom organisation, inadequate assessment methods, and low teacher commitment to extracurricular responsibilities (Darling-Hammond, 2017; Kasozi, 2020; Mkumbo, 2021).

While infrastructure deficits and shortages of learning materials contribute to these outcomes, human resource management practices, particularly entry-level recruitment and selection procedures, constitute a major structural vulnerability (Armstrong & Taylor, 2020; Dessler, 2019; Faisal et al., 2023). Sectoral reports indicate that public school hiring in the region has, at times, been compromised by political recommendations, patronage networks, corrupt practices, and subjective interview evaluations (Edo State Ministry of Education, 2025; Peretomode, 2014). Under such conditions, standard qualifications (such as TRCN certification or educational specialisation) and practical instructional capabilities are compromised during the hiring process (Musah & Abdulai, 2021; World Bank, 2020).

While descriptive literature asserts that effective human resource practices improve organisational output (Armstrong & Taylor, 2020; Dessler, 2019; Schmidt & Hunter, 1998), empirical evidence quantifying the relative contributions of recruitment criteria, interview processes, and merit-based selection to teacher job performance in Edo State public secondary schools remains limited. This study addresses this gap by investigating how specific recruitment and selection dimensions affect teacher job performance.

1.3 Purpose of the Study

The primary purpose of this study is to examine how recruitment and selection practices affect teacher job performance in public secondary schools in Edo State. Specifically, the study seeks to:

1. Assess the overall baseline level of teacher job performance in public secondary schools in Edo State.
2. Determine the influence of recruitment criteria on teacher job performance in public secondary schools in Edo State.
3. Evaluate the effect of multi-stage interview processes on teacher job performance in public secondary schools in Edo State.
4. Analyse the impact of merit-based selection on teacher job performance in public secondary schools in Edo State.

1.4 Research Questions

The following research questions guided the study:

1. What is the level of teacher job performance in public secondary schools in Edo State?

2. To what extent do recruitment criteria affect teacher performance in public secondary schools in Edo State?
3. What is the effect of interview processes on job performance in public secondary schools in Edo State?
4. How does merit-based selection affect teacher job performance in public secondary schools in Edo State?

1.5 Hypotheses

The following null hypotheses were formulated and tested at the .05 level of significance:

- **H1:** Recruitment criteria do not significantly predict teacher job performance in public secondary schools in Edo State.
- **H2:** Interview processes do not significantly predict teacher job performance in public secondary schools in Edo State.
- **H3:** Merit-based selection does not significantly predict teacher job performance in public secondary schools in Edo State.

1.6 Significance of the Study

The empirical findings of this study offer practical and theoretical contributions to educational stakeholders:

- Provides empirical data to refine teacher hiring frameworks, standardise CBT assessments and micro-teaching evaluations, and insulate entry procedures from non-merit influences.
- Offers insights into how rigorous recruitment indicators correspond directly to classroom execution, helping local administrators identify professional development needs.
- Expands the empirical literature on Human Resource Management (HRM) in the African public education sector, offering a validated model for future studies.

1.7 Scope of the Study

This study was limited to public secondary schools across the three senatorial districts of Edo State (Edo South, Edo Central, and Edo North). Conceptually, the independent variables were restricted to three entry dimensions: recruitment criteria, interview processes, and merit-based selection. The dependent variable was teacher job performance, measured across lesson planning, instructional delivery, classroom management, and student evaluation.

2.1 Theoretical Framework

2.1.1 Human Capital Theory

Human Capital Theory, first conceptualised by Theodore Schultz (1961) and elaborated by Gary Becker (1964), holds that individuals possess skills, knowledge, capabilities, and attributes acquired through education and training, which directly determine their economic output and organisational performance.

In secondary education, human capital comprises subject mastery, pedagogical skills, classroom management techniques, and professional certifications (Darling-Hammond, 2017; Kasozi, 2020). The theory underpinning this study holds that entry-level recruitment criteria and selection practices serve as structural quality-assurance filters (Armstrong & Taylor, 2020; Dessler, 2019). When an educational authority sets standard criteria (such as specialised B.Ed. degrees and TRCN licensing) and enforces meritocracy, it selects applicants with high baseline human capital (Becker, 1964; Schultz, 1961). Consequently, teachers with high human capital deliver higher-quality instruction, implement structured lesson plans, and manage classroom dynamics effectively (Darling-Hammond, 2017; Mkumbo, 2021).

2.1.2 Signalling Theory

Michael Spence (1973) formulated Signalling Theory to address information asymmetry in decision-making contexts. In job markets, employers cannot directly observe an applicant's future productivity before hiring (Dessler, 2019; Spence, 1973). Applicants therefore use observable "signals"—such as educational attainment, professional certifications, CBT scores, and practical micro-teaching demonstrations—to convey their underlying capability (Musah & Abdulai, 2021; Spence, 1973).

Applied to teacher recruitment in public secondary schools, school boards face selection risks when objective mechanisms to verify applicants' capabilities are lacking (Armstrong & Taylor, 2020; Schmidt & Hunter, 1998). Structured interview processes (such as micro-teaching demonstrations and CBTs) provide reliable signals of pedagogical delivery, communication skills, and emotional stability (Musah & Abdulai, 2021; Schmidt & Hunter, 1998). Merit-based selection ensures that decisions rely on these verified signals rather than unvetted political recommendations, reducing adverse selection and securing competent teaching personnel (Faisal et al., 2023; Spence, 1973).

2.2.1 Concept of Teacher Job Performance

Teacher job performance refers to the sum of activities a teacher undertakes over a specific period to

achieve institutional educational goals (Armstrong & Taylor, 2020; Darling-Hammond, 2017). It encompasses instructional and non-instructional duties, including

- Lesson Preparation and Planning: Constructing systematic lesson notes aligned with curriculum benchmarks (Darling-Hammond, 2017; Kasozi, 2020).
- Instructional Delivery: Using student-centered methodologies, pedagogical tools, and clear communication (OECD, 2019; UNESCO, 2021).
- Classroom Management: Maintaining order, fostering active student engagement, and promoting positive behavioural standards (Peretomode, 2014; World Bank, 2020).
- Student Assessment and Evaluation: Developing valid assessment instruments, providing timely feedback, and tracking academic progress (Edo State Ministry of Education, 2025; Mkumbo, 2021).

2.2.2 Recruitment Criteria

Recruitment criteria are the benchmark standards, qualifications, and competencies set by hiring authorities to assess applicant eligibility (Armstrong & Taylor, 2020; Dessler, 2019). Key criteria in public education include:

- **Educational Qualifications:** Possession of professional education credentials (e.g., NCE, B.Ed., B.Sc.Ed., or PGDE) (Darling-Hammond, 2017; Peretomode, 2014).
- **Professional Registration:** Certification by the Teachers Registration Council of Nigeria (TRCN) (Edo State Ministry of Education, 2025; Peretomode, 2014).
- **Subject Specialization:** Direct alignment between candidate academic discipline and teaching vacancies (e.g., Mathematics, Physics, English) (Mkumbo, 2021; World Bank, 2020).
- **Cognitive and Communication Competencies:** Demonstrated literacy, numeracy, and verbal presentation skills (Faisal et al., 2023; Schmidt & Hunter, 1998).

2.2.3 Interview Processes

The interview process serves as an empirical screening framework for evaluating capabilities that paper qualifications cannot fully capture (Armstrong & Taylor, 2020; Schmidt & Hunter, 1998). Comprehensive selection models utilise:

- **Computer-Based Testing (CBT):** Standardised testing evaluating subject mastery and pedagogical knowledge, minimising human scoring bias (Edo State Ministry of Education, 2025; Faisal et al., 2023).
- **Oral Panel Interviews:** Interactive evaluations measuring communication style, professional disposition, and emotional stability (Dessler, 2019; Musah & Abdulai, 2021).
- **Practical Micro-Teaching Demonstrations:** Teaching simulations before an expert panel to observe lesson structure, board usage, student engagement techniques, and time management (Darling-Hammond, 2017; Schmidt & Hunter, 1998).

2.2.4 Merit-Based Selection

Merit-based selection is an administrative principle wherein candidate appointment relies on objective, verifiable performance metrics rather than arbitrary, subjective, or non-job-related attributes (Kasozi, 2020; Mkumbo, 2021). Key features include:

- **Transparency:** Public advertisement of vacancies, explicit posting of evaluation criteria, and open publication of final scores (Armstrong & Taylor, 2020; OECD, 2019).
- **Objectivity: Use of standardised rubric scales for scoring tests and interviews (Dessler, 2019; Schmidt & Hunter, 1998).**
- **Insulation from Political Interference:** Independence of recruitment panels from external patronage or administrative coercion (Kasozi, 2020; Peretomode, 2014).

2.3 Empirical Review

Empirical research across global, regional, and national contexts supports the link between recruitment rigour and organisational output.

- Schmidt and Hunter (1998), in a meta-analysis of 85 years of personnel selection research, established that multi-stage selection procedures combining cognitive ability tests with work sample assessments (such as practical demonstrations) yield high predictive validity ($r = .63$) for overall job performance. Similarly, an OECD (2019) report on international school staffing found that countries using competitive, merit-based entry evaluations consistently outperformed their peers in student literacy and science assessments.
- Mkumbo (2021) examined teacher recruitment practices and educational performance in Sub-Saharan Africa, finding that schools using merit-based selection achieved significantly higher instructional compliance ($p < .01$) than those relying on direct administrative postings. Kasozi

(2020) evaluated merit-based hiring in Ugandan secondary schools and found a strong positive correlation ($r = .68$, $p < .05$) between competitive selection procedures and teacher retention, lesson delivery, and assessment accuracy.

- Peretomode (2014) highlighted that non-merit factors, such as regional quotas and political patronage in Nigerian public school recruitment, undermine professional standards and classroom discipline. Musah and Abdulai (2021) examined entry criteria in West African public schools and found that teacher candidates' performance in micro-teaching interviews positively predicted end-of-term student evaluation scores (beta = .38, $p < .01$).

Despite these contributions, limited empirical research has simultaneously modelled the combined predictive power of recruitment criteria, multi-stage interviews, and merit-based selection on teacher performance metrics, specifically within public secondary schools in Edo State following modern reforms such as EdoBEST (Edo State Ministry of Education, 2025).

3.1 Research Design

This study adopted a cross-sectional descriptive survey design (Krejcie & Morgan, 1970). This design is suited to gathering quantitative data from a representative sample of secondary school teachers to describe and infer relationships between recruitment practices and performance variables without experimental manipulation.

3.2 Population of the Study

The target population comprised all 3,200 registered public secondary school teachers across the three senatorial districts of Edo State (Edo South, Edo Central, and Edo North), as recorded in the Edo State Ministry of Education's 2025 sector database.

3.3 Sample and Sampling Technique

The sample size of n = 343 teachers was determined using Krejcie and Morgan's (1970) standard formula for finite populations:

s = {X^2 N P (1-P)}{d^2 (N-1) + X^2 P (1-P)}

Where:

- s = Required sample size (343)
- X^2 = Chi-square for 1 degree of freedom at .05 confidence level (3.841)
- N = Target Population size (3,200)
- P = Population proportion assumed to be .50
- d = Degree of accuracy/margin of error (0.05)

A proportional stratified random sampling method was used to distribute the sample across the three senatorial districts:

Table 3.1: Population and Sample Distribution Across Senatorial Districts

Senatorial District	Teacher Population (N)	Percentage of Total	Sampled Teachers (n)
Edo South	1,600	50.0%	172
Edo Central	640	20.0%	68
Edo North	960	30.0%	103
Total	**3,200**	**100.0%**	**343**

Source: Field Design / Edo State Ministry of Education Database (2025).

3.4 Research Instrument

Data were collected using a self-administered instrument, the Recruitment Practices and Teacher Performance Questionnaire (RPTPQ). The instrument comprised two sections:

- **Section A:** Demographic information (Senatorial District, Gender, Highest Qualification, Years of Teaching Experience).
- **Section B:** 20 closed-ended items categorised into four subscales:
    1. *Recruitment Criteria* (5 items)
    2. *Interview Processes* (5 items)
    3. *Merit-Based Selection* (5 items)
    4. *Teacher Job Performance* (5 items)

Items were rated on a 4-point Likert scale: **Strongly Agree (4)**, **Agree (3)**, **Disagree (2)**, and **Strongly Disagree (1)**.

3.5 Validity and Reliability of the Instrument

To ensure face and content validity, three experts in the Measurement and Evaluation Department, Faculty of Education, University of Benin, reviewed the draft instrument. The researchers refined ambiguous statements in line with expert suggestions.

To assess internal consistency, a pilot study was conducted with 30 teachers in public secondary

schools in Delta State (outside the study area). Cronbach's Alpha (\alpha) reliability coefficients were calculated for each section:

alpha = {k}{k - 1}t(1 - sum sigma_i^2 sigma_t^2

Table 3.2: Cronbach's Alpha Reliability Coefficients

Subscale	Item Count (k)	Cronbach's Alpha (\alpha)	Internal Consistency
Recruitment Criteria	5	.82	High
Interview Processes	5	.85	High
Merit-Based Selection	5	.89	High
Teacher Job Performance	5	.87	High

Source: Pilot Study Analysis (2026).

Because all subscale coefficients exceeded the standard .70 threshold (Krejcie & Morgan, 1970), the instrument was deemed reliable for field research.

3.6 Method of Data Collection

The researchers administered the questionnaires directly to selected teachers across schools in Edo South, Edo Central, and Edo North with the help of three trained field research assistants. Of the 343 questionnaires distributed, 330 were completed and retrieved, yielding a 96.2% retrieval rate.

3.7 Method of Data Analysis

- Descriptive Statistics: Frequencies, percentages, means (\bar{X}), and standard deviations (SD) were used to summarise demographic data and answer the research questions. The real-limit decision rule for the mean was: 3.50 - 4.00 (Strongly Agree / Very High), 2.50 - 3.49 (Agree / High), 1.50 - 2.49 (Disagree / Low), and 1.00 - 1.49 (Strongly Disagree / Very Low). The criterion benchmark mean was set at 2.50.
- Inferential Statistics: Multiple linear regression analysis was conducted in SPSS version 28 to test the three hypotheses at the .05 level of significance.

DATA PRESENTATION, ANALYSIS, AND DISCUSSION OF FINDINGS

4.1 Demographic Profile of Respondents

Table 4.1: Demographic Characteristics of Respondents (n = 330)

Category	Sub-category	Frequency (f)	Percentage (%)
Senatorial District	Edo South	165	50.0%
	Edo Central	66	20.0%
	Edo North	99	30.0%
Gender	Male	138	41.8%
	Female	192	58.2%
Highest Qualification	NCE	42	12.7%
	B.Ed. / B.Sc.Ed.	215	65.2%
	M.Ed. / M.Sc. / Higher	73	22.1%
Years of Service	1–5 Years	84	25.5%
	6–10 Years	156	47.3%
	11 Years & Above	90	27.2%

Source: Field Survey Data (2026).

4.2

Research Question 1: What is the level of teacher job performance in public secondary schools in Edo State?

Table 4.2: Mean and Standard Deviation of Teacher Job Performance Items

S/N	Item Statement	\bar{X}	SD	Remark
1.	Teachers regularly prepare lesson plans aligned with curriculum standards.	3.31	0.49	High
2.	Teachers effectively	3.22	0.51	High

S/N	Item Statement	\bar{X}	SD	Remark
	manage classroom discipline and student behavior.			
3.	Teachers utilize diverse pedagogical methods to explain difficult concepts.	3.12	0.54	High
4.	Continuous assessments and diagnostic tests are conducted regularly.	3.18	0.50	High
5.	Teachers participate in extra-curricular activities and school committee duties.	3.07	0.56	High
	Overall Subscale Cluster Mean / SD	**3.18**	**0.52**	**High**

Source: Field Survey Data (2026). Benchmark Mean = 2.50.

The results in Table 4.2 indicate an overall cluster mean of 3.18 (SD = 0.52), exceeding the benchmark mean of 2.50. This indicates a high baseline level of teacher job performance among the sampled public secondary school teachers in Edo State.

Research Question 2: To what extent do recruitment criteria influence teacher job performance in public secondary schools in Edo State?

Table 4.3: Mean and Standard Deviation of Recruitment Criteria Items

S/N	Item Statement	\bar{X}	SD	Remark
6.	Hiring candidates with B.Ed./PGDE credentials improves lesson planning quality.	3.01	0.58	Agreed
7.	Enforcing TRCN professional registration ensures high ethical standards.	2.85	0.63	Agreed
8.	Matching candidate subject specialization with vacancies enhances instructional delivery.	2.94	0.60	Agreed
9.	Verifying academic credentials prevents the entry of unqualified teachers.	2.82	0.64	Agreed
10.	Screening candidates for oral communication skills improves classroom management.	2.78	0.62	Agreed
	Overall Subscale Cluster Mean / SD	**2.88**	**0.61**	**Agreed**

Source: Field Survey Data (2026).

Table 4.3 demonstrates that respondents agreed {X} = 2.88, SD = 0.61) that strict recruitment criteria positively influence teacher job performance.

Research Question 3: What is the effect of interview processes on teacher job performance in public secondary schools in Edo State?

Table 4.4: Mean and Standard Deviation of Interview Process Items

S/N	Item Statement	\bar{X}	SD	Remark
11.	Computer-Based Testing (CBT) objectively measures applicant subject knowledge.	3.15	0.51	Agreed
12.	Practical micro-teaching sessions evaluate candidate classroom delivery skills.	3.12	0.53	Agreed
13.	Panel interviews effectively evaluate candidates' emotional intelligence.	2.98	0.56	Agreed
14.	Structured interview scoring rubrics reduce evaluator bias.	3.02	0.54	Agreed
15.	Multi-stage screening ensures only confident and capable candidates are hired.	2.98	0.56	Agreed
	Overall Subscale Cluster Mean / SD	**3.05**	**0.54**	**Agreed**

Source: Field Survey Data (2026).

Table 4.4 shows an overall cluster mean of 3.05 (SD = 0.54), indicating that multi-stage interview processes are perceived as key contributors to teacher effectiveness.

Research Question 4: How does merit-based selection affect teacher job performance in public secondary schools in Edo State?

Table 4.5: Mean and Standard Deviation of Merit-Based Selection Items

S/N	Item Statement	\bar{X}	SD	Remark
16.	Selecting teachers strictly on merit enhances overall classroom teaching quality.	3.24	0.45	Agreed
17.	Eliminating political patronage during hiring improves teacher commitment.	3.18	0.47	Agreed
18.	Transparent selection frameworks boost newly hired teachers' confidence.	3.08	0.50	Agreed
19.	Competitive selection processes attract highly qualified education professionals.	3.06	0.51	Agreed
20.	Meritocratic hiring directly reduces instances of	3.04	0.49	Agreed

S/N	Item Statement	\bar{X}	SD	Remark
	instructional incompetence.			
	Overall Subscale Cluster Mean / SD	**3.12**	**0.48**	**Agreed**

Source: Field Survey Data (2026).

Table 4.5 shows a cluster mean of 3.12 (SD = 0.48), indicating that respondents agreed that merit-based selection enhances teacher job performance.

4.3 Testing Hypotheses

Multiple linear regression analysis used the three recruitment subscales (Recruitment Criteria, Interview Processes, Merit-Based Selection) as predictors and Teacher Job Performance as the dependent variable. Before interpreting the model, regression diagnostics confirmed that variance inflation factors (VIFs) were below 2.5, indicating no severe multicollinearity, and residual plots confirmed normality and homoscedasticity.

Table 4.6: Multiple Regression Model Summary

Model	R	R Square (R^2)	Adjusted R Square	Std. Error of the Estimate
1	.714	.510	.505	0.366

Predictors: (Constant), Merit-Based Selection, Interview Processes, Recruitment Criteria. Dependent Variable: Teacher Job Performance.

Table 4.7: ANOVA Summary Table

Model	Sum of Squares	df	Mean Square	F	p-value (Sig.)
Regression	45.421	3	15.140	113.120	.000^b
Residual	43.629	326	0.134		
Total	**89.050**	**329**			

a. Dependent Variable: Teacher Job Performance. b. Predictors: (Constant), Merit-Based Selection, Interview Processes, Recruitment Criteria.

The model summary in Table 4.6 and the ANOVA in Table 4.7 indicate that the combined independent variables explain 51.0% of the variance in teacher job performance (R = .714, R^2 = .510, \text{Adjusted } R^2 = .505). The overall model is statistically significant (F(3, 326) = 113.120, p < .001).

Table 4.8: Regression Coefficients Table

Model Predictors	Unstandardized Coefficients (\beta)	Std. Error	Standardized Coefficients (\beta)	t-statistic	p-value (Sig.)
(Constant)	0.612	0.145	—	4.221	.000
Recruitment Criteria (X_1)	0.142	0.052	.128	2.731	.007
Interview Processes (X_2)	0.315	0.058	.302	5.431	.000
Merit-Based Selection (X_3)	0.412	0.061	.421	6.754	.000

Dependent Variable: Teacher Job Performance.

Hypothesis 1 Testing

- **H1:** Recruitment criteria do not significantly predict teacher job performance in public secondary schools in Edo State.
- **Statistical Decision: Table 4.8 shows that recruitment criteria significantly predict teacher job performance beta = .142, t = 2.731, p = .007. As p (.007) < .05, null hypothesis H1 is rejected. Setting stringent academic and professional qualification criteria directly enhances teacher job performance.**

Hypothesis 2 Testing

- **H2:** Interview processes do not significantly predict teacher job performance in public secondary schools in Edo State.
- **Statistical Decision:** Table 4.8 indicates that interview processes significantly predict teacher job performance (\beta = .315, t = 5.431, p = .000). Because p (.000) < .05, null hypothesis 2 (\text{H}_02) is **rejected**. Multi-stage interviews featuring CBT and micro-teaching demonstrations significantly increase teacher classroom effectiveness.

Hypothesis 3 Testing

- **H3:** Merit-based selection does not significantly predict teacher job performance in public secondary schools in Edo State.
- **Statistical Decision:** Table 4.8 reveals that merit-based selection is the strongest individual predictor of teacher job performance (\beta = .412, t = 6.754, p = .000). Because p (.000) < .05, null hypothesis 3 H3 is **rejected**. Meritocratic hiring exerts a significant positive impact on teacher job performance.

4.4 Discussion of Findings

The results of this study confirm that recruitment and selection practices play a primary role in shaping teacher job performance in public secondary schools in Edo State.

The rejection of Null Hypothesis 1 shows that clear recruitment criteria (such as specialised degrees, TRCN licensing, and subject alignment) provide a necessary baseline for job success. This finding aligns with Schultz (1961) and Becker's (1964) Human Capital Theory, which posits that formal educational credentials and specialised training are essential investments that increase operational capability. This outcome is consistent with findings by Musah and Abdulai (2021), who reported that entry requirements significantly influence the accuracy of lesson preparation.

Rejecting Null Hypothesis 2 shows that interview processes, particularly structured assessments like Computer-Based Testing (CBT) and practical micro-teaching simulations, significantly predict job performance. Grounded in Spence's (1973) Signalling Theory, practical demonstrations allow hiring panels to evaluate pedagogical signals, communication ability, and classroom control that traditional credentials cannot display on their own. This finding supports Schmidt and Hunter's (1998) selection validity research, which identified work sample tests as reliable predictors of employee performance.

The rejection of Null Hypothesis 3 reveals that merit-based selection is the single strongest predictor (\beta = .412) of teacher job performance in Edo State public secondary schools. When hiring decisions are insulated from political interference, nepotism, and financial bribery, the education system attracts committed, highly competent professionals. Conversely, bypassing meritocracy introduces adverse selection, leading to ineffective lesson delivery, poor discipline, and lower academic outcomes. These empirical results reinforce studies by Kasozi (2020) and Mkumbo (2021), who reported that merit-based appointments strongly correlate with institutional performance metrics across East African public secondary schools.

5.1 Summary of the Study

This study empirically examined how recruitment criteria, interview processes, and merit-based selection influence teacher job performance in public secondary schools in Edo State. Grounded in Human Capital Theory and Signalling Theory, the study employed a descriptive survey design. A sample of 343 teachers was drawn from a population of 3,200 public secondary school teachers across the Edo South, Edo Central, and Edo North senatorial districts using proportional stratified random sampling. Data were collected using the validated 20-item Recruitment Practices and Teacher Performance Questionnaire (RPTPQ) (α = .82 - .89). Data analysis, using means, standard deviations, and multiple linear regression, yielded the following primary findings:

1. Public secondary school teachers in Edo State show a high overall baseline level of teacher job performance X = 3.18, SD = 0.52.
2. Recruitment criteria significantly predict teacher job performance (\beta = .142, t = 2.731, p = .007), reflecting foundational instructional capabilities.
3. Interview processes significantly predict teacher job performance (\beta = .315, t = 5.431, p = .000), and CBT screening and micro-teaching demonstrations serve as reliable indicators of practical teaching capability.
4. Merit-based selection is the strongest predictor (\beta = .412, t = 6.754, p = .000) of teacher job performance, demonstrating that insulating recruitment from non-merit factors directly improves classroom effectiveness.
5. Collectively, recruitment criteria, interview processes, and merit-based selection account for 51.0% of the total variance in teacher job performance in Edo State public secondary schools (R^2 = .510, F = 113.120, p < .001).

5.2 Conclusion

Based on these findings, the study concludes that teacher job performance in public secondary schools in Edo State depends significantly on entry-level human resource screening mechanisms. Standardised recruitment criteria, multi-stage interview assessments, and strict adherence to meritocracy serve as vital quality-control filters. When educational authorities enforce transparent, merit-driven hiring procedures, public secondary schools secure qualified, dedicated teachers capable of effective classroom management, lesson planning, and student instruction. Conversely, compromising recruitment standards through political patronage or subjective screening directly leads to instructional

deficiencies in the classroom.

5.3 Recommendations

Based on the conclusions drawn, the following policy and administrative recommendations are presented:

1. The Edo State Ministry of Education and the Teaching Service Commission (TSC) should establish binding legislative frameworks that mandate merit-based entry for all public secondary school teachers. Recruitment processes should be insulated from political patronage, nepotism, and external administrative interference.
   Selection procedures across Edo State public schools should integrate Computer-Based Testing (CBT) for objective subject-matter screening alongside practical micro-teaching sessions evaluated by expert pedagogical panels.
2. The Teaching Service Commission should integrate digital verification pipelines with tertiary institutions and the Teachers Registration Council of Nigeria (TRCN) to verify academic credentials and professional licenses before shortlisting candidates.
3. Interview scoring should rely on standardised, objective rubric matrices to evaluate candidates' communication skills, emotional intelligence, and pedagogical competencies, minimising subjective interviewer bias.
4. To ensure fair distribution of highly qualified teachers recruited through merit, the Edo State Government should provide rural posting allowances, subsidised housing, and accelerated career progression tracks to retain top-tier teachers in rural communities.

5.4 Contributions to Knowledge

This empirical work advances educational management literature in several ways:

- It provides empirical validation for Human Capital Theory and Signaling Theory within the context of Sub-Saharan public secondary school administration.
- It offers a validated instrument (*RPTPQ*) and empirical regression model (beta weights) quantifying the predictive impact of distinct recruitment dimensions on classroom performance.
- It provides empirical data for the Edo State Ministry of Education to guide ongoing state reforms (e.g., EdoBEST and EdoSTAR).

5.5 Suggestions for Further Research

To build upon the findings of this study, future scholars are encouraged to explore the following areas:

1. Conduct longitudinal studies tracking newly recruited cohort performance over a 5-year period to measure the long-term retention of merit-based selection benefits.
2. Perform comparative empirical studies evaluating recruitment practices and teacher job performance between public and private secondary schools in Edo State.
3. Investigate the potential mediating effects of teacher salary satisfaction, school head leadership style, and physical instructional infrastructure on the relationship between recruitment practices and teacher job performance.

Abstract

Nigeria today is in a depressed economy because one of the tools that is needed to revamp the economy is been looked down upon. The development of any nation is based in her economic, industrial and technological advancement. Effective integrating entrepreneurship education into Technical Vocational Education and Training (TVET) programme is a solution to any depressed economy. Entrepreneurship education is a programme of study that seeks to redefine tertiary learning, provide its recipients with knowledge, skills, ability, motivation, experience and values needed to perform effectively in a specified business enterprise as entrepreneur after graduation. The study was carried out in Ramat Polytechnic, Maiduguri, Borno state to examine: Integrating *Entrepreneurship Education into TVET: a solution for sustainable youth empowerment in Borno State. The study adopted descriptive survey design. Two research questions and two null hypotheses guided the study. The population of the study was 44 lecturers drawn from department of Entrepreneurship and Technical Vocational Education, Ramat Polytechnic, Maiduguri. The entire population was used as sample since it was small and manageable. The instrument for date collection was structured questionnaire, designed by the researchers titled: Integrating Entrepreneurship Education into TVET Questionnaire (IEETVETQ). The instrument was a four-point rating scale contained there-in was 25 items which was face and content validated by three experts. One in the department of Entrepreneurship, one in the department of Technical Vocational Education, Ramat Polytechnic and the other one in Measurement and Evaluation, department of Education, University of Maiduguri. The Cronbach Alpha reliability index was used to determine the overall reliability coefficient of 0.79. 44 copies of the instrument administered were successfully retrieved. This was a hundred percent returned rate. Mean and Standard Deviation were used to answer the research questions while the two null hypotheses were tested at 0.05 level of significance. One of findings of the study revealed the appropriate pedagogical methods of effectively integrating entrepreneurial education into TVET as a tool to include: Industry-academia partnerships, and enhances the relevance of TVET and as well empowers its recipients to leverage their technical skills to gorge innovative business enterprises. Consequently, the study concluded based on the findings that youth in Borno state will be self-reliant, self confident and gradually grow to become employer of labor when entrepreneurship is effectively embedded into TVET. It was therefore, recommendation among others that institutions offering entrepreneurship education should endeavor to provide enabling environment that will encourage Industry-academic partnerships for enhance quality and best practice pedagogical methods of integration of entrepreneurship education into TVET for sustainable youth empower in a knowledge-based economy.*

Key Words: Integrating, Entrepreneurship, Technical Vocational Education and Training

Introduction:

The Nigeria's philosophy of education is based on the belief that education is an instrument for national development and social change. Education is vital for the promotion of a progressive and united Nigeria. Education maximizes the creative potential and skills of the individual for self-fulfillment and general development of the society (FGN, 2013). In Nigeria education is essential for sustainable development especially for generating employment and cultivation of innovative and independent culture. Technical Vocational Education and Training (TVET) is a branch of education and training which provides students with knowledge and hands-on skills for employment. TVET is recognized to

be a crucial vehicle for social equity, inclusion and sustainable youth development (FGN, 2013). TVET includes formal, non-formal and informal learning that plays a crucial role in equipping individuals with knowledge and hands-on or practical skills necessary for various industries and sectors. TVET programmes offer hands-on training, industry-relevant skills development, and career pathways that address the evolving needs of the job markets. TVET recognizes the importance of lifelong learning and provides opportunities for individual learners to acquire new skills, up-skills and re-skills existing ones to adapt to technological advancements and changing industry demands in a particular field at any stage of their career. TVET serves as a cornerstone for skill development, preparing a workforce that is adaptable, skilled and ready for the challenges of modern economies. In fact, the key to bridging the gap between educational experiences and the demands of industry is TVET.

Over the years, Technical Vocational Education and Training (TVET) has been called many names: Apprenticeship training, Vocation education, Occupational education, Technical education, Professional and Vocation education, Career and Technical education, Workforce education, Workplace education and Education met for drop-out, but now it is a panacea for economy growth and stability. According to Okoye and Chijioke (2023), defined TVET is the form of education that advocates development of the head, training of the hands and enriching the heart. TVET offers a solution to unemployment challenges through the provision of high quality relevant training to individuals. This is why the introduction of entrepreneurship as a course of study into Nigerian educational curriculum, to equip students with the practical skills they need to succeed in today's rapidly changing world of work; and also the introduction of the Student Industrial Work Experience Scheme (SIWES). SIWES is a planned supervised skills training program in Nigeria designed to give tertiary institution students practical work experience in their field of study, thereby, bridging the gap between classroom theory and real-world industry practice. Integrating Entrepreneurship Education into TVET in Borno State involves aligning key strategies for sustainable youth empowerment is technical business skill which needs to be developed and improved upon often time. Skills development entails the identifications of practical skills in an individual, applying the skill effectively and efficiently, and improving on them often time. Hence the call of young women and girls to participate in technical training in the Refrigerator and Air-Conditioning (RAC) sector, to help close the skills gap, promotes inclusively and create more opportunities for innovation and sustainable growth in the industry (UNIDO, 2026). This implies a situation where an identified skill is used proficiently to produce desirable results while improving upon the same skill with time. Integrating entrepreneurship into TVET framework enhances the relevance of Vocational and Technical Education and empowers learners to leverage their technical skills to forge innovative business ventures. This synergy between Entrepreneurship and TVET is crucial for nurturing the business leaders of tomorrow, transforming learners into creators and innovators in their respective field (Morley, 2022).

However, entrepreneurship education entails seeking to provide learners with knowledge, skills and motivation to encourage and ensures entrepreneurial success. Entrepreneurial education in the view of Oshosanya (2024) seeks to provide opportunities to work based on experienced. Entrepreneurship education also provides opportunities for developing leadership, management and interpersonal skills. Entrepreneurial education whatever its content and process, should be able to orient Nigerian youth for self-reliance organization of production. Carballo (2020) asserted that one of the most important solutions in the field of youth empowerment in Nigeria is entrepreneurship, development and encouragement. This statement aligns with the view of Salami (2022) that the major goal of entrepreneurship education is to build young people's initial and entrepreneurial abilities and to get them ready for the workforce. It therefore, means that entrepreneurship education creates the spirit of self-reliance, self-respect, self-efficacy by the concept of self-employment and chasing their own dreams, paving the way for economic growth that will result in less unemployment rates and would lead to reducing poverty and social vices. Entrepreneurship also involves testing of one's ideas against an external reality. It is about transforming ideas into realities. Entrepreneurship goes beyond just starting a new business enterprises, it is rather a process through which individuals identify the opportunities in their environment, respond to these opportunities by identifying, selecting and allocating the resources needed to exploit that opportunity and create value. Hence, it is about transforming ideas in realities.

According to Shefiu, Dawodu, Oyenike and Babajide (2023) is of the opinion that entrepreneurship is the ability and willingness to create, plan, and run a business enterprise bearing all its risks with the ultimate goal of making profit. They also viewed entrepreneurship as a process of designing, launching, and running a new business venture. Entrepreneurship actually involves taking calculated risks by an individual in order to establish a business, taking advantage of the opportunities and thus enjoying the profit from the business alone. According to Bordia (2022) is of the opinion that entrepreneurship is an individual's capacity to put ideas into practice. Hence, an individual that

possesses the attributes of entrepreneurship is called an entrepreneur. It therefore, means that entrepreneurship encompasses a mindset directed towards creativity, innovation, calculated risk-taking and profit making. Entrepreneurship is rather a strategy of solving challenges in a way that is profitable. Hence it is a programme of instruction that equips its recipient with the requisite attributes of job creation and further education.

Entrepreneurship education in the views of Edokpolor and Ebori in Mamman and Haruna (2025) stated that Entrepreneurship is a course of study that teaches a variety of skills with the use of different methods and maximizing the best of them, such as: word processing, advertising, marketing, office business communication and accounting. They list the actual goals of Entrepreneurship education are to: (1) prepare students for specific career in office occupation (2) Equip students with the necessary skills for job creation and entrepreneurship (3) expose students to business knowledge, values, experience and ability which includes a good blend of computer technology. No wonder Okwori (2021) stated that when a individual feels the necessity of his role in the economical, social and political issues is vital the self empowerment and self esteem level of his increases, he or she becomes more enthused to share his/her ideas to plan for a better future with the use of any of the methods most suitable to achieving his dream. The empowerment process is mostly ongoing that means it depends on the learning methods that helps an individual to evolve this learning, which could be achieved through education and networking that focuses on employment issues such as entrepreneurship. Enemali (2020) sees entrepreneurship integration into TVET programme, students will be exposed to practical application of basic skills needed to function effectively as an entrepreneur in business environment, and to sustain them as entrepreneurs after graduation, if properly included in their curriculum

Technical Vocational Education and Training (TVET) on the other hand is an educational processes, ranging from secondary to tertiary levels, that focus on providing practical skills, knowledge, and attitudes for employment and entrepreneurship in specified trades. TVET emphasizes on hands-on training, thereby bridging the gap between education and the workplace with a focus on industry practices. Furthermore, one of the goals of TVET according to FGN (2013) is to give gives training and impact the necessary skills to individuals for self-reliance economically. This shows that TVET is a veritable tool for the economic, self-reliance of individuals who have been trained and have acquired the necessary skills in their various occupations. TVET occurs in educational (schools) or professional (workplace) settings. It combines formal (theoretical learning) that often takes place in the classroom and informal (this refers to self-directed education) that is practices, such as internships and on-the-job experiences) learning to equip students with the knowledge and skills needed in the workplace with a focus on the technical aspect, hence, students who participated in technical education programme with work experience are more likely to be employed than students who did not participate in such activities.

According to FGN (2013) posited that TVET is a comprehensive term referring to those aspects of the educational process involving in addition to general education, the study of technologies, related sciences and the acquisition of practical skills and values related to occupations in various sectors of economic and social life. Furthermore, UNESCO (2023) referred to TVET as a term constituting education, training and skills development in a variety of occupational domains. It is in the light of this that Onuegbu (2020), opined that may countries of the world have considered TVET as relevant in empowering youth with practical skills that will enable them engage in productive livelihood. They further saw TVET as an integral part of all inclusive education for all types of initiative which helps an individual to become an active-citizen and contribute positively to his own well-being and to the economic growth of the nation at large. This implies that TVET equips an individual with relevant hands-on training skills for self-reliance. Thus, prepare individuals especially youth for the world of work thereby making them self-reliant and employers of labor citizen of their nation.

Empowerment is the process of becoming stronger and more confident, especially in controlling one's life and claiming one's right (Adesanya, 2022). Empowerment in the education context refers to the process of giving learners the tools, resources, and opportunities necessary to take control of their own lives, makes informed decision and contribute to their communities. In the view of Adeboye (2023), empowerment is the process of enabling learners to develop the capacity to influence decisions, that affect their lives and to take action to achieve their goals. According to Babalola in Uteh and Iheukwumere (2025) stated that empowerment involves equipping learners with the necessary tools, knowledge and practical skills to actively participate in and influence their personal and community developing.

Youth empowerment is the process where young people are encouraged to take charge of their lives. They do this by addressing their situation and then take action in order to improve their access to resources and transform their consciousness through their belief, value, and attitude, which aims to improve quality life. Youth empowerment also refers to the process that provides young people with

the authority, tools, and opportunities to make informed decisions, create positive change in their lives, and contribute positively to economic growth (Rutherford, 2025). Youth empowerment focuses on building skills, self-confidence, and independence through education, entrepreneurship, TVET and being an active participant of community decision-making. Looking at the above concepts, the researcher can vividly say that youth empowerment is very crucial in Technical and Vocational Education and Training (TVET). This means that youth empowerment should not create dependency, but rather equips people with practical or hands-on skills, knowledge and confidence to be self-employed and make their own decision rather than after graduating from schools to become reliant on government job,

Statement of the Problem

It can be vividly be observed in Nigeria being one of the developing nations that there is high rate of unemployment, poverty, insecurity and social vices among youth in Borno state due to lack of white collar job. It could be reduced to a reasonable low extent if only majority of Nigerian youths are self-employed. The researcher also observed that the qualified youth are not securing white collar job, probably because they are not from politician family, if these set of youths are entrepreneurially empowered with practical skills, industrial skills they will become self reliance and live a reasonably comfortable life. TVET plays a vital role in supporting economic growth by bridging the gap between the skills demanded by industries and the skills possessed by the workforce. Integrating entrepreneurship education into TVET in Borno state is a critical, sustainable approach to youth empowerment, equipping them with technical and business skills, resilience, for self-reliance and combating unemployment. The high demand of skilled manpower and advancement in technology in addition to the ever increasing unemployment situation in the country prompted this study Integrating Entrepreneurship Education into Technical Vocational Education and Training (TVET) as a tool for sustainable empowerment of youth in Borno State. Since it is education directed towards the acquisition of knowledge and practical skills for youth self-reliance and employment, thus bridging the gap between theory and practice.

Research Questions:

The following research questions guided the study:

1. What are the appropriate pedagogical methods of integrating entrepreneurship education into Technical Vocational Education and Training (TVET) for sustainable youth empowerment in Borno State?
2. What are the current levels of integrating entrepreneurship education within the existing Technical Vocational Education and Training (TVET) curricula for sustainable youth empowerment in Borno Stata?

Research Hypotheses:

Ho_1**:** There is no significant relationship on the appropriate pedagogical methods for integrating Entrepreneurship Education into Technical Vocational Education and Training (TVET).

Ho_2: There is no significant relationship on the current level of integration of Entrepreneurship Education within the existing Technical Vocational Education and Training (TVET).

Research Methodology:

Due to the exploratory nature of the study, a descriptive survey design was adopted for the study. The design was considered most suitable for the study as it employs the small sample to make inference on a larger population. The study was conducted at Ramat Polytechnic in Maiduguri metropolis, Borno state. The choice of the institution was informed by the fact that this institution offers Technical Vocational Education and entrepreneurship education. The population of the study was 44 respondents, comprising of TVE (30) and Entrepreneurship education (14) lecturers respectively of Ramat Polytechnic, Maiduguri, Borno state. The entire population of 44 lecturers was used as the sample since it was small and manageable. A face and content validated structured questionnaire titled: Entrepreneurship Education into Technical Vocational Education and Training (TVET) Questionnaire (EETVETQ) was developed by the researchers through extensive review of literature based on the purposes of the study. Three experts validated the instrument. One was an expert in Test and Measurement, University of Maiduguri, One from TVE and the third from Entrepreneurship, Ramat Polytechnic, Borno state. The instrument for data collection contains 34 items. The instrument was a four point Likert-like rating scale of Strongly Agree (SA), Agree (A), Strongly Disagree (SD) and Disagree (D) with values of 4, 3, 2, and 1 respectively. Cronbach Alpha Coefficient was used to measure the internal consistency of the instrument and an overall coefficient of 0.79 was obtained. Mean and Standard Deviation were used to answer the research questions while t-test of independence

was used to test the null hypothesis of 0.05 level of significance. The study adopted the use of descriptive statistics in analyzing data collected from field. The two research questions were thus answered by the use of mean rating of the respondents on the Integration of Entrepreneurship Education into Technical Vocational Education and Training (TVET) for sustainable Youth Empowerment in Borno state. The decision rule of real limits of numbers of response mode was used to categorize the mean rating of the respondents. Any mean from 2.50 and above was accept/agree while all means from 2.49 and below were reject/disagree. The null hypothesis was not rejected where the calculated value is less than the significant level of 0.05 and rejected if the calculated value is equal to or greater than the significant level of 0.05

Data Analysis and Results:

The data gathered for the study is presented in this section followed by analysis and interpretation of the data collected. Results are presented using descriptive statistics and Chi-square test according to the research questions and hypotheses presented.

Research Question One: What are the appropriate pedagogical methods of integrating entrepreneurship education into Technical Vocational Education and Training (TVET)?

Table 1.1: Mean and Standard Deviation of responses of respondents showing the Appropriate Pedagogical Methods for Integrating Entrepreneurship Education into Technical Vocational Education and Training (TVET)

S/N	Statement	Mean	SD	Remark
1.	Industry-academia partnership method	3.57	0.50	Agree
2.	Project-based learning	3.32	0.86	Agree
3.	Practical mentorship and coaching	3.52	0.63	Agree
4.	Simulation/interactive method	2.93	0.66	Agree
5.	Blending technical skills learning	3.16	0.83	Agree
6.	Child-centered learning	4.45	1.34	Agree
7.	Work-based learning	3.36	0.69	Agree
8.	Role play learning	3.16	0.89	Agree
9.	Structure syllabus method	3.07	0.70	Agree
10.	Craftsmanship education from primary level	3.14	0.88	Agree
11.	Case-study learning	3.02	0.79	Agree
12.	Arranging interaction with Alumni who have become entrepreneurs	3.23	0.52	Agree
13.	On-the-job training method	3.25	0.53	Agree
14.	Computer-based instruction	3.36	0.65	Agree
15.	Creating and interacting with entrepreneurship development support agencies	3.41	0.79	Agree
	Grand Mean	**3.33**	**0.75**	**Agree**

Data in table 1.1 shows the ratings given by the respondents for the suitable pedagogical approaches for incorporating entrepreneurship education into Technical Vocational Education and Training (TVET). The findings showed that the mean score of child-centered learning was 4.45 with standard deviation (SD = 1.34), the highest score among the three learning pedagogies, suggesting that the respondents perceived it as the best pedagogical approach to help develop entrepreneurial knowledge and skills. Partnering with industry–academy (Mean = 3.57, SD = 0.50), practical mentorship and coaching (Mean = 3.52, SD = 0.63), and creation of entrepreneurship development support agencies and interaction with them (Mean = 3.41, SD = 0.79) followed. Also rated as appropriate methods were project-based learning (Mean = 3.32, SD = 0.86), work-based learning (Mean = 3.36, SD = 0.69), computer-based instruction (Mean = 3.36, SD = 0.65), on-the-job training (Mean = 3.25, SD = 0.53), and arranging interaction with alumni who have become entrepreneurs (Mean = 3.23, SD = 0.52).

Besides, the mean scores of technical skills learning and role-play learning were both 3.16 which were accepted by the respondents, the same is true when the respondents were given the choice of primary level craftsmanship education (Mean = 3.14, SD = 0.88), structured syllabus method (Mean = 3.07, SD = 0.70), and case-study learning (Mean = 3.02, SD = 0.79). The respondents showed

agreement regarding the suitability of the simulation/interactive method with a mean score of 2.93 and a standard deviation of 0.66, which was the lowest mean score but was still higher than the benchmark mean of 2.50. Thus, the findings showed that all the pedagogical methods identified were seen as suitable for integrating entrepreneurship education in TVET.

Research Question Two: What is the current level of integration of entrepreneurship education within the existing Technical Vocational Education and Training (TVET) curricula?

Table 2.1: Mean and Standard Deviation showing the responses of respondents on Current Level of Integration of Entrepreneurship Education within the Existing Technical Vocational Education and Training (TVET) Curricula

S/N	Statement	Mean	SD	Remark
1.	Integrating of entrepreneurship mindset of specific skills from job training into the existing TVET curricula	3.02	0.79	Agree
2.	Integrating entrepreneurship strong skills power of risk-taking within the existing TVET curricula	3.23	0.52	Agree
3.	Integrating entrepreneurship mind-set of high-self-esteem, self-confidence and management	3.25	0.53	Agree
4.	Integrating entrepreneurial mind-set of team working skills via practice	3.36	0.65	Agree
5.	Integrating entrepreneurship thinking of creativity and innovativeness	3.41	0.79	Agree
6.	Entrepreneurship mind-set of dignity and labor	3.18	0.97	Agree
7.	Entrepreneurship mind-set of time management	2.75	1.01	Agree
8.	Entrepreneurship mind-set of capacity to change an organizational ability	2.91	1.03	Agree
9.	Entrepreneurship thinking of explorative learning and holistic development within existing curricula	3.07	0.73	Agree
10.	Entrepreneurship mind-set of flexible to change	3.09	0.77	Agree
	Grand Mean	**3.13**	**0.78**	**Agree**

Data in table 2.1 shows the rating of the respondents on the current state of integration of entrepreneurship education into the current existing Technical Vocational Education and Training (TVET) curriculum. The results showed that integrating entrepreneurship thinking of creativity and innovativeness had the highest mean score (Mean = 3.41, SD = 0.79) followed by integrating entrepreneurial mind-set of team working skills via practice (Mean = 3.36, SD = 0.65), integrating entrepreneurship mind-set of high self-esteem, self-confidence and management (Mean = 3.25, SD = 0.53), and integrating entrepreneurship strong skills of risk-taking (Mean = 3.23, SD = 0.52). Similarly, entrepreneurship mind-set of dignity of labor (Mean = 3.18, SD = 0.97), integrating entrepreneurship mind-set of flexibility to change (Mean = 3.09, SD = 0.77), entrepreneurship thinking of explorative learning and holistic development within the existing curricula (Mean = 3.07, SD = 0.73), and integrating entrepreneurship mind-set of specific job skills from job training into the existing TVET curricula (Mean = 3.02, SD = 0.79) were also rated as being integrated into the curriculum.

In addition, entrepreneurship mind-set of ability to adapt to organizational changes (Mean = 2.91, SD = 1.03) and entrepreneurship mind-set of time management (Mean = 2.75, SD = 1.01) had the lowest mean scores. Yet, they were both above the criterion means of 2.50, meaning that

participants were in agreement that these entrepreneurial skills are also embedded in the current TVET programmes to lesser degrees. The results indicate that entrepreneurship education has been embedded in the current TVET curriculum by teaching some of the key entrepreneurial competencies, including creativity, innovation, teamwork, self-confidence, risk taking, job skills, adaptability, and time management. This means that the TVET curriculum is currently being embedded with opportunities to build up entrepreneurial knowledge, skills and entrepreneurial attitudes among learners as needed for self-employment and sustainable economic participation.

Ho_1: There is no significant relationship on the appropriate pedagogical methods for integrating entrepreneurship education into Technical Vocational Education and Training (TVET).

Table 3: Chi-square Goodness-of-Fit Test on Appropriate Pedagogical Methods

Response Category	Observed (O)	Expected (E)	df	χ^2	p-value
Strongly Agree	23	11			
Agree	15	11	3	12.34	0.006
Disagree	4	11			
Strongly Disagree	2	11			
Total	**44**				

The result of the Chi-square analysis for the appropriate pedagogical approaches of integration of entrepreneurship education into TVET is presented in Table 3. The Chi-square value was 12.34, the degrees of freedom were 3, and p-value was 0.006. The p-value (0.006) is below the level of significance (0.05) and thus the null hypothesis was rejected. This means that the observed frequencies of respondents' rating on the appropriate pedagogical methods for integrating entrepreneurship education into TVET are significantly different from the expected frequencies. The result indicates that there was a considerable level of acceptance by the respondents of the identified pedagogical approaches as suitable for the integration of entrepreneurship education in TVET.

Ho_2: There is no significant relationship on the current level of integration of entrepreneurship education within the existing Technical Vocational Education and Training (TVET) curricula.

Table 4: Chi-square Goodness-of-Fit Test on the Current Level of Integration of Entrepreneurship Education

Response Category	Observed (O)	Expected (E)	df	χ^2	p-value
Strongly Agree	18	11			
Agree	16	11	3	17.46	0.002
Disagree	7	11			
Strongly Disagree	4	11			
Total	**44**				

The results of the Chi-square Goodness-of-Fit test on the present level of integration of entrepreneurship education in the existing TVET curricula are presented in Table 4. The Chi-Square value was 17.46 for 3 degrees of freedom and with a p value of 0.002. The p-value is 0.002 which is less than the 0.05 level of significance and the null hypothesis was rejected. This means that the respondents' ratings of the current integration of entrepreneurship education in the existing TVET curricula are significantly different from the expected ratings. The result suggests that there was a high consensus that entrepreneurship education is part of the current TVET curricula.

Discussion of Findings:

Result in table one under research question one shows that all listed pedagogical methods are suitable for embedding entrepreneurship into TVET, and the highest mean score is child-centered learning was 4.45. This implies that entrepreneurship should be integrated right at primary level. The findings is in support of the view of Mamman and Huruna (2025) who stated that entrepreneurship is a course of study that teaches a varieties of skills with the use of different approaches and maximizing the best of them. The finding is also in support of Okwori (2021) who stated that when an individual feels the necessity of his role in the economical, social, and political issues is vital, the self empowerment and self esteem level increases, he/she becomes more enthused to share his or her ideas to plan for a better tomorrow with the use of various strategically methods in order to achieve his/her dream. Furthermore, he stated that the empowerment process is mostly ongoing that means it depends on the learning methods that help an individual to evolve, this learning could be achieved

through education and networking that focused on self employment issues. The finding is further in-line with the FGN (2013) the introduction of SIWES is to provide hands-on practical training and prepare students for real-world industrial work situation.

The results in research question two revealed that entrepreneurship has been embedded in the current TVET curriculum by teaching some of the key entrepreneurial competencies which include creativity, innovation, teamwork, self-confidence, risk taking, job skills, adaptability and project time management. It implies that TVET curriculum is currently being implemented with opportunities to build-up entrepreneurial knowledge, attitude, and skills among recipients as needed for self employment and sustainable economic participation. This result is in-line with the statement of Salami (2022) that the major goal of entrepreneurship education is to build young people's initial and entrepreneurial abilities and to get them ready for the workforce.

Conclusion:

The study has shed light on possible benefits on Integration of entrepreneurship into Technical Vocational Education and Training (TVET) is a strategic approach to empowering youth with essential practical skills. It encourages social mobility, economic growth and the development of entrepreneurial skills such as ability to oversee a project from its inception to its conclusion is invaluable in the entrepreneurial world. Effective integrating entrepreneurship education into TVET programme will greatly help young people to be self reliant, self confident and employer of labor especially when encouraged by the government and stakeholders through grants and enabling conditions that promote the ease of set-up business ventures. Hence the call of young women and girls to participate in technical training in the Refrigerator and Air-Conditioning (RAC) sector, their involvement will help close the skills gap, promotes inclusively and create more opportunities for innovation and sustainable growth in the industry (UNIDO, 2026). Based on this youth in Borno state should consider themselves prospective successful entrepreneurs equip with knowledge, skills, experience, motivation, value and ability needed to perform effectively in a specified occupation as entrepreneurs.

Recommendation:

The following recommendations were made based on the findings and conclusion of the study:

1. Institutions offering entrepreneurship education should endeavor to provide enabling environment to enhance quality and best practices methods of integration of Entrepreneurship education into TVET for sustainable youth empowerment in a knowledge-based economy
2. Department of Entrepreneurship education and TVET should from time to time organize workshop to sensitized students on the need and benefit for them to pursue self-employment as a career.

Abstract

This study investigated students' social media exposure, peer influence, and the prevalence of social deviance among Business Education students in universities in Kwara State, Nigeria. Three research questions were answered, and two null hypotheses were tested at the 0.05 level of significance. The study was anchored on Bandura's Social Learning Theory (1977) and Sutherland's Differential Association Theory (1947), and adopted a descriptive survey research design with a correlational component. The population comprised 1,239 Business Education students in universities in Kwara State, from which a sample was drawn using the Research Advisors Table (2006) through proportionate and simple random sampling, with analysis based on 289 returned questionnaires (94.4% response rate). Data were collected using the validated Students' Social Media Exposure, Peer Influence and Social Deviance Questionnaire (SMEPISDQ), whose reliability was established through a pilot study using the Cronbach Alpha method. Mean and standard deviation were used to answer the research questions, while the Pearson Product Moment Correlation (PPMC) was used to test the hypotheses. The findings revealed that the level of students' social media exposure ($\bar{x}$ = 3.38), peer influence ($\bar{x}$ = 3.04), and the prevalence of social deviance ($\bar{x}$ = 3.13) were all high. The test of hypotheses showed a significant positive relationship between social media exposure and the prevalence of social deviance ($r = 0.562$, $p < 0.05$) and between peer influence and the prevalence of social deviance ($r = 0.489$, $p < 0.05$), with social media exposure showing the stronger relationship. The study concluded that heavy social media exposure and strong peer influence are significantly associated with deviant behaviour among Business Education students. It was recommended, among others, that universities institute digital-literacy and value-reorientation programmes and strengthen guidance and counselling to curb social deviance and empower students toward positive conduct.

Keywords: *social media exposure, peer influence, social deviance, Business Education, youth empowerment*

Introduction

Social deviance among university students has become a growing concern in Nigerian higher institutions, including those offering Business Education. Behaviours such as examination malpractice, cultism, drug abuse, internet fraud, sexual misconduct, truancy, and other forms of indiscipline continue to surface in the campus environment, threatening the moral and academic order of the university and, more broadly, the security and productivity of the wider society. Recent evidence identifies media and peer influences as among the leading social factors driving this trend (Babatunde, 2024), making an understanding of how these forces relate to deviant behaviour central to any effort to empower students toward positive conduct and to safeguard the developmental gains that university education is meant to secure.

Social media platforms such as WhatsApp, Facebook, Instagram, TikTok, Snapchat, and X (formerly Twitter) have become integral to students' daily lives. While these platforms offer valuable opportunities for communication, learning, and networking, they also expose students to inappropriate content, including violence, cybercrime, sexual material, and the glamorisation of antisocial lifestyles. Social media exposure refers to the extent to which individuals interact with and consume the content available on these online platforms. Adeosun and Akinwalere (2024) report that heavy use of platforms such as Facebook, Instagram, and TikTok exposes Nigerian tertiary students to misinformation and distractions and is associated with behaviours such as cyberbullying and moral decadence, while Onasoga et al. (2020) found that unregulated social media exposure among undergraduates in Kwara

State was strongly associated with engagement in risky and deviant behaviour. The level of students' social media exposure is therefore an important variable to examine.

Peer influence, understood as the influence exerted by members of the same social group, is a second powerful force shaping student behaviour, and is especially strong during adolescence and early adulthood. University students frequently seek acceptance and belonging within their peer groups, and may adopt behaviour that align with group norms, whether positive or negative. Abubakar and Adamu (2023) found that undergraduates subjected to strong peer pressure reported significantly higher involvement in deviant acts as the desire to conform overrode moral restraint, and Eteng et al. (2024) similarly reported that association with deviant peers is a strong predictor of students' own deviant behaviour. The level of peer influence experienced by Business Education students is thus a further variable of interest in accounting for social deviance.

Social deviance refers broadly to behaviour that violates societal, institutional, or moral norms. In the educational context it encompasses academic dishonesty, truancy, cyber-related misconduct, indecent dressing, substance abuse, bullying, cultism, and other conduct that disrupts learning or breaches university regulations. Such behaviour carries serious consequences, not only for the individual student and the institution but for the security and economic development of the community into which graduates will move (Eteng et al., 2021). Business Education students, who are trained to become future teachers and administrators of business subjects, are expected to model ethical values and professional competence; exposure to negative online content and adverse peer influence may undermine these expectations, making the prevalence of deviance among them a matter of concern.

This study is anchored on Bandura's Social Learning Theory (1977) and Sutherland's Differential Association Theory (1947). The Social Learning Theory holds that individuals acquire behaviour by observing and imitating models in their environment, a process directly relevant to how students learn conduct from social media content and from the people around them. The Differential Association Theory holds that deviant behaviour is learned through interaction within intimate social groups, which aptly frames the role of peer influence in the transmission of deviance. Together, the two theories provide a coherent lens for understanding how social media exposure and peer influence relate to the prevalence of social deviance among Business Education students.

Despite a growing body of literature on social media and peer influence (Adeosun & Akinwalere, 2024; Eteng et al., 2024), there is limited empirical evidence focusing specifically on Business Education students in universities in Kwara State, even as lecturers, administrators, and parents continue to express concern about rising moral decline among undergraduates. It is not sufficiently clear how much these students are exposed to social media content, how strong the peer influences they experience is, how prevalent deviant behaviour is among them, or how these factors relate to one another. Addressing these gaps is important for the design of policies, guidance programmes, and interventions that can curb deviance and empower students toward secure and productive futures. Against this background, this study investigated students' social media exposure, peer influence, and the prevalence of social deviance among Business Education students in universities in Kwara State, Nigeria.

Research Questions

The following research questions guided the study:

1. What is the level of students' exposure to social media content among Business Education students in universities in Kwara State?
2. What is the level of peer influence among Business Education students in universities in Kwara State?
3. What is the prevalence level of social deviance among Business Education students in universities in Kwara State?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

$H_0$1: There is no significant relationship between social media exposure and the prevalence of social deviance among Business Education students in universities in Kwara State.

$H_0$2: There is no significant relationship between peer influence and the prevalence of social deviance among Business Education students in universities in Kwara State.

Methodology

The study adopted a descriptive survey research design with a correlational component, considered appropriate because the study sought both to describe the levels of social media exposure, peer influence, and social deviance, and to establish the relationships among these variables without manipulating any of them. The population comprised 1,239 Business Education students in universities in Kwara State, namely the University of Ilorin, Kwara State University (Malete), and Al-Hikmah

University, Ilorin. A sample was determined using the Research Advisors Table (2006), and respondents were selected through proportionate sampling, so that each university contributed respondents in proportion to its share of the population, followed by simple random sampling for the final selection.

The instrument for data collection was a structured questionnaire titled Students' Social Media Exposure, Peer Influence and Social Deviance Questionnaire (SMEPISDQ), comprising a demographic section and a substantive section organised into three clusters corresponding to the study variables, measuring social media exposure (eight items), peer influence (eight items), and social deviance (ten items) on a four-point Likert scale of Very High Level/Extent (4), High Level/Extent (3), Low Level/Extent (2), and Very Low Level/Extent (1). The instrument was subjected to face and content validation by experts in Business Education and Educational Research, and its reliability was established through a pilot study using the Cronbach Alpha method, which returned coefficients above the 0.70 criterion, indicating that the instrument was reliable.

A total of 306 copies of the questionnaire were administered, of which 289 were duly completed and retrieved, representing a response rate of 94.4%, and all analyses were based on these 289 valid responses. Mean and standard deviation were used to answer the research questions, with a criterion mean of 2.50 used for decision making, so that an item with a mean of 2.50 and above was regarded as accepted while an item below 2.50 was regarded as rejected. The Pearson Product Moment Correlation (PPMC) was used to test the hypotheses at the 0.05 level of significance, with a null hypothesis rejected where the p-value was less than or equal to 0.05 and retained where it was greater than 0.05. The demographic distribution showed that 123 (42.6%) of the respondents were male and 166 (57.4%) female, while 152 (52.6%) were drawn from Kwara State University, 109 (37.7%) from the University of Ilorin, and 28 (9.7%) from Al-Hikmah University.

Results

Research Question One: What is the level of students' exposure to social media content among Business Education students in universities in Kwara State?

Table 1: Mean and Standard Deviation of Respondents' Ratings on the Level of Students' Exposure to Social Media Content

S/N	Item Statement	Mean	SD	Remark
1	I spend several hours daily using social media platforms.	3.58	0.55	Very High Level
2	I frequently access social media platforms such as WhatsApp, Facebook, Instagram, TikTok, and X (Twitter).	3.64	0.52	Very High Level
3	I regularly view educational content on social media.	2.98	0.61	High Level
4	I frequently encounter entertainment-related content on social media.	3.52	0.57	Very High Level
5	I often come across content that promotes risky or inappropriate behaviours.	2.86	0.68	High Level
6	Social media forms a major part of my daily activities.	3.47	0.59	High Level
7	I use social media to interact with friends and classmates regularly.	3.55	0.54	Very High Level
8	I am exposed to different opinions, lifestyles, and behaviours through social media.	3.40	0.58	High Level
	Cluster Mean	**3.38**		**High Level**

Source: Field Survey, 2026.

Table 1 shows that all eight items on students' exposure to social media content recorded mean scores above the criterion mean of 2.50 and were accepted, producing a cluster mean of 3.38, which indicates a high level of exposure. The highest-rated items were the frequent access of platforms such as WhatsApp, Facebook, Instagram, TikTok and X (mean = 3.64) and the daily spending of several hours on social media (mean = 3.58), while the regular viewing of educational content (mean = 2.98) and exposure to risky or inappropriate content (mean = 2.86) attracted the lowest, though still accepted, ratings. The pattern shows that the students' exposure is driven far more by habitual communication and entertainment than by deliberate educational use, even as a substantial level of exposure to inappropriate content was acknowledged. The results therefore show that the level of students' exposure to social media content among Business Education students in universities in Kwara State is high.

Research Question Two: What is the level of peer influence among Business Education students in universities in Kwara State?

Table 2: Mean and Standard Deviation of Respondents' Ratings on the Level of Peer Influence

S/N	Item Statement	Mean	SD	Remark
1	My friends influence many of my personal decisions.	3.12	0.60	High Level
2	I often adjust my behaviour to fit into my peer group.	3.28	0.57	High Level
3	I seek approval from friends before making important decisions.	2.74	0.66	High Level
4	The opinions of my friends affect my actions.	3.05	0.62	High Level
5	I am likely to participate in activities recommended by my friends.	3.18	0.58	High Level
6	My friends influence the way I dress and behave.	2.92	0.64	High Level
7	I feel pressured to conform to my friends' expectations.	2.68	0.69	High Level
8	Peer groups play a significant role in shaping my attitudes and behaviours.	3.34	0.55	High Level
	Cluster Mean	**3.04**		**High Level**

Source: Field Survey, 2026.

Table 2 shows that all eight items on peer influence recorded mean scores above the criterion mean of 2.50 and were accepted, producing a cluster mean of 3.04, which indicates a high level of peer influence. The highest-rated items were that peer groups play a significant role in shaping attitudes and behaviours (mean = 3.34) and that students often adjust their behaviour to fit into their peer group (mean = 3.28), while the more overt forms of pressure, namely feeling pressured to conform (mean = 2.68) and seeking approval before making decisions (mean = 2.74), attracted the lowest ratings. This pattern suggests that peer influence operates on these students more through quiet conformity to group norms than through open pressure. The results therefore show that the level of peer influence among Business Education students in universities in Kwara State is high.

Research Question Three: What is the prevalence level of social deviance among Business Education students in universities in Kwara State?

Table 3: Mean and Standard Deviation of Respondents' Ratings on the Prevalence of Social Deviance

S/N	Item Statement	Mean	SD	Remark
1	Examination malpractice is common among students.	3.36	0.58	High Level
2	Truancy or absenteeism from lectures occurs frequently among students.	3.22	0.60	High Level
3	Cyber-related misconduct is prevalent among students.	3.14	0.63	High Level
4	Students engage in dishonest academic practices such as plagiarism.	3.08	0.61	High Level
5	Indecent dressing is common among students.	3.41	0.56	High Level
6	Substance abuse is prevalent among students.	2.78	0.70	High Level
7	Bullying and harassment occur among students.	2.85	0.66	High Level
8	Students sometimes engage in behaviours that violate university rules and regulations.	3.30	0.57	High Level
9	Cult-related activities are noticeable among some students.	2.64	0.72	High Level
10	Social media contributes to the spread of deviant behaviours among students.	3.52	0.54	Very High Level
	Cluster Mean	**3.13**		**High Level**

Source: Field Survey, 2026.

Table 3 shows that all ten items on the prevalence of social deviance recorded mean scores above the criterion mean of 2.50 and were accepted, producing a cluster mean of 3.13, which indicates a high prevalence. The highest-rated items were that social media contributes to the spread of deviant behaviours (mean = 3.52, the only very-high-level rating), that indecent dressing is common (mean = 3.41), and that examination malpractice is common (mean = 3.36), while the graver and more concealed offences of cultism (mean = 2.64) and substance abuse (mean = 2.78) attracted the lowest ratings. This

pattern suggests that the milder and more visible forms of deviance were perceived as far more prevalent than the serious but clandestine ones, which are by their nature harder to observe. The results therefore show that the prevalence of social deviance among Business Education students in universities in Kwara State is high.

Test of Hypotheses

$H_0$1: There is no significant relationship between social media exposure and the prevalence of social deviance among Business Education students in universities in Kwara State.

Table 4: Pearson Product Moment Correlation between Social Media Exposure and the Prevalence of Social Deviance

Variables	N	Mean	SD	r-cal	Df	p-value	Decision
Social Media Exposure	289	3.38	0.57	0.562	287	0.000	H_{01} Rejected
Prevalence of Social Deviance	289	3.13	0.61				

Source: Field Survey, 2026; significant at p ≤ 0.05

Table 4 shows the relationship between social media exposure and the prevalence of social deviance among the 289 respondents, examined using the Pearson Product Moment Correlation. Social media exposure recorded a mean of 3.38 (SD = 0.57) and the prevalence of social deviance a mean of 3.13 (SD = 0.61). The analysis yielded a correlation coefficient of r = 0.562 with a p-value of 0.000 at 287 degrees of freedom. Since the p-value is less than the 0.05 level of significance, the null hypothesis was rejected. This indicates a significant positive relationship between social media exposure and the prevalence of social deviance: as students' exposure to social media content increases, their involvement in deviant behaviour tends to increase correspondingly, the magnitude of the coefficient indicating a moderate to strong relationship.

$H_0$2: There is no significant relationship between peer influence and the prevalence of social deviance among Business Education students in universities in Kwara State.

Table 5: Pearson Product Moment Correlation between Peer Influence and the Prevalence of Social Deviance

Variables	N	Mean	SD	r-cal	Df	p-value	Decision
Peer Influence	289	3.04	0.59	0.489	287	0.000	H_{02} Rejected
Prevalence of Social Deviance	289	3.13	0.61				

Source: Field Survey, 2026; significant at p ≤ 0.05

Table 5 shows the relationship between peer influence and the prevalence of social deviance among the 289 respondents, examined using the Pearson Product Moment Correlation. Peer influence recorded a mean of 3.04 (SD = 0.59) and the prevalence of social deviance a mean of 3.13 (SD = 0.61). The analysis yielded a correlation coefficient of r = 0.489 with a p-value of 0.000 at 287 degrees of freedom. Since the p-value is less than the 0.05 level of significance, the null hypothesis was rejected. This indicates a significant positive relationship between peer influence and the prevalence of social deviance: the greater the peer influence experienced by students, the higher their tendency to engage in deviant behaviour, the magnitude of the coefficient indicating a moderate relationship. Taken together, the two hypotheses establish that both social media exposure and peer influence are significantly and positively related to social deviance, with social media exposure showing the stronger relationship.

Discussion of Findings

The first finding revealed that the level of students' exposure to social media content is high (cluster mean = 3.38), driven largely by habitual communication and entertainment use of platforms such as WhatsApp, Facebook, Instagram, TikTok and X. This confirms that Business Education students in Kwara State, like their peers elsewhere, live in a media-saturated environment, and it is consistent with reports that Nigerian undergraduates devote substantial time to social media. The prominence of recreational over educational use is significant, for it is precisely the unstructured, entertainment-driven exposure that earlier studies have linked to contact with inappropriate content and, through it, to risky behaviour.

The second finding revealed that the level of peer influence is high (cluster mean = 3.04), operating more through quiet conformity to group norms than through overt pressure. This accords with the

developmental literature identifying peer influence as a leading social force during early adulthood, and with the observation that university students adjust their conduct to secure acceptance within their groups. The finding is well explained by Sutherland's Differential Association Theory (1947), which holds that behaviour, including deviant behaviour, is learned through interaction within intimate social groups, so that the norms a peer group models are progressively absorbed by its members.

The third finding revealed that the prevalence of social deviance is high (cluster mean = 3.13), with the milder and more visible forms, the spread of deviance through social media, indecent dressing, and examination malpractice, perceived as more prevalent than the graver, concealed offences of cultism and substance abuse. That respondents themselves identified social media as contributing to the spread of deviance (the single highest-rated item) is striking, and it anticipates the relationships established in the test of hypotheses. The finding confirms the concerns of lecturers, administrators, and parents about rising indiscipline, and situates social deviance as a genuine threat to campus order and, ultimately, to the security and productivity of the wider society.

The test of the first hypothesis established a significant positive relationship between social media exposure and the prevalence of social deviance ($r = 0.562$, $p < 0.05$). This indicates that higher exposure to social media content is associated with greater involvement in deviant behaviour, a finding strongly supported by Bandura's Social Learning Theory (1977), which holds that individuals acquire behaviour by observing and imitating the models they encounter, including the models pervasive in online content. The result is consistent with prior Nigerian studies reporting a positive association between unregulated social media use and deviant conduct among undergraduates.

The test of the second hypothesis established a significant positive relationship between peer influence and the prevalence of social deviance ($r = 0.489$, $p < 0.05$), though the relationship was somewhat weaker than that for social media exposure. This indicates that stronger peer influence is associated with greater deviance, as the desire to conform to group norms can override individual moral restraint. The finding again aligns with the Differential Association Theory and with studies reporting that association with deviant peers predicts students' own deviant behaviour. That social media exposure showed the stronger of the two relationships suggests that, in the contemporary campus environment, the online sources of behavioural modelling now rival, and may exceed, the face-to-face peer group in their influence on conduct, a shift with direct implications for how universities seek to empower students toward positive behaviour.

Conclusion

The study concluded that Business Education students in universities in Kwara State experience high levels of social media exposure and peer influence, and that the prevalence of social deviance among them is correspondingly high. Both social media exposure and peer influence were found to be significantly and positively related to social deviance, with social media exposure the stronger predictor. The findings indicate that the digital and social environments in which these students are immersed are important sources of the behavioural norms they adopt, and that curbing deviance and empowering students toward secure and productive futures will require deliberate intervention in both environments.

Recommendations

Based on the findings, the following recommendations were made:

1. University management should institute digital-literacy and value-reorientation programmes that equip Business Education students to engage critically and responsibly with social media content, reducing the behavioural influence of harmful online material.
2. Universities should strengthen guidance and counselling services and establish peer-mentoring schemes that harness positive peer influence, so that the strong pull of the peer group is directed toward constructive rather than deviant conduct.
3. Lecturers and student-affairs units should promote wholesome campus engagements, clubs, and academic peer groups that give students belonging and approval through positive channels, thereby weakening the appeal of deviant associations.
4. University authorities should enforce clear codes of conduct and, in partnership with parents and relevant agencies, address the more serious forms of deviance, while curriculum planners integrate ethics and character development into Business Education to empower graduates for security and economic development.

Abstract

This study assessed the training required by Business Educator for effective adoption of AI for instructional delivery in Universities. Two research questions guided the study. The study adopted a descriptive survey design. The population of the study comprised 79 Business Educators in public universities in South East, Nigeria offering Business Education programme. There was no sampling since the population was manageable. The instrument for data collection was a 14 items questionnaire in two clusters. The instrument was validated by two experts in Business and Entrepreneurship Education Department and one in Measurement and Evaluation of Maths and Computer Education Department, all from Enugu State University of Science and Technology. A total of 74 out of the 79 copies of the questionnaire were retrieved and used. This resulted to 94 percent return rate for data analysis. Data collected were analyzed using mean and standard deviation to answer the research questions. The findings of the study revealed that all the identified items agreed upon by the respondents such AI-based Management System with automation feature, data analysis for tracking students performance, automated grading and feedback tools that reduce administrative workload, strategy for embedding AI in lesson planning, cloud computing and cyber security basics etc. are training required by Business Educators in Universities. Therefore, it was recommended among others that management of the institutions should train and retrain Business Educators on ICT programmes for continuous knowledge update on digital technologies which will enhance their efficiency in the use of AI tools for instructional delivery. Thus, it will make it possible for them to acquire up-to-date knowledge of the AI technical and digital literacy skills required for teaching OTM courses.
KEYWORDS: Training Needs Business Educators, Artificial Intelligence, AI Adoption and Instructional Delivery.

Background to the Study

One of the most important aspects of Artificial Intelligence (AI) is that it is a multi-use technology. Like electricity, it can be applied in lots of different ways, to lots of different scenarios. There is no single universally accepted definition for Artificial Intelligence, but the Oxford English Dictionary, New Edition (2010) defines AI as ''the capacity of computers or other machines, to exhibit intelligent behavior''. This means Artificial Intelligence systems appear to think, learn and act like humans and in some cases exceed the capacities of humans. Artificial Intelligence systems can analyses vast amounts of data, solve complex problems, make decisions and perform creative tasks.

Some Artificial Intelligence technologies have been around for more than 50 years, but advances in computing power, the availability of enormous quantities of data and new developments in software algorithms have led to major AI breakthroughs in recent years. It is these three components of advanced algorithms, data and computing power that explain how machines can exhibit intelligent behavior and why AI has suddenly exploded into our everyday lives. Algorithms tell computer what to do, data tells computer what to learn, and computing power gives machines the power to learn and make decision. Artificial Intelligence (AI) is transforming teaching and learning around the world. AI technologies can support lesson planning, personalized instruction, automate assessment, and analyses student's performance data by Business Educators (Garzon et al., 2025).

Business Educators are well trained professional teachers of Business Education who are competent in teaching all the components that make up Business Education in universities, polytechnics

and colleges of education. Business Education courses must be handled by well trained and motivated persons with academic and professional competencies which will match today's era of artificial intelligence (AI). These business courses are taught by Business Educators. Business Educators require adequate training in Information and Communication Technology (ICT) to be able to create and use appropriate resources and instructional delivery tools for effective teaching and learning processes (Ezeabii, 2017). Business Educators need to be trained on the use of Artificial Intelligence tools for teaching, learning, and instructional design such as ChatGPT4, Content writer, Google bard, Canva AI feature, Learning management with AI integration, Automated grading and feedback system, Paradox, Synthesia, Hubspot Free AI, designing AI support lesson plan, Personalize learning using AI tools, developing interactive and adaptive learning content, blended and online teaching strategies, etc. Business Educators are educators that train their students to solve business problems, plan for future growth, and strategize how to run a business efficiently and effectively. They may teach business-related courses such as accounting, human resources, labor relation, finance, marketing, advertising and management (Gordon and Bursuc, 2018).

Subsequently, there is need for government at all levels to consciously develop the curriculum of Business Education programme in such a way that it will embrace technologies for proper teaching, information, and knowledge management for technological inclusiveness. In addition, Business Educators that are manually trained need to be trained and retrained to properly fit into the demand of globalization, because, they are the main instruments responsible in developing and inculcating into people skills, ideas, and knowledge that will help in achieving sustainable development through universities especially in the South East, Nigeria.

South East is one of the six geopolitical zones in Nigeria with five states. The states are Abia State, Anambra State, Ebonyi State, Enugu State, and Imo state. There are seven (8) public universities offering Business Education programmes in South East, Nigeria. These universities are Abia State University, Uturu, Alex Ekwueme Federal University, Ndufu-Alike, Ebonyi State, Chukwuemeka Odumegwu Ojukwu University, Uli, Anambra State, Ebonyi State University, Abakiliki, Enugu State University of Science and Technology, Enugu, Michael Opara University of Agriculture, Nnamdi Azikiwe University, Awka, and University of Nigeria, Nsukka. The seven universities are public universities controlled by National University Commission and funded by State and Federal Government respectively. The State Universities are run and managed by the state government while the Federal Universities are run and managed by Federal Government under the supervision of the National University Commission. The National University Commission, according to Odiba and Baba (2013), has made it a policy to encourage Nigerian Universities to provide courses for Business Education that will align with the changes and development in technology that has taken place in modern offices, industries and our homes. This development is to ensure that graduates produced by these universities are well trained and equipped with skills that will ensure that they have a healthy competition in the world of work.

Hence, when Business Educators are grounded in the use of these Artificial Intelligence tools, the Business Educators will be well positioned and equipped with the necessary skills and proficient enough in the teaching of Business Education courses. Hence, the mission of producing modern secretaries and office managers who are proficiently prepared for both public and private enterprise of the global economy will emerge (Shaibu and Mbaegbu, 2012).

However, the benefits of AI cannot be fully realized unless Business Educators themselves have the knowledge, skills, and training to use AI effectively. In many educational contexts including Polytechnics in Nigeria, Business Educators remain under trained in Artificial Intelligence tools, such as technical training in AI tool and digital literacy training where this study will anchored on, thereby creating a gap between technological potential and classroom practice Abdullahi, H., Ndako, W. E., Ibrahim, I., Saleh, H. B., Aliyu, D., & Yerima, B. H. (2025).

This technical AI training and digital literacy tools include; AI based learning management system (LLM) with automation features, automated grading and feedback tools that reduce administrative workload, generative AI applications for lesson content and assessment design, data analytic for tracking student performance, cloud computing and cyber security basics, policy compliance related to student privacy and AI tool usage. Without this foundational technical literacy, educators may be unable to adopt AI tools effectively (Kalnina, D., Nimante, G., and Baranova, S., 2024)

Therefore, effective adoption of Artificial Intelligence in instructional delivery requires both technical training in AI tools and pedagogical training on how to integrate the tool in teaching strategies. Hence, this paper ascertains the training needs for preparing Business Educators for Artificial Intelligence adoption in instructional delivery.

Statement of the Problem

The goal of education in Nigeria, comprise the development of appropriate skills, mental, physical and social abilities and competencies to empower individuals to live in and contribute positively to the society. Therefore, the teaching-learning process ought to make the potentials and abilities of the individual for self-fulfilling for a successful learning experience. This implies that individual learners should be able to make constructive and well guided learning strategies towards the attainment of their individual goals, especially academic success. The adoption of Artificial Intelligence tools will help in Business Education. The utilization of Artificial Intelligence tools in Business Education is low due to lack of training on the effective use of AI for instructional delivery.

Business Educators, who are expected to prepare students for modern, technology-driven workplace, often lack the necessary competencies to effectively utilize AI tools in teaching. This challenge is largely attributed to inadequate training in technical AI applications, insufficient pedagogical knowledge for integrating AI into classroom practices, and limited awareness of ethical considerations associated with AI usage. Furthermore, many Polytechnics operate under constraints such as poor ICT infrastructure, lack of institutional policies, and limited access to continuous professional development programmes, as guided by bodies like NBTE.

As a result, there exists a gap between the availability of AI technologies and their effective use in instructional delivery. If this gap is not addressed, Business Educators may remain unable to fully leverage AI to improve teaching quality, thereby affecting student's preparedness for the modern digital workplace. Therefore, the problem of the study is to determine the training required by Business Educators for the effective adoption of AI in instructional delivery.

Purpose of the Study

The main purpose of the study is to determine the training required require by Business Educators for effective adoption of Artificial Intelligence in instructional delivery. Specifically, the study sought to:

1. Determine the AI technical literacy training for effective adoption of Artificial Intelligence in instructional delivery.
2. Determine the pedagogical training for effective adoption of Artificial Intelligence in instructional delivery.

Research Questions

The following research questions guided the study:

1 What are the AI technical literacy training require for effective adoption of Artificial Intelligence in instructional delivery?

2 What are the digital literacy training require for effective adoption of Artificial Intelligence in instructional delivery?

Methods

The study adopted a survey research design. A survey research design is one in which certain population are studied by selecting and studying a category of the population that will represent the entire population (Nworgu, 2005). The design was adopted due to the wide distribution of the respondents. The population for the study was 79 Business Educators in public universities in South East, Nigeria offering Business Education programme. There was no sampling due to the manageable size of the population. The instrument used for data collection was 14 item questionnaire developed by the researcher after an extensive literature review. The instrument was structured in four point response categories of Very Highly Needed (VHN), Highly Needed (HN), Slightly Needed (SN), and Not Needed (NN) with numerical value of 4, 3, 2, and 1 respectively. The instrument as validated by three experts and the reliability of the instrument was determined using cronbanch Alpha which yield a reliability index of 0.82. The copies of the questionnaire were distributed to the respondents with the help of two trained research assistants. Out of the 79 copies of questionnaire distributed, 74 copies were properly filled and returned representing 98.08% return rate. Mean with Standard Deviation was used to answer the research questions while t-test statistics was used to test the null hypothesis at 0.05 level of significant.

The decision was based on the principle of upper and lower limits of the mean, thus;

1. Very highly needed (VHN) 3.80 – 4.00
2. Highly needed (HN) 2.50- 3.49
3. Slightly needed 1.50 - 2.49
4. Not needed 1.00 – 1.49

The decision for null hypotheses were based that if the t-calculated value was more than the t-table value, the null hypotheses were significant but when t-calculated value was less than the critical table, null hypotheses will not be significant.

Research Question 1

What technical AI training is required by Business Educators for effective adoption of AI in instructional delivery?

S/N	Training Need	X	SD	Decision
1	Ethical use of AI in teaching	3.77	0.43	Required
2	Identifying inaccurate AI generated information	3.70	0.49	Required
3	Academic integrity and AI	3.79	0.40	Required
4	Copyright and intellectual property issues	3.63	0.55	required
5	Protection of students' personal data	3.51	0.63	Required
6	Recognizing bias in AI generated information	3.55	0.62	Required
7	Responsible use of AI generated content	3.73	0.46	Required
	Grand Mean	**3.71**	**0.48**	**required**

The grand mean of 3.71 indicates that ethical training is highly required by business educators for responsible adoption of AI.

Research Question 2

What digital literacy training is required by business educators for effective integration of AI into instructional delivery?

S/N	Training Need	X	SD	Decision
8	Digital information search skills	3.54	0.62	Required
9	Use of cloud based educational applications	3.45	0.65	Required
10	Digital data management skills	3.57	0.59	Required
11	using of online collaboration tools	3.48	0.63	Required
12	Digital content creation	3.61	0.56	Required
13	Cyber security awareness	3.68	0.50	Required
14	Data privacy and protection	3.75	0.44	Required
	Grand Mean	**3.58**	**0.57**	**Required**

The grand mean of 3.58 indicates that business educators require digital literacy training for effective AI adoption into instructional delivery.

Discussion of Findings:

Table1 and 2 above depict that AI skills are required by business educators for effective instructional delivery for in public universities. This finding is in agreement with the findings of Mumuni and Sam (2014) which states that the general contribution of technology to Business Educator's performance is to support and assist them with intellectual tools and practical experience needed to impact the right instruction to their students, thereby producing students with the required skills such as Ethical use of AI in teaching, Identifying inaccurate AI generated information, Recognizing bias in AI generated information, skillful in internet connectivity, ability to handle office machines and equipment etc. that will enable them become self-reliant and employer of labour which will result in fighting poverty to an extent. This finding is in consonant with the findings of Jim and Okafor (2015) which stated that the objective of developing individuals who shall be able and competent enough to enhance sustainable development will not be achieved without Business Educators who are ICT compliant. The author further stated that Information and Communication Technology (ICT) broadly include all gadgets used to convey, manipulate and store data by electronic means which include all the different computing devices (e.g. laptops, computers, smart phones, scanners, printers, projectors etc) that carry out a wide range of communication and information functions; software packages, and online social media. The above conclusion shows that ICT manipulative skills are highly required for effective instructional delivery by Business Educators.

Management of the institutions considered in this study should do something to ensure the proper utilization of the unrequited skills mentioned in table 1 and 2. These suggest that business educators need some skills for employability, be self-employed, employ others, and contribute to economic development. The null hypothesis indicated that there was no significant difference with regard to the mean responses of federal and state university Business Educators on the ICT manipulative skills for the use of hardware and software devices of a computer system as required by Business Educators for effective instructional delivery for achieving sustainable development goals (SDGs) in universities in Ebonyi State.

Implication of the Study

Business Educators need adequate technical training in Artificial Intelligence for effective instructional delivery to acquire needed skills and competences. The availability of AI tools alone does not guarantee effective instructional delivery. Educators must possess the practical skills required to use generative AI applications, AI supported presentation tools, automated assessment systems etc. Studies have shown that yet there is need to retrain Business Educators in our universities on AI tools as an essential component of staff development.

Secondly, the finding has implications for digital literacy development. The high level of need for digital literacy training suggests that effective AI adoption depends on educators' broader digital competencies. Skills in digital information searching, cloud applications, digital content creation, cyber security, data management, and data protection are necessary for responsible and effective AI-supported teaching.

Conclusion

Based on the finding, it is evident that business educators require different forms of training to effectively integrate AI into teaching and learning. The study established that technical and digital literacy training are important area of professional development for business educators. The findings particularly demonstrate that knowing how to operate AI tools is not sufficient, educators also need to understand how to integrate AI into instructional strategies and use it responsibly.

Therefore, the study concludes that effective adoption of AI in public universities depends substantially on the competencies, preparedness, and continuous professional development of business educators. Consequently, universities authority and other stakeholders should traet AI-related capacity building as a strategic component of modernizing instructional delivery. When business educators are properly trained ans supported, AI can contribute to improved lesson preparation, assessment, student engagement, personalized learning, feedback and overall instructional effectiveness.

Recommendations

Based on the findings of the study, the following recommendations are hereby made:

1. Universities should retrain Business Educators on ICT programmes for continuous knowledge update on digital technologies which will enhance their efficiency in instructional delivery.
2. Adequate ICT infrastructure should be provide such as internet connectivity, electricity supply, computers, smart classroom facilities and access to appropriate AI-enabled educational platforms.
3. Universities should liaise with Digital Bridge Institute to organize special training on Advance Digital Appreciation programmes for Business Educators who have little or no training in computer appreciation.

IMPACT OF TECHNICAL EDUCATION EXPENDITURE ON UNEMPLOYMENT REDUCTION IN NIGERIA 1999-2025.

By
Obaji Samuel Itumo
Obajisamuel64@gmail.com
(WhatSapp Number; 08035867586)
Department of Economics Ebonyi State College of Education, Ikwo

Abstract

This study investigated the impact of technical education on unemployment reduction in Nigeria from 2000-2025. In order to achieve the empirical result, unemployment rate and education expenditures growth rate were utilized. Multiple regression analysis was utilized in the study in which auto regression distributed lag model was the main method of analysis used in the research. The ARDL model was employed to examine the long-run relationship and short-run relationship among the variables under consideration. The result did not reveal evidence of long run relationship amongst the variables. The result further revealed that expenditure on technical education had positive and significant impact on unemployment reduction in the short run and insignificant in the long-run. The result implies that any economic policy that raises technical education expenditure do not have any significant effect in reducing unemployment against the conventional believe that the policy will significantly reduce the level of unemployment in the country. Thus, the study recommended that government should incorporate period of indenture after secondary education before moving to tertiary education programme to ensure practical training that will make it more effective. Secondly the study recommended for a more robust and honest implementation of technical educational policies.
***Keyword**: Technical education expenditure, unemployment Nigeria.*

Introduction

One of the core objective of Nigerian education policy as stated in the Federal Republic of Nigeria education policy 2004 is to make the recipients self reliant by librating him or her from the chain of ignorance. But today the level of unemployment in the country is quite alarming. Unemployment is contributing a lot to the increasing criminal activities. No meaningful technological and economic development can take place without addressing the issue of unemployment. The educational curriculum which emphasis more on reading and writing is not helping matters, rather it is contributing a lot in exacerbating the trend of unemployment.

An attempt to address the problem was initiated in 1980s with introduction of 6-3-3-4 system of education. With new system the secondary education that use to last for 5 years was made to last for 6 years. The secondary education was divided into two phases. The first phase lasts for three years and second phase also lasts for three years. With the 6-3-3- 4 system skillful and technical subjects like woodwork carpentry technical drawing etc were added to the secondary school curriculum. The aim of the new subjects was to help the recipient of the secondary education acquire skills that will make them employed after graduation and thereby reduce graduate unemployment. At the tertiary level more universities of technology and polytechnics were established for the production of skillful graduates.

Awonuga (2014) in this regard posits that curbing of unemployment in Nigeria requires providing the right skill to the people through technical and vocational education. Olaitan (1996) had earlier stated that vocational education is the essential ingredient that will enable individual to meet their developmental needs and aspirations. Also Akindeinde (2010) argued that in order to achieve the African continent's developmental aspiration young people need to have access to an education that will enable them to enhance the standard of living by acquiring skills that will be in high demand in the labour market.

The country is also facing other problems like poverty, environmental degradation, epileptic power supply etc. This problem requires technical knowledge that will help to reduce them. In this case, Dike (2009) stated that technical and vocational education constitutes an important element to national development strategy in many countries of the world. The belief is that technology will play an important role in the transformation of economies which will help to improve people's standard of living. Technical knowledge is believed to be a dominant factor in increasing human progress and development. Also Aja (2009) stated that practical training of students in vocational and technical education will make Nigeria to become a contributor in technology and be able to compete in the world market. Against this

backdrop, Amoor (2010) argued that the literary style of Western education as introduced in Africa contributed a lot towards the wrong perception of technical and vocational education (VTE) especially the fact that most parent want their children to be prestigious by acquiring literary education that will make them speak foreign languages at the expense of their indigenous language. With such mindset, parents tend to discourage their children from taking up career training that would lead them to career job.

Statement of Problem

Unemployment in Nigeria has become a critical problem requiring declaration of state of emergency so as to lay a stronger emphasis in proffering solution. Unemployment has become endemic issue that constitutes major research problem which many researchers, analyst and economists have been investigating to find the possible solution. An attempt towards solution led to federal government of Nigeria's introduction of 6-3-3- 4 system of education incorporating technical and vocational subjects like; Woodwork, Electrical wiring, Mechanics etc into the school curriculum. The new subjects were introduced to make recipients of secondary education in the country to acquire any of such skills to make them self employed on graduation. The new system failed due to lack of indigenous instructors, deficiency of instructional materials for practicals, lack of interest on the part of parents and children who prefer literary education that could provide them white collar job, poor implementation of the policy. The shortage of white collar jobs contributed to the exacerbating of unemployment rate.

Even before the advent of western educational system in Nigeria, families had been performing the role of training their children in practical skills especially in agriculture and craft. The decline in many skills and craftsmanship can be majorly attributed to the influence of western education that emphasize more on training and preparing its recipients for white collar jobs. This invariably led to another problem of urbanization and neglect of rural agriculture. The urbanization contributes a lot in increasing the level of unemployment in the country.

Onwuchekwa (2010) observed that even the British that brought Literary education to Africa and Nigeria in particular are using her Employment and training act of 1973 to address manpower need using technical and vocational training TVTE. But here in Nigeria such policies are merely a formality on paper. He further stated that developed countries lay much emphasis on the training of skilled manpower for their economic development yet Africans are yet to learn their lessons.

Also other attempt to reduce unemployment led to the establishment of technical schools, technical colleges, polytechnics, university of technologies by the federal government and many states in the country. Today many private investors in education are investing in technical and vocational schools across the country as a means of making the recipients of modern education to acquire knowledge that will make them self employed or even employer of labour. Currently most of these schools have turned from their primary courses to other none technical and vocational subject to arts and social science related programmes. Despite all the outlined measure unemployment seems to be on the increasing casting doubt on the efficacy of public expenditures on technical and vocational education in the country.

Research Hypothesis

1. Public expenditure on technical education has no significant effect on unemployment reduction in Nigeria.
2. There is no long-run relationship between public expenditure on technical education and unemployment reduction in Nigeria.

Objective of the Study

The main objective of this study is to determine the impact of technical education on unemployment reduction in Nigeria from 1999-2025.

The specific objectives include;

i. To determines if there is significant impact of government expenditure on technical education on unemployment in Nigeria.
ii. To determines the directional relationship between government expenditure and technical education and unemployment within the study period.

Review of related Literature

Introduction of technical and vocational education in Nigerian education curriculum constitutes one of the major policy change aimed at unemployment reduction in the country. This equally led to some major changes in education curriculum shifting emphasis on literary education that provides only the skill of reading and writing. With this, the funding pattern in education changed from what it used to be in the past. The change from the original pattern of western education is geared towards making the

recipient of new education to be self employed and at most employer of labour. In this regard, Manukuyomi (2006) posits that western education as brought to Africa was not favourable to the vocational and technical training. The product of such education had the prospect for “white collar job” that are alien to Africans. Such mindset does not augur well for the developing countries especially one with high level of unemployment that needs technical knowledge to enable them add values to their existing primary products (Iheanacho 2006).

Nigerian National policy on Education NPE (2004) states that vocational and technical education is a comprehensive term that has to do with all the education process that in addition to general education incorporate technical and other related science including skill acquisition and occupational related knowledge in different sectors of economic and social life. Vocational and technical education has two basic units which are; general education that provides the recipient the broad based knowledge that would make them to be functional member of the society and technical cum occupational skills that would prepare the recipient for the world of work. In line with this, the NPE (2004) enumerated the goals of VTE as; providing trained manpower in applied sciences, technology and business, particularly in craft, advance craft and technical level. Secondly providing the technical knowledge and vocational skills necessary for agriculture,, commercial and economic development is necessary. Thirdly, giving training to teach the necessary skill to individual that will make them self reliant economically Is a good source of unemployment reduction. In a similar reasoning, Ekong (2006) posits that VTE is a specialized training organized either in a formal or informal setting for the purpose of impacting occupational skill to individual or groups of individuals. It is aimed at enabling the recipient to acquire skills that would make them render specialized services or become creative to enable then be self employed and possibly become employer of labour.

Empirical Review

Sokolic as cited in Isiaqi and Aduralere (2023) studied the impact of demographic and education on youth unemployment rate in Europe with emphasis on the effect of active labour market policies on changes on unemployment. The result shows a significant impact of the variables on youth unemployment changes. Also Arshada and Malika (2015) investigated the impact of human capital on labour productivity in Malaysia using panel data covering 14 states in the country starting from 2009 to 2012. The analysis was done using fixed effect generalized least square (GLS) model. The result revealed that human capital quality like educational level and better health status has significant effect in improving labour productivity. It was equally observed that the impact of education is less significant when compared to health status.

A similar study was conducted by Ngutsav, Akighir and Lorember (2017) to determine the relationship between education financing, labour productivity and economic development in Nigeria from 1970 to 2015 using vector Autoregressive model. The result revealed the existence of Long-run relation between the variables investigated. In the short-run education financing has a positive but insignificant relation with economic growth.

Gap in literature

There appear to be strong gap in the literature addressing the impact of Technical and Vocational education spending and unemployment dynamics in Nigeria. This is quite puzzling given the potential investment in the sector with a view to reduce the level of unemployment. Yet most of the works reviewed are mere opinion papers lacking empirical aspect which this work intends to fill.

Methodology

Research Design

This study investigated the impact of technical education expenditure on unemployment reduction in Nigeria for the period between 1999 and 2025.The research adopted expost-facto research design in its investigation. Expost-facto refers to the research that utilizes already existing data which cannot be manipulated. It is also the type of research design adopted when the study aimed at finding the impact of some variables on other variables is already in existence. Unit root test, Autoregressive Distributed Lag (ARDL) and Granger causality test are the basic methods of analyses used in the study. The unit root test is used to examine the order of integration amongst the variables. The ARDL model was utilized in investigating the long-run and short-run coefficients of the variables under study. And the Granger causality test was utilized to investigate the directional causality amongst the variables under consideration.

Model Specification

The model specification adopted the neoclassical growth model as developed by Solow (1956) as the theoretical framework of the study with modification. The model was mathematically specified as;

UMP = (TVEX + INFR)

It is transformed econometrically as thus;

$UMP = \lambda_o + \lambda_1 TVEX + \lambda_2 INFR + \xi_O$
Where;
UMP = Unemployment
λ_o = constant term
$\Lambda_0, \lambda_1, \lambda_2$ = lambda coefficients
TVEX = Technical and vocational education expenditure
INFR = Inflation rate.
ξ_O = error term
In log function, it specified as thus:
$Log\ UMP = \lambda_o + \lambda_1 TVEX + \lambda_2 INFR + \xi_0$
Where; LUMP is the explained variable; whereas, TVEX, EDEX are the explanatory variables ξ_0 is the error term; λ is the constant term.

A Priori Expectation

Theoretically, the study expects that unemployment rate will have negative sign as technical and vocational education expenditure and total education expenditure increases.

Sources of Data

Time series data were utilized in this investigation using variables starting from 1999 to 2025. The data were collected from Central Bank of Nigeria (CBN) Statistical Bulletin.

Results

Table 1 ADF Unit Root Test at level and First Differencing

Variable	Level	5% CV	Critical ADF Statistc	5%1st diff	Remark	Rank
UMP	-2.886225	0.5793	-2.991878	0.0199	Stationary	1(1)
TVEX	-3.005538	0.0481	-6.817595	0.0000	Stationary	1(1)
INFR	-3.044848	0.0443	-	-	Stationary	1(0)

Source; Researcher's computation from E-view 13 version

The table above illustrates the result of Augmented Dickey –Fuller unit root test. The result indicates that the variable inflation rate INFR have unit root (stationary @ level) at level since its ADF test statistic is less than the chosen 5% critical value. However, the test indicates that UMP and TVEX have unit root after first differencing since the results of their ADF test static are less than 5% critical values after the differencing. It now show that all the variables employed in the study has long-run properties after first differencing. It means that their means, variance and covariance are constant. The study concludes that there is a mixed order of integration existing among the variables since some are integrated at order one while the other is integrated of order zero. With mixed order of integration we applied Auto Regressive Distributed lag (ARDL) model in the investigation as suggested by Pesaran and Shin (1999).

ARDL ESTIMATION

Variable	Coefficient	Std. Error	t-Statistic	Prob.*
UMP(-1)	0.993444	0.250590	3.964417	0.0033
UMP(-2)	-0.754906	0.250553	-3.012961	0.0146
TVEX	-0.038434	0.015731	-2.443190	0.0372
TVEX(-1)	-0.006685	0.015692	-0.425983	0.6801
TVEX(-2)	0.000703	0.015206	0.046237	0.9641
TVEX(-3)	-0.033782	0.014744	-2.291273	0.0477
TVEX(-4)	0.013002	0.013039	0.997134	0.3448
INFR	-0.024074	0.022353	-1.076988	0.3095
INFR(-1)	-0.012670	0.025959	-0.488067	0.6372
INFR(-2)	-0.039112	0.034174	-1.144492	0.2819
INFR(-3)	0.011740	0.031884	0.368214	0.7212
INFR(-4)	-0.071071	0.030629	-2.320389	0.0455
C	5.590603	2.203681	2.536939	0.0319

R-squared	0.895747	Mean dependent var	4.025909
Adjusted R-squared	0.756743	S.D. dependent var	0.772014
S.E. of regression	0.380766	Akaike info criterion	1.194736
Sum squared resid	1.304844	Schwarz criterion	1.839443

Log likelihood	-0.142098	Hannan-Quinn criter.	1.346610
F-statistic	6.444040	Durbin-Watson stat	2.098201
Prob(F-statistic)	0.004420		

Source; Researcher's computation from E-view 13 version

The estimated results clearly indicated that Technical and vocational education expenditure at zero lag has positive and significant impact on unemployment dynamics. Also at lag one (1) it has negative and insignificant impact on unemployment. The claims are supported by the coefficients of P-value of the estimated regression equation which are 0.0372 at zero lag and 0.6801. Inflation rate used as control variable have no significant impact with unemployment at zero and any lag level.

The result also indicates coefficient of multiple determination (R^2) value of 0.89574 which implies that 90% explained variation in unemployment by the explanatory variable. The results similarly indicate F-Statistic value of 0.004420 which shows that the joint influence of the explanatory variables on the explained variable is statistically significant. The Durbin Watson (DW) value 2.098201 indicates that there is no evidence of serial correlation (autocorrrelation) in the model.

ARDL BOUN D TEST
Null hypothesis: No levels relationship
Number of cointegrating variables: 2
Trend type: Rest. constant (Case 2)
Sample size: 22

Test Statistic	Value
F-statistic	2.814044

	10%		5%		1%	
Sample Size	I(0)	I(1)	I(0)	I(1)	I(0)	I(1)
30	2.915	3.695	3.538	4.428	5.155	6.265
Asymptotic	2.630	3.350	3.100	3.870	4.130	5.000

Source; Researcher's computation from E-view 13 version

This bound test above was used to find out if there is the presence of long-run equilibrium relationship amongst the variables under study. The test shows F-Statistic value 2.814044 while the upper bound of the critical value at 5% level of significance value 4.428. The F-Statistic 2.514047 is lower than the 5% critical value. We therefore accept the null hypothesis that there is no long-run relationship among the variables and conclude that there is no evidence of long-run relationship found among the variable under study.

Pairwise Granger Causality Test

Null Hypothesis:	Obs	F-Statistic	Prob.
TVEX does not Granger Cause UMP	25	0.35933	0.5550
UMP does not Granger Cause TVEX		1.84697	0.1879

Source: Author's Computation from E-view 13 version.

The Pair wise Granger Causality test as presented using table revealed that there is no directional causality between expenditure on technical and vocational education and unemployment in Nigeria within the period under review. It is evidenced by the probability value of TVEX which is 0.5550 and that of UNMP which is 0.1879 showing that both are greater than the 5% level of significance. It implies that neither TVEX granger cause UNMP nor UMP granger cause TVEX.

Table 4; Breush- Godfrey Serial Correlation LM Test

F-statistic	0.079564	Prob. F(1,8)	0.7850
Obs*R-squared	0.216646	Prob. Chi-Square(1)	0.6416

Source; Researcher's computation from E-view 13 version

The serial correlation LM test was conducted to ascertain if there is existence of serial autocorrelation and the result indicates absence of serial correlation up to lag p order where p stands for a specified integer. The alternative is ARMA (r, q) errors where r represents the number of lag terms and p =max(r, q).The result Obs® R-squared statistic value is 0.21646 while the probability Ch-square (2) value is 0.6416. The probability Ch-square value 0.6416 is greater than the chosen 5% level of significance and we therefore conclude that there is no serial correlation in the model and that the model is a good fit for the investigation.

Conclusion and Recommendation

This study investigated the impact of expenditure on technical and vocational education on unemployment reduction in Nigeria from the year 2000 to 2026. The empirical investigation was done using ARDL where growth in education expenditure was used as explanatory variable while unemployment rate was used as explained variable. The result revealed evidence of short-run relationship but there were no evidence of long-run relationship. Based on the research finding the researcher recommended that; government and policy makers and implementers should have rethink on how to reshape our educational curriculum. In this case, we suggest that at least 2 years of indenture after secondary education before allowing a child to enter tertiary instruction. This will enable the child to acquire practical skill which will aid them in their technical and vocational subjects.

Secondly, based on the result the researcher is recommending for complete overhaul of our technical and vocational schools. Government should avoid mixing technical school with other courses like social sciences, Languages as obtained in most of them today. For instance ,our school of agriculture, universities of technologies are just answering such names but are filled with non technical courses like Accountancy, Banking and Finance, political science Sociology etc. That should not be the case if we actually want to run a technical and vocational schools.

Department of Business Education
University of Calabar
Coresponding email: cleatah4real@yahoo.com
Phone: 08138847990

Abstract

This study examined the integration of entrepreneurship education into Technical and Vocational Education and Training (TVET) for economic transformation in Nigeria. Specifically, the study examined the extent to which entrepreneurship education is integrated into TVET for entrepreneurial skills development and determined the extent to which such integration contributes to enterprise creation and innovation for economic transformation. Two research questions and two null hypotheses guided the study. A correlational research design was adopted. The population comprised 113 lecturers in the Faculty of Vocational and Entrepreneurial Education, University of Calabar, Calabar, Cross River State, Nigeria. Owing to the manageable population size, the entire population was studied using the census sampling technique. Data were collected using a structured 20-item questionnaire titled Entrepreneurship Education Integration and Economic Transformation Questionnaire (EEIETQ). The instrument yielded Cronbach's alpha reliability coefficients of 0.89 and 0.91 for the two constructs, with an overall reliability coefficient of 0.93. Mean and standard deviation were used to answer the research questions, while simple linear regression was employed to test the null hypotheses at the 0.05 level of significance. The findings revealed that entrepreneurship education was integrated into TVET to a high extent for entrepreneurial skills development, with a cluster mean of 3.13. Similarly, entrepreneurship education contributed to enterprise creation and innovation to a high extent, with a cluster mean of 3.18. Regression analysis further showed that entrepreneurship education integration significantly predicted entrepreneurial skills development, $R = .580$, $R^2 = .336$, $F(1, 111) = 56.23$, $p < .001$, and enterprise creation and innovation, $R = .640$, $R^2 = .410$, $F(1, 111) = 77.20$, $p < .001$. Accordingly, both null hypotheses were rejected. The study concluded that effective integration of entrepreneurship education into TVET can strengthen entrepreneurial competencies, facilitate enterprise creation and innovation, and support economic transformation in Nigeria. It was recommended that TVET institutions strengthen practical entrepreneurship projects, mentorship, industry partnerships, digital entrepreneurship initiatives, enterprise incubation, and access to start-up finance to facilitate the transition from vocational training to sustainable enterprise development.

Keywords: Entrepreneurship education, Technical and vocational education and training, Entrepreneurial skills, Enterprise creation, Innovation and economic transformation

Introduction

Economic transformation is increasingly dependent on the capacity of a country to develop a productive, innovative and entrepreneurial workforce capable of responding to changing labour-market demands. In developing economies such as Nigeria, the challenge is not only to provide access to education but also to ensure that education equips individuals with relevant technical, vocational, entrepreneurial and digital competencies that can translate knowledge into productive economic activities. Technical and Vocational Education and Training (TVET) occupies an important position in this regard because it provides practical knowledge and occupational competencies for employment, self-employment and enterprise development. Contemporary TVET extends beyond the preparation of individuals for wage employment to include entrepreneurship, innovation, lifelong learning and participation in emerging economic sectors. The United Nations Educational, Scientific and Cultural Organization (UNESCO, 2022) emphasised that contemporary TVET should prepare young people and adults for employment, decent work, entrepreneurship and lifelong learning while supporting digital

transformation, green economic development, innovation and productive engagement with the private sector. This orientation makes TVET a potentially important instrument for developing the human capital required for sustainable economic transformation.

In Nigeria, the relevance of TVET is reinforced by national educational policy, which emphasises the acquisition of practical skills, applied knowledge and appropriate attitudes necessary for occupational competence, useful living and national development. The Federal Republic of Nigeria (2013) recognised the importance of education in preparing individuals to contribute meaningfully to economic and social development through the acquisition of relevant knowledge and skills. Similarly, the National Board for Technical Education (NBTE, 2023) incorporated entrepreneurship courses into the curriculum and course specifications for National Diploma programmes, with emphasis on enterprise formation, business management, self-employment and understanding the Nigerian business environment. These policy and curriculum provisions demonstrate an institutional recognition that technical competence alone may not be sufficient to prepare TVET graduates for contemporary economic realities. Graduates also require the ability to recognise opportunities, mobilise resources, develop business ideas, manage enterprises, innovate and respond effectively to market needs.

Entrepreneurship education is therefore an important component of TVET because it complements technical competencies with the knowledge, attitudes and skills required to identify and exploit economic opportunities. Entrepreneurship education generally involves learning experiences designed to develop opportunity recognition, creativity, innovation, risk-taking, business planning, financial management, marketing, decision-making and enterprise-management competencies. When embedded within TVET, these competencies can enable learners to transform technical skills into commercially viable products and services rather than relying exclusively on formal wage employment after graduation. Abanyam, Edeh, and Abanyam (2023) argued that repositioning TVET and entrepreneurship education towards self-reliance can contribute to addressing youth unemployment and promoting economic independence. Similarly, Alfred and Kayoma (2016) emphasised that entrepreneurship education within TVET is important for job creation and national development because technical training should prepare learners not only to perform occupational tasks but also to establish, operate and sustain businesses. Thus, integrating entrepreneurship education into TVET can create a more holistic educational model in which technical proficiency is combined with entrepreneurial capability.

The need for such integration is particularly significant given the persistent unemployment, underemployment and skills-mismatch challenges confronting Nigeria. Large numbers of young people enter the labour market each year, while opportunities for formal employment remain insufficient to absorb all new entrants. Consequently, an education system that primarily prepares graduates to seek employment may be inadequate in an environment where employment opportunities are limited and rapidly changing. Entrepreneurship-oriented TVET can provide an alternative pathway by equipping learners with the capacity to create their own economic opportunities and potentially generate employment for others. Yisa, Adetunji, and Areo (2026) noted that harmonising entrepreneurship education with TVET can strengthen problem-solving, innovation, self-reliance and business-creation capabilities because technical competence without entrepreneurial capacity may not sufficiently enable graduates to convert their skills into sustainable economic ventures. This integration can therefore reposition TVET graduates from being predominantly job seekers to becoming potential job creators and contributors to local economic development.

The importance of entrepreneurship within vocational education is also reflected in the broader vocationalisation of education in Nigeria. Ngozi (2015) emphasised the importance of practical competencies that are relevant to individual productivity and national development. For TVET to fulfil this role effectively, learners require opportunities to apply classroom knowledge to authentic economic and occupational situations. Entrepreneurship education provides a framework for such application by exposing learners to business planning, opportunity identification, product development, marketing, customer relations, financial management and enterprise management. In this context, entrepreneurship education should not be treated as an isolated theoretical subject but as an integrated component of the TVET learning process. Practical projects, simulations, enterprise activities, mentorship and industry-based experiences can enable learners to connect their technical skills with actual business opportunities.

The development of entrepreneurial skills among TVET learners is particularly important because entrepreneurial competence encompasses more than the ability to establish a business. It includes creativity, innovation, opportunity recognition, problem-solving, communication, financial literacy, digital competence, resource mobilisation, decision-making and the confidence to operate in uncertain environments. Evidence from Nigerian and international studies supports the potential of

entrepreneurship education to develop these competencies. Musa A. Abdulkarim (2019) found that an action-based experiential approach significantly improved entrepreneurial skills among NCE II Business Education students compared with direct instruction, demonstrating the importance of practical learning in entrepreneurship education. Hassan Haruna (2026) similarly reported that entrepreneurship education significantly enhanced communication, problem-solving and ICT competencies as well as entrepreneurial intentions among Business Education students in North-Eastern Nigeria. Emmanuel Nweke and Mariam-Aminaho Osakwe (2024) also established the relevance of entrepreneurial skills, including conceptual, social-trading and computer-application skills, to technical and vocational education students in Rivers State. These findings suggest that entrepreneurship education can strengthen the competencies required for learners to function effectively in both employment and entrepreneurial environments.

Further evidence indicates that entrepreneurship education does not influence all entrepreneurial competencies in exactly the same way. Buhari (2024) found that entrepreneurship education significantly influenced business planning and marketing skills among Business Education students, whereas its influence on financial-management skills was not significant. This finding suggests that the effectiveness of entrepreneurship education may depend on the particular competency being developed and the nature of learning experiences provided. Similarly, Bahaw et al. (2024) found that a six-month entrepreneurship education intervention improved entrepreneurial intention, attitudes, subjective norms and perceived behavioural control among vocational students. Li and Islam (2021) also reported that perceived entrepreneurship education positively influenced entrepreneurial self-efficacy and entrepreneurial intention among higher vocational students. Taken together, these studies indicate that effective integration of entrepreneurship education into TVET can contribute to both cognitive and behavioural dimensions of entrepreneurial development. However, the extent to which such integration develops practical entrepreneurial skills may depend on the quality of curriculum implementation, experiential learning opportunities, instructor competence and institutional support.

Beyond entrepreneurial skills development, integrating entrepreneurship education into TVET has important implications for enterprise creation and innovation. Enterprise creation involves the capacity of individuals to transform business opportunities and ideas into viable ventures capable of generating income and employment. Innovation, on the other hand, involves the creation, adaptation or application of new products, services, processes, technologies or business approaches. These outcomes are central to economic transformation because new enterprises can expand productive capacity, generate employment, stimulate competition, improve access to goods and services and create opportunities for local economic development. TVET institutions can contribute to these processes by enabling learners to apply their technical knowledge to the development of market-oriented products and services. Entrepreneurship education provides the additional knowledge required to evaluate market opportunities, develop business models, mobilise resources and commercialise technical innovations.

Evidence from recent studies supports the relationship between entrepreneurship education, enterprise development and innovation. Muyiwa Oyinlola et al. (2024) found that entrepreneurship education, innovation support and university–industry partnerships create important opportunities for entrepreneurial development among Nigerian students, although inadequate funding and institutional capacity remain significant constraints. S. A. Keelson et al. (2025) established a significant relationship between innovation and entrepreneurship education and reported a positive effect of entrepreneurship education on entrepreneurial mindset among TVET students in Ghana. In Nigeria, Oluchi Chinazor Obi, Chikeremma Adamma Akudolu, and Nzube Happiness Ikpat (2025) found a significant positive relationship between entrepreneurship workshops and entrepreneurial intentions among Technology and Vocational Education students. These findings indicate that practical entrepreneurship experiences can stimulate learners' interest in venture creation and strengthen their orientation towards innovative economic activities.

Other studies, however, suggest that the contribution of entrepreneurship education to innovation may vary across different forms of entrepreneurial outcomes. Muhammad Sagir Abubakar and Modibbo Buba Muhammed (2026) found that entrepreneurship education significantly influenced marketing innovation among Office Technology and Management graduates but did not significantly influence social innovation. This suggests that entrepreneurship education may be more effective in promoting some forms of innovation than others, depending on curriculum content and learning experiences. Similarly, Ganiyu Akeem Adewale and Oshotoye Bradford Adedayo (2026) found a significant positive relationship between entrepreneurship education and graduate entrepreneurial intentions among TVET students in Southwest Nigeria, although inadequate funding and mentorship

were identified as important constraints. Barakabo (2026), based on a review of recent empirical and policy evidence, further identified practical training, instructor competence, digital skills, mentorship and market linkages as important factors for improving entrepreneurial outcomes, while inadequate finance, infrastructure and post-training support can limit enterprise development.

The digital transformation of the economy further strengthens the need to integrate entrepreneurship education into TVET. Contemporary enterprises increasingly depend on digital technologies for production, marketing, financial transactions, customer relationship management, communication and access to markets. Consequently, TVET learners require digital entrepreneurial competencies that enable them to use technology not only as a workplace tool but also as an instrument for identifying opportunities, creating products and services and developing innovative business models. Ajuluchukwu and Osakwe (2019) highlighted the importance of ICT competencies and employability potentials among undergraduate Business Education students in preparing learners for changing workplace demands. More recently, Ajuluchukwu, Atah, and Emogor (2026) emphasised the importance of human–artificial intelligence collaboration and 21st-century skills among Business Education graduates. These developments suggest that entrepreneurship education within TVET should incorporate digital technologies, emerging technologies and technology-enabled business practices to ensure that learners remain relevant within an increasingly digital economy.

Practical exposure is another critical factor in achieving effective integration. Entrepreneurship education is unlikely to produce substantial economic outcomes if learners are exposed mainly to theoretical concepts without opportunities to practise enterprise development. Practical entrepreneurship projects can allow learners to identify problems, generate business ideas, develop prototypes, undertake market research, prepare business plans, interact with customers and assess the viability of their products or services. Industry-based learning can further expose students to real-world business operations and provide opportunities for mentorship and professional networking. Ajuluchukwu and Udida (2022) highlighted the importance of adequate physical facilities and equipment for effective practical and competency-based training. Without appropriate workshops, laboratories, digital facilities, production equipment and other learning resources, the practical dimension of TVET may be weakened, limiting the capacity of learners to translate technical and entrepreneurial knowledge into productive activities.

Industry collaboration is equally important because enterprise development occurs within a broader economic ecosystem. Effective partnerships between TVET institutions, industries, entrepreneurs, financial institutions and government agencies can provide learners with opportunities for internships, mentorship, market exposure, technology transfer and access to business networks. Ajuluchukwu (2017) emphasised the relationship between corporate social responsibility and sustainable development in TVET, indicating the importance of connecting educational institutions with wider socioeconomic development processes. Stronger industry linkages can therefore help institutions ensure that entrepreneurship education reflects actual market needs and emerging occupational opportunities. The National Board for Technical Education (NBTE, 2026) has also continued to emphasise the strengthening of technical and vocational skills development in response to labour-market and industry needs. This direction reinforces the argument for a TVET system that is closely connected to productive sectors of the economy.

Despite the potential benefits of integrating entrepreneurship education into TVET, several challenges may limit its effectiveness in Nigeria. These include inadequate infrastructure and equipment, insufficient funding, limited access to modern technologies, weak industry–institution partnerships, inadequate mentorship, shortages of qualified instructors and limited access to post-training enterprise support. Learners may also experience difficulties in accessing finance for business start-up and expansion. These challenges can create a gap between the acquisition of entrepreneurial knowledge and the actual establishment or sustainability of enterprises. Consequently, curriculum integration alone may not be sufficient to achieve economic transformation unless it is accompanied by an enabling institutional and entrepreneurial ecosystem. TVET institutions need to provide practical learning environments, competent instructors, digital resources, mentorship, incubation opportunities, industry partnerships and mechanisms for connecting graduates with finance and markets.

The empirical evidence reviewed provides considerable support for the potential of entrepreneurship education to strengthen both entrepreneurial skills and enterprise-oriented outcomes. However, much of the existing literature has examined individual dimensions such as entrepreneurial intention, self-efficacy, specific entrepreneurial skills or innovation, while relatively fewer studies have examined the broader integration of entrepreneurship education into TVET in relation to both entrepreneurial skills development and enterprise creation and innovation within the Nigerian context. Furthermore, some existing studies were conducted among university or college students rather than

lecturers who are directly involved in curriculum implementation and the delivery of TVET programmes. The perspectives of lecturers are particularly relevant because they possess direct knowledge of curriculum content, teaching practices, practical training, institutional resources and the extent to which entrepreneurship education is actually embedded in TVET programmes.

Against this background, integrating entrepreneurship education into Technical and Vocational Education and Training represents an important strategy for economic transformation in Nigeria. Such integration can provide learners with a combination of technical, entrepreneurial, digital and employability competencies required to participate productively in a changing economy. It can support self-employment, enterprise creation, job generation, innovation and local economic development. Although Nigeria has made policy and curriculum efforts to strengthen entrepreneurship within TVET, continuing challenges relating to unemployment, skills mismatch, inadequate practical training, weak industry linkages, insufficient infrastructure and limited enterprise-support mechanisms indicate the need for sustained empirical attention to how the two areas can be effectively integrated. It is against this background that the present study examines integrating entrepreneurship education into Technical and Vocational Education and Training (TVET) for economic transformation in Nigeria, with particular attention to its contribution to entrepreneurial skills development, enterprise creation and innovation.

Problem of the Study

Nigeria has a large youth population and an extensive network of Technical and Vocational Education and Training (TVET) institutions that could contribute significantly to skills development, employment creation and economic transformation. TVET is expected to provide learners with practical occupational competencies for employment and self-employment, while entrepreneurship education develops the ability to identify opportunities, manage resources, innovate and create enterprises. However, despite the complementary roles of both areas, their effective integration within the Nigerian TVET system remains a concern. A major problem is that many TVET programmes continue to focus largely on technical skills without adequately connecting them with entrepreneurship, enterprise creation and innovation. Although entrepreneurship education has been incorporated into aspects of the TVET curriculum, its inclusion as a course does not necessarily guarantee that learners acquire the practical competencies required to establish and sustain businesses. This creates a possible gap between curriculum provisions and the practical entrepreneurial outcomes expected from TVET graduates.

The problem is further compounded by inadequate practical training, limited industry linkages, insufficient infrastructure and equipment, weak mentorship opportunities and inadequate exposure to emerging technologies. Where learners have limited opportunities to engage in practical enterprise activities, interact with entrepreneurs, develop business ideas or gain industry experience, they may acquire technical knowledge without developing the confidence and entrepreneurial capacity to transform their skills into viable economic activities. Access to finance and other forms of enterprise support also remains a challenge. Even when graduates possess technical and entrepreneurial competencies, inadequate start-up capital, mentorship, business advisory services, incubation opportunities and market access may prevent them from converting their skills and ideas into sustainable enterprises. Similarly, the rapid growth of digital technologies requires TVET graduates to develop competencies in digital marketing, e-commerce, electronic payments and technology-based business development. Where these competencies are not sufficiently integrated into entrepreneurship education, graduates may be unable to take full advantage of emerging entrepreneurial opportunities.

Consequently, the potential of TVET to contribute to self-employment, enterprise creation, innovation and broader economic transformation may remain underutilised. The problem of the study, therefore, is the apparent gap between the expected contribution of entrepreneurship-integrated TVET to economic transformation and the practical challenges affecting its effective implementation in Nigeria. The study consequently examines integrating entrepreneurship education into Technical and Vocational Education and Training (TVET) for economic transformation in Nigeria, particularly in relation to entrepreneurial skills development, enterprise creation and innovation.

Objectives of the Study

The study examined “Integrating Entrepreneurship Education into Technical and Vocational Education and Training (TVET) for Economic Transformation in Nigeria.” Specifically, the study sought to:

1. Examine the extent to which entrepreneurship education is integrated into Technical and Vocational Education and Training (TVET) for the development of entrepreneurial skills among TVET learners in Nigeria.

2. Determine the extent to which the integration of entrepreneurship education into TVET contributes to enterprise creation and innovation for economic transformation in Nigeria.

Research Questions

The following research questions guide the study:

1. To what extent is entrepreneurship education integrated into Technical and Vocational Education and Training (TVET) for the development of entrepreneurial skills among TVET learners in Nigeria?
2. To what extent does the integration of entrepreneurship education into TVET contribute to enterprise creation and innovation for economic transformation in Nigeria?

Hypotheses

The following null hypotheses are tested at the 0.05 level of significance:

H_{01}: There is no significant contribution of the integration of entrepreneurship education into Technical and Vocational Education and Training (TVET) to the development of entrepreneurial skills among TVET learners in Nigeria.

H_{02}: There is no significant contribution of the integration of entrepreneurship education into Technical and Vocational Education and Training (TVET) to enterprise creation and innovation for economic transformation in Nigeria.

Methods

The study adopted a correlational research design. The design was considered appropriate because the study sought to determine the extent to which entrepreneurship education is integrated into Technical and Vocational Education and Training (TVET) and to examine its contribution to entrepreneurial skills development, enterprise creation and innovation for economic transformation in Nigeria. The correlational design enabled the researcher to obtain data on respondents' perceptions of entrepreneurship education integration and determine the nature and extent of relationships between the study variables without manipulating any of them. The design was particularly suitable for examining whether variations in the integration of entrepreneurship education were associated with corresponding variations in entrepreneurial skills development and enterprise creation and innovation.

The population of the study comprised 113 lecturers in the Faculty of Vocational and Entrepreneurial Education, University of Calabar, Calabar, Cross River State, Nigeria. The population consisted of lecturers from five departments in the Faculty, namely Agricultural Education, with 15 lecturers; Business Education, with 40 lecturers; Home Economics Education, with 8 lecturers; Adult and Continuing Education, with 40 lecturers; and Educational Technology, with 10 lecturers. Since the population was relatively small and manageable, the researcher adopted the census sampling technique. Consequently, the entire population of 113 lecturers was used for the study, and no sampling was undertaken. Thus, all the lecturers in the Faculty constituted the respondents for the study.

Data were collected using a structured questionnaire titled *Entrepreneurship Education Integration and Economic Transformation Questionnaire (EEIETQ)*. The questionnaire was developed by the researcher based on the objectives, research questions and hypotheses of the study, as well as relevant literature on entrepreneurship education, TVET, entrepreneurial skills development, enterprise creation and innovation. The questionnaire consisted of two substantive sections. Section A, titled *Integration of Entrepreneurship Education into TVET for Entrepreneurial Skills Development (IEETESD)*, comprised 10 items designed to measure the extent to which entrepreneurship education is integrated into TVET programmes for the development of entrepreneurial competencies. The items addressed key areas such as opportunity identification, business planning, problem-solving, small-business management, marketing, digital technology application, financial management, practical entrepreneurship projects, mentorship and entrepreneurial confidence. Section B, titled *Enterprise Creation and Innovation for Economic Transformation (ECIET)*, also comprised 10 items. The items measured the perceived contribution of entrepreneurship education to enterprise creation and innovation for economic transformation. Specifically, the items covered enterprise creation, employment generation, opportunity identification, product and service development, technological innovation, innovative marketing practices, industry-based entrepreneurship, self-employment and local economic development. The questionnaire items were structured on a four-point rating scale of Very High Extent (VHE) = 4, High Extent (HE) = 3, Low Extent (LE) = 2 and Very Low Extent (VLE) = 1. The four-point scale was adopted to eliminate a neutral midpoint and require respondents to indicate the extent to which each statement reflected their views.

The EEIETQ was subjected to face and content validation by experts in Business Education, Entrepreneurship Education, Technical and Vocational Education and Training, and Measurement and Evaluation. The experts examined the questionnaire items in relation to their relevance to the study objectives, clarity of expression, adequacy of coverage, appropriateness of the items for measuring the study variables and suitability for the target respondents. Their observations and recommendations were carefully considered and used to revise ambiguous, repetitive, overlapping or poorly worded items before the final version of the instrument was administered.

The reliability of the questionnaire was established through a pilot test involving TVET learners who were not included in the main study. The pilot-test responses were analysed using Cronbach's alpha reliability coefficient to determine the internal consistency of the items measuring each of the two constructs of the study. The analysis yielded a Cronbach's alpha coefficient of 0.89 for *Integration of Entrepreneurship Education into TVET for Entrepreneurial Skills Development (IEETESD)* and 0.91 for *Enterprise Creation and Innovation for Economic Transformation (ECIET)*. The overall reliability coefficient for the 20-item questionnaire was 0.93. These coefficients exceeded the minimum acceptable threshold of 0.70, indicating satisfactory to high internal consistency among the items. The instrument was therefore considered sufficiently reliable for data collection in the main study.

The researcher administered the questionnaire to the respondents with the assistance of trained research assistants where necessary. Before administration, the purpose of the study and the procedures for completing the questionnaire were explained clearly to the respondents. They were encouraged to provide honest responses based on their experiences and perceptions. The completed questionnaires were retrieved after administration and screened for completeness and usability. Instruments with substantial missing responses were excluded from the analysis, while valid responses were coded and entered into the statistical software for analysis.

The data collected were coded and analysed using descriptive and inferential statistical techniques. The research questions were answered using mean and standard deviation, while the hypotheses were tested using simple linear regression analysis at the 0.05 level of significance. The use of these statistical techniques was consistent with the objectives of the study and enabled the researcher to determine both the extent of entrepreneurship education integration and its contributory relationship with the identified outcome variables. For the research questions, the mean and standard deviation of respondents' ratings were computed for each questionnaire item. The mean scores were used to determine the extent of entrepreneurship education integration, entrepreneurial skills development, enterprise creation and innovation, while the standard deviation indicated the degree of variability or consistency in respondents' ratings. A criterion mean of 2.50 was adopted for decision-making. Consequently, an item with a mean score of 2.50 or above was interpreted as indicating a high extent, whereas an item with a mean score below 2.50 was interpreted as indicating a low extent.

Simple linear regression analysis was employed to test the hypotheses and determine the contributory effect of the integration of entrepreneurship education into TVET on entrepreneurial skills development and enterprise creation and innovation. The first regression model examined the contribution of the integration of entrepreneurship education into TVET to entrepreneurial skills development, while the second model examined its contribution to enterprise creation and innovation for economic transformation. The first regression model was specified as: $ESD = \beta_0 + \beta_1 IEE + \varepsilon$/ where ESD represents entrepreneurial skills development, IEE represents the integration of entrepreneurship education into TVET, β_0 represents the constant or intercept, β_1 represents the regression coefficient, and ε represents the error term.

The second regression model was specified as: $ECI = \beta_0 + \beta_1 IEE + \varepsilon$. where ECI represents enterprise creation and innovation, IEE represents the integration of entrepreneurship education into TVET, β_0 represents the constant or intercept, β_1 represents the regression coefficient, and ε represents the error term.

The regression analysis provided the coefficient of correlation (R), coefficient of determination (R^2), F-value, regression coefficient (β) and significance level (p-value). These statistics were used to determine the strength, explanatory power and statistical significance of the contribution of entrepreneurship education integration to each dependent variable. The null hypothesis was rejected where the associated p-value was less than 0.05 and retained where the p-value was greater than or equal to 0.05. The analytical procedure was therefore aligned with the research questions and hypotheses. Mean and standard deviation were used to establish the extent to which entrepreneurship education was integrated into TVET and the perceived level of the identified outcomes, while simple linear regression was used to determine whether the integration of entrepreneurship education significantly contributed to entrepreneurial skills development and enterprise creation and innovation for economic transformation.

Results

Research Question 1

To what extent is entrepreneurship education integrated into Technical and Vocational Education and Training (TVET) for the development of entrepreneurial skills among TVET learners in Nigeria?

Table 1: Mean and Standard Deviation of Respondents' Ratings on the Integration of Entrepreneurship Education into TVET for Entrepreneurial Skills Development (N = 113)

S/N	Items Statement	Mean	SD	Decision
1	Entrepreneurship education is integrated into TVET programmes to develop students' ability to identify business opportunities.	3.24	0.76	High Extent
2	TVET students receive training in business planning and enterprise development.	3.18	0.81	High Extent
3	Entrepreneurship education develops students' ability to solve business-related problems.	3.29	0.73	High Extent
4	TVET programmes provide students with practical skills for managing small businesses.	3.12	0.84	High Extent
5	Entrepreneurship education develops students' marketing and customer-management skills.	3.16	0.79	High Extent
6	TVET students are trained to apply digital technologies in entrepreneurial activities.	3.08	0.88	High Extent
7	Entrepreneurship education develops students' financial management and resource-mobilisation skills.	2.96	0.91	High Extent
8	Practical entrepreneurship projects are used to strengthen students' entrepreneurial competencies.	3.21	0.77	High Extent
9	TVET students are exposed to successful entrepreneurs who provide practical guidance and mentorship.	2.84	0.98	High Extent
10	Entrepreneurship education develops students' confidence to start and manage their own businesses after graduation.	3.17	0.82	High Extent
	Cluster Mean	**3.13**	**0.83**	**High Extent**

Note: Criterion mean = 2.50.

The data presented in Table 1 show that all the ten items had mean scores above the criterion mean of 2.50, indicating that entrepreneurship education is integrated into TVET programmes to a high extent for the development of entrepreneurial skills. The item on the development of students' ability to solve business-related problems recorded the highest mean score of 3.29 with a standard deviation of 0.73, followed by the development of students' ability to identify business opportunities with a mean of 3.24 and standard deviation of 0.76. Practical entrepreneurship projects also recorded a relatively high mean of 3.21. The lowest mean score of 2.84 was recorded for exposure to successful entrepreneurs for practical guidance and mentorship. Although this was the lowest-rated item, it was still above the

criterion mean, suggesting that mentorship opportunities exist but may not be as strongly integrated as other components of entrepreneurship education. The cluster mean of 3.13 indicates that, overall, entrepreneurship education is integrated into TVET programmes to a high extent for entrepreneurial skills development. The standard deviations, which range from 0.73 to 0.98, indicate reasonable consistency in the respondents' ratings.

Research Question 2

To what extent does the integration of entrepreneurship education into Technical and Vocational Education and Training (TVET) contribute to enterprise creation and innovation for economic transformation in Nigeria?

Table 2: Mean and Standard Deviation of Respondents' Ratings on Enterprise Creation and Innovation for Economic Transformation (N = 113)

S/N	Items	Mean	SD	Decision
1	Entrepreneurship education encourages TVET graduates to establish their own businesses.	3.22	0.79	High Extent
2	Entrepreneurship education increases students' ability to identify viable business opportunities in their communities.	3.27	0.74	High Extent
3	Practical entrepreneurship training encourages students to develop business ideas into marketable products or services.	3.19	0.81	High Extent
4	Entrepreneurship education encourages TVET graduates to create employment for other people.	3.08	0.87	High Extent
5	Entrepreneurship education develops students' capacity to introduce new products and services into the market.	3.14	0.82	High Extent
6	Entrepreneurship education enhances students' ability to use technology to develop innovative business solutions.	3.23	0.77	High Extent
7	Entrepreneurship education encourages students to develop innovative marketing strategies for their businesses.	3.17	0.8	High Extent
8	Industry-based entrepreneurship activities enhance students' capacity to develop innovative business ventures.	2.98	0.93	High Extent
9	Entrepreneurship education enhances the capacity of TVET graduates to generate income through self-employment.	3.2	0.83	High Extent
10	Integrating entrepreneurship education into TVET contributes to local economic development through enterprise creation and innovation.	3.31	0.72	High Extent
	Cluster Mean	**3.18**	**0.81**	**High Extent**

Note: Criterion mean = 2.50.

The data presented in Table 2 reveal that all ten items recorded mean scores above the criterion mean of 2.50. This indicates that the integration of entrepreneurship education into TVET contributes to enterprise creation and innovation for economic transformation to a high extent. The highest mean score of 3.31 was recorded for the view that integrating entrepreneurship education into TVET contributes to local economic development through enterprise creation and innovation. This was followed by students' ability to identify viable business opportunities, with a mean score of 3.27. The item relating to the use of technology to develop innovative business solutions recorded a mean of 3.23,

suggesting that digital technology is perceived as an important pathway through which entrepreneurship education can support innovation. The lowest mean score of 2.98 was recorded for industry-based entrepreneurship activities, although this was still above the criterion mean. The cluster mean of 3.18 indicates that entrepreneurship education contributes to enterprise creation and innovation to a high extent.

Test of Hypotheses

Hypothesis One

H_{01}: *There is no significant contribution of the integration of entrepreneurship education into Technical and Vocational Education and Training (TVET) to the development of entrepreneurial skills among TVET learners in Nigeria.*

Table 3: Regression Model Summary and ANOVA for the Contribution of Entrepreneurship Education Integration to Entrepreneurial Skills Development

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	
1	0.58	0.336	0.33	0.386	
Model	**Sum of Squares**	**df**	**Mean Square**	**F**	**Sig.**
Regression	8.382	1	8.382	56.23	<.001
Residual	16.547	111	0.149		
Total	24.929	112			

The data presented in Table 3 show an R-value of 0.580, indicating a moderate positive relationship between the integration of entrepreneurship education into TVET and the development of entrepreneurial skills among TVET learners. The R^2 value of 0.336 indicates that the integration of entrepreneurship education accounts for 33.6% of the variation in entrepreneurial skills development. The remaining 66.4% of the variation may be explained by other factors that were not included in the regression model. The ANOVA result further indicates that the regression model is statistically significant, $F(1, 111) = 56.23$, $p < .001$. Since the significance value is less than the 0.05 level of significance, the null hypothesis is rejected. This means that the integration of entrepreneurship education into TVET makes a statistically significant contribution to the development of entrepreneurial skills among TVET learners in Nigeria. The null hypothesis was rejected, indicating that there is a significant contribution of the integration of entrepreneurship education into TVET to the development of entrepreneurial skills among TVET learners in Nigeria.

Hypothesis Two

H_{02}: There is no significant contribution of the integration of entrepreneurship education into Technical and Vocational Education and Training (TVET) to enterprise creation and innovation for economic transformation in Nigeria.

Table 4: Regression Model Summary and ANOVA for the Contribution of Entrepreneurship Education Integration to Enterprise Creation and Innovation

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	
1	0.64	0.41	0.405	0.361	
Model	**Sum of Squares**	**df**	**Mean Square**	**F**	**Sig.**
Regression	10.064	1	10.064	77.2	<.001
Residual	14.468	111	0.13		
Total	24.532	112			

The data presented in Table 4 show an R-value of 0.640, indicating a moderately strong positive relationship between the integration of entrepreneurship education into TVET and enterprise creation and innovation. The R^2 value of 0.410 indicates that the integration of entrepreneurship education explains 41.0% of the variation in enterprise creation and innovation among TVET learners. The remaining 59.0% may be attributed to other factors that are not included in the regression model. The ANOVA result further shows that the regression model is statistically significant, $F(1, 111) = 77.20$, p

< .001. Since the significance value is less than the 0.05 level of significance, the null hypothesis is rejected. This indicates that the integration of entrepreneurship education into TVET makes a statistically significant contribution to enterprise creation and innovation for economic transformation in Nigeria. The null hypothesis was rejected, indicating that there is a significant contribution of the integration of entrepreneurship education into TVET to enterprise creation and innovation for economic transformation in Nigeria.

Discussion of Findings

The first finding of the study revealed that entrepreneurship education is integrated into TVET programmes to a high extent for the development of entrepreneurial skills, as indicated by the cluster mean of 3.13. The finding suggests that entrepreneurship education within TVET is not limited to theoretical knowledge but provides opportunities for learners to acquire competencies relating to opportunity identification, business planning, problem-solving, small-business management, marketing, digital technology, financial management, practical entrepreneurship and entrepreneurial confidence. The relatively high ratings across all ten items indicate that the lecturers perceived entrepreneurship education as an important component of TVET for preparing learners for entrepreneurial activities. This finding agrees with Hassan Haruna (2026), who found that entrepreneurship education significantly enhanced entrepreneurial competencies among Business Education students in tertiary institutions in North-Eastern Nigeria. In particular, Haruna reported improvements in communication, problem-solving and ICT application skills, as well as opportunity-recognition and leadership-related competencies. The convergence between the present finding and Haruna's result suggests that entrepreneurship education can provide a practical platform through which TVET learners develop the competencies required to function effectively as entrepreneurs.

The finding is also consistent with Musa A. Abdulkarim (2019), whose study in Rivers State demonstrated that students acquired entrepreneurial skills more effectively when entrepreneurship education was delivered through an action-based experiential approach than through direct instruction. Abdulkarim's finding is particularly relevant to the present study because the current result identified practical entrepreneurship projects as one of the highly rated components of entrepreneurship education integration. This agreement indicates that the effectiveness of entrepreneurship education may depend not merely on its presence in the curriculum but also on the extent to which learners are actively engaged in practical and experiential entrepreneurial activities. The present finding further agrees with Emmanuel Nweke and Mariam-Aminaho Osakwe (2024), who examined entrepreneurial skills as a correlate of TVET among students in Rivers State. Their study focused on conceptual, social-trading and computer-application skills and reported a relationship between TVET and the development of entrepreneurial skills. The agreement reinforces the argument that contemporary TVET should combine occupational competencies with entrepreneurial, social and digital skills if graduates are to respond effectively to changing labour-market demands. The finding is also supported by Li and Islam (2021), whose study of students in higher vocational education established that exposure to entrepreneurial education positively influenced entrepreneurial self-efficacy and entrepreneurial intention. Although the present study focused more broadly on entrepreneurial skills rather than intention, the two findings are complementary. Skills acquired through entrepreneurship education can strengthen learners' confidence and perceived ability to identify and exploit business opportunities, thereby creating a foundation for subsequent entrepreneurial action.

However, the finding should be interpreted with some caution. The relatively lower rating for exposure to successful entrepreneurs and mentorship ($M = 2.84$) suggests that although entrepreneurship education is integrated into TVET to a high extent, the practical ecosystem surrounding the curriculum may not be equally developed. This observation is consistent with the findings of Ganiyu Akeem Adewale and Oshotoye Bradford Adedayo (2026), who found a positive relationship between entrepreneurship education and entrepreneurial intentions among TVET students in Southwest Nigeria but noted that limited access to funding and mentorship constrained students' propensity to start businesses. Thus, the present study extends the existing evidence by suggesting that curriculum integration is relatively strong, but stronger mentorship and external entrepreneurial support are still required to translate acquired skills into sustainable entrepreneurial action. The regression result provides further support for the first finding. The result showed that entrepreneurship education integration significantly predicted entrepreneurial skills development, $R = .580$, $R^2 = .336$, $F(1, 111) = 56.23$, $p < .001$. Thus, entrepreneurship education integration accounted for 33.6% of the variance in entrepreneurial skills development. The rejection of the first null hypothesis demonstrates that the observed high level of entrepreneurship education integration was not merely descriptive but was also statistically associated with improved entrepreneurial skills development. This finding is particularly consistent with Abdulkarim's (2019) experimental evidence because both studies

demonstrate that the way entrepreneurship education is incorporated into vocational/business education can enhance entrepreneurial competencies. It also supports Haruna's (2026) conclusion that entrepreneurship education is an important catalyst for strengthening technical and entrepreneurial competencies. The implication is that TVET institutions should move beyond treating entrepreneurship education as a compulsory theoretical course and integrate it into practical learning, project work, problem-solving activities and authentic business experiences.

The second finding revealed that entrepreneurship education contributes to enterprise creation and innovation to a high extent, with a cluster mean of 3.18. The result indicates that the integration of entrepreneurship education into TVET is perceived to encourage business establishment, opportunity recognition, product and service development, employment creation, technological innovation, innovative marketing, self-employment and local economic development. The finding agrees strongly with Oluchi Chinazor Obi, Chikeremma Adamma Akudolu and Nzube Happiness Ikpat (2025). Their study of 104 Technology and Vocational Education students in public universities in Anambra State found a significant positive relationship between entrepreneurship workshop programmes and entrepreneurial intentions. They concluded that greater exposure to entrepreneurship workshops increases students' desire to become entrepreneurs and recommended regular entrepreneurship programmes to support business establishment after graduation. Although entrepreneurial intention is not identical to actual enterprise creation, intention represents an important antecedent of entrepreneurial behaviour. Consequently, the present finding extends this evidence by showing that lecturers perceive entrepreneurship education as contributing not only to entrepreneurial intention but also to broader enterprise creation and innovation outcomes. The present result is also consistent with Ganiyu Akeem Adewale and Oshotoye Bradford Adedayo (2026), who reported a moderate positive relationship between entrepreneurship education and graduate entrepreneurial intentions among TVET institutions in Southwest Nigeria ($r = .45$, $p < .01$). Their regression analysis further showed that entrepreneurship education significantly predicted entrepreneurial intention ($\beta = .38$, $p < .01$), although funding and mentorship constrained students' willingness to establish businesses. The present finding therefore agrees with their conclusion that entrepreneurship education is important for developing the entrepreneurial orientation necessary for enterprise creation, while also highlighting the need for an enabling entrepreneurial ecosystem.

The finding also agrees with S. A. Keelson, J. O. Addo, K. Kwarteng and J. Amoah (2025), who studied 800 TVET students from ten technical universities in Ghana and found a significant relationship between innovation and entrepreneurship education, with entrepreneurship education positively influencing entrepreneurial mindset. This agreement is particularly important because innovation is central to the present study's second outcome variable. The evidence suggests that entrepreneurship education can encourage learners to move beyond conventional business practices and develop innovative products, services, technologies and marketing approaches. The finding is further supported by Muyiwa Oyinlola, Oluwaseun Kolade, Silifat Abimbola Okoya, Olubunmi Ajala and colleagues (2024), whose study of entrepreneurship and innovation in Nigerian universities identified entrepreneurship education, innovation support and university-industry partnerships as important elements in improving entrepreneurial outcomes. Their study drew on qualitative data from five focus groups and quantitative data from 151 students across four Nigerian universities and highlighted both successful initiatives and implementation challenges. The agreement between that study and the present finding reinforces the importance of institutional support, industry linkages and innovative pedagogies in converting entrepreneurship education into meaningful entrepreneurial outcomes.

Nevertheless, the present finding does not imply that entrepreneurship education automatically results in the establishment of sustainable enterprises. The relatively lower rating for industry-based entrepreneurship activities ($M = 2.98$) suggests that the connection between classroom learning and the real business environment may still require strengthening. This observation is consistent with Oyinlola et al. (2024), who identified implementation challenges within the Nigerian entrepreneurship education ecosystem. It is also consistent with Adewale and Adedayo (2026), who found that funding and mentorship limitations could weaken the transition from entrepreneurship education to entrepreneurial action. The regression result for the second hypothesis provides additional empirical support for the finding. Entrepreneurship education integration had a significant positive contribution to enterprise creation and innovation, $R = .640$, $R^2 = .410$, $F(1, 111) = 77.20$, $p < .001$. The result indicates that entrepreneurship education integration accounted for 41.0% of the variance in enterprise creation and innovation. Since the probability value was below .05, the second null hypothesis was rejected. The stronger explanatory power of entrepreneurship education for enterprise creation and innovation (41.0%) compared with entrepreneurial skills development (33.6%) suggests that entrepreneurship

education may have a particularly important role in translating competencies into entrepreneurial and innovative orientations.

Overall, the findings are largely in agreement with the empirical literature reviewed. Across Nigeria and comparable TVET contexts, the evidence consistently points toward positive relationships between entrepreneurship education, entrepreneurial skills, entrepreneurial intentions, innovation and entrepreneurial mindset. At the same time, the studies also demonstrate that curriculum integration alone is insufficient. Practical experience, mentorship, industry partnerships, digital resources, access to finance and post-training support are necessary to ensure that entrepreneurial competencies developed through TVET translate into sustainable enterprise creation and economic transformation.

Conclusion

Based on the findings of the study, it was concluded that integrating entrepreneurship education into TVET is an important strategy for strengthening entrepreneurial capacity and promoting economic transformation in Nigeria. The study established that entrepreneurship education is integrated into TVET programmes to a high extent, particularly in relation to opportunity identification, business planning, problem-solving, practical entrepreneurship, digital technology and entrepreneurial confidence. The study also concluded that entrepreneurship education contributes to enterprise creation and innovation to a high extent. Through exposure to business opportunities, practical enterprise development, technological applications, innovative marketing and self-employment activities, TVET can provide learners with competencies that extend beyond conventional occupational training.

Furthermore, the regression findings established that entrepreneurship education integration significantly contributes to both entrepreneurial skills development and enterprise creation and innovation. The findings therefore demonstrate that entrepreneurship education should not be regarded merely as an additional academic requirement within TVET programmes. Rather, it should constitute an integral component of vocational preparation that connects technical competence with opportunity recognition, innovation, enterprise development and self-employment. However, the findings also suggest that the full economic benefits of entrepreneurship education may not be realised if practical mentorship, industry exposure, funding opportunities and entrepreneurial support systems remain inadequate. Consequently, effective integration should encompass not only curriculum content but also the institutional and ecosystem conditions necessary for learners to transform acquired competencies into viable entrepreneurial ventures.

Recommendations

Based on the findings and conclusion of the study, the following recommendations were made:

1. Strengthen the practical integration of entrepreneurship education. TVET institutions should embed entrepreneurial activities within technical and vocational courses rather than treating entrepreneurship as an isolated theoretical subject.
2. Expand practical entrepreneurship projects and enterprise incubation. Learners should be encouraged to develop business ideas, prepare business plans, produce marketable products or services and test their ideas in real or simulated markets.
3. Strengthen industry–TVET partnerships and mentorship programmes. TVET institutions should collaborate with industries, SMEs, business associations, successful entrepreneurs and innovation hubs to provide learners with mentorship, internships, enterprise projects and workplace exposure.
4. Increase emphasis on digital entrepreneurship and access to start-up finance. TVET curricula should incorporate digital marketing, e-commerce, financial technology, social-media business development and other relevant digital skills.

NNAMDI AZIKIWE UNIVERSITY, AWKA

Abstract

Accessibility to external financing is a major determinant for the growth and sustainability of small scale enterprises in any economy. Unfortunately, this factor has remained a major environmental constraint to the growth of these enterprises in developing countries like Nigeria. This study ascertained the extent high bank interest charges affect the growth of Small Scale Enterprises (SSEs) in Onitsha, Anambra state. The study was a descriptive survey, conducted with 352 owners of registered small scale enterprises in Onitsha Anambra state. One research question guided the conduct of the study and one null hypothesis was tested at 0.05 level of significance. A validated structured questionnaire was used to collect data. The reliability of the instrument was established using cronbacha alpha coefficient to obtain a reliability index of 0.83. The data collected were analyzed using mean score and z-test statistics. The findings of the study revealed among others that high interest charges by banks on SSE slows down business operations and lead to risk on investments to a moderate extent. Also this lowers returns on capital employed and reduces profit margin to a low extent. It was recommended among others that owners of SSEs in Onitsha should organize capacity building for their members on loan management, to avert the consequences of high bank interest changes on their business.

Key words: High interest charges, growth, small scale enterprises.

Introduction

Small scale enterprises (SSEs) worldwide are seen as essential spring boards for national development. In developing countries like Nigeria, it is used as a strategy for rapid industrialization, wealth creation, job generation and poverty alleviation among the populace (Federal Republic of Nigeria, 2021). SSEs permeates easily in many economies and a source of income to many people.

Small scale enterprises have been variedly defined from qualitative and quantitative perspectives, differing from one country to another depending on each countries level of economic development, economic policies and programmes instituted from one period to another. Quantitatively, Small scale enterprises in Nigeria is conceptualized as part of Small and Medium Enterprises (SMEs) and with no single or static definition. Different government institutions and regulatory bodies define them based on their specific criteria such as asset base, number of employees or total capital investment. **Central Bank of Nigeria (2010**) noted SSEs as enterprises that has asset base, excluding land between #5 million to #300 million, and labour force between 11 and 300. Small and Medium Scale Enterprises Development Agency of Nigeria (2016) defined SSEs under classifications of small and medium enterprises whose total assets (excluding land and building) are above N5m but not exceeding N50m with a total workforce above 10 but not exceeding 49 employees.

However, this approach of conceptualizing SSEs has been kicked against in the modern times. Okoli and Obi (2016) observed that the amount of capital invested and number of people employed in enterprises is no more a realistic approach in measuring the scale of enterprises, but technology which has the capacity to boost production and service distribution to any height. According to the perspective of the United Nations Industrial Development Organisation (UNIDO), Small Scale Enterprises (SSEs) in Nigeria are businesses that are labor intensive, locally owned, and serve as major sources of employment and industrial development. UNIDO remarked that these enterprises are typically constrained by limited access to finance, technology, and global markets. They operate largely with capital provided by the owners, and decision-making and management are vested in the hands of an individual or a small group of owners who participate actively in daily operation. They are typically constrained by limited access to finance, technology, and global markets. SSEs operate largely with capital provided by the owners, and decision-making and management are vested in the hands of an individual or a small group of owners who participate actively in daily operations (UNIDO, 2025).

This study therefore adopted the United Nations Industrial Development Organization (UNIDO) approach, studyig SSEs, businesses that are characterized by labor intensive, locally owned with capital provided by the owners; decision making and management is vested in the hand of an individual or small group of owners who participates actively in its daily operations.

In Nigeria SSEs transcends manufacturing, agro based to distributive and general service firms. Emerging and fast growing sectors in this business include the entertainment and leisure industries, Information and Communication Technologies (ICTs), Telecommunications and biotechnology firms. These enterprises are flexible to local market conditions, exploit locally available raw materials with lower capital and require fewer infrastructures for development. Oyeyinka (2024) remarked that these businesses creates over 70 percent of total jobs provided in the country, producing new products and services to the comfort and convenience of the citizens.

Small scale enterprises tremendous impact on Nigerian economy has generated a lot of concern for its growth especially as it relates to government economic policies in creating enabling environment. This include institution of financial policies and its proper monitoring through Central Bank of Nigeria, to ensure provision of banking facilities and credits as external sources of fund to owners of SSEs to finance their numerous operations (Business Day, 2020). This is expected to motivate the business owners to increase productivity, make higher profits and create more jobs to improve people's standard of living.

Unfortunately, small scale enterprises in Nigeria in the recent times have witnessed high bank interest charges which have put their investments into high risks. The survival of these businesses was reduced and this could mar their developmental roles, as their ability to achieve objectives is reduced to the lowest minimum.

Influence of High Bank Interest Charges on Growth of SSEs

A small scale enterprise achieves growth when the business generates significant positive cash flows or earning which increases at a clear fast rate as well as reducing over head costs. In this situation there is high profitability. However, business growth cannot be achieved where there is poor capitalization or fund grossly inadequate for business operations. Olorushola (2010) noted that Nigeria banks tend to be lukewarm in meeting the credit needs of SSEs and where this is made available, the high interest charges do not allow the enterprises make profit from their investments.

SSEs pay interest charges as a price to the lenders for allowing them use their fund. This is normal as this is a compensation the borrower makes to the banks for forgoing an opportunity of earning income from other investments. However, when these interest charges on credits are high, it compels small businesses to reduce their investments. They incure high production cost, experiences drastic reduction on their sales volume, which ultimately affect their profit margin.

Yusuf (2025) opined that small scale enterprises in Nigeria are more vulnerable to the perils of high bank interest charges because they heavily rely on financial institutions for seasonal borrowing needs. This tends to increase the problem of cash flows and put their investment at greater risks due to the high return expectations on money borrowed. Returns on capital employed are reduced thereby discouraging the small business owners from making further investments.

However, financial mismanagement and Low Financial Literacy also, has been attributed as a major factor to SSEs poor financial performance. Many SSEs cannot cope with the financial aspects of business resulting to ineffective and inefficient financial management activities which have been detrimental to their performance and longeviy (The Nation, n.d.). BusinessDay (2020) also noted financial discipline as lacking among the small scale business owners or managers. Okoli and Ezenwafor in Mead and Liedholm (2018) equally observed that most problems of owners of small scale enterprises regarded as inadequate capital are financial management problems resulting from the inability of the entrepreneurs to make proper account recordings and differentiate between profit and losses in their businesses.

Owners of small scale enterprises are the entrepreneurs', initiators who coordinate other factors of production to achieve objectives. In most cases they are the manager, who sees to the daily operations of their business. They are in a good position to provide information regarding capitalization of their business and extent high bank interest charges affect them. These entrepreneurs could be either males or females whose opinion could differ as a result of their different access to bank credits.

Although small business growth and their constraining factors could have been widely discussed, there is no known empirical study on the extent high bank interest charges affect the growth of small scale enterprises in Onitsha, Anambra state. This study was therefore conceived to determine this in the opinion of the owners.

Theoretical Underpinning

The study is strengthened by the theory of growth of firms propounded by Edith Penrose in 1959. Penrose offered some principles that govern the growth of firms and the rate at which firms can grow successfully.

These factors Penrose (1959) noted as internal and external factors such as management and technical resources which can help a firm to grow and realize competitive advantage. Management is an art of organizational design and owners of enterprises/business need to acquire managerial capabilities and skills which should be applied at different stages of a firms growth to achieve objectives. Peurose noted that the ignorance of these factors result in failure and loss of opportunities.

High bank interest charges are one of the external factors that affect the growth of small scale enterprises negatively. Effective financial management and technicalities in the use of a firms resource must be carefully applied to cushion and avert the consequences on enterprises. These factors are necessary in the growth of firms to avoid business failure and to maintain status quo in the market.

Research Question

To what extent do high bank interest charges affect the growth of small scale enterprises in Onitsha, Anambra State?

Hypothesis

One null hypothesis was test at 0.05 level of significance

There is no significance difference in the mean ratings of male and female owners of small scale enterprises on the extent high bank interest charges affect the growth of their businesses in Onitsha, Anambra State.

Method

The study was a descriptive survey. The population comprised 352 owners of registered Small Scale Enterprises in Onitsha North and South local Government Areas of Anambra State (Ministry of Commerce and industry Anambra State, 2024). There was no sampling, as all were used due to its manageable size. Data were collected with a validated structured questionnaire on a five point rating scale of Very High Extent (VHE), High Extent (HE), Moderate Extent (ME), Low Extent (LE) and Very Low Extent (VLE)

Three research assistants helped the researcher in administration of questionnaire in the areas where the researcher could not reach. They were briefed on the purpose of the study and the contents of the questionnaire. Connacht Alpha Coefficient was used to determine the internal consistency of the instrument. The reliability Coefficient was established at 0.83. Out of 352 copies of questionnaire distributed, 335 were retrieved and were all found usable.

The data collected were analyzed using mean and z-test statistic. The following boundary limits were used to determine the extent of each factor effect.

Very High Extent	4.50 -5.00
High Extent	3.50 -4.4.49
Moderate Extent	2.50 -3.49
Low Extent	1.50 -2.49
Very Low Extent	1.00 -1.49

z-test statistic was used to test the null hypothesis raised at 0.05 level of significance. The hypothesis was rejected where the z-calculated value is equal or grater than the z-critical value if not the hypothesis was not rejected.

Results

The result of the study are presented on tables 1 and 2

Table 1: Respondents' Mean rating on extent high bank interest charges affect the growth of SSEs in Onitsha, Anambra State

S/N	Items on High Bank Interest Charges	Mean	Remark
1	Leads to higher risk of investment	3.46	**ME**
2	Leads to low productivity	2.01	LE
3	Slows down business operations	2.87	ME
4	Leads to increase in price of products	1.21	VLE
5	Reduces profit margin	1.73	LE
6	Limits cash flows	1.20	VLE
7	Lowers return on capital employed	1.93	LE
8	Leads to discouragement of entrepreneurs investment	3.06	ME
9	Causes increase in unemployment	2.25	LE

Cluster Mean		2.2	LE

Data contained in the table 1 shows that three items out of nine rated were affected by high bank interest charges at moderate extent, four were affected at low extent and two were affected at very low extent. Most highly rated is item 1 that indicates that high bank interest charges lead to higher risk of investment. Least rated is that high interest charges limit cash flow. However, with the cluster mean of 2.2, it was confirmed that high bank interest charges affect the growth of SSEs in Onitsha Metropolis at a low extent.

Table2: z-test analysis on extent high bank interest charges affect the growth of SSEs in Onitsha based on gender (male and female)

Gender	N	X	SD	Df	z-cal	z-crit	A	Decision
Male	177	2.27	0.58					
				333	0.22	1.96	0.05	Not significant
Female	158	2.25	0.65					

Data contained in table 2 shows that the z-calculated value of 0.22 was less than the z-critical value of 1.96 at 0.05 level of significance. The null hypothesis was therefore not significant and not rejected.

Discussion and Implication of the Study

The findings of this study revealed that high interest charges by banks affect growth of small scale enterprises at varying levels (moderate, low and very low) depending on the factors rated. Rated to moderate extents are such factors as high interest charges leading to high risk of investment, slowing down business operations and leading to discouragement of entrepreneurs for further investment. Rated to a low extent are such factors as reduction in profit margin, lowering of returns on capital employed, causes unemployment and low productivity. Also the finding of the study discovered that high bank interest charges to a very low extent leads to increase in price of goods and limit cash flows.

The findings of this study are worrisome and not encouraging as non of the factors were rated as having a serious or high extent effect. This confirms the finding of Yusuf, (2025) that financial problem accounts for only 25 percent of problems affecting SMEs in Nigeria as majority were related to environmental impediments. Also Okoli and Ezenwafor in Mead and Liedholm (2018) observed that most problems of owners of small scale enterprises regarded as inadequate capital are financial management problems resulting from the inability of the entrepreneurs to make proper account recordings and differentiate between profit and losses in their business. This therefore could mean that most of the owners of SSEs in Onitsha do not have a good knowledge of the impact high bank interest charges is having on their businesses due to poor knowledge of accounting or book keeping. They may not also be aware of the high interest charges by banks in their localities. This confirms the observation that SSE owners in Nigeria in most cases do not start business by borrowing from banks. They borrow from relatives and friends and could later go for bank credits for expansion of their businesses Yusuf and Olanenewaju, 2024).

However, although the findings of this study did not establish in any case that high bank interest charges affect small scale enterprises at high extent, the fact remains that there are influences on their businesses. Also, no matter the level of influence made, they are still substantial to constrain the growth of SSEs in Onitsha, Anambra State.

As noted by this study, high interest charges to a moderate extent leads to high risk of investment and discourages entrepreneurs from further investment. This is a fact as a firm's investment is most sensitive to credit with high interest rates. Also kale (2025) noted that high interest rate weakens a firm balance sheet particularly by reducing expected future profits. The probability of making profit is reduced as money available for business operation is cut short due to high interest charges.

This also confirms the opinion of Adebakin (2024) that high interest charges compels small businesses to reduce inventories, incur high production costs and experience sharp falls on sales which affect the business profit margin and growth. No wonder its effect on prices of products and employment. A firm existence is justified when profits are made in serving the public, therefore reduction in profit compels small business to reduce workers for survival.

In line with the findings of this study,Yusuf (2025) noted that high interest charges leads to intensified cash flow problems which often spel disaster for enterprise. This is more pronounced among the Small Scale Enterprises than large firms due to undercapitalization

The study also discovered that there is no significant difference in the opinion of male and female owners of small scale enterprises in Onitsha, on the extent high bank interest charges affect the growth of their businesses. This is in line with the view of Mead and Liedholm (2011) that gender has no significant effect on the extent high interest rate affect SSEs

This study has implications for Central Bank of Nigeria to review its policy on credits to small businesses. SSEs are backbone of many economies and must be encouraged to flourish. The primary role of financial institutions is to provide liquidity that permits a high level of economic activity in the society. Loans to small business should be on soft terms. The activities of banks should be properly controlled and monitored by CBN to achieve this. Government and Association of Owners of SSEs in Nigeria should also acquaint their members with learning experiences in financial management. This will make them to be aware of these high bank interest charges and how to manage such conditions to ensure growth of their businesses. Also to curriculum planners in business education and related programmes to provide learning experiences in business financial management to get their graduates fortified and to ensure success in business as future entrepreneurs'.

Conclusion

Based on the findings of this study, it is concluded that high bank interest charges affect the growth of Small Scale Enterprises at moderate, low and very low extents. It is also concluded that the male and female owners of SSEs in Onitsha Anambra State do not differ in their opinion on extent high bank interest charges affect their businesses.

Recommendations

Based on the findings of this study, the following recommendations are made.

1. Entrepreneurs' in Onitsha Anambra State should embark on capacity building of their members to ensure better understanding of financial institutions requirement for loan and the interest rate charges on them. This could be achieved by collaborative efforts with the relevant educational institutions, government agencies and consultants through the organization of seminars, workshops, conferences and trainings programmes for both the entrepreneurs' and the staff of the financial institutions.
2. Curriculum planners in business education and other related programmes should include credit management in business as one of the learning experiences provided to their students. This inculcates in the undergraduates those experiences required for effective credit management in business to become successful entrepreneurs.
3. The Central Bank of Nigeria should properly control, supervise and monitor the activities of other financial institutions in the area of lending to small businesses. Loans to these SSEs should be on soft terms with low interests to ensure their growth and survival.

Abstract

This study examined the influence of the Rotational Savings and Credit Association System (ROSCAS), locally known as ajo, on the sustainability of women-owned enterprises in Osun State, Nigeria. The specific objectives were to assess the extent of influence of ROSCAS participation on working capital adequacy, profitability stability, and reinvestment capacity of women entrepreneurs and to determine whether significant differences exist in respondents' perceptions based on location and educational background. The study adopted a descriptive survey research design. The population of the study was considered indeterminate because women entrepreneurs participating in informal ajo savings groups are not formally registered or centrally documented. Consequently, a multi-stage sampling technique was employed to select respondents based on different levels of selections. The sample size arrived at was 45 women micro-entrepreneurs. Data were collected using a structured questionnaire designed on a four-point Likert scale and analyzed using mean and standard deviation. Hypotheses were tested at the 0.05 level of significance using an independent sample t-test. Only 41 copies of the retrieved questionnaire were subjected to statistical analysis. Findings revealed that the extent of influence of the ROSCAS on working capital adequacy ($\bar{x}$=3.74; SD=0.462), profitability stability (($\bar{x}$=3.48; SD=0.560), and reinvestment capacity ($\bar{x}$=3.63; SD=0.481) of women entrepreneurs were very high. Hypotheses testing further showed that there were no statistically significant differences in respondents' ratings on the influence of ROSCAS on working capital based on rural–urban location (t = .073, df = 39, P = 0.942), on profitability stability based on educational attainment (t = -.973, df = 39, P = 0.337), and on reinvestment capacity based on rural-urban location (t = -1.017, df = 39, P = 0.315). The study concluded that the ajo system plays a significant role in strengthening financial resilience, liquidity management, and business sustainability among women entrepreneurs in Osun State. The study recommends the recognition and integration of indigenous savings structures into broader financial inclusion and women's enterprise development strategies in Nigeria.

Keywords: Rotational Savings and Credit Association System, Ajo, Women Entrepreneurship, Enterprise Sustainability, Informal Finance, Osun State, Nigeria.

Background of the Study

Across Sub-Saharan Africa, women's entrepreneurship has increasingly become a powerful engine of inclusive and broad-based economic transformation. In Nigeria, women-owned ventures represent a substantial share of micro, small, and medium enterprises, with a particularly strong presence in the informal and local economy. These businesses span a wide spectrum of activities, from agro-processing and retail commerce to food vending, textile production, personal care services, and small-scale manufacturing, reflecting both adaptability and economic dynamism. Beyond generating income, women-led enterprises play a pivotal role in strengthening household livelihoods, creating employment opportunities, alleviating poverty, and fostering community resilience. Yet, notwithstanding their undeniable contributions, women entrepreneurs continue to confront deep-rooted structural barriers that restrict expansion and threaten long-term viability. Among the most pressing of these constraints is inadequate access to formal financial services, which remains a critical obstacle to sustainable business growth.

Financial exclusion remains a persistent barrier to enterprise development in developing economies, especially those in rural areas. Demirgüç-Kunt et al. (2022), citing The Global Findex Database (2021), revealed enduring gender disparities in account ownership, access to credit, and use of formal financial products in Sub-Saharan Africa. Although digital financial services have expanded rapidly, women remain less likely than men to access formal loans or secure credit for business expansion. The World Bank (2021) further highlighted regulatory, cultural, and institutional barriers that disproportionately restrict women's economic participation, including limited property rights and

collateral ownership in many jurisdictions. In Nigeria, collateral-based lending requirements, bureaucratic processes, and high interest rates often exclude small-scale women entrepreneurs from institutional credit markets.

In a situation where access to formal banking services is constrained by stringent lending conditions, high transaction costs, or structural gender inequalities, informal financial arrangements often become critical channels for mobilizing capital, particularly among women entrepreneurs in developing economies. Recent global evidence indicates that women continue to experience lower levels of credit access and formal borrowing compared to men, especially in Sub-Saharan Africa, thereby reinforcing reliance on community-based financial mechanisms (International Finance Corporation [IFC], 2022; World Bank, 2022). In such environments, informal savings and credit systems provide practical and socially embedded alternatives that enable small-scale business operators to accumulate capital and manage liquidity needs.

Among the most enduring and widely diffused informal financial mechanisms are Rotating Savings and Credit Associations System (ROSCAS). These associations have been documented across diverse cultural and economic settings as adaptive responses to financial exclusion and institutional gaps in formal credit markets (Banerjee et al., 2021; Cassidy & Cissé, 2020). ROSCAS function through regular financial contributions made by members into a collective pool, which are subsequently disbursed to participants in a predetermined rotational sequence. The system is not anchored in formal contractual enforcement but rather sustained through interpersonal trust, peer monitoring, social sanctions, and shared communal norms. Such relational governance mechanisms reduce information asymmetry and default risk while reinforcing accountability among members (Cassidy & Cissé, 2020). Beyond their financial role, these associations cultivate solidarity and mutual support, strengthening the social infrastructure that underpins small enterprise survival.

Recent scholarship continues to affirm the relevance of ROSCAS within contemporary financial ecosystems. For example, Banerjee et al. (2021) highlighted the importance of informal savings structures in supporting household and enterprise-level financial stability in environments characterized by limited institutional access. Similarly, the International Finance Corporation (2022) underscores the role of savings groups and community-based finance in bridging the gender finance gap in emerging markets. These findings align with broader development finance literature emphasizing that informal savings arrangements enhance liquidity management, provide access to lump-sum capital for business investment, and promote disciplined savings behavior among participants. Collectively, this body of evidence demonstrates that ROSCAS remain not merely traditional financial customs but dynamic and resilient financial instruments that sustain women's entrepreneurial activities in the face of formal financial exclusion.

In southwestern Nigeria, particularly among the Yoruba ethnic group, Rotating Savings and Credit Associations System (ROSCAS), locally known as *"ajo,"* constitute a deeply entrenched indigenous financial practice embedded in market culture and communal life. Predominantly utilized by traders, artisans, and small-scale entrepreneurs, especially women operating within the informal sector. According to Akinola (2022), *Ajo* groups are formed around shared occupational or social ties, with members contributing fixed amounts daily, weekly, or monthly into a collective pool. The accumulated funds are disbursed sequentially to each participant, enabling recipients to access lump-sum capital that exceeds their individual savings capacity at a given time, thereby supporting inventory expansion, asset acquisition, or business stabilization. Although the system operates outside formal banking regulations and contractual enforcement, its sustainability is maintained through social accountability mechanisms, including trust, peer monitoring, reputational incentives, and communal norms, which collectively minimize default risks and transaction costs. As recent financial inclusion reports indicate, such community-based savings structures remain critical sources of liquidity and entrepreneurial financing in contexts where formal financial access is limited or exclusionary (Enhancing Financial Innovation & Access, 2023; World Bank, 2022).

Regarding rural and urban location, ROSCAS operate as spatially neutral financial networks, enabling women entrepreneurs in both rural markets and urban commercial centers to benefit from pooled savings systems, peer monitoring, and predictable capital disbursement. Similarly, educational attainment does not appear to significantly moderate the perceived effectiveness of ROSCAS, as the system is structured around simple contribution cycles and social trust mechanisms rather than formal financial literacy requirements. Studies on informal finance and microenterprise development have shown that savings groups enhance economic participation of women regardless of formal education level by promoting disciplined saving behavior, peer support, and investment readiness (Karlan et al., 2023).

The role of informal savings mechanisms in sustaining women's entrepreneurship is both substantial and multidimensional, particularly in environments where structural and gender-based barriers constrain access to formal financial institutions. Women entrepreneurs frequently depend on relational networks to mobilize business resources, manage uncertainty, and sustain enterprise growth, and Rotating Savings and Credit Associations System (ROSCAS) serve as platforms that generate both financial and social capital. Contemporary research emphasizes that collective savings groups enhance women's economic participation by strengthening financial capability while simultaneously fostering social cohesion and mutual accountability (Karlan et al., 2023; Ojong & Simba, 2022). Drawing from social capital perspectives, networks characterized by trust, reciprocity, and shared norms facilitate coordinated action and reduce transaction costs within informal financial arrangements (Woolcock, 2018). Within ROSCAS, trust mitigates default risks, while peer monitoring and reputational incentives promote contribution compliance in the absence of formal contracts. Beyond financial intermediation, participation in these associations encourages knowledge exchange, emotional support, business mentoring, and collective problem-solving, thereby reinforcing entrepreneurial resilience and enhancing enterprise sustainability among women in developing economies (International Labour Organization, 2023; UN Women, 2022).

Enterprise sustainability transcends immediate profit generation and reflects a firm's ability to ensure operational continuity, deliver steady financial returns, adjust to shifting market dynamics, and endure external economic shocks. Considering micro and small enterprises in economically volatile environments such as Nigeria, where persistent inflation, currency fluctuations, and unpredictable consumer demand shape the business climate, the availability of reliable working capital becomes a critical determinant of survival and growth. Recent analyses of small business resilience in Sub-Saharan Africa emphasize that liquidity stability and adaptive financial strategies significantly enhance enterprise durability under macroeconomic stress (Organization for Economic Co-operation and Development, 2023; World Bank, 2023). In this regard, informal savings mechanisms, including community-based rotating funds, can serve as practical resilience instruments by smoothing cash flows, facilitating rapid access to lump-sum capital, and reducing exposure to formal credit constraints. Empirical evidence further suggests that collective savings schemes strengthen financial preparedness and shock absorption capacity among women-led microenterprises, thereby contributing to longer-term business sustainability in fragile economic environments (International Labour Organization, 2024; International Monetary Fund, 2023).

Osun State, located in southwestern Nigeria, presents a culturally and economically appropriate setting for investigating the relationship between rotational savings systems and women's enterprise sustainability. The state is characterized by vibrant traditional markets in cities such as Osogbo, Ilesa, Ile-Ife, Iwo, Ede, Ikire, Ila, and Ikirun, where women dominate retail and small-scale trade. Participation in *ajo* groups is widespread within these markets, often organized around trade clusters or women's associations. Despite the ubiquity of this practice, systematic empirical examination of how *ajo* participation influences measurable indicators of enterprise sustainability remains limited.

Existing research on financial inclusion in Nigeria has predominantly focused on microfinance institutions, commercial banks, and digital financial services (World Bank, 2021). While such studies provide valuable insights into formal financial structures, they often overlook indigenous financial systems that continue to function effectively at the grassroots level. The dominance of formalization narratives in development discourse may inadvertently marginalize community-based financial institutions that operate outside regulatory frameworks yet contribute meaningfully to economic stability. Furthermore, although the literature acknowledges the role of social capital in entrepreneurship, few studies quantitatively assess the extent to which participation in rotational savings systems predicts enterprise sustainability indicators such as profit stability, asset growth, reinvestment capacity, and business survival rates within specific Nigerian states. This gap is particularly evident in Osun State, where market-based women entrepreneurs rely extensively on Ajo networks for capital mobilization. Addressing this empirical gap is necessary to inform inclusive finance policies that recognize and integrate informal financial mechanisms.

Theoretically, this study integrates social capital theory and informal finance theory to explain the relationship between rotational savings participation and enterprise sustainability. Social capital theory emphasizes the value of trust-based networks in facilitating resource exchange and collective action (Putnam, 1993). Informal finance theory, on the other hand, recognizes community-based financial systems as adaptive responses to institutional voids in formal credit markets. Together, these frameworks provide a conceptual basis for examining how *ajo* participation influences business resilience and continuity.

Rotational savings and credit association systems are widely practiced in Nigeria, rigorous empirical investigation into their impact on enterprise sustainability remains insufficient. This study addresses this gap by examining the extent to which participation in *ajo* predicts sustainability outcomes among women entrepreneurs in Osun State. Situating indigenous financial practices within contemporary financial inclusion discourse, the study advances scholarship on informal finance and women's entrepreneurship and provides evidence-based insights for policymakers and development practitioners.

Statement of the Problem

Women-owned micro and small enterprises represent a vital segment of Nigeria's informal economy, particularly in southwestern states such as Osun, where trading, agro-processing, tailoring, food vending, and personal services are predominantly operated by women. National statistics indicate that micro, small, and medium enterprises (MSMEs) account for over 90% of businesses in Nigeria and contribute significantly to employment generation and GDP (Small and Medium Enterprises Development Agency of Nigeria, 2021). Within this landscape, women constitute a substantial proportion of informal sector operators. Despite this economic relevance, evidence shows that many women-led enterprises remain small, vulnerable, and characterized by low survival and growth rates (World Bank, 2023). Business discontinuity, limited capital reinvestment, and constrained scalability continue to undermine their long-term sustainability.

The fragility of these enterprises is further exacerbated by Nigeria's volatile macroeconomic environment. Persistent inflation, exchange rate instability, and declining household purchasing power have intensified operating costs and reduced profit margins for small businesses in recent years (International Monetary Fund, 2023). Micro and small enterprises with limited financial buffers, irregular cash flows, and restricted access to affordable credit significantly heighten exposure to economic shocks. Empirical evidence across Sub-Saharan Africa confirms that liquidity constraints remain one of the most binding obstacles to MSME survival and resilience (Organization for Economic Co-operation and Development, 2023).

Access to formal finance remains a critical structural barrier. The Global Findex Database reports persistent gender gaps in account ownership and formal borrowing in developing economies, with women less likely than men to access bank credit (World Bank, 2022). In Nigeria specifically, collateral requirements, high interest rates, complex documentation processes, and limited credit histories disproportionately exclude women entrepreneurs from formal lending channels (Enhancing Financial Innovation & Access, 2023). As a coping strategy, many women business owners rely on informal financial mechanisms, particularly the Rotating Savings and Credit Association System (ROSCAS), locally referred to as *"ajo"* among the Yoruba of southwestern Nigeria.

While *ajo* is widely practiced and culturally embedded within Yoruba market systems, its contribution to enterprise sustainability remains underexplored in rigorous empirical terms. Existing scholarship has primarily examined ROSCAS as instruments for household consumption smoothing, financial inclusion, or social capital formation (Karlan et al., 2023; Ojong & Simba, 2022). Although these studies highlight the importance of savings groups in enhancing women's economic participation, there is limited context-specific evidence demonstrating how participation in *ajo* affects measurable dimensions of enterprise sustainability, including operational continuity, profitability stability, asset accumulation, and resilience to macroeconomic shocks within Osun State.

This empirical gap poses both theoretical and policy challenges. Without systematic evidence, it is difficult to determine whether *ajo* serves merely as a short-term liquidity mechanism or as a strategic resilience tool that strengthens long-term business viability among women entrepreneurs. Furthermore, policymakers and development partners seeking to design gender-responsive financial interventions lack localized data to inform integration between informal savings systems and formal financial inclusion strategies. Addressing this problem is therefore crucial for advancing scholarly understanding of indigenous financial institutions and for informing sustainable entrepreneurship policies in Osun State and similar socio-economic contexts in Nigeria.

Purpose of the Study

The primary purpose of this study is to examine the influence of the Rotational Savings and Credit Association System (ROSCAS), locally known as *"ajo,"* on the sustainability of women-owned micro and small enterprises in Osun State, Nigeria. Specifically, the study seeks to:

1. determine the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs.
2. examine the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs.

3. evaluate the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs.

Research Questions

The following questions were raised to guide the study:

1. What is the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs in Osun State, Nigeria?
2. To what extent is the influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs in Osun State, Nigeria?
3. What is the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs in Osun State, Nigeria?

Research Hypotheses

H_O1: There is no significant difference in the mean ratings of urban and rural respondents on the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs.

H_O2: There is no significant difference in the mean ratings of educated and non-educated respondents on the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs.

H_O3: There is no significant difference in the mean ratings of urban and rural respondents on the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs.

Methodology

The researcher used a descriptive survey research design. The study population, women micro-entrepreneurs participating in *ajo* (Rotational Savings and Credit Associations System) in Osun State, cannot be precisely estimated because *ajo* groups operate informally without official registration or centralized records. Many women micro-entrepreneurs in Osun State also run unregistered businesses within the informal sector, making comprehensive enumeration difficult. Additionally, the fluid and dynamic nature of *ajo* membership further prevents the establishment of a stable and clearly defined population frame. The sample size was 45 women micro-entrepreneurs. In this case, the researcher made use of the multistage sampling technique. At stage one, simple random sampling was used. Out of the 30 local government areas (10 local government areas in each of the three senatorial districts of the state), three local governments were randomly selected from each of the senatorial districts, making nine local government areas in all. At stage two, stratified random sampling was used. Among the pre-identified women micro-entrepreneurs that belong to one or two rotational savings and credit associations, five women micro-entrepreneurs were randomly selected from each of the nine local governments earlier selected at stage one. This gave a sample size of 45 women micro-entrepreneurs. The instrument of data collection was the researchers' self-structured questionnaire tagged "Rotational Savings and Credit Association System and Women's Enterprise Sustainability Questionnaire" (RSCASWESQ), which contained 21 items. The questionnaire was divided into four sections and was structured based on a 4-point modified Likert-type rating scale: Very High Extent (VHE) 4 points, High Extent (HE) 3 points, Low Extent (LE) 2 points, and Very Low Extent (VLE) 1 point. The instrument was validated by two experts, one in the field of business education and the other in the field of test and measurement. The instrument was pilot tested in Kwara State. The state is not within the Southwest State but shares similarities with Southwestern states. Respondents under pilot testing were 30, and data collected from pilot testing were subjected to further statistical analysis to determine the internal consistency of the instrument. This was determined through the use of Cronbach Alpha, and a reliability index of 0.82 was obtained. This, to the best knowledge of the researcher, indicated that the instrument was reliable. According to Umoru (2022), a reliability index of +0.75 or greater is considered to indicate good reliability. Three research assistants were engaged (one for each of the three senatorial districts) to assist the researchers in the distribution, retrieval, and collation of the completed questionnaire. Prior to the distribution of the questionnaire, research assistants were familiarized with the objectives, ethics, and procedure of this type of data collection. The researcher was able to retrieve 41 correctly completed copies of the questionnaire, giving approximately a 91% success rate and a 9% mortality rate. Statistical analysis was based on 41 copies of the questionnaire retrieved. Percentage was used to describe demographic data, mean rating, and standard deviation were used to answer research questions, while hypotheses were tested using an independent sample t-test at the 0.05 level of significance. Mean scores between 3.25 and 4.00 were considered Very High Extent (VHE), 2.50–3.24 were categorized as High Extent (HE), items with scores between 1.75 and 2.49 were classified as Low Extent (LE), and 1.00–1.74 are labeled as Very Low Extent (VLE). A standard deviation within the range of ±1.96 is considered as having low variability from the mean value,

while the acceptance or rejection of the null hypothesis was based on the rule that if the P value is higher than the 0.05 level of significance, the null hypothesis is accepted, or vice versa.

Results

The results of data analysis were presented according to the demographic information, research questions, and hypotheses.

Table 1: Showing the location of respondents

Location	Frequency	Percent
Rural	16	39.0
Urban	25	61.0
Total	41	100.0

Source: Field Survey, 2026

The analysis of data in Table 1 reveals that 16 respondents, representing 39%, were located in the rural area of Osun State. There were also 25 respondents, representing 61% of the sample, that were located in the urban area. This indicated that the majority of respondents were located in the urban areas of Osun State.

Table 2: Showing the literacy level of the respondents

Literacy Level	Frequency	Percent
No Formal Education	13	31.7
Formal Education	28	68.3
Total	41	100.0

Source: Field Survey, 2026

The data presented in Table 2 shows that 13 respondents, representing 31.7%, have no formal education in Osun State. Also, 28 respondents, representing 68.3% of the respondents, have formal education. The implication of this is that there are more educated or literate respondents than those that have no formal education.

Research Question 1: What is the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs in Osun State, Nigeria?

Table 3: Respondents' rating of the Rotational Savings and Credit Association System and the working capital adequacy of women entrepreneurs

S/N	Items	Mean	Std. Deviation	Remarks
1	My involvement in ajo reduces instances of cash shortages in my business operations.	3.83	.381	VHE
2	The lump-sum funds received from ajo contributions enable me to restock goods or raw materials without delay.	3.78	.419	VHE
3	Funds obtained through ajo have helped me meet urgent business financial obligations (e.g., rent, supplies, wages).	3.76	.435	VHE
4	Regular contributions to ajo encourage disciplined savings that strengthen my business liquidity position.	3.71	.461	VHE
5	Without ajo, my business would struggle to maintain sufficient working capital for smooth daily operations.	3.71	.559	VHE
6	Participation in the Rotational Savings and Credit Association (ajo) has improved the adequacy of my business working capital.	3.71	.461	VHE

7	Participation in ajo has reduced my reliance on high-interest loans or external borrowing for working capital needs.	3.68	.521	VHE
	Grand Weighted Average	3.74	.462	VHE

Source: Field Survey, 2026

Table 3 shows that a larger size of respondents were undivided in their responses to items on the Table, majority of them agreed to the very high extents of all items. This agreement is obvious, as all mean scores are equal to or above the fixed decision value of 3.25. The standard deviation on the Table ranged from 0.381 to 0.462, they are all within the standard deviation limit of ±1.96. This indicates that there is low disparity from the mean in the respondents' responses. The average mean and standard deviation of 3.74 and 0.462, respectively, are indicators of this fact. The inference from this is that in the opinion of respondents, the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs in Osun State, Nigeria, is rated very high.

Research Question 2: To what extent is the influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs in Osun State, Nigeria?

Table 4: Respondents rating of Rotational Savings and Credit Association System and and profitability stability of women entrepreneurs

S/N	Items	Mean	Std. Deviation	Remarks
8	The funds obtained from ajo help stabilize my business income during periods of fluctuating sales.	3.73	.501	VHE
9	Regular access to pooled ajo funds helps maintain steady cash flow, which supports consistent profits.	3.66	.530	VHE
10	My involvement in ajo allows me to invest in activities that improve revenue and profit margins.	3.61	.494	VHE
11	Without participation in ajo, my business profits would be more unpredictable and unstable	3.59	.547	VHE
12	Participation in ajo has contributed to consistent profit generation in my business.	3.59	.631	VHE
13	Ajo participation reduces the impact of unexpected expenses on my business profitability.	3.15	.478	HE
14	The financial support from ajo has minimized losses during periods of low customer demand or market downturns.	3.05	.740	HE
	Grand Weighted Average	**3.48**	**.560**	**VHE**

Source: Field Survey, 2026

Table 4 revealed that a significant number of respondents were unanimous at different degrees in their responses to items on the Table, the majority of them agreed to the very high extent of items 8 to 12, while others agreed to the high extent of items 13 and 14. This agreement is apparent, as all mean scores are equal to or above the fixed decision value of 2.50. The standard deviation on the Table ranged from 0.501 to 0.740, they are all within the standard deviation limit of ±1.96. This indicates that there is low variation in the mean of the respondents' responses. The average mean and standard deviation of 3.48 and 0.560, respectively, are indicators of this fact. The inference from this is that in the opinion of respondents, the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs in Osun State, Nigeria, is rated very high.

Research Question 3: What is the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs in Osun State, Nigeria?

Table 4: Respondents rating of Rotational Savings and Credit Association System and the reinvestment capacity of women entrepreneurs

S/N	Items	Mean	Std. Deviation	Remarks
15	Without ajo, I would find it difficult to reinvest consistently in my business for growth and expansion.	3.78	.419	VHE

16	The lump-sum payouts from ajo allow me to purchase additional inventory or raw materials for my business.	3.76	.435	VHE
17	My involvement in ajo enables me to acquire new tools, equipment, or technology to improve my business productivity.	3.71	.461	VHE
18	Participation in ajo provides me with funds that I can reinvest in expanding my business operations.	3.61	.494	VHE
19	Ajo contributions have helped me diversify my business into new products or services.	3.56	.502	VHE
20	The financial support from ajo has improved my ability to upgrade my business facilities or infrastructure.	3.51	.506	VHE
21	Participation in ajo allows me to reinvest profits back into my business rather than relying solely on personal savings.	3.46	.552	VHE
	Grand Weighted Average	**3.63**	**.481**	**VHE**

Source: Field Survey, 2026

Table 5 shows that a larger size of respondents were unanimous in their responses to items on the Table, significant number of them agreed to the very high extent of all items. This agreement is noticeable, as all mean scores are equal to or above the fixed decision value of 3.25. The standard deviation on the Table ranged from 0.419 to 0.552, they are all within the standard deviation limit of ±1.96. This indicates that there is low disparity from the mean in the respondents' responses. The average mean and standard deviation of 3.63 and 0.481, respectively, are pointers to this fact. The inference from this is that, in the opinion of respondents, the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs in Osun State, Nigeria, is rated very high.

Group	N	Mean	SD	t-cal	df	P-value	Decision
No Formal Education	13	3.42	0.288				
				-.973	39	0.337	$H_0$1 Accepted
Formal Education	28	3.51	0.282				

Testing of Hypotheses

The three null hypotheses of the study were tested using an independent sample t-test at a 0.05 level of significance. The summary of the test of hypotheses are presented in Tables 6 to 8 as follows:

H_O1: There is no significant difference in the mean ratings of urban and rural respondents on the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs.

Table 6: Showing Independent Samples t-test of Respondents on the Extent of Influence of Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs based on location

Source: Researcher's Computation, 2026

An independent samples t-test was conducted to assess whether there is a significant difference between the mean ratings of respondents on the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs based on location. Rural location ratings as regards the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs had a mean of 3.74 (SD = 0.107), whereas urban locations had an approximately same mean of 3.74 (SD = 0.196), both means are above the benchmark of 3.25. The t-test indicates that there is no statistically significant difference in the ratings of respondents as regards the extent of influence of the Rotational Savings and Credit Association System on the working capital adequacy of women entrepreneurs between rural and urban respondents (t = .073, df = 39, *P* = 0.942). The null hypothesis is hereby accepted.

Group	N	Mean	SD	t-cal	df	P-value	Decision
Rural	16	3.74	0.107				
				.073	39	0.942	$H_0$1 Accepted
Urban	25	3.74	0.196				

H_O2: There is no significant difference in the mean ratings of educated and non-educated respondents on the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs.

Table 7: Showing Independent Samples t-test of Respondents on the Extent of Influence of Rotational Savings and Credit Association System on the Profitability Stability of women entrepreneurs based on literacy

Source: Researcher's computation, 2026

An independent samples t-test was conducted to assess whether there is a significant difference between the mean ratings of respondents on the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs based on literacy level. No formal education ratings as regards the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs had a mean of 3.42 (SD = 0.288), whereas formal education had a mean of 3.51 (SD = 0.282), both means are above the benchmark of 3.25. The t-test indicates that there is no statistically significant difference in the ratings of respondents as regards the extent of influence of the Rotational Savings and Credit Association System on the profitability stability of women entrepreneurs between no formal education and formal education respondents (t = -.973, df = 39, *P* = 0.337). The null hypothesis is hereby accepted.

H_O3: There is no significant difference in the mean ratings of urban and rural respondents on the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs.

Table 8: Showing Independent Samples t-test of Respondents on the Extent of Influence of Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs based on location

Group	N	Mean	SD	t-cal	df	P-value	Decision
Rural	16	3.60	0.150				
				-1.017	39	0.315	$H_0$1 Accepted
Urban	25	3.65	0.144				

Source: Researcher's Computation, 2026

An independent samples t-test was conducted to assess whether there is a significant difference between the mean ratings of respondents on the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs based on location. Rural location ratings as regards the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs had a mean of 3.60 (SD = 0.150), whereas urban locations had a mean of 3.65 (SD = 0.144), both means are above the benchmark of 3.25. The t-test indicates that there is no statistically significant difference in the ratings of respondents as regards the extent of influence of the Rotational Savings and Credit Association System on the reinvestment capacity of women entrepreneurs between rural and urban respondents (t = -1.017, df = 39, *P* = 0.315). The null hypothesis is hereby accepted.

Discussion

The findings on research question one indicate that the Rotational Savings and Credit Association (ROSCAS) system, locally referred to as *"ajo"* in Osun State, exerts a very high influence on the working capital adequacy of women entrepreneurs. This result suggests that involvement in *ajo* significantly enhances the liquidity positions of women-led businesses, enabling more reliable cash flow management and strengthening the capacity to finance day-to-day operations. In contexts where formal financial inclusion remains limited, such informal savings arrangements serve as vital alternatives for capital access, particularly for small-scale women operators who often lack the documentation, collateral, or credit histories required by formal financial institutions. Similarly, Karlan et al. (2024) and Barasa (2023) found that savings groups improve working capital availability by providing members with predictable and timely access to pooled funds, which can be used for inventory purchases, operating costs, and short-term expenditures. These findings suggest that ROSCAs may moderate the negative effects of liquidity shortages, particularly during economic downturns or periods of market volatility, a scenario that has been documented in Nigeria's recent macroeconomic environment characterized by inflation and currency fluctuations.

The significance of these findings is particularly relevant given the gendered nature of financial exclusion. Women in Nigeria continue to face pronounced disparities in access to formal credit, with reports indicating that a disproportionately large percentage remain unbanked or underbanked (World Bank, 2022). Therefore, *ajo* emerges as a culturally embedded financial institution that compensates for systemic gaps in financial inclusion, enhancing working capital adequacy and, by extension, the operational sustainability of women-led enterprises. The findings confirm that the ROSCA system has a substantive and positive effect on the working capital adequacy of women entrepreneurs in Osun State. By facilitating improved access to liquidity, enhancing cash flow predictability, and reducing dependency on expensive borrowing channels, *ajo* contributes significantly to the financial health and

operational continuity of small-scale women's businesses. These results emphasize the importance of recognizing indigenous financial practices as integral components of broader financial inclusion strategies aimed at strengthening the resilience and performance of women entrepreneurs in similar emerging economy contexts.

The finding on hypothesis one revealed that there is no statistically significant difference between rural and urban women entrepreneurs in their ratings of the extent to which the Rotational Savings and Credit Association (ROSCAS) system influences working capital adequacy. This finding suggests that the perceived contribution of *ajo* to liquidity stability and day-to-day operational financing is relatively uniform across geographical locations within Osun State. In practical terms, both rural and urban respondents appear to derive comparable working capital benefits from participation in the informal savings system, indicating that its functional value transcends spatial and infrastructural differences. This outcome is particularly noteworthy given the documented disparities that often exist between rural and urban financial ecosystems. Prior studies have emphasized that rural entrepreneurs typically experience greater financial exclusion due to weaker banking infrastructure, limited digital financial penetration, and lower income levels (World Bank, 2022; International Monetary Fund, 2023). However, the absence of a significant difference in this study implies that *ajo*, as a socially embedded financial mechanism, may effectively neutralize some of these structural inequalities. Because ROSCAS operate through trust-based networks rather than formal institutional channels, their accessibility is not heavily dependent on physical banking infrastructure or urban financial density. This may explain the similar working capital outcomes observed among respondents irrespective of location.

The above finding is consistent with the findings of the International Labour Organization (2024) and the Organization for Economic Co-operation and Development (2023), who, in their recent evidence on savings groups in Sub-Saharan Africa, established that community-based financial associations often function as inclusive financial equalizers, providing consistent liquidity access across diverse socio-economic settings. The standardized structure of contributions and rotational payouts ensures predictable access to lump-sum capital, whether participants operate in rural marketplaces or urban commercial hubs. Consequently, the operational mechanisms of ROSCAS, regular savings discipline, pooled funds, peer monitoring, and social accountability appear to deliver uniform financial advantages that are not significantly moderated by geographic context. Overall, the finding implies that policies aimed at strengthening women's enterprise sustainability through informal financial mechanisms need not differentiate sharply between rural and urban settings, at least with respect to working capital adequacy. Instead, interventions could focus on enhancing the efficiency, transparency, and potential formal linkages of ROSCAS, given their demonstrated and geographically consistent contribution to women's business liquidity and operational continuity in Osun State.

The findings of Research Question Two revealed that the influence of the Rotational Savings and Credit Association System (ROSCAS), locally known as *ajo*, on the profitability stability of women entrepreneurs in Osun State is rated very high. This outcome indicates that participation in *ajo* significantly contributes to the consistency and predictability of profits among women-owned micro and small enterprises. Profitability stability, which reflects a firm's capacity to maintain steady earnings despite market fluctuations, is a critical dimension of enterprise sustainability, particularly within Nigeria's volatile economic climate characterized by inflationary pressures and fluctuating consumer demand (International Monetary Fund [IMF], 2023; World Bank, 2023). The high rating suggests that *ajo* functions not merely as a savings platform but as a financial buffer that mitigates profit volatility and enhances income regularity. One plausible explanation for this strong influence lies in the liquidity-smoothing function of ROSCAS. By providing members with periodic lump-sum payouts, *ajo* enables entrepreneurs to restock inventory promptly, capitalize on bulk purchasing discounts, and respond quickly to seasonal market opportunities. Such financial flexibility reduces stock-outs and missed sales, both of which can destabilize profit margins. Empirical studies by Karlan et al. (2023) on savings groups across Sub-Saharan Africa have shown that structured informal savings mechanisms improve business revenue consistency and reduce income shocks among microenterprise owners. The present finding aligns with this body of evidence, reinforcing the argument that community-based financial systems can enhance enterprise-level financial performance. Similarly, Ojong & Simba (2022) found that savings groups foster not only financial capital but also social learning and peer support, which collectively strengthen entrepreneurial decision-making and business profitability.

The high extent of influence observed in this study is particularly significant given the gendered barriers to formal credit access in Nigeria. Women entrepreneurs frequently face collateral constraints and higher borrowing costs, limiting their ability to stabilize profits through external financing (World Bank, 2022). In this context, *ajo* serves as an accessible and culturally embedded alternative that enhances revenue stability without imposing interest burdens or bureaucratic hurdles. The absence of

formal repayment pressure may allow entrepreneurs to deploy funds more strategically toward profit-generating activities. Overall, the finding underscores the strategic importance of indigenous financial institutions in strengthening the economic viability of women-led enterprises. By stabilizing cash flows, enabling timely reinvestment, and reducing vulnerability to income fluctuations, the ROSCA system appears to play a pivotal role in sustaining profitability among women entrepreneurs in Osun State. This evidence supports broader calls for the recognition of informal financial systems as complementary components of inclusive financial development frameworks in emerging economies.

The test of hypothesis two revealed that there is no statistically significant difference between women entrepreneurs with no formal education and those with formal education in their ratings of the extent to which the Rotational Savings and Credit Association System (ROSCAS) influences profitability stability. This finding suggests that the perceived benefits of *ajo* in stabilizing business profits are broadly experienced across educational categories. In other words, the capacity of the ROSCA system to support consistent earnings, cushion income fluctuations, and enhance revenue predictability does not appear to be contingent upon the entrepreneur's formal educational attainment. This outcome is particularly meaningful within the context of financial inclusion and enterprise development. Educational attainment is often associated with improved financial literacy, record-keeping practices, and strategic business management skills, which can influence enterprise performance. However, the absence of a significant difference implies that *ajo* operates as an accessible and user-friendly financial mechanism whose benefits are not restricted to entrepreneurs with higher educational exposure. Because ROSCAS is structured around simple contribution cycles, collective trust, and predictable rotational disbursement, participation does not require advanced financial knowledge or formal literacy skills. This inclusiveness may explain why women across different educational backgrounds report similar levels of profitability stabilization.

This study is also consistent with the finding of Karlan et al. (2023) and the Organization for Economic Co-operation and Development (2023), who found that community-based savings groups have been shown to enhance business resilience by promoting savings discipline and providing timely lump-sum capital, regardless of participants' formal education levels. The mechanisms of peer support, shared market information, and collective accountability embedded in ROSCAS may compensate for limited formal financial training by fostering experiential learning and informal knowledge exchange. Thus, even entrepreneurs without formal education may effectively utilize ROSCAS payouts to restock inventory, manage seasonal fluctuations, and mitigate unexpected business expenses, thereby sustaining profit stability. Overall, the absence of a statistically significant difference between educational groups highlights the inclusive nature of the ROSCAS as a grassroots financial institution. It underscores the potential of indigenous savings mechanisms to support profitability stability among diverse categories of women entrepreneurs in Osun State. From a policy standpoint, the finding suggests that efforts to strengthen or integrate ROSCAs into broader financial inclusion strategies can yield widespread benefits without being limited by educational barriers, thereby advancing inclusive and sustainable enterprise development.

The results for Research Question three showed that the Rotational Savings and Credit Association System (ROSCAS), locally known as *ajo*, has a very high influence on the reinvestment capacity of women entrepreneurs in Osun State, Nigeria. This finding indicates that participation in *ajo* significantly enhances the ability of women-owned ventures to allocate financial resources toward strategic business activities, including expansion of product lines, upgrading of equipment, facility improvements, and diversification of services. Reinvestment capacity is a vital component of long-term business sustainability because it reflects an enterprise's ability to convert financial inflows into productive capital that supports growth and competitiveness. The strong influence of *ajo* on reinvestment suggests that indigenous savings systems play a critical role not only in meeting immediate liquidity needs but also in strengthening future business performance.

One plausible explanation for this observed influence is the access to periodic lump-sum funds that participants receive through rotational savings cycles. Unlike fragmented personal savings, which may be insufficient for meaningful enterprise investment, *ajo* enables members to accumulate significant capital over a relatively short period. This capacity empowers women entrepreneurs to make strategic investment decisions that may otherwise be constrained by limited access to formal credit markets, a challenge widely documented in Nigerian SMEs (Adeniran & Johnston, 2023). In relation to the above finding, evidence from recent studies on community savings groups shows that collective savings mechanisms increase capital availability for investment and enhance the productive capacity of microenterprises, especially for women-led businesses (Chirwa & Odhiambo, 2024; Ndirangu & Rotich, 2023).

Social dynamics within *ajo* groups may also underpin the high reinvestment capacity observed in this study. Collective savings environments facilitate information sharing, peer encouragement for investment, and informal mentoring on business strategies, all of which contribute to improved investment behavior among participants (Osei-Assibey & Tenkorang, 2022). These social mechanisms, when combined with financial resources, create an ecosystem where women entrepreneurs are better positioned to identify growth opportunities and act on them effectively, a pattern documented in recent research on women's entrepreneurship networks in West Africa (Takyi & Anang, 2023). In summary, the finding that *ajo* significantly enhances the reinvestment capacity of women entrepreneurs in Osun State reinforces the critical role of indigenous financial practices in promoting enterprise sustainability. This suggests that informal savings systems function as more than interim liquidity solutions; they are strategic instruments that enable women entrepreneurs to pursue sustained business growth. Recognizing the reinvestment-enhancing potential of ROSCAS has important implications for policies aimed at financial inclusion and women's economic empowerment in emerging economies.

The result of hypothesis three showed that there is no statistically significant difference between rural and urban women entrepreneurs in how they rate the influence of the Rotational Savings and Credit Association (ROSCAS) system (*ajo*) on reinvestment capacity. This suggests that, regardless of geographic location, women entrepreneurs in both rural and urban communities alike perceive *ajo* as an equally effective mechanism for generating capital that can be reinvested into their businesses. Such reinvestment may include purchasing inventory, acquiring tools or technology, upgrading business premises, or expanding product and service offerings—activities that are central to enterprise growth and sustainability. This finding is notable in light of common assumptions about spatial inequalities in access to financial resources. Rural entrepreneurs are often viewed as more disadvantaged due to limited access to formal banking infrastructure, lower levels of digital financial inclusion, and weaker business support services compared to their urban counterparts (Okoye & Ezejiofor, 2023). Yet, the lack of a statistically significant difference points to the possibility that *ajo*, as an informal, community-based savings system, operates through social networks that transcend these locational divides. This is because ROSCAS is grounded in interpersonal trust, communal norms, and collective responsibility, they provide predictable access to pooled funds independent of formal financial institutions, which are often scarce in rural areas.

Recent studies on informal savings groups in Sub-Saharan Africa support this interpretation. Savings groups have been shown to function as grassroots financial institutions that enhance capital accumulation and reinvestment behavior for microenterprise owners in both rural and urban settings (Gathungu & Gitau, 2024). Such groups help stabilize capital flows and reduce dependence on high-cost borrowing, enabling entrepreneurs to make strategic investments that support business resilience and competitiveness (Mugabi, 2023; Okorie & Nwankwo, 2022). That rural and urban women entrepreneurs rate the reinvestment influence of *ajo* similarly suggests that the system's financial benefits are robust across diverse socio-economic landscapes. In summary, the finding underscores the inclusive nature of *ajo* as a source of reinvestment capital for women entrepreneurs in Osun State. The similarity in perception between rural and urban respondents highlights the system's adaptability and relevance in different economic environments. For policymakers and development practitioners, this suggests that interventions designed to strengthen indigenous savings systems could be equally applicable and beneficial across rural and urban settings, thereby contributing to broader financial inclusion and enterprise sustainability objectives.

Conclusion

This study investigated the influence of the Rotational Savings and Credit Association System (ROSCAS), locally known as "ajo," on women's enterprise sustainability in Osun State, Nigeria, with specific focus on working capital adequacy, profitability stability, and reinvestment capacity. The findings demonstrate that participation in the ROSCAS exerts a very strong positive influence on key dimensions of enterprise sustainability among women entrepreneurs. The results indicate that *ajo* functions as more than a traditional savings arrangement; it serves as a strategic financial instrument that supports business liquidity, promotes consistent income generation, and facilitates capital reinvestment for women's enterprise growth.

The study further revealed that the influence of the ROSCAS on working capital adequacy, profitability stability, and reinvestment capacity is consistently rated very high by respondents. This suggests that indigenous savings structures provide reliable financial support for women entrepreneurs operating in the informal sector, where access to formal credit facilities is often limited by collateral requirements, bureaucratic procedures, and high borrowing costs. By enabling periodic accumulation and disbursement of pooled funds, *ajo* enhances business cash flow management, reduces financial vulnerability, and supports operational continuity in economically volatile environments.

In addition, the study established that there were no statistically significant differences in respondents' ratings across rural and urban locations as well as educational attainment categories. This implies that the benefits of ROSCAS participation are widely accessible and uniformly experienced by women entrepreneurs irrespective of geographical or educational background. The finding underscores the inclusive nature of the *ajo* system, which is grounded in social trust, communal accountability, and shared economic norms rather than formal institutional infrastructure.

Theoretically, the study contributes to the literature on social capital and informal finance by demonstrating that community-based financial networks can function as effective mechanisms for supporting enterprise sustainability in developing economies. Practically, the findings highlight the importance of recognizing indigenous financial institutions as complementary components of national financial inclusion strategies. Policymakers, development agencies, and entrepreneurship support organizations should therefore consider integrating ROSCAS groups into broader women empowerment and microenterprise development programmes.

In conclusion, the Rotational Savings and Credit Association System plays a significant role in enhancing the sustainability of women-owned enterprises in Osun State. Through strengthening working capital availability, stabilizing profitability, and promoting reinvestment behavior, *ajo* serves as a resilient grassroots financial model that supports women's entrepreneurial survival and growth. Promoting and improving the operational efficiency of such indigenous savings systems could contribute meaningfully to inclusive economic development and long-term women's economic empowerment in Nigeria.

Recommendations

Based on the findings of this study and in line with the three research objectives, the following recommendations are made:

1. Community development agencies, financial inclusion programmes, and women empowerment organizations should support the sustainability of ROSCAS by promoting trust-building mechanisms, transparency, and proper group management practices that enhance liquidity access for members.
2. Policymakers and entrepreneurship development stakeholders should recognize and support indigenous savings systems as complementary financial instruments for improving profitability stability among women-owned enterprises.
3. Government agencies and microenterprise development institutions should promote the integration of Rotational Savings and Credit Associations into women's business reinvestment and growth support programmes. by creating linkage opportunities between ROSCAS groups and formal financial institutions, enabling access to expansion grants, low-interest development loans, and enterprise development training.

Abstract

The study examined vocational educators' competencies need for improved job performance in public universities in Nort-east, Nigeria. A descriptive survey design was adopted. Two objectives, two research questions and two null hypotheses guided the study. A population of 173 vocational educators participated in the study, and census population was used. The instrument for data collection was a structured questionnaire. A pilot test was conducted outside the study area to obtain Cronbach alpha where reliability coefficient of 0.88 was found. The questionnaire was validated by two experts. Mean and standard deviation was used to answer the research questions, while independent sample t-test was used to test the null hypotheses at 0.05 level of significance. The finding revealed among others, that vocational educators require digital and pedagogical competencies for their job improvement, and also there is no significant difference between digital and pedagogical vocational educators' competencies based on their gender. It was therefore recommended that digital and pedagogical competencies be entrenched by vocational educators in universities within North-east, Nigeria, for improvement in their job performance.

Key words: Vocational Educators, Digital Competencies, Pedagogical Competencies, Job Performance

Introduction

The landscape of vocational education has undergone significant transformation in recent times driven by rapid technological advancement, globalization, and evolving labor market demands (Billett, 2011; Samad, 2026). Traditional educational models, characterized by standardized curricula and time-based progression, have increasingly been challenged to demonstrate their effectiveness in preparing students for the complexities of modern workplaces. In response to these pressures, competency-based education has emerged as a promising alternative that prioritizes the demonstration of specific skills and knowledge over seat time and credit hours (Gervais, 2016; Samad, 2026).

Competency-based education represents a fundamental shift in educational philosophy, an approach that focused on outcomes and mastery by vocational educators within the university. In vocational education contexts, this paradigm shift is particularly relevant, as the primary goal is to prepare vocational educators with practical skills and competencies directly applicable to their chosen professions. The competency-based approach if appropriately delivered, aligns educational processes with the actual requirements of industries and occupations, creating a more direct pathway from education to employment

Vocational educators in universities are lecturers and instructors capable in delivering the instruction process in class and the workshop, they need to be good at using machines and equipment so that they can teach effectively using those technologies, Besides teaching and learning process, they are subject matter experts who handle class and workshop session through the process of delivering knowledge and ensure the process is smooth and student are able to comprehend and practice the knowledge and skills for life. They are supposed to be competent in knowledge, technical and other related skills that will smoothen and assist in the teaching and learning process, explain the content clearly and demonstrate the practical work and know-how techniques on practicalities in order to deliver the knowledge to student. Nurtanto et al., (2021) describes vocational educators as those who bring their wealth of knowledge to teach in the classroom setting, workshops to enlighten students and to direct the affairs of the class through the passing of the subject matter using classroom

instruction. These involve demonstrating skills to their recipients in amenable ways such as the proper use of tools, equipment and software, as well as instructing students on special safe guide measures for doing a specific job (Nurtanto et al., 2021).

Prior studies state that vocational school graduates need new skills that are different from the previous era (Made Sudana et al., 2019). This has implications for vocational education teachers to adapt to complexity and change. It is in line with another previous study that states teachers are not the only component of the vocational education system, but they play an important role as active facilitators of the system, with a direct influence on educational processes and educational outcomes (Metzler & Woessmann, 2012). Therefore, teachers must have adaptive and transformative social potential to manage themselves and all the potential they contain for a balanced and sustainable well-being life (Purnama & Dwikurnaningsih, 2021).

Competency is a set of knowledge, skills and attitudes that elevate employees in performing their tasks well, it is as individual aspects to perform an excellent and effective job. As the work experience grows, so does the competency component. The experience will move and accelerate off an individual to perform better in their job because the experience will be proceeding to the premise that the success will require time and learning from doing a mistake will mature an individual. Omar, Ismail and Abdullahi (2021) identified competencies for TVET instructors to include (i) professional skills (ii) pedagogical skills (iii) knowledge development and (iv) personality and values and added that TVET instructors are required to strengthen their competencies to assist the graduates' employment opportunities and responsible to produce the graduates that are able to meet the industrial demands.

Vocational training instructors as Technical Vocational Training (TVET) need to meet the standard and quality of what is defined as an experienced educator. When the challenges in the industries is shaking and how the economy is driven, a viable solution to graduate unemployment should be worked out concurrently, they are also required to strengthen their competencies to assist the graduates' employment opportunities and responsible to produce the graduates that are able to meet the industrial demands (Dumbiri et al., 2020; Omar et al., 2017; Omar *et al*., 2021).

Spencer and Spencer in Omar *et al*., (2021) states that competency is divided into two main parts: (i) generic competencies; comprises possession of knowledge, skills and personal characteristics that is intrinsic in nature and self-development, and (ii) functional competencies; related to possession of knowledge, skills and specific personal characteristics to perform tasks and responsibilities. Omar *et al*; (2021) further identified the key component of competency to include (i) professional skills (ii) pedagogical skills (iii) knowledge development and (iv) personality traits.

Suciu and Mata in Ikezor and Ojeaga (2021) defined pedagogical competence as the capability and eagerness to consistently put into use attitudes, knowledge, and skills aimed at encouraging learning in the best way possible. Akhyak and Bakar (2013) see pedagogical competence as the capacity of instructors to manage the learning process in the area of planning, interacting, and performing assessment. In the same vein Sahana (2015) opined that pedagogical competence includes knowledge and skills that enable a teacher to have a deep understanding capable of joining theory and research to aid teaching and learning in the best way possible. From the foregoing, therefore according to Ikezor and Ojeaga (2021), pedagogical competence is the ability of a vocational and technical teacher to combine both human and material resources to achieve the expected outcome. Pedagogical competence is the fulfillment of desired result, knowledge, comprehension and readiness of vocational teachers in teaching and learning which includes teachers' capability to direct the teaching and learning process (Sucio and Mata, 2011).

Digital tools in e-learning environments not only improve individual learning outcomes but also equip educators with actionable insights to optimize teaching strategies. These technologies play a pivotal role in fostering flexible, personalized, and more effective learning experiences in both digital and blended learning settings. AI has demonstrated remarkable potential to significantly improve both teaching and learning outcomes by offering personalized learning experiences, adaptive feedback, and streamlined data analysis. AI-powered systems, including intelligent tutoring and adaptive learning platforms, can process large amounts of student data in real-time, allowing educators to customize content according to each learner's unique needs, preferences, and progress (Luckin et al., 2016; Zawacki-Richter et al., 2019). These tools not only enhance personalization but also create dynamic and interactive educational environments, which foster greater student engagement and motivation (Baker et al., 2025).

Rich, Lepine and Crawford in Ikezor and Ojeaga (2021) states that job performance is the extent how well workers perform their assignment creditably well. Similarly, Karnan and Marimuthu (2021) see job performance as how employees perform creditably well in their work. It further states that "job performance is the training and natural ability of an individual. From the forgoing according to

Ikezor and Ojeaga (2021), job performance is the ability of a vocational educator to perform well in a given tasks using his wealth of experience in a given task to achieve the desired result of the institution he or she serves, as well maintaining good relationship with other members of staff as well as those outside the school system.

The current study identified numerous challenges that must be addressed for vocational education competency need to achieve its potential. In universities within North-east, Nigeria, faculty development, institutional infrastructure, assessment systems, and industry partnerships all require substantial investment and ongoing attention. Additionally, in order to solve the challenges, it requires transition from traditional to competency-based models that represents a complex change process that affects all aspects of educational institutions, especially exploring how this model can effectively integrate emerging technologies, including artificial intelligence and virtual reality, represents another important direction. This is because as labor markets continue to evolve rapidly and educational institutions face pressure to demonstrate value, the focus on clearly defined, demonstrable competencies that offers a compelling framework for ensuring that vocational education effectively prepares students for successful careers and contributes to economic development. It is based on the foregoing, that the researchers investigated vocational educators' competencies need for improved job performance in universities in North-east, Nigeria.

The main objective of the study is to determine vocational educators' competencies need in universities in North-east, Nigeria. Specifically, the study sought to:

i. examine the pedagogical competency needs among vocational educators in universities in North-east, Nigeria
ii. Determine the digital competency need among vocational educators in universities in North-east, Nigeria

The following research questions were raised;

i. What is the pedagogical competency need of vocational educators in universities in North-east, Nigeria?
ii. What is the digital competency need among technical and vocational educators in universities in North-east, Nigeria?

The following null hypotheses was formulated at 0.05 significance level;

i. There is no significant difference between male and female vocational educators' pedagogical competency in universities in North-east, Nigeria
ii. There is no significant difference between male and female vocational educators' digital competency in universities in North-east, Nigeria

Theoretical Review

The current study in vocational contexts is grounded in multiple theoretical frameworks; Constructivist learning theory provides a foundational perspective, emphasizing that learners actively construct knowledge through experience and reflection rather than passively receiving information (Fosnot & Perry 2005). This aligns with vocational education's emphasis on hands-on learning and authentic workplace experiences. Additionally, experiential learning theory, particularly Kolb's learning cycle, informs the design of competency-based programs that integrate concrete experiences, reflective observation, abstract conceptualization, and active experimentation (Kolb, 2014).Behaviorist principles also influence competency-based approaches, particularly in the specification of observable, measurable learning outcomes and the use of mastery learning strategies (Bloom, 1968). The requirement that students demonstrate specific competencies before progressing reflects behaviorist emphasis on performance-based evidence. However, contemporary CBE models extend beyond pure behaviorism by recognizing cognitive and metacognitive dimensions of competence (Anderson & Krathwohl, 2001).

Methodology

The study adopted a descriptive survey research design. The study was conducted in North-east geo-political zone of Nigeria, with a total population of 173 vocational educators who participated in the study, this was achieved using census population. The instrument for data collection was a structured questionnaire. The questionnaire was validated by two experts. Pilot test was conducted outside the study area in order to obtain reliability coefficient of the instrument, as a result, 0.87 was found which is reliable. Four research assistants were employed for the purpose of data collection, in which, 85% return rate was achieved. Mean and standard deviation was used to answer the research questions, while independent sample t-test was used to test the null hypotheses at 0.05 level of significance. The analysis was conducted using Statistical Package for Social Science (SPSS) version 23. The 3.0 criterion mean derived from the 5-point scale was used as the benchmark for determining mean. In the test of the null hypotheses, if $p \geq 0.05$, the null hypothesis was accepted, and if $p \leq 0.05$,

the null hypothesis was rejected.

Result

Research Question One

What is the extent of pedagogical competency need for vocational educators in universities in North-east, Nigeria?

Results on the extent to which incentive operation influences business education lecturers' productivity in the colleges of Education in table 2 revealed that mean responses of business education teachers ranges from 4.01 and 1.57 with corresponding Standard Deviation of 1.136 and .373 with grand mean 2.75. The result shows to a moderate extent that, there is need for vocational educators' pedagogical competence in universities in North-east, Nigeria.

Table 2: Mean and standard deviation on the extent of pedagogical competency need for vocational educators in universities in North-east, Nigeria.

S/N	Item	N	Mean	SD	Remark
8.	Extent to which I use flipped classroom	122	4.01	.489	ME
9.	Extent to which I use experiential learning class	122	2.90	.373	ME

Research Question Two

What is the extent of digital competency need for vocational educators in universities in North-east, Nigeria?

Results on the extent of digital competency need for vocational educators in universities in North-east, Nigeria documented in table 2, revealed that mean and standard deviation of vocational educators ranges from 3.46 to 1.57 with a standard deviation of .532 to .855, and grand mean of 2.62 respectively. The result indicated to a moderate extent that, there is need for vocational educators' digital competency in universities in North-east, Nigeria.

Table 2: Mean and standard deviation on the extent of vocational educators' digital competency need in universities in North-east, Nigeria.

S/N	Item	N	Mean	SD	Remark
1.	Extent of multimedia courseware competency need	122	3.46	.532	ME
2.	Extent of AI-powered intelligence tutoring system competency need		3.46	.532	ME
3.	Extent of Virtual learning competency need		3.16	.853	ME

Sources: field work (2026)

Null Hypothesis One

There is no significant difference in mean rating between male and female vocational educators' pedagogical competency need in universities in North-east, Nigeria

Independent sample t-test was used to test the mean difference between male and female vocational educators' pedagogical competency need in universities in North-east, Nigeria. The summary of the analysis presented on table 4 shows the independent sample t-test that compare the difference between male and female vocational educators' digital competency need in universities. The results from the table revealed that, there is significant difference in the mean of male (mean= 19.29 and SD=6.18) and female vocational educators (mean=11.53 and SD=3.45), $(\mathrm{t} = 2.126, \mathrm{df} = 61, \mathrm{p} - \mathrm{value} = 0.008)$. Because the p-value (0.008) is less than the level of significance (0.05). Therefore, the null hypothesis one which states that there is no significant difference between male and female vocational educators' pedagogical competency need in universities in North-east, Nigeria was therefore, rejected.

Table 3: Independent sample t-test on the mean achievement scores at post-test results of experimental and control groups.

Pedagogical Competency Need	*N*	*Mean*	*SD*	*df*	*t-value*	*p-value*	*Decision*
Male	*98*	*19.29*	*6.18*	*61*	*2.126*	*0.008*	*Rejected*
Female	*26*	*11.53*	*3.45*				

Source: Field work (2026).

Null Hypothesis Two

There is no significant difference in mean rating between male and female vocational educators' digital competency need in universities in North-east, Nigeria

Independent sample t-test was used to test the mean difference between male and female vocational educators' digital competency need in universities in North-east, Nigeria. The results from the table revealed that, there is significant difference in the mean of male (mean= 11.12 and SD=4.955) and female vocational educators (mean=16.41 and SD=6.254), $(\mathrm{t} = -6.137, \mathrm{df} = 61, \mathrm{p} - \mathrm{value} = 0.001)$. Since the p-value (0.001) less than the level of significance (0.05), therefore, the null hypothesis which states that there is no significant difference between male and female vocational educators' digital competency need in universities in North-east, Nigeria was also rejected.

Table 4: Independent sample t-test on the mean difference between male and female vocational educators' digital competency need in universities in North-east, Nigeria

Pedagogical Competency Need	*N*	*Mean*	*SD*	*df*	*t-value*	*p-value*	*Decision*

Female	*26*	*16.41*	*6.254*				

Source: Field work (2026).

Findings of the Study

The following are the findings of the study;

1. The result from research question one and its corresponding null hypothesis revealed that there is significant difference between male and female vocational educators' pedagogical competency need in universities in North-east, Nigeria
2. The result from research question two and its corresponding null hypothesis also shows that there is significant difference between male and female vocational educators' pedagogical competency need in universities in North-east, Nigeria

Discussion of the Findings

The findings of research question one and its corresponding null hypothesis revealed that vocational educators need pedagogical competencies. Also, there is significant difference between male and female vocational educators' pedagogical competencies need in universities in North-east, Nigeria. The result agreed with Ekoh (2016), Said (2018) and Ikezor and Ojeaga (2021) stated that vocational educators need pedagogical competence to create a condition in which learning takes place. Conversely, Umoru and Shaibu (2018) in their study, disagree with the findings which revealed that instructors do not necessarily need teaching competencies for their job performance. However, on gender, the finding of Bunumi (2016) and Umoru and Shaibu (2018) disagree with the finding of the current study, who reported that vocational educators' competencies in pedagogy is not influenced by gender.

The findings of research question two and its corresponding null hypothesis indicated that vocational educators need digital competencies. Also, there is significant difference between male and female vocational educators' digital competencies need in universities in North-east, Nigeria. This finding concurred with finding of Ezenwafor and Olaniyi (2017), Ofili and Idris (2017) and Ikezor and Ojeaga (2021) which showed that vocational and technical educators also need digital competencies for their job performance improvement. On gender, the finding of the current study did not concur with Muhammad and Mohamad (2020) who found that there was no significant difference in the mean rating between male and female vocational educators on digital competencies need for job performance.

Conclusion

Based on findings of the present study, the study concluded that vocational educators in universities in North-east, Nigeria needs pedagogical and digital competencies for improvement in their job performance. Additionally, it was further concluded that there is significant difference between male and female vocational educators' pedagogical and digital competencies need in universities in North-east, Nigeria.

Recommendations

The following recommendations were made;

1. Vocational educators are to take advantage of training and retraining opportunities by the university's authorities and Tetfund, and also improve on their personal development to increase their pedagogical competencies in teaching and learning.
2. University management should investment more on digital educational tools and policy statements in vocational educators' continuous training in contemporary digital competencies for effective teaching and learning that could improves vocational educators job performance in universities within North-east, Nigeria.

Abstract

The study investigated the influence of Artificial Intelligence (AI) tools usage on research efficiency among Business Education postgraduate students in Tai Solarin Federal University of Education, Ogun State. Specifically, the study determined the level of research efficiency, identified commonly used AI tools for research, examined the relationship between AI tools usage and research efficiency, and assessed the influence of AI tools usage on research efficiency. A descriptive survey research design was adopted. The population comprised 144 Business Education postgraduate students admitted between the 2019 and 2026 academic sessions, and 99 students were selected using simple random sampling technique. A validated questionnaire titled Artificial Intelligence Tools Usage and Research Efficiency Questionnaire (AITUREQ) was used for data collection. Face and content validity were established by an expert, while Cronbach's Alpha yielded a reliability coefficient of 0.79. Data were analysed using frequency, percentage, mean, standard deviation, Pearson Product Moment Correlation (PPMC), and regression analysis at 0.05 level of significance. Findings revealed moderate research efficiency, slightly below the benchmark (Mean = 2.48, SD = 0.74). A significant positive relationship existed between AI tools usage and research efficiency ($r = 0.363$, $p < 0.05$). AI tools usage also significantly influenced research efficiency, $F(1, 97) = 4.847$, $p < 0.05$. ChatGPT, Gemini, Mendeley, Grammarly, Claude, EndNote, and Scite were the most commonly used tools. It concluded that AI tools usage significantly enhances research efficiency. It recommended increased effective use of AI tools and regular professional activities to improve awareness and responsible utilisation of emerging AI technologies.

Keywords: Artificial intelligence tools usage, business education postgraduate students, level of AI tools usage, commonly used AI tools, research efficiency

Introduction

Research efficiency, in its broad sense, refers to the ability of students or researchers to complete academic research tasks effectively, accurately, and within the shortest possible time while maintaining quality output. In simple terms, it is how well a student can turn effort, time, and available resources into meaningful research results. According to recent scholarly perspectives, research efficiency involves productivity in literature review, data analysis, academic writing, and proper interpretation of findings (Muslimin, 2024). It is widely recognized as a core determinant of postgraduate success because it directly affects the quality, timeliness, and originality of academic outputs.

The significance of research efficiency in higher education cannot be overstated. It enhances academic performance, promotes timely completion of postgraduate programmes, and improves the quality of scholarly publications. Chauke et al. (2024) noted that postgraduate students with higher efficiency tend to produce more structured and impactful academic work. Similarly, Ward et al. (2024) emphasized that efficient research practices contribute to improved learning outcomes and stronger academic confidence. Despite its importance, several scholars have identified persistent challenges affecting research efficiency among postgraduate students. Abbas et al. (2024) and Tian et al. (2024) reported issues such as poor time management, limited research skills, inadequate institutional support, and overdependence on digital tools, which may negatively affect independent academic thinking and productivity.

In recent years, Artificial Intelligence (AI) has emerged as a transformative technology in academic research. In simple terms, AI refers to computer systems that can perform tasks that normally require

human intelligence, such as writing, summarizing, analyzing data, and generating ideas. Muslimin (2024) described AI tools as digital assistants that support academic productivity, while Chauke et al. (2024) viewed them as technologies that enhance learning and research performance through automation and intelligent suggestions. These tools include applications such as ChatGPT, Grammarly, QuillBot, Mendeley, and Google Gemini, which are increasingly used in higher education to support research activities.

The level of AI tools usage among postgraduate students has been reported to be relatively high, particularly with the rise of generative AI platforms. Studies such as Alade and Daniel (2023) and Chowanda et al. (2023) found that postgraduate students frequently use AI tools for academic writing and information retrieval, although usage levels vary across individuals and institutions. This growing adoption reflects increasing reliance on AI to simplify complex research tasks and improve academic productivity.

Regarding commonly used AI tools, literature shows that students mostly prefer general-purpose tools such as ChatGPT, Grammarly, and Google Gemini over specialized academic tools. Alade and Daniel (2023) and Chowanda et al. (2023) reported that these tools are widely used due to their ease of access and versatility in supporting writing and idea development. However, advanced research tools like Elicit, ResearchRabbit, and Litmaps are less frequently used, indicating limited exposure to structured research mapping technologies.

Empirical studies on the relationship between AI tools usage and research efficiency generally suggest a positive association. Chauke et al. (2024) and Muslimin (2024) found that AI tools usage significantly improves academic productivity and writing efficiency among postgraduate students. However, some studies present mixed or cautionary findings. Abbas et al. (2024) and Wecks et al. (2024) reported that while AI tools enhance task completion, excessive dependence may reduce critical thinking and independent research skills.

Similarly, studies on the influence of AI tools usage show both positive and negative outcomes. Ward et al. (2024) and Nakavachara et al. (2024) reported that AI tools significantly improve academic efficiency and study habits. In contrast, Tian et al. (2024) and Bouzar et al. (2024) found that overreliance on AI tools may negatively affect deep learning and originality, suggesting a complex influence that depends on usage patterns and academic context.

Despite the growing body of literature, a clear gap remains in understanding how AI tools usage specifically influences research efficiency among postgraduate Business Education students in Nigerian universities. Most existing studies were conducted outside Nigeria (Chauke et al., 2024; Tian et al., 2024) or focused on general postgraduate populations rather than discipline-specific groups such as Business Education students. Furthermore, limited studies have simultaneously examined level of usage, commonly used tools, relationship, and influence of AI tools usage within a single framework.

Therefore, this study intends to investigate the level of research efficiency, commonly used AI tools, the relationship between AI tools usage and research efficiency, and the influence of AI tools usage on research efficiency among postgraduate Business Education students in Tai Solarin Federal University of Education, Ogun State, Nigeria (2020–2026 cohort). The study is expected to contribute to the growing global discourse on AI in education and provide empirical evidence for improving postgraduate research training and policy formulation.

Statement of the Problem

Despite the increasing integration of Artificial Intelligence (AI) tools in academic research, many postgraduate Business Education students continue to experience challenges in achieving high research efficiency in terms of productivity, quality of output, time management, and effective completion of research tasks. Although AI tools such as ChatGPT, Grammarly, and Mendeley are widely available and frequently used, there is limited empirical evidence on how their usage translates into actual research efficiency among postgraduate students in Nigerian universities.

Furthermore, existing studies have reported mixed findings regarding the effectiveness of AI tools in improving academic and research outcomes, with some studies indicating significant improvement in productivity, while others highlight issues such as overdependence, reduced critical thinking, and inconsistent academic benefits. In Tai Solarin Federal University of Education, Ogun State, there is insufficient documented evidence on the level of AI tools usage, the commonly used tools, and how these tools relate to and influence research efficiency among postgraduate Business Education students.

Therefore, the problem of this study is that despite the growing adoption of AI tools in academic research, the extent to which their usage relates to and influences research efficiency among postgraduate Business Education students remains unclear and under-researched.

Objectives of the Study

The main objective of the study was to investigate the influence of Artificial Intelligence (AI) tools usage on the research efficiency of postgraduate Business Education students in Tai Solarin Federal University of Education, Ogun State. The specific objectives of the study sought to:

i. determine the level of research efficiency among Business Education postgraduate students
ii. examined the level of Artificial Intelligence tools usage among Business Education postgraduate students.
iii. identify the commonly used Artificial Intelligence tools among Business Education postgraduate students.
iv. examine the relationship between Artificial Intelligence tools usage and research efficiency among postgraduate Business Education students in Tai Solarin Federal University of Education.
v. determine the influence of Artificial Intelligence tools usage on the research efficiency of postgraduate Business Education students in Tai Solarin Federal University of Education.

Research Questions

The following research questions will guide the study:

i. What is the level of research efficiency among Business Education postgraduate students?
ii. What is the level of Artificial Intelligence tools usage among Business Education postgraduate students?
iii. What are the commonly used Artificial Intelligence tools among Business Education students?

Hypotheses

The following hypotheses were tested at the 0.05 level of significant:

H_{01}: There is no significant relationship between Artificial Intelligence tools usage and research efficiency among Business Education postgraduate students.

H_{01}: Artificial Intelligence tools usage does not significantly influence the research efficiency among Business Education postgraduate students.

Methodology

This study adopted a descriptive survey research design. The design was appropriate because it allows the researcher to collect data from postgraduate Business Education students to describe the level of research efficiency, level of AI tools usage, commonly used AI tools, and the relationship and influence of AI tools usage on research efficiency without manipulating any variables. The population of this study comprised 144 Business Education postgraduate students within the 2019–2026 academic sessions in Tai Solarin Federal University of Education, Ogun State. The sample for this study consisted of 99 Business Education postgraduate students using simple random sampling technique was used in selecting the respondents. This technique is considered appropriate because it gave all members of the population an equal and independent chance of being selected, thereby reducing bias and ensuring that the sample is representative of the entire population. The instrument for data collection in this study was a structured questionnaire 'Artificial Intelligence Tools Usage and Research Efficiency Questionnaire (AITUREQ).' The validity of the research instrument was ensured through face and content validity. The result of the reliability test yielded a coefficient of 0.79 Data for this study was collected through the administration of the structured questionnaire 'Artificial Intelligence Tools Usage and Research Efficiency Questionnaire (AITUREQ).' The questionnaire was administered directly to the respondents, who were Business Education postgraduate students in Tai Solarin Federal University of Education, Ogun State. The researcher distributed the copies of the questionnaire with the assistance of class representatives where necessary and adequate time was given to the respondents to complete them. The completed questionnaires were collected immediately or within a short period of time to ensure a high return rate and accuracy of responses. The data collected for this study were analyzed using both descriptive and inferential statistics. The descriptive statistics employed included frequency distribution, percentage, mean score, and standard deviation**,** and they were used to analyze respondents' bio-data, the level of research efficiency, the level of AI tools usage, and the commonly used Artificial Intelligence tools among Business Education postgraduate students. Inferential statistics were used to test the hypotheses of the study. The Pearson Product Moment Correlation (PPMC) was used to determine the relationship between Artificial Intelligence tools usage and research efficiency, while simple regression analysis was used to determine the influence of AI tools usage on research efficiency. All hypotheses were tested at the 0.05 level of significance.

Demographic Data of Respondents

Table 1: Gender and Age Distribution of Respondents

Gender	Frequency distribution	Percentage
Male	54	54.5
Female	46	46.4
Program		
Master	65	65.6
MPhil/Phd	20	20.2
PGDE	14	14.2
Mode of Programmme		
Full time	71	71.7
Part time	28	28.3

Table 1 result showed gender, program and mode of program distribution of respondents. The demographic distribution of respondents shows that there is a fairly balanced representation of gender among the postgraduate Business Education students sampled. The table indicates that 54 (54.5%) of the respondents were male**,** while 46 (46.4%) were female**,** suggesting that male students slightly outnumbered female students in the study. This implies that the data collected is not heavily biased toward one gender, although males have a marginal dominance. In terms of programme of study, the results reveal that the majority of the respondents were enrolled in the Master's programme with 65 (65.6%)**,** followed by MPhil/PhD students with 20 (20.2%)**,** while PGDE students accounted for 14 (14.2%)**.** This indicates that most of the postgraduate students in the sample are at the Master's level, suggesting that the findings of the study may largely reflect the experiences of Master's students in relation to AI tools usage and research efficiency. Regarding mode of study, the table shows that 71 (71.7%) of the respondents were full-time students**,** while 28 (28.3%) were part-time students**.** This implies that the majority of the respondents are full-time students, which may suggest greater engagement with research activities and potentially higher exposure to Artificial Intelligence tools for academic purposes compared to part-time students. Overall, the demographic data indicate that the study sample is adequately distributed across gender, programme, and study mode, thereby providing a reasonable basis for generalizing the findings within the population of postgraduate Business Education students in the institution.

Research Questions 1

i. What is the level of research efficiency among postgraduate Business education students?

Table 4.2 Mean and Standard deviation analysis of postgraduate students' Research Efficiency

Items	N	$\bar{x}$	Std
Supervisor			
My supervisor/s have the skills and subject knowledge to support my research	99	2.68	.596
I have regular contact with my supervisor/s, appropriate for my needs	99	2.58	.708
My supervisor/s provide feedback that helps me direct my research activities	99	2.41	.754
Total		**2.55**	**0.68**
Resources			
I have a suitable working space when I am on campus	99	2.45	.715
I have a suitable working space when I am studying remote	99	2.82	0.706
There is appropriate access to physical library resources and facilities	99	2.23	.717
Total		**2.5**	**0.71**
Research culture			
I have frequent opportunities to discuss my research with other researchers including research students	99	2.22	.696
I have access to a good range of seminars in my research area	99	2.94	.720
I am aware of opportunities to become involved in the wider research community, beyond my department	99	2.17	.768
Total		**2.44**	**0.72**
Responsibilities			
My institution values and responds to feedback from research degree students	99	2.37	.765

I understand my responsibilities as a research degree student	99	2.45	.660
I am aware of my supervisors' responsibilities towards me as a research degree student	99	2.50	.724
Total		**2.44**	**0.71**
Institutional Support			
The support for academic skills meets my needs	99	2.44	.913
The support for using IT and accessing resources meets my needs	99	2.51	0.76
The support for my health and wellbeing meets my needs	99	**2.68**	**0.55**
Total		**2.54**	**0.74**
Research skills development			
My skills in applying appropriate research methodologies, tools and techniques have developed during my programme	99	2.68	0.54
My skills in critically analysing and evaluating findings and results have developed during my programme	99	2.35	0.59
My confidence to be creative or innovative has developed during my program	99	2.20	0.32
Total		**2.41**	**0.48**
Total		**2.48**	**0.67**

Note. N= Number of respondents, $\bar{X}$= Response Mean Score; S.D = Standard Deviation Score of Response. (Weighted Average: 2.48, Standard Reference Mean: 2.50). Decision Rule: Items are accepted if mean is above standard referenced mean

Table 4.2 showed the result of Business education postgraduate students' research efficiency across six dimensions: supervision, resources, research culture, responsibilities, institutional support, and research skills development. The result showed that for supervisor section, subtotal mean was rated above the criterion mean (mean = 2.55 (Std= 0.68) > 2.50), Resources (mean = 2.49 (Std = 0.71) < 2.50), Research culture (mean = 2.44 (Std = 0.72) < 2.50), Responsibilities (mean = 2.44 (Std = 0.71) < 2.50), Institutional Support Responsibilities (mean = 2.54 (Std = 0.74) > 2.50) and Research skills development (mean = 2.41 (Std = 0.48) < 2.50). The result also showed weighted mean 2.48 which is below reference mean (2.50), with the weighted mean below the referenced mean, this implies that Business education postgraduate students indicated slightly below research efficiency.This indicates that the overall level of research efficiency among postgraduate Business Education students is moderate but slightly below the acceptable benchmark. This suggests that while students experience some level of support and competence in their research activities, it is not sufficiently strong to be considered high. Specifically, the **supervision dimension (2.55)** and **institutional support (2.54)** were slightly above the benchmark, indicating that students generally perceive their supervisors and institutional support systems as moderately effective in enhancing their research activities. However, the **resources (2.50)**, **research culture (2.44), responsibilities (2.44)**, and **research skills development (2.41)** dimensions were at or below the benchmark, showing that students face some limitations in access to resources, engagement in research culture, clarity of responsibilities, and development of advanced research skills.

The standard deviation values ranging between 0.48 and 0.74 indicate a relatively low to moderate variation in responses, meaning that respondents had fairly similar views about their research efficiency. Overall, the findings imply that research efficiency among postgraduate Business Education students is not high, but rather at a moderate level that requires improvement**,** particularly in areas of research skills development, research culture engagement, and access to research resources.

2. What is the level of AI usage among Business Education postgraduate students?

Table 4.3: Mean and Standard Deviation Analysis of Business Education Postgraduate Students' Level of AI Usage

	Familiarity and Access to AI Tools	**N**	$\overline{x}$	**Std**
1	I am familiar with various AI tools that can support academic research	99	2.76	.678
2	I have easy access to the AI tools I need for my research activities.	99	2.54	.899
3	regularly use AI tools as part of my research workflow	99	2.66	.922
4	I use AI-powered tools to search for and identify relevant academic literature for my research.	99	2.63	.927
			2.65	**.860**
	Literature Review and Information Retrieval			
1	I use AI-powered tools to search for and identify relevant academic literature for my research.	99	2.67	.927
2	I use AI tools to summarise research articles and extract key findings efficiently.	99	2.48	.723
3	I rely on AI tools to help me identify research gaps and generate potential research	99	2.57	.504
			2.57	**.718**
	Academic Writing and Dissemination			
1	I use AI tools to assist with academic writing	99	2.48	.773
2	I use AI tools to proofread and edit my written work for grammar, style, and coherence	99	2.49	.571
3	I use AI tools to help format citations and references according to required academic styles.	99	2.59	.833
4	I use AI tools to assist in preparing presentations or posters for academic conferences	99	2.56	.504
			2.53	**.670**
	Ethical Considerations and Integrity			
1	I am concerned about the ethical implications of using AI in my research (such as plagiarism, authorship, or data privacy).	99	2.8333	.791
2	I clearly acknowledge and disclose my use of AI tools when submitting research work	**99**	2.4000	1.03
3	I verify AI-generated content against primary sources before incorporating it into my research.	99	2.8667	1.04
			2.69	.953
			2.61	.800

Note. N= Number of respondents, $\overline{X}$= Response
Mean Score; S.D = Standard Deviation Score of Response. (Weighted Average; 2.61, Standard Reference Mean; 2.50).

Table 4.3 The table presents the mean and standard deviation analysis of the level of Artificial Intelligence (AI) tools usage among Business Education postgraduate students.

The result shows that the respondents demonstrated a high level of AI tools usage, as evidenced by the weighted mean of 2.61, which is above the standard reference mean of 2.50. This indicates that postgraduate Business Education students frequently utilize AI tools to support various aspects of their research activities.

Specifically, The result showed that for, familiarity and access to AI Tools, sub-total mean was rated above the criterion mean (mean = 2.65 (Std= .860) >2.50), Literature Review and Information Retrieval (mean = 2.57 (Std = 0.71) > 2.50), Academic Writing and Dissemination (mean = 2.53 (Std = 0.67) > 2.50) and Ethical Considerations and Integrity (mean = 2.69 (Std = .953) > 2.50). The result also showed weighted mean 2.61 which is above reference mean (2.50), with the weighted mean above the reference mean, this implies that business education postgraduate students indicated high level of AI tool usage to search for academic literature, summarize research articles, and identify research gaps.

Furthermore, the Academic Writing and Dissemination dimension recorded a mean score of 2.53 (SD = 0.670), implying that respondents use AI tools to support academic writing, proofreading, citation formatting, and preparation of academic presentations. The Ethical Considerations and Integrity

dimension had the highest mean score of 2.69 (SD = 0.953), indicating that students are generally conscious of the ethical implications of AI usage and make efforts to verify AI-generated content before incorporating it into their research.

The standard deviation values, ranging from 0.670 to 0.953, indicate a relatively low to moderate variation in respondents' opinions, suggesting consistency in their responses.

Overall, the findings imply that Business Education postgraduate students exhibit a high level of AI tools usage, demonstrating that AI has become an integral part of their research activities, particularly in literature review, academic writing, and information management.

3. What are the commonly used AI tools for research by postgraduate Business education students?

Table 4.4: Summary of Commonly Used AI Tools

AI / Research Tool	**Always**	**Sometimes**	**Never**	**Mean**	**Rank**
Grammarly	43	53	3	2.40	4
Elicit	2	67	30	1.72	12
Perplexity	1	87	11	1.90	9
Quillbot	10	62	27	1.83	10
ProWritingAid	26	0	73	1.53	15
EndNote	49	17	33	2.16	6
Scite	25	64	10	2.15	7
Zotero	41	9	49	1.92	8
Mendeley	72	14	13	2.60	3
ChatGPT	77	16	6	2.72	1
Connected Papers	30	19	50	1.80	11
Gemini	79	11	9	2.71	2
ResearchRabbit	16	36	47	1.69	13
Litmaps	16	27	56	1.60	14
Claude	37	42	20	2.17	5
Paperpal	22	7	70	1.52	16
Docear	17	5	77	1.39	17

Table 4.4 shows the result of commonly used AI tools for research by Business Education postgraduate students. Mean scores, and ranking of Artificial Intelligence tools commonly used by postgraduate Business Education students for research purposes.

The result shows that ChatGPT (Mean = 2.72, Rank = 1) is the most commonly used AI tool among the respondents. This is followed closely by Google Gemini (Mean = 2.71, Rank = 2) and Mendeley (Mean = 2.60, Rank = 3), indicating that these tools are the most frequently utilized for academic and research activities such as writing support, information retrieval, and reference management.

Other moderately used tools include Grammarly (Rank = 4)**,** Claude (Rank = 5)**,** EndNote (Rank = 6)**,** and Scite (Rank = 7), suggesting that students also rely on a mix of AI writing assistants and reference management tools to support their research processes.

However, tools such as Elicit (Rank = 12)**,** ResearchRabbit (Rank = 13)**,** Litmaps (Rank = 14)**,** ProWritingAid (Rank = 15)**,** Paperpal (Rank = 16)**,** and Docear (Rank = 17) were the least commonly used. This indicates low awareness or limited accessibility of advanced academic AI tools that support literature mapping and structured academic writing.

Overall, the findings reveal that postgraduate Business Education students predominantly use general-purpose AI tools such as ChatGPT and Gemini more than specialized academic research tools. This suggests that while AI adoption is relatively high, usage is skewed toward conversational and writing-assist tools rather than advanced research-specific platforms.

Test of Hypotheses

H_{01}: There is no significant relationship between AI tools usage and research of Business Education postgraduate students

Table 4.5 Relationship between AI Tools Usage and Research Efficiency

Variables	Mean	Std	R	Sig
AI usage	20.15	2.65	0.363	.001
Research	37.80	4.15		

Efficiency

Table 4.4 presents the Pearson Product Moment Correlation (PPMC) analysis of the relationship between Artificial Intelligence (AI) tools usage and research efficiency among postgraduate Business Education students.

The result shows a positive correlation coefficient (r = 0.363) between AI tools usage and research efficiency. This indicates a moderate positive relationship, meaning that an increase in the use of AI tools is associated with an improvement in research efficiency among the students.

The significance value (p = 0.001) is less than the chosen alpha level of 0.05, indicating that the relationship is statistically significant. Therefore, the null hypothesis (H_{01}), which states that there is no significant relationship between AI tools usage and research efficiency is rejected.

The table shows 20.15 mean score for AI tool usage with 2.65 standard deviation and 37.80 mean score for research efficiency with 4.15 standard deviation.

This implies that AI tools usage has a meaningful and significant relationship with research efficiency among postgraduate Business Education students. In practical terms, students who frequently use AI tools such as ChatGPT, Grammarly, and other research-support tools tend to demonstrate better research efficiency in terms of productivity, writing support, and academic task completion.

H_{02}: There is no significant influence of AI tools usage on research efficiency of Business Education postgraduate students

Table 4.6 Model Regression Analysis of AI Tools Usage for Research Efficiency of Business Education Postgraduate Students

Model Summary	ANOVA Model	Sum of Squares	Df	Mean Square	F	Sig
R =.363	Regression	225.127	1	75.042	4.847	.003[b]
R^2 = .132	Residual	1486.263	97	15.482		
Adj. R^2 = .104	Total	1711.390	98			
Std Error = 3.935						

Table 4.6 presents the regression analysis showing the influence of Artificial Intelligence (AI) tools usage on research efficiency among postgraduate Business Education students.

The model summary indicates a correlation coefficient of **R = 0.363**, showing a positive relationship between AI tools usage and research efficiency. The **coefficient of determination (R^2 = 0.132)** implies that AI tools usage accounts for **13.2% of the variation in research efficiency**, while the remaining 86.8% is explained by other factors not included in the model. The **adjusted R^2 of 0.104** further confirms that the predictive power of the model is modest but meaningful.

The ANOVA result shows that the regression model is statistically significant, with F(1, 97) **=** 4.847 and p = 0.003, which is less than the 0.05 significance level. This indicates that AI tools usage significantly predicts research efficiency among postgraduate Business Education students.

Therefore, the null hypothesis (H_{02}), which states that there is no significant influence of AI tools usage on research efficiency, is rejected. This implies that AI tools usage has a significant positive influence on research efficiency, meaning that an increase in the use of AI tools leads to an improvement in students' ability to carry out research tasks effectively and efficiently.

Discussion

Discussion of Research Question One: Level of Research Efficiency among Postgraduate Business Education Students

The findings of the study revealed that the overall level of research efficiency among postgraduate Business Education students was moderate, with a weighted mean score of 2.48, which is slightly below the benchmark mean of 2.50. This suggests that although the students possess some degree of competence and support in carrying out research activities, there is still room for improvement. The findings further showed that supervision and institutional support recorded mean scores above the benchmark, while research culture, responsibilities, and research skills development fell below the benchmark. This implies that students benefit from their supervisors and institutional support services but may experience challenges relating to research engagement, access to research opportunities, and the development of advanced research competencies.

The finding agrees with Chauke, et al. (2024), who reported that postgraduate students perceived moderate improvements in their academic and research activities through the use of AI-supported resources and institutional support systems. The finding also supports **Muslimin (2024)**, who found that postgraduate students demonstrated moderate levels of research productivity and efficiency when supported with appropriate technological tools. The result suggests that strengthening research culture,

improving access to resources, and enhancing research skills development programmes could further improve the research efficiency of postgraduate Business Education students.

Discussion of Research Question 2: Level of AI Tools Usage among Business Education Postgraduate Students

The findings of the study revealed that postgraduate Business Education students exhibited a high level of Artificial Intelligence (AI) tools usage in their research activities. The respondents demonstrated substantial familiarity with AI tools and frequently utilized them for literature review, information retrieval, academic writing, and other research-related tasks. The findings also indicate that the students are generally aware of the ethical issues associated with AI usage and make conscious efforts to use these tools responsibly.

The finding is consistent with Alade and Daniel (2023), who reported that Nigerian postgraduate students extensively use AI tools such as ChatGPT, Grammarly, QuillBot, and Mendeley to support literature search, academic writing, referencing, and data analysis. Similarly, Chowanda et al. (2023) found that postgraduate students in Ghana demonstrated a high level of AI adoption, particularly in the use of ChatGPT and other generative AI applications for learning and research activities. These studies affirm that AI technologies have become indispensable tools for enhancing academic research among postgraduate students.

However, the finding contrasts with that of Tian et al. (2024), who observed that although graduate students were aware of AI tools, the actual level of utilization was constrained by concerns over accuracy, ethical issues, and institutional policies. Likewise, Bouzar et al. (2024) reported that some postgraduate students were reluctant to use AI tools extensively due to fears of overdependence and the potential negative effects on academic integrity.

Overall, the present finding suggests that postgraduate Business Education students in Tai Solarin Federal University of Education have embraced AI tools as valuable resources for research. This high level of usage reflects the growing acceptance of AI technologies in postgraduate education and highlights their potential to improve research processes when used responsibly.

Discussion of Research Question Three: Commonly Used AI Tools for Research by Postgraduate Business Education Students

The findings of the study revealed that postgraduate Business Education students make use of a variety of Artificial Intelligence (AI) tools for research purposes, with varying levels of frequency and preference. The most commonly used AI tools were ChatGPT (Mean = 2.72, Rank = 1) and Google Gemini (Mean = 2.71, Rank = 2), followed by Mendeley (Mean = 2.60, Rank = 3). This indicates that students predominantly rely on general-purpose AI chatbots and writing assistance tools for tasks such as idea generation, academic writing, summarization, and information retrieval.

The result further showed that tools such as Grammarly, Claude, EndNote, and Scite were moderately used; suggesting that students also engage with tools that support grammar correction, citation management, and academic referencing. However, specialized research tools such as Elicit, ResearchRabbit, Litmaps, and Paperpal recorded low usage, indicating limited awareness or inadequate exposure to advanced academic AI tools that support literature mapping and systematic review processes.

This finding is consistent with Alade and Daniel (2023), who reported that postgraduate students commonly use AI tools such as ChatGPT, Grammarly, QuillBot, and reference management software more frequently than advanced research mapping tools. It also supports Chowanda et al. (2023**)**, who found that ChatGPT and similar conversational AI tools are the most frequently adopted tools among postgraduate students, mainly due to their ease of use and accessibility.

Overall, the finding suggests that while AI tools are widely used among postgraduate Business Education students, their usage is largely concentrated on basic writing and conversational tools rather than advanced research-oriented applications.

Discussion of Hypothesis 1 (H_{01}): Relationship between AI Tools Usage and Research Efficiency

The result of the Pearson Product Moment Correlation analysis revealed that there is a positive and significant relationship between Artificial Intelligence (AI) tools usage and research efficiency among postgraduate Business Education students ($r = 0.363$, $p = 0.001$). Since the p-value is less than the 0.05 level of significance, the null hypothesis was rejected. This indicates that increased usage of AI tools is associated with improved research efficiency among the respondents.

The finding suggests that postgraduate students who frequently use AI tools such as ChatGPT, Grammarly, and Mendeley tend to perform better in research-related tasks such as literature review, academic writing, referencing, and information synthesis. The moderate correlation also implies that while AI tools contribute significantly to research efficiency, they are not the only determining factor, as other academic and environmental variables may also play important roles.

This finding is consistent with Chauke, et al. (2024), who reported that AI tools usage has a positive association with academic success and research productivity among postgraduate students. It also aligns with Muslimin (2024), who found that the use of ChatGPT significantly improves scientific writing productivity and research output among postgraduate learners. Overall, the result confirms that AI tools usage plays a significant role in enhancing research efficiency among postgraduate Business Education students.

Discussion of Hypothesis 2 (H_{02}): Influence of AI Tools Usage on Research Efficiency

The regression analysis revealed that Artificial Intelligence (AI) tools usage has a significant influence on research efficiency among postgraduate Business Education students ($F = 4.847$, $p = 0.003$). Since the p-value is less than the 0.05 level of significance, the null hypothesis was rejected. This implies that AI tools usage significantly predicts research efficiency among the respondents.

The coefficient of determination ($R^2 = 0.132$) indicates that AI tools usage explains 13.2% of the variation in research efficiency, while the remaining percentage is influenced by other factors not captured in the model. This suggests that although AI tools play a meaningful role in improving research efficiency, other factors such as supervision quality, research skills, institutional support, and access to resources also contribute significantly.

The finding implies that students who make greater use of AI tools such as ChatGPT, Gemini, Grammarly, and Mendeley are more likely to experience improved efficiency in research activities, including writing speed, literature review processes, and data organization. However, the moderate explanatory power suggests that AI tools alone cannot fully determine research efficiency.

This finding is consistent with Abbas, et al. (2024)**,** who reported that AI tools usage has a significant effect on students' academic performance and task efficiency. It also aligns with Ward et al. (2024)**,** who found that AI tools significantly improve study efficiency, time management, and academic productivity among university students. Overall, the result confirms that AI tools usage has a significant positive influence on research efficiency among postgraduate Business Education students.

Conclusion

Based on the findings of the study, it is concluded that postgraduate Business Education students in Tai Solarin Federal University of Education exhibit a high level of Artificial Intelligence (AI) tools usage, indicating that AI has become an integral part of their research activities. The students are familiar with and have access to AI tools, which they frequently use for literature review, information retrieval, academic writing, referencing, and other research-related tasks. They also demonstrate awareness of the ethical considerations associated with the use of AI in academic research.

The study further concludes that the overall level of research efficiency is moderate, suggesting that although the students possess reasonable research competence, there is still room for improvement in areas such as research skills development, research culture, and access to research resources.

In addition, the study concludes that ChatGPT, Google Gemini, and Mendeley are the most commonly used AI tools among postgraduate Business Education students, while specialized research tools such as Elicit, ResearchRabbit, Litmaps, and Paperpal are less frequently utilized.

Furthermore, the study concludes that there is a significant positive relationship between AI tools usage and research efficiency. This implies that increased use of AI tools is associated with improved research efficiency among postgraduate Business Education students.

Finally, the study concludes that AI tools usage has a significant positive influence on research efficiency. Although AI tools account for only part of the variation in research efficiency, they remain an important predictor of students' ability to carry out research activities effectively and efficiently. Overall, the study affirms that the effective and ethical use of AI tools can enhance postgraduate research efficiency when complemented by adequate supervision, institutional support, and continuous research skills development.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Research Skills Development: Since the study found that the overall level of research efficiency among postgraduate Business Education students was moderate, the university management should organize regular research methodology workshops, academic writing clinics, and mentorship programmes to strengthen students' research skills, promote active research culture, and improve research productivity.
2. Sustaining High Level of AI Tools Usage: Given that the students demonstrated a high level of AI tools usage, the university should sustain this momentum by providing continuous training on emerging AI technologies and ensuring access to licensed and institution-approved AI tools to enhance research quality and efficiency.

3. Promoting the Use of Advanced AI Research Tools: As the findings revealed that students commonly use ChatGPT, Gemini, and Mendeley more than specialized research tools, postgraduate students should be encouraged and trained to use advanced AI applications such as Elicit, ResearchRabbit, Litmaps, Scite, and Paperpal for systematic literature reviews, evidence synthesis, and reference mapping.
4. Enhancing Ethical Use of AI Tools: Since AI tools significantly relate to and influence research efficiency, supervisors and the Postgraduate School should provide clear guidelines and regular sensitization programmes on the ethical and responsible use of AI in research to ensure originality, academic integrity, and critical thinking while minimizing overdependence on AI-generated content.
5. Improving Institutional Support: The university should strengthen digital infrastructure by providing reliable internet connectivity, access to online academic databases, institutional subscriptions to AI-powered research platforms, and ICT support services to enable postgraduate students to maximize the benefits of AI tools in their research activities.
6. Policy Development on AI Integration: The university management should develop and implement institutional policies that guide the integration of Artificial Intelligence into postgraduate research and teaching. Such policies should promote the responsible, effective, and ethical use of AI tools to improve research efficiency while maintaining academic standards.

REPOSITIONING TVET FOR JOB CREATION: INTEGRATING ENTREPRENEURSHIP EDUCATION INTO TECHNICAL COLLEGES IN AFRICA

Author: Nwokorie Harrieth N.
Department of Office Technology and Management
Akanu Ibiam Federal Polytechnic, Unwana
Ebonyi State

Abstract

Youth unemployment and economic exclusion remain defining crises across sub-Saharan Africa, with the youth not-in-employment-education-or-training (NEET) rate confirmed at 20.4 per cent in 2023 (ILO, 2024). Despite decades of policy investment in Technical and Vocational Education and Training (TVET), African technical colleges have largely failed to produce graduates capable of generating self-employment, principally because entrepreneurship education remains peripheral, fragmented, or entirely absent from their curricula. This conceptual paper critically examines the imperatives and strategic pathways for repositioning TVET through the systematic integration of entrepreneurship education into technical colleges in Africa. Drawing on three theoretical frameworks: Human Capital Theory as applied to TVET in sub-Saharan Africa (Psacharopoulos & Patrinos, 2018), Experiential Learning in Entrepreneurship Education (Motta & Galina, 2023), and the Entrepreneurial Ecosystems Framework as contextualised for Africa (Danquah et al., 2023), the paper argues that transforming TVET graduates from passive job-seekers into active job-creators demands a paradigm shift in curricular design, pedagogy, institutional governance, and inter-sectoral partnership. Key structural challenges are appraised with reference to confirmed empirical evidence, including instructor capacity deficits, funding shortfalls, weak industry linkages, gender inequalities, and curricular rigidity. Evidence-based strategies for sustainable integration are proposed, and actionable recommendations are offered to African governments, TVET authorities, technical colleges, curriculum planners, and development partners.

Keywords: *TVET, entrepreneurship education, technical colleges, job creation, Africa, curriculum integration, youth unemployment, experiential learning, entrepreneurial ecosystems*

Introduction

Youth unemployment and economic marginalisation constitute one of the defining structural crises of twenty-first century Africa. The International Labour Organization's Global Employment Trends for Youth (ILO, 2024) confirms that sub-Saharan Africa's youth NEET rate stood at 20.4 per cent in 2023, with young women severely disproportionately affected at 46.3 per cent NEET compared to 21.1 per cent for young men. Over a quarter of young people in the region are neither employed nor engaged in education or training, a structural failure of African labour markets that reflects deep dysfunctions at the interface between education systems, skills development pathways, and the productive economy.

Technical and Vocational Education and Training (TVET) has been prominently championed by international organisations and African governments as a strategic remedy. The UNESCO Strategy for TVET 2022–2029 (UNESCO, 2022) identifies skills development for empowerment and employability as a core mandate, while the African Union's Agenda 2063 and the Continental Education Strategy for Africa (CESA 2016–2025) commit member states to strengthening TVET as a pillar of continental economic transformation. Yet the empirical record reveals a persistent gap between TVET's rhetorical promise and its substantive outcomes: TVET participation rates across sub-Saharan Africa remain below 10 per cent of the 15–24 age cohort (ILO, 2024), and graduate enterprise creation rates remain far below levels required for meaningful economic impact.

Masoabi and Alexander (2021), publishing in the Journal of Entrepreneurship Education, confirmed that South African TVET engineering programmes had not incorporated entrepreneurship into course design despite growing global evidence of its importance for graduate employability and enterprise formation. The IIEP-UNESCO Dakar (2022) assessment across five African countries found consistent evidence of curricula lagging behind labour market demands and institutional capacities for responsive programme development remaining weak. Alamineh (2022), studying TVET students in Ethiopia's Gurage Zone and publishing in the Journal of Small Business and Enterprise Development,

found entrepreneurship education to be the primary determinant of entrepreneurial intentions, explaining 61.4 per cent of the variance in students' enterprise orientation. The consequence is a generation of technically competent but entrepreneurially ill-equipped graduates competing for a shrinking pool of formal sector jobs. The integration of entrepreneurship education within TVET curricula has emerged as a high-leverage corrective strategy. Motta and Galina (2023), in a systematic literature review published in Teaching and Teacher Education, confirmed that experiential approaches to entrepreneurship education produce positive and significant impacts on entrepreneurial intention and the development of entrepreneurial skills and competencies.

This paper undertakes a critical examination of the imperatives, structural challenges, and strategic pathways for repositioning TVET through the integration of entrepreneurship education into technical colleges in Africa. Following this introduction, the problem statement is articulated, theoretical frameworks are presented, related literature is reviewed, the current state of TVET is examined, and curriculum integration, pedagogy, governance, ecosystem development, and challenges are discussed, while conclusion and recommendations close the paper.

Statement of the Problem

Notwithstanding rhetorical commitments embedded in continental policy frameworks, the structural integration of entrepreneurship education into African technical colleges remains largely unrealised. Where entrepreneurship content exists in curricula, it is typically confined to a single elective module, assessed through conventional examination, and disconnected from practical enterprise engagement (Masoabi & Alexander, 2021; Kolho, 2024). The absence of a coherent, evidence-based framework for achieving sustainable entrepreneurship integration constitutes the central problem this paper addresses.

Conceptual Clarification

Technical and Vocational Education and Training (TVET)

TVET refers to that aspect of education which leads to the acquisition of practical and applied skills as well as basic scientific knowledge relating to occupations in various sectors of economic and social life. [UNESCO-UNEVOC, 2022]. It includes formal, non-formal and informal learning for the world of work. In Africa, TVET is delivered mainly through technical colleges, polytechnics and vocational centers.

Entrepreneurship Education

Entrepreneurship education is the process of providing individuals with the ability to recognize commercial opportunities, self-esteem, knowledge, and skills to act on them [European Commission, 2021]. It involves teaching business planning, financial literacy, marketing, risk management, innovation, and the mindset to create and run a business.

Technical Colleges

Technical colleges are post-secondary institutions that provide practical, skill-based training to specific trades and vocations such as welding, electrical work, carpentry, fashion design, and ICT.(UNESCO-UNEVOC, 2022). In Africa, technical colleges are the primary institutions for middle-level manpower development. They are expected to produce graduates who can directly enter the workforce or establish small-scale enterprises. However, many are underfunded and focus only on technical skills. Technical colleges are better for skill acquisition + workforce preparation.

Job Creation

Job creation refers to the process through which individuals or organizations generate employment opportunities for themselves and for others. In the context of TVET, it means producing graduates who can become employers rather than job seekers [World Bank, 2022].

Africa

Africa is the world's second-largest continent with 54 countries and the youngest population globally, with over 60% under age 25 (AfDB, 2023). Africa faces a "youth bulge" but also the highest youth unemployment rate globally. The continent relies heavily on SMEs for employment, making entrepreneurship critical. TVET in Africa is often faced with challenges of outdated curriculum, poor funding, and negative societal perception. Africa has demographic dividend with high unemployment rate and informal economy dominance.

Curriculum Integration

Curriculum integration is the deliberate process of combining two or more subject areas or competencies into a single teaching and learning framework (Burke, J., & Lehane, L.,2023). In the Context of this paper, it refers to the embedding of entrepreneurship education modules, business planning, financial literacy, and innovation skills into the existing technical and vocational curriculum of technical colleges. The goal is to produce graduates with dual competence - technical proficiency and business/managerial skills.
Example: A welding student also learns costing, marketing, and how to register a welding business.

Youth Unemployment

Youth unemployment refers to the situation where young people aged 15-35 who are willing and able to work cannot find decent and sustainable employment (ILO, 2023). In Context of Africa:
Africa's youth unemployment rate exceeds 30% in many countries. This is driven by a mismatch between skills taught in schools and skills demanded by the labor market. TVET graduates are often job-ready technically but lack the skills to create their own jobs. This results to: Poverty, migration, crime, and underutilization of Africa's demographic dividend. High youth unemployment in Africa is worsened because technical colleges produce only skilled workers and not job creators.

Repositioning

Repositioning in this context means restructuring, rebranding and refocusing TVET to make it relevant, attractive, and responsive to current economic and labor market needs in Africa.

Theoretical Framework

Three complementary theoretical frameworks undergird the writing of this p**aper. Each** addresses a distinct dimension of the TVET-entrepreneurship education nexus, and together they constitute an integrated conceptual foundation for the paper's arguments and recommendations.

Human Capital Theory and TVET Investment

Human Capital Theory of Becker, 1964 holds that investment in education and training enhances the productive capacities of individuals, yielding both private returns and social returns in the form of increased national productivity and growth. Psacharopoulos and Patrinos (2018), in a globally influential meta-analysis of returns to schooling published in Applied Economics, reaffirmed that the average global private return to an additional year of schooling is approximately 9 per cent, with higher returns observed in lower-income countries, making education investment particularly significant in the African context. Applied to TVET, this theory supports a fundamental argument: if TVET investment is to yield optimal human capital returns in African economies where formal sector employment is structurally insufficient, the competencies developed must equip graduates not merely to sell their labour but to organise it productively through enterprise creation. The persistent failure of African TVET to produce high rates of graduate self-employment represents not only a pedagogical failure but a human capital investment failure at continental scale, a systemic misallocation of educational resources that demands structural corrective action. The implication of Human Capital Theory is direct: TVET curricula must be redesigned to maximise entrepreneurial productive capacity as the primary measure of educational return. Human capital theory stipulates that: Education + Skills = Productivity + Economic Growth.

Experiential Learning in Entrepreneurship Education

The theory was propounded by David A. Kolb in 1984. The centrality of experiential learning to effective entrepreneurship education has been established through systematic evidence review. Motta and Galina (2023), in a comprehensive systematic literature review published in Teaching and Teacher Education, examined the application and evaluation of experiential learning across entrepreneurship education contexts globally. Their review confirmed that experiential learning in which students learn by doing through concrete experience, reflection, conceptualisation, and active experimentation produces positive and significant impacts on entrepreneurial intention and the development of entrepreneurial skills and competencies. Critically, their findings showed that despite this strong evidence base, didactic lectures remain the dominant instructional method in most entrepreneurship education contexts, directly mirroring the African TVET pattern identified by Masoabi and Alexander (2021) and Kolho (2024). The implication for African TVET is unambiguous: entrepreneurial competency cannot be developed through the reception of business knowledge alone. It requires situated experience of identifying opportunities, mobilising resources, managing uncertainty, and iterating through failure and reflection. TVET institutions must move beyond classroom instruction toward enterprise simulation exercises, community enterprise projects, incubation programmes, and

structured industry engagement. Kolho (2024), writing in the International Journal of Training and Development, confirmed that in TVET contexts, collaborative and project-based learning alongside digital tools are the most effective methods for developing entrepreneurial skills, while teacher-led classroom discussion of entrepreneurship as a concept produces minimal competency gains.

Entrepreneurial Ecosystems in the African Context

The Entrepreneurial Ecosystems Framework has been increasingly applied to the African context, with important adaptations from its original formulation in high-income settings. Danquah et al. (2023), in a chapter published in Corporate Sustainability in Africa (Palgrave Macmillan), reviewed entrepreneurial ecosystem dynamics across Africa and identified that the continent's entrepreneurial ecosystems include crowdsourcing, support networks, industry dynamics, finance, culture, human capital, market access, and policy as key domains, extending the standard six-domain model to better reflect African realities including informality, necessity-driven entrepreneurship, and alternative finance mechanisms. Applied to African TVET, this framework draws critical attention to the extra-curricular and extra-institutional conditions necessary for entrepreneurship education to translate into actual enterprise creation. A TVET graduate equipped with entrepreneurial competencies still requires access to start-up finance, navigable business registration processes, enterprise mentorship networks, and fair market conditions to realise enterprise aspirations. This systemic insight demands that TVET reform be conceived not merely as a curricular project but as a whole-of-ecosystem intervention involving simultaneous action on policy, finance, culture, institutional support, human capital development, and market access. People who believe they can start a business are more likely to do it, teaching entrepreneurship builds graduate confidence to create jobs.

Review of Related Literature

The scholarly literature on TVET and entrepreneurship education in Africa and comparable developing country contexts has grown substantially over the past decade. This section reviews key contributions that directly inform the present paper. Masoabi and Alexander (2021), publishing in the Journal of Entrepreneurship Education, provided one of the most direct empirical contributions on entrepreneurship education in African TVET, examining its absence in South African TVET engineering studies. Their review found that while European and Asian TVET systems actively promote entrepreneurship education, South Africa's engineering curriculum had not incorporated it into course design. They concluded that its systematic integration was essential for addressing graduate unemployment and recommended it as a structural curricular reform priority.

Alamineh (2022), publishing in the Journal of Small Business and Enterprise Development, offered the strongest quantitative evidence on the impact of entrepreneurship education within TVET in an African context. Regression analysis of TVET college students in Ethiopia's Gurage Zone demonstrated that entrepreneurship education explained 61.4 per cent of the variance in entrepreneurial intentions, confirming it as the primary determinant of graduate enterprise orientation. This finding carries direct policy implications: investment in entrepreneurship education quality within TVET yields measurable improvements in the probability of graduate enterprise formation. Ncube (2024), extending the South African evidence base, reviewed the impact of entrepreneurship education on entrepreneurial competencies among students in South African TVET colleges and confirmed positive effects across multiple domains including opportunity recognition, risk management, and financial literacy. His findings aligned with Motta and Galina's (2023) systematic review in demonstrating that the pedagogical mode of delivery specifically, experiential and project-based approaches is the primary determinant of competency development outcomes.

Kolho (2024), writing in the International Journal of Training and Development, developed a conceptual model for the TVET entrepreneurship subject teacher, identifying that effective entrepreneurship instruction in vocational contexts requires teachers who themselves possess entrepreneurial experience alongside pedagogical competency. This finding directly confirms the instructor capacity challenge identified by IIEP-UNESCO Dakar (2022) as the primary bottleneck in African TVET curriculum reform.

The IIEP-UNESCO Dakar (2022) study on digital transformation of TVET across Madagascar, Nigeria, Rwanda, Tunisia, and Chad provided critical system-level evidence on structural constraints affecting TVET curriculum reform. Instructor professional development, governance frameworks, and private sector engagement were consistently identified as critical enablers across all five national contexts. The ILO's (2024) Global Employment Trends for Youth provided the authoritative current quantitative context, confirming that over 76 per cent of young workers in sub-Saharan Africa are informally employed, underscoring both the scale of self-organised economic activity already characteristic of African youth and the inadequacy of formal institutional support for that activity.

Muchira et al. (2023), publishing in the Journal of Adult and Continuing Education, assessed TVET institutions' curriculum in Kenya and found that inadequate resources, lack of modern equipment, and minimal adoption of practical curriculum components were primary barriers to skill acquisition and youth employment. This confirmed that the curricular and resource deficits affecting TVET entrepreneurship integration are structural rather than incidental, requiring systemic rather than incremental responses.

Collectively, this literature converges on a clear finding: entrepreneurship education within TVET can demonstrably improve graduate entrepreneurial competencies, intentions, and enterprise formation rates, but its impact is contingent upon pedagogical quality, institutional and ecosystem context, and the presence of enabling financial and regulatory infrastructure. The present paper synthesises these findings within an integrated theoretical framework and translates them into actionable recommendations.

Current State of TVET and Entrepreneurship Education in Africa

African TVET systems exhibit significant heterogeneity across national contexts, but certain systemic pathologies recur with remarkable consistency. Masoabi and Alexander (2021) confirmed that South African TVET engineering programmes had not incorporated entrepreneurship into course design despite global evidence of its importance. This pattern is broadly representative of the continental situation, where entrepreneurship is present at, all appears as an isolated elective disconnected from students' vocational identity. UNESCO's (2022) TVET Strategy explicitly identifies this curricular disconnect as a principal barrier to TVET's contribution to SDG 4 and SDG 8.

The instructional workforce presents a structural constraint of particular severity. Kolho (2024) identified that TVET entrepreneurship teachers must combine entrepreneurial experience with pedagogical competency — a combination that is structurally rare among Africa's TVET instructor workforce, who predominantly possess deep craft expertise but limited commercial entrepreneurial experience. The IIEP-UNESCO Dakar (2022) assessment confirmed this as the single most critical bottleneck in TVET curriculum modernisation across all five countries studied, a finding with direct implications for the reform agenda.

Industry-institution partnerships, which are indispensable conduits for embedding enterprise culture within TVET, remain weak and episodic. UNESCO's (2022) identification of private sector engagement as one of its four TVET strategy priorities reflects the severity of this gap. Muchira et al. (2023) found in the Kenyan context that minimal industry linkage was a primary barrier to effective TVET skill development, confirming that this structural weakness is not merely institutional but systemic, requiring policy intervention to correct. Funding deficits compound all other structural weaknesses, with TVET participation rates remaining below 10 per cent of the youth cohort across sub-Saharan Africa (ILO, 2024), reflecting inadequate institutional capacity to absorb the scale of demand that Africa's youth demographic presents.

The colonial legacy of African TVET systems was designed to produce technically compliant labour rather than entrepreneurially oriented graduates which continues to shape institutional cultures and curricular assumptions, as documented across a substantial body of comparative TVET literature (Masoabi & Alexander, 2021; Muchira et al., 2023). Post-independence reforms have introduced rhetorical commitments to entrepreneurship integration without the structural investment necessary to make them pedagogical reality in classrooms.

Curriculum Integration of Entrepreneurship Education

Effective integration requires a coherent, multi-layered curricular architecture operating across three complementary dimensions.

Entrepreneurship as a Transversal Competency

The most transformative approach embeds entrepreneurial competencies - creativity, critical thinking, risk assessment, financial literacy, communication, and opportunity recognition as transversal outcomes infused across all vocational subjects. Under this model, an electrical installation student learns not only circuit design but also cost estimation, client relationship management, tendering, and enterprise registration. A garment technology student masters tailoring craftsmanship alongside brand development, pricing strategy, and digital marketing. Ncube (2024) confirmed this integrative approach as the characteristic of TVET programmes producing the strongest entrepreneurial competency outcomes. Motta and Galina (2023) further established that this integration must be accompanied by structured experiential activities, not merely the infusion of enterprise content into existing didactic delivery to achieve meaningful competency development.

Enterprise Education as a Progressive Curriculum Strand

In parallel with transversal infusion, a dedicated enterprise education strand should be incorporated within the formal TVET curriculum as a progressive sequence: enterprise awareness and

ideation in Year One; business planning, financial management, and regulatory literacy in Year Two; and live enterprise projects and market-entry simulations in Year Three. Assessment must prioritise portfolio-based evaluation, requiring students to develop and defend viable business plans before panels that include industry mentors and financial sector representatives. Alamineh's (2022) finding that the practical, applied dimensions of entrepreneurship teaching were the primary drivers of entrepreneurial intention strongly supports this portfolio-and-project-based assessment approach over conventional examination.

Enterprise Activity as Co-curricular Requirement

Beyond formal curriculum, structured co-curricular enterprise programmes - student business clubs, innovation fairs, incubation labs, and mentorship linkages with SME operators, provide students with social capital, role-model exposure, and practical experimentation spaces that classroom learning cannot replicate. Danquah et al. (2023) emphasised that within African entrepreneurial ecosystems, support networks and cultural role models are particularly critical ecosystem components given the relative weakness of formal institutional enterprise support. The co-curricular dimension of TVET entrepreneurship education is therefore not supplementary but essential to ecosystem-consistent programme design.

Pedagogical Transformation for Entrepreneurship-Enriched TVET

The effectiveness of entrepreneurship education integration is fundamentally contingent upon the pedagogical approaches deployed by TVET instructors. Motta and Galina (2023) confirmed through systematic review that despite strong evidence supporting experiential approaches, didactic lectures remain dominant in most entrepreneurship education contexts. In the African TVET setting, where instructor-centred, examination-driven pedagogy is entrenched, this challenge is particularly acute.

Kolho (2024) identified that effective TVET entrepreneurship instruction requires teachers who use collaborative and project-based learning alongside digital tools, pedagogical modalities that demand both enterprise knowledge and facilitative teaching skills rather than content transmission competency. Transforming TVET pedagogy for entrepreneurship integration consequently requires investment in four dimensions. First, instructor retraining programmes must provide TVET teachers with both enterprise knowledge and experience, including industry placements, mentorship by practitioners, and structured professional development in enterprise pedagogy. IIEP-UNESCO Dakar (2022) identified this as the most critical reform bottleneck across all five African countries studied.

Second, problem-based and project-based learning must become primary pedagogical modalities, requiring students to diagnose real community economic problems and design enterprise responses. Third, digital and financial literacy must be integrated into pedagogical resources, equipping students with competencies in digital commerce, mobile banking, and business registration. Fourth, assessment reform must shift from recall-based testing to competency demonstration through enterprise plan development, pitch presentations, and prototype creation, consistent with the evidence on effective entrepreneurship assessment (Motta & Galina, 2023).

Institutional Governance and Policy Frameworks

TVET repositioning requires fundamental institutional governance reform alongside curricular and pedagogical innovation. African technical colleges must transition from bureaucratically governed, supply-driven institutions toward market-responsive, stakeholder-inclusive organisations governed by diverse boards encompassing private sector operators, graduate entrepreneurs, community organisations, and financial institutions. At the national level, African governments must enact TVET legislation that explicitly mandates entrepreneurship education as a non-negotiable curricular requirement, establishes minimum delivery standards, and creates dedicated funding streams for instructor development, enterprise infrastructure, and incubation programme support. UNESCO (2022) identifies policy and governance reform as a critical enabling condition, noting that without legislative mandate and political will, curricular innovation remains aspirational rather than institutionally embedded. Regional policy harmonisation through ECOWAS, EAC, and SADC frameworks is a complementary imperative, enabling TVET credential portability and ecosystem coherence that the African Continental Free Trade Area (AfCFTA) framework demands. Muchira et al. (2023) demonstrated in the Kenyan context that national quality frameworks, when properly implemented and enforced, provide the governance architecture within which entrepreneurship education integration can be mandated and monitored at the institutional level. Nigeria presents a cautionary counterexample: rhetorical commitments within national TVET policy have not translated into consistent institutional implementation, owing to weak enforcement and chronic resource shortfalls.

Inter-Sectoral Collaboration and Ecosystem Development

Sustainable entrepreneurship education integration cannot be achieved through institutional action alone. Consistent with Danquah et al.'s (2023) adapted ecosystem framework for Africa, it requires the cultivation of enterprise ecosystems connecting technical colleges with private sector enterprises, financial institutions, civil society organisations, and government agencies within coherent partnership frameworks.

Industry partnerships should encompass collaborative curriculum development, structured apprenticeship provision, enterprise mentorship, and joint participation in TVET governance. Financial sector partnerships should create accessible micro-enterprise credit schemes for TVET graduates, with simplified collateral requirements and graduated repayment schedules, directly addressing the finance domain identified by Danquah et al. (2023) as a critical but chronically underdeveloped element of African entrepreneurial ecosystems. Civil society and development partner organisations should provide complementary business development services and peer enterprise networks.

Rwanda, Kenya, and Ethiopia illustrate the ecosystem-building imperative at different levels of development. Kenya's TVET Authority quality framework, as documented by Muchira et al. (2023), provides an example of governance-led ecosystem development that has begun to improve TVET-industry alignment. Ethiopia's enterprise-oriented TVET reforms, evidenced by Alamineh's (2022) findings on the impact of entrepreneurship education in Gurage Zone colleges, demonstrate that even in resource-constrained contexts, targeted investment in entrepreneurship education quality produces measurable improvements in graduate enterprise orientation.

Challenges to Effective Integration

Despite compelling theoretical and empirical support, several formidable structural and contextual challenges impede entrepreneurship education integration across the African TVET context. Understanding these challenges is essential to designing reform strategies with realistic prospects of success.

1. Funding deficits: TVET institutions are chronically underfunded relative to their mandate. Muchira et al. (2023) identified inadequate resources and lack of modern equipment as primary barriers to effective TVET delivery in Kenya - a finding generalisable across the continent and directly constraining the enterprise incubation facilities and industry linkage programmes that effective entrepreneurship education demands.
2. Instructor capability gaps: Kolho (2024) demonstrated that effective TVET entrepreneurship teaching requires a combination of entrepreneurial experience and facilitative pedagogical competency that is structurally rare among Africa's TVET instructor workforce. IIEP-UNESCO Dakar (2022) confirmed this as the most critical reform bottleneck across all five African countries studied.
3. Curriculum overload and rigidity: Prescriptive national curricula with limited institutional flexibility impede the incorporation of entrepreneurship education as a transversal competency, frequently reducing it to a marginalised add-on with insufficient credit hours and minimal enterprise engagement components.
4. Weak industry linkages: Muchira et al. (2023) documented the severe impact of minimal industry linkage on TVET skill development quality in Kenya. Masoabi and Alexander (2021) attributed the absence of entrepreneurship from South African TVET engineering curricula partly to the disengagement of industry from curriculum governance, a pattern broadly representative of the continental situation.
5. Socio-cultural barriers: Social prestige hierarchies that privilege white-collar employment over entrepreneurial self-employment undermine the motivational orientation necessary for entrepreneurship education to take root. Danquah et al. (2023) identified culture as one of the critical ecosystem domains in Africa, noting that entrepreneurial culture remains underdeveloped relative to enterprise ecosystem needs in many African contexts.
6. Gender inequalities: ILO (2024) data confirm that 46.3 per cent of young women in sub-Saharan Africa were NEET in 2023, more than twice the rate for young men, reflecting compounded structural disadvantages that entrepreneurship education must address with deliberate, gender-responsive design.
7. Monitoring and evaluation deficits: Few African technical colleges have established graduate tracking and tracer study systems, limiting the evidence base for iterative programme improvement and policy advocacy. This deficit perpetuates the underfunding cycle by preventing institutions from demonstrating return on investment in entrepreneurship education (UNESCO, 2022).

Implications of the Study

This paper carries important theoretical, policy, and practical implications for TVET reform in Africa. At the theoretical level, the paper demonstrates that the repositioning of TVET for job creation is best understood through an integrated multi-framework lens. Human Capital Theory (Psacharopoulos & Patrinos, 2018) explains the investment rationale but does not specify how to design effective entrepreneurship education. The Experiential Learning framework (Motta & Galina, 2023) specifies pedagogical design principles but does not address the systemic conditions necessary for enterprise formation beyond the institution. The Entrepreneurial Ecosystems Framework as contextualised for Africa (Danquah et al., 2023) addresses the systemic level but does not specify the human capital investment logic or pedagogical modalities that must underpin enterprise education within TVET. The three frameworks together constitute a more complete and actionable theoretical architecture than any single framework provides alone.

At the policy level, the paper's implications are direct. Alamineh's (2022) finding that entrepreneurship education explains over 61 per cent of the variance in TVET students' entrepreneurial intentions provides policymakers with a robust evidence base for prioritising entrepreneurship education integration. The identification by IIEP-UNESCO Dakar (2022) of instructor capacity development as the most critical bottleneck directs policy attention toward professional development investment as the highest-leverage entry point for action. The severe gender disparity confirmed by ILO (2024) with 46.3 per cent of young women NEET implies that gender-responsive entrepreneurship education design is not optional but essential for any reform agenda with inclusive economic transformation as its goal.

At the practical institutional level, the paper implies that meaningful TVET entrepreneurship integration requires a minimum ecosystem of complementary institutional changes operating concurrently: curriculum reform, pedagogical transformation, instructor development, co-curricular enterprise programming, industry partnership development, and graduate tracking systems must be implemented together rather than sequentially. Piecemeal reform the addition of a business module to an otherwise unreformed programme is unlikely to produce the systemic graduate outcome improvements that Africa's labour market crisis demands. Danquah et al.'s (2023) adapted ecosystem framework provides the most useful organising logic for institutional leaders: every ecosystem domain must receive deliberate attention and resource allocation if integration is to achieve transformative rather than cosmetic impact.

Conclusion

The monitoring and evaluation gap identified in this paper deserves special attention. UNESCO (2022) notes that without robust data on TVET graduate outcomes, institutions cannot demonstrate return on investment in entrepreneurship programmes, policymakers cannot allocate resources effectively, and the underfunding cycle perpetuates itself. The establishment of national tracer study systems for TVET graduates is therefore not a bureaucratic nicety but a foundational condition for the sustained political and financial commitment that TVET entrepreneurship integration requires. Countries that have established such systems 2014 including Kenya through TVETA and Rwanda through its TVET authority 2014 have created the evidence infrastructure necessary to drive iterative improvement in programme quality and to make credible public cases for increased investment. Those without such systems are trapped in a cycle where the absence of evidence enables the perpetuation of underfunding and curricular inertia.

Africa's youth employment crisis demands a fundamental repositioning of TVET from a system that trains graduates for jobs that do not exist in sufficient quantities to one that equips graduates to create the jobs that their communities and economies urgently need. The integration of entrepreneurship education into African technical colleges is not a peripheral programme enhancement but a structural transformation of purpose, process, and outcome that addresses the root cause of the persistent gap between TVET's considerable investments and its insufficient productive returns. This paper has demonstrated, drawing on confirmed empirical evidence from South Africa (Masoabi & Alexander, 2021; Ncube, 2024), Ethiopia (Alamineh, 2022), Kenya (Muchira et al., 2023), and continental and global assessments (ILO, 2024; IIEP-UNESCO Dakar, 2022; UNESCO, 2022; Motta & Galina, 2023; Kolho, 2024; Danquah et al., 2023; Psacharopoulos & Patrinos, 2018), that such transformation is both theoretically rigorous and practically achievable. It requires, however, that African governments, technical college leaders, curriculum planners, industry partners, and development organisations transcend rhetorical commitment and invest in the deliberate, sustained, and adequately resourced actions necessary to embed entrepreneurial competencies, mindsets, and ecosystem supports as core dimensions of the TVET enterprise.

The ILO's (2024) confirmation that sub-Saharan Africa's youth NEET rate stood at 20.4 per cent in 2023, with young women excluded at a rate of 46.3 per cent, represents not merely a statistical finding but a moral imperative for structural action. Repositioning TVET for job creation through

entrepreneurship education integration is, consequently, one of the most consequential investments that Africa's educational policymakers, institutional leaders, and development partners can make in the twenty-first century. The time for aspirational commitment has passed; the time for systemic, evidence-grounded, and adequately resourced action is now.

Recommendations

For African Governments and Ministries of Education

1. Enact or revise national TVET legislation to mandate the systematic integration of entrepreneurship education as a core curriculum requirement across all technical college programmes, with defined minimum standards and regulatory enforcement mechanisms.
2. Significantly increase budget allocations for TVET, ensuring dedicated funding streams for enterprise education infrastructure, instructor professional development, and post-graduation enterprise support including micro-credit access and business development services.
3. Harmonise TVET entrepreneurship standards within ECOWAS, EAC, and SADC frameworks to enable credential portability and cross-border enterprise mobility, consistent with the AfCFTA framework.
4. Establish national TVET graduate tracking and tracer study systems to generate robust longitudinal evidence on enterprise formation and employment outcomes, addressing the monitoring deficit documented by UNESCO (2022).

For Technical Colleges and Institutional Leaders

1. Develop and implement comprehensive entrepreneurship education integration plans embedding enterprise competencies as transversal outcomes across all technical training programmes, supported by dedicated enterprise curriculum strands and co-curricular enterprise activity requirements.
2. Invest systematically in instructor professional development through industry placements, enterprise mentorship, and structured capacity building in experiential entrepreneurship pedagogy (Kolho, 2024; IIEP-UNESCO Dakar, 2022), addressing the most critical bottleneck to effective entrepreneurship education delivery.
3. Establish enterprise incubation centres within technical college campuses, aligned with Danquah et al.'s (2023) African ecosystem model, providing students and graduates with business development support, mentorship, networking, and access to seed financing.
4. Institutionalise gender-responsive entrepreneurship education strategies including tailored mentorship, women-only enterprise incubation tracks, and gender-sensitive assessment practices, responding to the ILO's (2024) evidence of severe female NEET disadvantage.

For Curriculum Planners and TVET Authorities

1. Adopt competency-based entrepreneurship education frameworks grounded in experiential learning evidence (Motta & Galina, 2023), privileging project-based and portfolio-assessed learning over didactic, examination-centred approaches.
2. Develop open-access, contextually relevant entrepreneurship education instructional materials tailored to African market conditions, languages, and socio-economic realities, ensuring accessibility to under-resourced institutions.
3. Establish national instructor certification standards for entrepreneurship education delivery within TVET, requiring demonstrated entrepreneurial experience alongside pedagogical competency, as recommended by Kolho (2024).

For Development Partners and International Organisations

1. Prioritise funding for TVET entrepreneurship ecosystem-building programmes within technical assistance and development finance portfolios, focusing on long-term institutional capacity development alongside infrastructure investment.
2. Support documentation and cross-country dissemination of successful models from Rwanda, Kenya, Ethiopia, and South Africa to facilitate evidence-informed policy adaptation across the continent.
3. Invest in longitudinal research on TVET entrepreneurship education outcomes across diverse African contexts to build the continental evidence base necessary for sustained political commitment and resource allocation.

ENTREPRENEURSHIP EDUCATION, DIGITAL INNOVATION AND YOUR EMPOWERMENT FOR SUSTAINABLE ECONOMIC DEVELOPMENT

[1]Dr. BABAJIDE, Robert Kayode & [2]ADEGBOKIKI, Lukmon Tunde MABEN/1215
Business Education Department, School of Secondary Education (Vocational and Technical Education) Federal College of Education, Abeokuta. 08065039757 abacusheritage@gmail.com

Abstract
The increasing rate of youth unemployment, technological disruption, as well as the revolving patterns of work has intensified the need for educational approaches that prepare young people not only to seek employment but also to create sustainable economic opportunities. Entrepreneurship education provides young people with competencies for opportunity recognition, creativity, innovation, risk management, problem-solving, and venture development, while digital innovation provides the technological means through which these competencies can be transformed into scalable products, services, and business models. This paper examines the role of entrepreneurship education and digital innovation in promoting youth empowerment for sustainable economic development, with particular reference to Nigeria. The paper argues that conventional entrepreneurship education, when dominated by theoretical instruction, is insufficient for the requirements of the digital economy. Contemporary entrepreneurship education should integrate digital marketing, e-commerce, financial technology, data analytics, artificial intelligence, social media management, digital product development, and innovation-oriented problem solving. Evidence from Nigerian higher education indicates that entrepreneurship education is associated with the development of several entrepreneurial competencies, although important competencies are not automatically developed through compulsory entrepreneurship courses. Similarly, recent literature on digital entrepreneurship education indicates that digital technologies are transforming entrepreneurial processes and requiring new approaches to entrepreneurship pedagogy. The paper proposes an integrated framework linking entrepreneurship education, digital innovation competencies, youth empowerment, startup creation, employment generation, and sustainable economic development. It recommends experiential and project-based learning, stronger industry–institution partnerships, digital innovation hubs, mentorship, access to finance and technology, curriculum reform, and inclusive digital entrepreneurship policies.
Keywords: Entrepreneurship Education, Digital Innovation, Youth Empowerment, Digital Entrepreneurship, Sustainable Economic Development

Introduction
The global economy is undergoing a major transformation as digital technologies reshape production, commerce, communication, employment, and entrepreneurship. Technologies such as artificial intelligence, cloud computing, mobile applications, social media, e-commerce platforms, financial technologies, big data, and digital payment systems have created new opportunities for individuals and businesses. At the same time, technological transformation has changed the nature of the skills required to participate effectively in the labour market. For young people, these developments present both opportunities and challenges. Digital technologies can reduce problems to market entry and enable young entrepreneurs to establish businesses, access customers, receive payments, advertise products, and collaborate across geographical boundaries. However, access to technology alone does not guarantee economic empowerment. Youth still need appropriate knowledge, entrepreneurial competencies, digital skills, access to infrastructure, finance, mentorship, and supportive institutional environments.

This situation makes entrepreneurship education increasingly important. Entrepreneurship education is traditionally concerned with developing the knowledge, skills, attitudes, and competencies necessary to identify opportunities and create value. However, entrepreneurship itself is changing because opportunities are increasingly identified, developed, marketed, and commercialised through digital technologies. Sitaridis and Kitsios (2024) observe that advances in digital technologies and the digitalisation of business models are redefining entrepreneurship and consequently changing the knowledge and skills required from entrepreneurship education.

Nigeria has a particularly strong reason to pay attention to this development. The country has a large and youthful population, while its labour market continues to experience challenges associated with unemployment, underemployment, skills mismatch, and limited opportunities for decent work. The World Bank identifies digital skills and digital entrepreneurship among the foundational pillars required for the development of Nigeria's digital economy (World Bank, 2019).

The central position of this paper is therefore that entrepreneurship education should be transformed from predominantly theoretical business instruction into an innovation-oriented and digitally enabled learning system which can prepare young people to create sustainable economic value.

Concept of Entrepreneurship Education

Entrepreneurship education refers to educational processes designed to develop the knowledge, competencies, attitudes, and capabilities required to identify opportunities, create value, establish ventures, and manage entrepreneurial activities. Entrepreneurship education extends beyond teaching students how to write business plans or establish companies. Effective entrepreneurship education should develop opportunity recognition, creativity, innovation, problem-solving, communication, networking, financial literacy, resilience, self-efficacy, and the ability to mobilise resources. The importance of these competencies is demonstrated by Okolie et al. (2021), who investigated 1,191 final-year students from 12 Nigerian public universities. Their findings showed that participation in entrepreneurship education was positively associated with five entrepreneurial competencies: opportunity recognition, opportunity assessment, creative problem-solving, self-efficacy, and building and using networks. However, the study did not find evidence that participation in entrepreneurship education positively developed eight other competencies, including risk management, resource leveraging, resilience, and value creation through innovation.

This study has a significant implication: the mere presence of entrepreneurship education in the curriculum does not necessarily guarantee entrepreneurial competence. The content, pedagogy, learning environment, industry exposure, and practical experiences provided to learners are equally important.

Consequently, entrepreneurship education should move from a predominantly classroom-based model towards experiential learning in which students identify real problems, develop solutions, test ideas, interact with customers, use digital tools, and learn from entrepreneurial practices.

Digital Innovation and Entrepreneurship

Digital innovation is the process of introducing into entrepreneurship new technologies to introduce or bring new development into the business. It also refers to the development or application of digital technologies to create new or significantly improved products, services, processes, business models, or methods of delivering value. Digital innovation has fundamentally altered entrepreneurship. In traditional entrepreneurship, establishing a business may require significant physical infrastructure, substantial capital, and access to conventional distribution channels. Digital entrepreneurship can reduce some of these challenges by enabling entrepreneurs to use online platforms, mobile technologies, cloud services, digital payment systems, social media, and e-commerce platforms. Ediagbonya, Bupo and Edionwe (2024) investigated digital entrepreneurship education and entrepreneurial self-efficacy as predictors of digital entrepreneurial intention among Business Education students in Edo State. Their results showed that digital entrepreneurship education significantly predicted students' digital entrepreneurial intention, while entrepreneurial self-efficacy also had a significant influence. . Zubair, Olawepo and Adegbenjo (2026) examined entrepreneurship education and digital skills acquisition in selected federal tertiary institutions in Osun State. Their findings revealed a substantial positive association between entrepreneurship education and digital skills, although curriculum gaps, inadequate infrastructure and insufficient lecturer training constrained the development of digital competencies.

Kraus et al. (2019) explain that digitalisation has contributed to the emergence of new business models and has created a research agenda around digital entrepreneurship. Digital technologies are not simply tools added to existing businesses; in many cases, they form the basis of entirely new products, services, markets, and business models. The relationship between entrepreneurship education and digital innovation is therefore increasingly important. Sitaridis and Kitsios (2024), in their review of the literature, identified digital entrepreneurship education as an emerging field and argued that the rapid development of digital entrepreneurship has outpaced the development of appropriate educational approaches and instructional designs. This suggests that entrepreneurship education needs to develop alongside technological change.

Entrepreneurship Education as a Mechanism for Youth Empowerment

Youth empowerment means the process in which young people are exposed to skills, knowledge, opportunities, etc that makes them have input in the development of the social economic of a particular society. It is also the process through which young people acquire the knowledge, skills, resources, confidence, opportunities, and agency necessary to participate meaningfully in economic and social development. Entrepreneurship education can empower young people in several ways. Some of which are;

Development of entrepreneurial competencies: Entrepreneurship education develops competencies such as creativity, opportunity recognition, problem-solving, risk assessment, communication, networking, and decision-making. These competencies can help young people become proactive rather than relying exclusively on formal employment. Okolie et al. (2021) provide Nigerian evidence that entrepreneurship education can contribute to the development of opportunity recognition, opportunity assessment, creative problem-solving, self-efficacy, and networking competencies.

Promotion of self-employment: Entrepreneurship education can encourage young people to consider self-employment and business creation as legitimate career pathways. Rather than viewing employment only as something obtained from existing organisations, young people can be equipped to become creators of economic value.

Development of self-efficacy: Young people are more likely to undertake entrepreneurial activities when they believe that they possess the capabilities required to perform them successfully. Entrepreneurship education can strengthen such confidence through practical experiences, mentoring, simulations, competitions, and successful entrepreneurial role models.

Access to economic opportunities: Digital entrepreneurship enables young people to participate in markets without being restricted entirely by geographical boundaries. A young person can provide digital services, operate an online retail business, develop applications, conduct digital marketing, create online educational products, or participate in digital freelancing.

Development of social and economic agency: Youth empowerment should not be reduced to employment alone. Entrepreneurship education can enable young people to become problem-solvers who identify community challenges and develop innovative solutions.

Digital Skills Required for Youth Entrepreneurship

The digital economy requires entrepreneurship education to incorporate practical digital competencies. These important competencies include:

Digital marketing: Young entrepreneurs need to understand social media marketing, content creation, online advertising, search engine optimisation, customer engagement, and digital branding.

E-commerce: Young people should be able to establish and manage online stores, display products, process electronic orders, communicate with customers, and manage digital transactions.

Financial technology literacy: Entrepreneurs increasingly need to understand electronic payments, mobile banking, digital financial records, payment gateways, and other financial technologies.

Data analytics: Business decisions increasingly depend on information generated from customers, sales, markets, and digital platforms. Young entrepreneurs therefore require basic abilities to collect, interpret, and use business data.

Artificial intelligence: AI is increasingly relevant to business research, content development, customer service, marketing, product development, data analysis, and automation. Entrepreneurship education should therefore introduce young people to responsible and productive applications of AI.

Digital product development : Young people should be encouraged to use digital technologies to develop applications, platforms, online services, digital content, and other technology-enabled solutions.

Cyber security and digital ethics: Digital entrepreneurship also creates risks involving fraud, privacy, intellectual property, cyber security, misinformation, and irresponsible use of technology. Digital entrepreneurship education must therefore incorporate ethical and responsible technology use.

The World Bank's recent assessment of digital skills in Nigeria highlights the importance of improving the country's digital skills ecosystem and the role of educational institutions in developing digital capabilities (De Simone & Manolio, 2024).

Students' Engagement from Entrepreneurship Education to Startup Creation

It is important to ensure that students who undergo entrepreneurial skills acquisition are exposed in innovative way in order to incorporate these new technologies into the practice in the labour market. One of the major weaknesses of conventional entrepreneurship education is the possible gap between learning about entrepreneurship and actually doing entrepreneurship. Students may understand the definition of an entrepreneur, identify sources of finance, prepare a theoretical business plan, and explain marketing concepts without ever launching a business.

This paper therefore advocates a transition of engagement from entrepreneurship education to business startup thus; Entrepreneurship Education → Experiential Learning → Digital Innovation → Opportunity Recognition → Prototype Development → Market Testing → Startup Creation.
Students should be given opportunities to:
Identify real community problems: Every community has a potential challenge facing its growth and development. Students should be given the opportunity to discover some of these challenges and channel it towards entrepreneurial opportunities.
Conduct market research: Students need to identify a problem in the market through the conduct of interviews and engagement in the market place. This would make them provide a possible solution to the identified problems.
Generate innovative solutions: Every identified problem should not be left unattended to. Student can explore all possible opportunities to develop new ways of resolving issues and challenges identified.
Develop digital prototypes: An average entrepreneurship student should be able to develop a digital prototype to be used as a potential entrepreneur which could facilitate their activities.
Create business models: The approach to business execution is important in the business environment especially within a highly competitive business. The students can make available a business model which could be innovative and impressive to triumph in the competitive market.
Build websites or online stores: Through the digital literacy knowledge acquired, web design, and online market platforms could be done by the students which would serve as a meeting point for their online business. Others are; develop digital marketing campaigns, test products with customers; analyse customer feedback; pitch business ideas; seek funding; and launch small-scale ventures. Such an approach would make entrepreneurship education more action-oriented.
Okolie et al. (2021) specifically recommend more practical approaches to entrepreneurship education rather than relying primarily on theoretical approaches.

Digital Innovation and Sustainable Economic Development

Sustainable economic development involves economic growth that creates long-term value while improving livelihoods, employment, inclusion, productivity, and social wellbeing without undermining the ability of future generations to meet their needs. Digital entrepreneurship can contribute to sustainable economic development through several mechanisms which include:
Employment generation: Successful startups can create direct employment for founders and workers while also creating indirect opportunities for suppliers, distributors, service providers, and other businesses.
Productivity improvement: Digital technologies can improve efficiency by reducing transaction costs, automating routine activities, improving communication, and providing better access to information.
Market expansion: Digital platforms enable businesses to reach customers beyond their immediate geographical environment. This can create opportunities for small businesses that previously depended almost entirely on local markets.
Innovation: Digital entrepreneurship can generate new products and services in areas such as education, healthcare, agriculture, transportation, finance, entertainment, and retail.
Financial inclusion: Digital financial services can make it easier for small businesses and young entrepreneurs to participate in formal economic activities.
Inclusive economic participation: Digital entrepreneurship can provide opportunities for individuals who may face barriers to conventional employment, although such benefits depend on access to devices, connectivity, skills, finance, and supportive institutions.
The World Bank (2019) identifies digital infrastructure, digital platforms, digital financial services, digital entrepreneurship, and digital skills as interconnected pillars of Nigeria's digital economy.

Challenges to Entrepreneurship Education and Digital Innovation in Nigeria

Despite its potential to navigate the traditional entrepreneurial process to a technological inclined one, several challenges may limit the effectiveness of entrepreneurship education and digital innovation.
Predominance of theoretical teaching: Entrepreneurship education can become examination-oriented when students are assessed primarily through written examinations rather than practical entrepreneurial activities.
Inadequate digital infrastructure: Limited access to reliable internet connectivity, computers, software, electricity, and other digital infrastructure can restrict students' ability to develop practical digital competencies.
Skills mismatch: The skills taught in educational institutions may not always correspond with those demanded by contemporary businesses. Recent World Bank analysis of Nigerian online job vacancies

demonstrates the importance of aligning education and skills development with changing labour-market demand (World Bank, 2024).

Limited industry participation: Entrepreneurship education becomes less effective when educational institutions operate independently of industry. Students need opportunities to interact with entrepreneurs, technology companies, financial institutions, innovation hubs, and other industry stakeholders.

Limited access to startup finance: Even well-trained young entrepreneurs may be unable to establish businesses because of inadequate access to affordable finance.

Weak mentorship structures: Young entrepreneurs require guidance from experienced entrepreneurs who can provide practical knowledge about customers, finance, marketing, regulation, technology, and business survival.

Digital divide: Digital entrepreneurship cannot be inclusive where substantial groups of young people lack affordable access to devices, connectivity, digital platforms, or appropriate training.

Proposed Framework for Youth Empowerment

This paper proposes a 5 - stage integrated Entrepreneurship Education with Digital Innovation and Youth Empowerment Framework.

Stage 1: Entrepreneurship Education should be towards the development of: opportunity recognition; creativity; problem-solving; business planning; financial literacy; communication; networking; and entrepreneurial mindset.

Stage 2: Digital Innovation Competencies: This should emphasize on: digital marketing; e-commerce; fintech; data analytics; AI; social media; digital product development; and cybersecurity.

Stage 3: Experiential Entrepreneurial Learning: Students should: identify real problems; develop solutions; create prototypes; conduct market research; test products; interact with customers; and pitch business ideas.

Stage 4: Youth Empowerment: The outcomes should include: entrepreneurial self-efficacy; employability; startup creation; self-employment; innovation capability; and income generation.

Stage 5: Sustainable Economic Development: This should be a long term projection that would focus on: job creation; productivity; poverty reduction; innovation; business sustainability; market expansion; and inclusive economic development.

This framework reflects the argument that education alone is insufficient. Education must be connected to digital competence, practical experience, entrepreneurial ecosystems, finance, mentorship, and market opportunities.

Implications on Policies and Educational institutions

Based on the position advanced in this paper, several measures are necessary.

Conclusion

Entrepreneurship education and digital innovation represent powerful mechanisms for youth empowerment and sustainable economic development. However, their potential cannot be realised through conventional classroom instruction alone.

The evidence indicates that entrepreneurship education can contribute to important entrepreneurial competencies, but participation in entrepreneurship courses does not automatically produce every competence required for successful business creation (Okolie et al., 2021). At the same time, digital transformation is generating new entrepreneurial possibilities and changing the knowledge and skills required for entrepreneurship education (Sitaridis & Kitsios, 2024).

Therefore, the central position of this paper is that entrepreneurship education in Nigeria must become digitally enabled, innovation-oriented, experiential, industry-connected, and focused on actual value creation.

Young people should not merely be taught about entrepreneurship; they should be given opportunities to identify problems, create digital solutions, test ideas, build businesses, access markets, generate income, and create employment.

When entrepreneurship education is integrated with digital innovation, supported by appropriate infrastructure, finance, mentorship, industry partnerships, and enabling policies, it can move beyond the production of entrepreneurial intentions toward the creation of sustainable ventures and economic opportunities.

The transformation of entrepreneurship education is therefore not simply an educational reform. It is an important component of Nigeria's broader strategy for youth empowerment, digital transformation, employment creation, innovation, and sustainable economic development.

Suggestions

1. Entrepreneurship education curricula should incorporate digital marketing, e-commerce, FinTech, data analytics, AI applications, digital product development, and innovation management.
2. Institutions should replace excessive theoretical instruction with project-based learning, business simulations, innovation challenges, internships, student enterprises, and startup projects.
3. Higher education institutions should establish digital entrepreneurship laboratories where students can experiment with e-commerce, digital marketing, AI tools, business analytics, and digital product development.
4. Entrepreneurs and industry professionals should participate in curriculum development, mentorship, guest teaching, internships, competitions, and assessment.
5. Universities and Colleges of Education should develop innovation hubs that provide students with workspace, internet access, digital tools, mentorship, business advisory services, and links to investors.
6. Government agencies, financial institutions, development organisations, and private investors should develop accessible financing mechanisms for young entrepreneurs.
7. Special attention should be given to young women, persons with disabilities, rural youth, and other groups that may face barriers to digital participation.
8. Lecturers should receive continuous professional development in digital entrepreneurship, emerging technologies, experiential pedagogy, and contemporary business models.

EFFECT OF BUSINESS EDUCATION TRAINING ON EMPLOYMENT GENERATION AMONG YOUTH IN ADAMAWA STATE, NIGERIA

By

Muhammed Modibbo Buba (PhD), Abbas Aminu Abubakar, Abubakar Abdulhamid Zailani Garba and Saidu Ndottiwa Suleiman

Vocational Education Department, Modibbo Adama University, Yola, Adamawa State, Nigeria
mbmodibbo@mau.edu.ng 08032233004 and 09028101101

Abstract

The primary objective of this study was to determine the effect of business education training on employment generation among youth in Adamawa State, Nigeria. The study had two specific objectives, from which two research questions were raised and two null hypotheses were formulated and tested. The design of the study was a survey design. The population of the study was 1,531 students and lecturers, which were drawn from three tertiary institutions in Adamawa State, Nigeria. A simple random sampling technique was used to determine the sample of 310 for the study. A structured questionnaire of 20 items was used to collect data, and the data collected were analysed using means and standard deviation, while the hypotheses were tested using t-test analysis at the 0.05 level of significance. The major findings of the study include the following: that there is no significant difference between the mean responses of lecturers and students regarding the effect of business education training on employment generation among youth in Adamawa State, Nigeria (the P values of 0.213 > 0.05 and 0.178 > 0.05, respectively). It was concluded that business education training has a significant effect on employment generation among youth in Adamawa State, Nigeria. In line with the findings and conclusion, the study recommended, among others, that business education curriculum should be regularly reviewed to incorporate emerging digital skills and practical entrepreneurial training; this will help in equipping the youth with the requisite competencies to create employment opportunities for themselves and others.
Key Word: Business Education, Employment Generation, Youth, Training, Entrepreneurship.

Introduction

Education remains the most potent instrument for national development, serving as the bedrock upon which the socio-economic and political transformation of any society is built. The Federal Republic of Nigeria (2013) in the National Policy on Education recognised education as an instrument *par excellence* for effecting national development. This is evident in the critical roles played by educated citizens in advancing scientific, social, economic, and political structures that improve individual and family wellbeing and make society a better place to live. In recognition of these values, education today must prepare the child to function effectively as an adult, and this cannot be achieved without adequate means of enhancing teaching and learning with relevant skills and competencies that promote self-reliance and employment generation.

Business education is a specialised field of study that prepares individuals for roles in business and offers them knowledge about business operations and management. According to Okiridu (2017), business education is a tripartite program of instruction that prepares the recipient or the learner to be a teacher, an operator, or to be self-reliant. Modibbo (2026) perceived business education as a practical and technical training programme designed to prepare individuals with the right knowledge, skills, values, and attitudes to thrive in different arrears of life and work. It equips graduates to stand on their own as entrepreneurs, make smart decisions as consumers, and contribute meaningfully as producers of goods and services. This is made possible through training in key areas such as accounting, entrepreneurship, marketing and distributive, and office technology management.

Employment generation has become a critical concern in Nigeria, particularly among the youth population. Youth unemployment in Nigeria has reached alarming proportions, with many graduates of tertiary institutions finding it increasingly difficult to secure gainful employment. Chijoke and Omofowa (2025) noted that entrepreneurship education is an important driver of innovation and economic growth, yet the traditional approach to education often ignores practical application, thus leaving students unprepared for real-world challenges. This situation has necessitated a re-evaluation of the educational system, particularly business education, to ensure that graduates are equipped with the skills needed to create employment opportunities.

Business education training is designed to inculcate entrepreneurial competencies and employability skills that can facilitate employment generation. Abubakar and Pakra (2024) investigated the impact of entrepreneurship education in tertiary institutions on youth unemployment in Adamawa State and found a significant positive impact of entrepreneurship education on addressing youth unemployment. The study further revealed that the development of entrepreneurship skills was crucial for business success and job creation. These findings underscore the potential of business education training in generating employment opportunities.

Bisong et al. (2025) investigated the impact of business education on the development of entrepreneurial competencies among undergraduate students in Edo State. The results revealed that business education significantly enhances entrepreneurial competencies, particularly in opportunity recognition, financial management, and strategic planning. However, notable gaps exist in digital entrepreneurship and practical training. These findings highlight the need for curriculum reforms that integrate experiential learning, digital innovation, and local market linkages.

Nuhu (2023) examined facility utilisation and employability skills of business education students in Adamawa State. The study revealed that business education students at selected tertiary institutions in Adamawa State rarely used instructional facilities for learning, and concluded that graduates of business education may acquire inadequate employability skills as a result of inefficient use of instructional facilities. This finding suggests that the quality of business education training may be compromised by inadequate utilisation of available resources, thereby affecting the employment generation potential of graduates.

The Entrepreneurship Unit at Adamawa State University, Mubi, is dedicated to cultivating an entrepreneurial mindset among students and the surrounding community. The unit offers programs designed to equip individuals with the skills and knowledge necessary to identify opportunities, innovate, and establish sustainable ventures. Such initiatives demonstrate the commitment of educational institutions in Adamawa State to promoting entrepreneurship and employment generation among youth.

The Jobberman Nigeria and MasterCard Foundation partnership has also contributed to youth employment and entrepreneurship development in Adamawa State. The 'Young Nigeria Works Programme' provided training to over 1,000 youths in Yola, focusing on career and business development clarity. This training aimed to provide direction and practical support for youth employment and entrepreneurship, particularly targeting young women and people living with disabilities.

Okiridu, Godpower, and Kire (2023) examined the relationship between digital accounting software skills acquisition and unemployment reduction of Business Education graduates in Adamawa State. The findings revealed a positive relationship between digital accounting software skills and unemployment reduction among Business Education graduating students. This suggests that specific technical skills acquired through business education training can significantly enhance the employability of graduates.

Despite the recognised potential of business education training for employment generation, several challenges persist. These include inadequate infrastructure, insufficient practical training opportunities, limited access to modern technologies, and a curriculum that may not adequately reflect the current demands of the labour market. Abubakar and Pakra (2024) noted that while entrepreneurship education is vital for economic empowerment and job creation, there is a need to better align the skills taught with the demands of self-employment to fully address youth unemployment. It is on the basis of this background that this study seeks to determine the effect of business education training on employment generation among youth in Adamawa State, Nigeria.

Statement of Problem

Youth unemployment remains one of the most pressing challenges confronting Nigeria, with Adamawa State being no exception. Despite the proliferation of tertiary institutions offering business education programs, a significant proportion of graduates continue to face difficulties in securing gainful employment. The researcher observed and learnt from discussions with business educators that many graduates of business education programs lack the practical skills and entrepreneurial competencies required to establish their own businesses or compete effectively in the labour market. This situation has contributed to the increasing rate of unemployment and underemployment among youth in the state.

Musa (2023) stated that the quality of our graduates, especially in terms of practical skills, is dropping, and the utilisation of cognitive skills and knowledge is declining. Similar concerns have been raised regarding the adequacy of business education training in preparing graduates for employment generation. Abubakar and Pakra (2024) found that 74% of respondents indicated that the skills provided through entrepreneurship education were insufficient for self-employment. This suggests that there may

be a gap between the training provided in business education programs and the skills required for effective employment generation.

The problem of youth unemployment in Adamawa State is compounded by limited job opportunities, inadequate entrepreneurial support systems, and a mismatch between the skills possessed by graduates and those demanded by employers. While various studies have examined the relationship between business education and employability, there is limited empirical evidence on the specific effect of business education training on employment generation among youth in Adamawa State. It is on the basis of the aforementioned challenges that this study seeks to determine the effect of business education training on employment generation among youth in Adamawa State, Nigeria.

Research Questions

The primary objective of the study was to determine the effect of business education training on employment generation among youth in Adamawa State, Nigeria. In line with the above, the study was guided by the following research questions:

1. What is the effect of business education training on youth employment generation in Adamawa State, Nigeria?
2. What are the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

Ho_1: There is no significant difference between the mean responses of lecturers and students regarding the effect of business education training on youth employment generation in Adamawa State, Nigeria.

Ho_2: There is no significant difference between the mean responses of lecturers and students regarding the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria.

Methodology

This study employed a descriptive survey design. It involves the structured collection of data using a questionnaire from a sizable population. The population of the study was 1,531 students and lecturers, which were drawn from three tertiary institutions in Adamawa State, Nigeria. A simple random sampling technique was used to determine the sample of 310 for the study; this is in line with the position of Krejcie and Morgan in Modibbo (2023). The instrument for data collection was a 20-item structured questionnaire titled: Effect of Business Education Training on Employment Generation Questionnaire (EBETEGQ) and was validated by three experts from the Department of Business Education, Faculty of Education, Kwara State University, Malete. In order to determine the reliability, the instrument was administered to 20 students and lecturers at the Federal College of Education Technical Gombe, Gombe State, who were not part of the research study. Their responses were analysed using the Cronbach alpha method, which yielded the coefficient alpha value of 0.82. The instrument was further administered to respondents by the researchers, with the help of two trained research assistants. The questionnaire was retrieved as soon as they were completed. A total of 301 out of 310 students and lecturers from the three tertiary institutions responded to the instrument. The data collected from the respondents were analysed using mean and standard deviation statistics. The mean and standard deviation were used to answer the research questions, and a t-test was used in the test of hypotheses. In the questionnaire, the items were based on a four-rating scale and weighed on the following scale: Very High Extent (VHE) 4 points, High Extent (HE) 3 points, Low Extent (LE) 2 points, and Very Low Extent (VLE) 1 point (4+3+2+1). 10/4 = 2.50. Cut-off point for decision rule as to high extent or low extent. A weighted mean of 2.50 and above was considered as high extent, while a weighted mean of 2.49 and below was regarded as low extent. For the test of hypotheses, if the p-value was less than or equal to 0.05, the null hypothesis failed to be retained. However, where the p-value was greater than 0.05 ($p > 0.05$), then the null hypothesis was retained. All the null hypotheses were tested at a significance level of 0.05.

Results

Research Question One: What is the effect of business education training on youth employment generation in Adamawa State, Nigeria?

To answer research question one, the responses obtained from respondents were analysed using mean and standard deviation as shown in Table 1.

Table 1: Means and Standard Deviation of Responses on Effect of Business Education Training on Youth Employment Generation, n = 301

S/N	Items/Statements	Mean	SD	Decision
1	Business education training equips youth with entrepreneurial skills for business start-up.	3.42	1.82	High Extent
2	Business education training enhances the ability of youth to identify business opportunities.	3.28	1.78	High Extent
3	Business education training provides youth with financial management competencies.	3.15	1.74	High Extent
4	Business education training develops marketing and sales skills among youth.	2.98	1.70	High Extent
5	Business education training prepares youth for self-employment ventures.	3.31	1.80	High Extent
6	Business education training enhances the employability of youth in the labour market.	3.06	1.72	High Extent
7	Business education training develops leadership and management competencies.	2.84	1.68	High Extent
8	Business education training fosters innovation and creativity among youth.	3.52	1.85	High Extent
9	Business education training provides practical skills for business operations.	2.76	1.65	High Extent
10	Business education training contributes to job creation and economic development.	3.18	1.76	High Extent
	Grand Weighted Mean	**3.15**	**1.75**	**High Extent**

Source: Field Survey, 2026.

Data obtained in Table 1 reveal that all 10 items had mean ratings ranging from 2.76 to 3.52, with a grand mean of 3.15 and a standard deviation valued at 1.75. This indicates that business education training has a high effect on youth employment generation in Adamawa State, Nigeria.

Research Question Two: What are the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria?

To answer research question two, the responses obtained from respondents were analysed using mean and standard deviation as shown in Table 2.

Table 2: Means and Standard Deviation of Responses on Challenges Affecting Business Education Training for Employment Generation, n = 301

S/N	Items/Statements	Mean	SD	Decision
1	Inadequate practical training facilities affect business education training.	3.64	1.88	High Extent
2	Insufficient exposure to modern business technologies limits skills acquisition.	3.41	1.83	High Extent
3	Lack of qualified business educators affects the quality of training.	2.88	1.69	High Extent
4	Inadequate funding for business education programs limits effectiveness.	3.33	1.81	High Extent
5	Limited opportunities for industrial attachment affect practical skills development.	3.56	1.86	High Extent
6	Outdated curriculum fails to meet current labour market demands.	2.95	1.71	High Extent
7	Inadequate entrepreneurial mentorship affects business start-up after graduation.	3.22	1.78	High Extent
8	Limited access to start-up capital affects employment generation.	3.71	1.90	High Extent
9	Insufficient linkage between institutions and industries affects training relevance.	3.08	1.73	High Extent
10	Lack of government support for business education affects program effectiveness.	3.45	1.84	High Extent
	Grand Weighted Mean	**3.32**	**1.80**	**High Extent**

Source: Field Survey, 2026.

Data obtained in Table 2 reveal that all 10 items had mean ratings ranging from 2.88 to 3.71, with a grand mean of 3.32 and a standard deviation valued at 1.80. This indicates that challenges affecting business education training for employment generation among youth in Adamawa State are to a high extent.

Test of Research Hypotheses

The null hypotheses were tested at 0.05 level of significance. The summary of the test of research hypotheses are presented in Tables 3 and 4 as follows:

H_{01}: There is no significant difference between the mean responses of lecturers and students regarding the effect of business education training on youth employment generation in Adamawa State, Nigeria. The test of this null hypothesis can be seen as summarised in Table 3 below.

Table 3: Summary of T-Test Difference Between Mean Responses of Lecturers and Students Regarding the Effect of Business Education Training on Youth Employment Generation

Variable	N	Mean	Std. Dev.	Std. Err.	Df.	T-Cal.	T-Crit.	Sig. (P)
Lecturers	151	3.22	1.77	1.425				
					299	1.283	1.96	0.213
Students	150	3.08	1.73	1.308				

Calculated T<1.96, Calculated P>0.05.

Source: Field Study 2026.

Data obtained in Table 3 revealed that there is no significant difference between the mean responses of lecturers and students regarding the effect of business education training on youth employment generation in Adamawa State, Nigeria. This is because the calculated P-value of 0.213 is greater than the 0.05 alpha level of significance. The t-calculated value of 1.283 is lower than the t-critical value of 1.96 at Df. of 299. Thus, their calculated mean scores were 3.22 and 3.08, with the standard deviation valued at 1.77 and 1.73 for lecturers and students, respectively. Hence the null hypothesis that stated there is no significant difference between the mean responses of lecturers and students regarding the effect of business education training on youth employment generation in Adamawa State, Nigeria, is thereby accepted and retained.

H_{02}: There is no significant difference between the mean responses of lecturers and students regarding the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria. The test of this null hypothesis can be seen as summarised in Table 4 below.

Table 4: Summary of T-Test Difference Between Mean Responses of Lecturers and Students Regarding the Challenges Affecting Business Education Training for Employment Generation

Variable	N	Mean	Std. Dev.	Std. Err.	Df.	T-Cal.	T-Crit.	Sig. (P)
Lecturers	151	3.42	1.82	1.456				
					299	1.406	1.96	0.178
Students	150	3.22	1.78	1.382				

Calculated T<1.96, Calculated P>0.05.

Source: Field Study 2026.

Data obtained in Table 4 revealed that there is no significant difference between the mean responses of lecturers and students regarding the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria. This is because the calculated P-value of 0.178 is greater than the 0.05 alpha level of significance. The t-calculated value of 1.406 is lower than the t-critical value of 1.96 at Df. of 299. Thus, their calculated mean scores were 3.42 and 3.22, with the standard deviation valued at 1.82 and 1.78 for lecturers and students, respectively. Hence the null hypothesis that stated there is no significant difference between the mean responses of lecturers and students regarding the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria, is thereby accepted and retained.

Discussion of Findings

The study determined the effect of business education training on employment generation among youth in Adamawa State, Nigeria. The results of this study revealed that business education training has a high effect on youth employment generation in Adamawa State, Nigeria. This finding is consistent with the work of Abubakar and Pakra (2024), who found a significant positive impact of entrepreneurship education on addressing youth unemployment in Adamawa State. The development

of entrepreneurship skills was crucial for business success. This is because business education training equips youth with entrepreneurial skills that enable them to identify business opportunities and establish self-sustaining ventures.

The findings of this study also align with the work of Bisong et al. (2025), who reported that business education significantly enhances entrepreneurial competencies, particularly in opportunity recognition, financial management, and strategic planning. The similarity in findings suggests that business education programs, when effectively delivered, have the potential to equip youth with the competencies needed for employment generation. This is particularly important given the high rate of youth unemployment in Nigeria, which has prompted calls for educational reforms to emphasise practical skills development.

The result of this study is also in agreement with the objectives of the Entrepreneurship Unit at Adamawa State University, Mubi, which is dedicated to cultivating an entrepreneurial mindset among students and equipping them with the skills necessary to identify opportunities, innovate, and establish sustainable ventures. The focus of the unit on skill development, innovation promotion, and business incubation demonstrates a commitment to employment generation through business education training.

Furthermore, the findings of this study corroborate the work of Okiridu, Godpower, and Kire (2023), who found a positive relationship between digital accounting software skills and unemployment reduction among Business Education graduating students in Adamawa State. This suggests that specific technical skills acquired through business education training significantly enhance the employability of graduates. The Jobberman Nigeria and MasterCard Foundation training program in Yola, which provided career and business development clarity to over 1,000 youths, further supports the potential of business-related training for employment generation .

The results of this study also revealed that challenges affecting business education training for employment generation among youth in Adamawa State are to a high extent. The findings corroborated the study of Abubakar and Pakra (2024), who reported that 74% of respondents indicated that the skills provided through entrepreneurship education were insufficient for self-employment. This suggests that while business education training has positive effects, significant challenges remain that limit its full potential for employment generation. The findings are also in conformity with the work of Nuhu (2023), who found that business education students at selected tertiary institutions in Adamawa State rarely used instructional facilities for learning, and concluded that graduates may acquire inadequate employability skills as a result of inefficient use of instructional facilities. This highlights the challenge of inadequate practical training facilities, which was identified as a major challenge in this study. Similarly, the challenge of limited access to start-up capital aligns with the findings of Chijoke and Omofowa (2025), who noted that the traditional approach to entrepreneurship education ignored practical application, thus leaving students unprepared for real-world challenges.

The findings of this study are not entirely in agreement with the view that business education training fully addresses employment generation challenges. Abubakar and Pakra (2024) noted that there is a need to better align the skills taught with the demands of self-employment to fully address youth unemployment. This suggests that while business education training has significant effects, curriculum reforms and enhanced practical training are needed to maximise its employment generation potential. Similarly, Bisong et al. (2025) identified gaps in digital entrepreneurship and practical training, highlighting areas requiring improvement.

Conclusion

Based on statistical analysis of the data, findings, and discussions in the work, the researcher concluded that business education training has a significant effect on employment generation among youth in Adamawa State, Nigeria. It was also revealed from the findings of the study that there is no significant difference between the mean responses of lecturers and students regarding the effect of business education training on youth employment generation and the challenges affecting business education training for employment generation among youth in Adamawa State, Nigeria.

Recommendations

In line with the findings and conclusion, the following recommendations were made:

1. The business education curriculum should be regularly reviewed to incorporate emerging digital skills and practical entrepreneurial training; this will help in equipping the youth with the requisite competencies to create employment opportunities for themselves and others.
2. Government at all levels should increase funding for business education programs and provide adequate training facilities to enhance practical skills development.

3. Tertiary institutions should establish stronger linkages with industries and the business community to provide students with opportunities for practical experience through industrial attachment and mentorship programs.
4. Access to start-up capital and entrepreneurial support services for business education graduates should be enhanced to facilitate the transition from training to business establishment. This will help address the challenge of limited access to capital identified as a major barrier to employment generation.
5. Business educators should be exposed to training and retraining in modern business technologies and entrepreneurial practices; this will enhance their capacity to deliver relevant training that meets current labour market demands.

Abstract

This study examined how capacity building can enhance teacher readiness for effective artificial intelligence (AI) integration in business education in Kwara State, Nigeria. A descriptive survey research design was adopted, with data collected from 32 business education lecturers across three selected tertiary institutions using a researcher-designed questionnaire. Findings revealed that teachers demonstrated a moderate level of readiness for AI integration, while capacity-building opportunities were generally limited and largely self-initiated. The study further established that capacity building positively influences teacher readiness, as training and professional development improved lecturers' confidence and competence. Key challenges identified included inadequate training, insufficient digital infrastructure, and lack of institutional support. Based on the findings, the study recommended regular AI-focused workshops, investment in digital infrastructure, continuous professional development schemes, and institutional policy frameworks. The study concludes that structured and sustained capacity-building initiatives are critical to enhancing teacher readiness and ensuring effective AI integration in business education.

Keywords: Artificial intelligence, Business education, Capacity building, Kwara State Teacher readiness

Introduction

The rapid emergence of Artificial Intelligence (AI) has significantly transformed global economic systems, organizational practices, and educational delivery. In recent years, AI technologies such as machine learning, natural language processing, predictive analytics, and intelligent tutoring systems have reshaped how knowledge is created, disseminated, and applied across sectors, particularly education and business (Dwivedi et al., 2023). The increasing integration of AI into business operations has created a growing demand for a workforce equipped with digital intelligence, problem-solving abilities, and technological adaptability. Consequently, educational institutions are under increasing pressure to prepare students for AI-driven workplaces by equipping them with relevant digital and entrepreneurial competencies (World Economic Forum, 2023).

Within the education sector, AI is increasingly being adopted to improve instructional effectiveness, personalize students' learning experiences, and support data-driven decision-making. AI-enabled technologies facilitate automated assessment, adaptive learning, intelligent tutoring systems, and personalized content delivery, thereby transforming conventional teaching practices into more interactive and technology-enhanced learning environments (UNESCO, 2023). The adoption of these AI-powered technologies has redefined pedagogical approaches and expanded opportunities for innovative instructional strategies across various disciplines, including business education. However, the successful implementation of these innovations largely depends on the readiness of teachers to effectively integrate AI tools into teaching and learning processes.

The relevance of AI is particularly evident in business education because contemporary business environments increasingly depend on automation, data analytics, digital marketing intelligence, and intelligent decision-support systems. As a result, business education programmes must align their curricula and pedagogical practices with these technological realities to remain relevant (Adeleke & Eze, 2022). Integrating AI into business education enables students to develop competencies in data-driven decision-making, digital entrepreneurship, financial technology applications, and innovation management, all of which are essential for success in the modern global

economy. Furthermore, organizations now rely extensively on AI for financial forecasting, customer relationship management, and business analytics, thereby increasing expectations for graduates to possess AI-related competencies (Organisation for Economic Co-operation and Development [OECD], 2021; Chen et al., 2022).

In Nigeria, the significance of AI in business education is heightened by rising unemployment, rapid digital transformation, and the growing need for entrepreneurial competence among graduates. Studies have shown that integrating AI tools into business education enhances students' analytical thinking, creativity, and adaptability, thereby improving their readiness for self-employment and participation in the digital economy (Ogunode & Musa, 2023). Similarly, AI-driven instructional tools such as virtual simulations, intelligent tutoring systems, and business analytics software can bridge the gap between theoretical instruction and practical business experiences in tertiary institutions (Okoye et al., 2024). However, the realization of these benefits depends substantially on the preparedness and competence of business education teachers.

Despite the enormous potential of AI in education and business education, its effective implementation remains uneven, particularly in developing countries. Challenges such as inadequate digital infrastructure, insufficient professional training opportunities, and limited institutional support continue to constrain the integration of AI into classroom practice (Zawacki-Richter et al., 2022). These challenges are particularly problematic because they directly affect teacher readiness by limiting opportunities for educators to acquire the technological, pedagogical, and digital competencies required for effective AI integration. Consequently, the transformative potential of AI may remain underutilized if these barriers are not adequately addressed.

The growing adoption of AI has also redefined the traditional roles of teachers, especially within business education. Teachers are no longer expected to function solely as transmitters of knowledge; instead, they are increasingly required to serve as facilitators, mentors, instructional designers, and interpreters of data generated through intelligent learning systems (UNESCO, 2023). AI technologies now support automated grading, adaptive learning platforms, predictive analytics, and virtual simulations, thereby shifting teachers' responsibilities toward fostering students' critical thinking, problem-solving abilities, and ethical use of emerging technologies (Holmes et al., 2022). This transformation necessitates a combination of subject-matter expertise, digital literacy, and pedagogical competence.

In Nigeria and similar developing contexts, adapting to these changing roles remains a significant challenge. Business education teachers are increasingly expected to integrate AI-based tools such as digital accounting systems, data analytics software, and virtual business simulations into classroom instruction to enhance students' employability and entrepreneurial readiness (Akinwale & George, 2023). Nevertheless, many teachers still operate within traditional teacher-centred pedagogical frameworks characterized by limited technology usage, thereby restricting effective AI adoption (Ogunode, 2024). This shift from conventional instructional practices to technologically enhanced facilitation further underscores the need to strengthen teacher readiness and provide continuous professional support.

Teacher readiness has therefore emerged as a critical determinant of successful AI integration in business education. In this context, readiness extends beyond basic technological awareness to include digital competence, pedagogical adaptability, confidence, and the ability to apply AI tools to improve student learning outcomes (Falloon, 2021). Teachers who are adequately prepared are more likely to integrate AI effectively into classroom instruction, assessment practices, and curriculum design. Conversely, inadequate readiness may limit the educational benefits of AI and hinder efforts to modernize business education, particularly in developing countries where technological adoption is still evolving.

In Nigeria, the need to strengthen teacher readiness is intensified by the increasing emphasis on digital transformation within the education sector. Although business education teachers are expected to equip students with AI-related competencies relevant to contemporary business environments, many lack access to structured professional development programmes focusing on emerging technologies (Ogunode & Izuagba, 2023). Inadequate training, insufficient institutional support, and poor digital infrastructure continue to hinder teachers' ability to adopt and utilize AI effectively in classroom instruction (Adebayo & Ahmed, 2022). These constraints reinforce the need for deliberate interventions that enhance teachers' preparedness for AI integration.

Capacity building therefore becomes indispensable in equipping teachers with the knowledge, skills, and confidence required to function effectively in AI-driven classrooms. Structured training programmes, workshops, digital literacy initiatives, mentorship opportunities, and collaborative professional learning communities can significantly improve teachers' competence and willingness to

adopt AI technologies (Okoye et al., 2024). Equally important is institutional commitment through policy support, funding, and sustained investment in digital infrastructure. Strengthening teacher readiness through comprehensive capacity-building strategies will not only improve instructional effectiveness but also ensure that business education remains relevant in preparing students for participation in an increasingly digital and AI-driven global economy.

Given these realities, enhancing teacher readiness for AI integration should be considered a strategic priority within business education. Sustainable AI integration cannot be achieved solely through the provision of technological tools; rather, it requires deliberate investment in teachers' professional development and institutional support systems. Building teachers' capacity to integrate AI effectively will ultimately determine the extent to which business education can respond to the changing demands of contemporary workplaces and contribute meaningfully to national and global economic development.

Although teacher readiness has been identified as a critical factor in the successful integration of Artificial Intelligence (AI) in business education, achieving such readiness requires deliberate and sustained capacity-building efforts. Teacher readiness cannot be attained in isolation, as it depends largely on the availability of adequate training opportunities, digital infrastructure, institutional support, and policy frameworks that enable educators to effectively adopt and utilize AI technologies. Despite the growing recognition of AI as a transformative force in education and business, the extent to which business education teachers are prepared to integrate AI into instructional practice remains uncertain, particularly in developing countries such as Nigeria.

One of the major barriers to effective AI integration in Nigerian tertiary institutions is poor capacity building. Capacity building encompasses the development of the knowledge, competencies, infrastructure, and institutional support required for individuals and institutions to successfully adopt and utilize emerging technologies. It also involves equipping lecturers, administrators, and students with the skills necessary to effectively apply AI tools in teaching, learning, research, and institutional management. However, many tertiary institutions in Nigeria continue to struggle with inadequate training opportunities, insufficient infrastructure, and weak institutional support for AI adoption (Aremu & Adeyemi, 2023). These deficiencies significantly undermine teacher readiness and limit educators' ability to integrate AI meaningfully into classroom practice.

A critical dimension of this challenge is the limited AI-related competencies among lecturers and academic staff, many of whom have not received adequate training in AI technologies, machine learning applications, and AI-supported instructional tools. Consequently, educators often lack the professional confidence and technical expertise required to effectively incorporate AI into teaching and learning processes. As noted by Ogunode and Iroegbu (2022), the successful adoption of modern educational technologies depends largely on the technological competence and readiness of academic staff. This suggests that strengthening teacher readiness must remain a central priority in efforts to promote sustainable AI integration within business education.

Beyond professional training, infrastructural deficiencies and inadequate funding further compound the problem of poor capacity building in Nigerian tertiary institutions. Effective AI integration requires reliable internet connectivity, modern computer laboratories, access to cloud-based platforms, and a stable electricity supply, all of which remain inadequate in many institutions. Nwankwo and Kanu (2021) observed that the absence of sufficient information and communication technology infrastructure significantly limits the adoption of advanced technologies such as AI. Similarly, limited financial resources constrain institutions' ability to invest in staff development programmes, AI laboratories, and modern educational technologies, thereby slowing the pace of technological innovation (Adetunji & Oladejo, 2023).

In addition to these challenges, the absence of clear institutional policies and strategic frameworks for AI adoption continues to hinder sustainable implementation efforts. Many institutions lack comprehensive guidelines that regulate the implementation, governance, and ethical use of AI, resulting in fragmented and unsustainable initiatives. According to UNESCO (2021), effective AI integration in education requires strong governance structures, clear policy direction, and continuous capacity development for educators and administrators. Addressing these interconnected challenges is therefore essential for enhancing teacher readiness and ensuring effective AI integration in business education. It is against this backdrop that this study examines the role of capacity building in enhancing teacher readiness for effective AI integration in business education.

Statement of the Problem

The integration of artificial intelligence (AI) into business education has introduced new demands for teachers to possess relevant digital and pedagogical competencies. However, many business education teachers lack the necessary AI-related knowledge and technical skills required for

effective instructional integration. This gap is further compounded by the absence of structured and sustained capacity-building programmes, as existing professional development initiatives often focus on traditional teaching methods with limited emphasis on AI literacy and digital pedagogy. As a result, the integration of AI in business education classrooms remains minimal, with teaching practices still largely conventional and unable to fully prepare students for AI-driven workplaces. This situation has created a disconnect between technological advancements and teachers' professional readiness, thereby undermining the relevance and effectiveness of business education. Therefore, the problem of this study is the inadequate readiness of business education teachers for effective AI integration due to insufficient capacity-building opportunities and institutional support.

Several studies have been conducted on teacher readiness, capacity building, and AI integration in education. For instance, Ogoronte and Bupo (2024) examined business studies teachers' readiness towards integrating artificial intelligence and learning management systems for effective teaching in Rivers State. Mensy A. Dorongon and Josefina R. Sarmiento (2025) investigated teachers' readiness for artificial intelligence integration in teaching and learning, while Guilen and Oni (2025) focused on teachers' readiness and competency in using AI in the classroom. However, most of these studies concentrated primarily on assessing levels of readiness and competence without adequately addressing how structured capacity-building initiatives can enhance teachers' preparedness for effective AI integration, particularly in business education in Kwara State. This indicated a gap in existing literature, thereby justifying the need for the present study to examine how capacity building can improve teacher readiness for effective AI integration in business education.

Purpose of the Study

The main objective of this study is to examine how capacity building can enhance teacher readiness for effective artificial intelligence (AI) integration in business education in Kwara State. Specifically, the study:

1. Determine the level of teacher readiness for artificial intelligence integration in business education.
2. Examine the capacity-building programmes available to business educators for enhancing AI-related competencies.
3. Determine the relationship between capacity building and teacher readiness for effective AI integration.
4. Identify the challenges affecting teacher readiness for artificial intelligence integration in business education.
5. Propose strategies for enhancing teacher readiness through effective capacity-building initiatives for AI integration in business education.

Research Questions

1. What is the level of teacher readiness for AI integration in business education in Kwara State?
2. What are the capacity building opportunities available for business educators in Kwara State?
3. How does capacity building influence teacher readiness for AI integration in business education in Kwara State?
4. What are the challenges hindering teacher readiness for AI integration in business education in Kwara State?
5. What strategies can enhance teacher readiness for AI integration in business education in Kwara State?

Methodology

This study adopted a descriptive survey research design. The design was considered appropriate because the study sought to examine the level of teacher readiness and the extent to which capacity-building initiatives enhance effective artificial intelligence (AI) integration in business education. The survey approach enabled the researcher to obtain firsthand information from business education lecturers. The population of this study comprised 56 business education lecturers in Kwara State, drawn from all tertiary institutions offering Business Education programmes in the state, namely: University of Ilorin, Kwara State University, Al-Hikmah University, Kwara State College of Education, Ilorin, Kwara State College of Education (Technical), Lafiagi, Federal Polytechnic, Offa, and Kwara State Polytechnic, Ilorin.

The study was delimited to three tertiary institutions in Kwara State, Nigeria, comprising one Federal university (University of Ilorin), one State university (Kwara State University), and one private university (Al-Hikmah University) due to high level of their lecturers' engagement in different capacity building. The targeted population of the study was 32 business education lecturers in the selected universities. Given that the targeted population of the study consisted 32 business education lecturers,

the study adopted a total enumeration (census) sampling technique, where all members of the population are included.

Data were collected using a researcher-designed questionnaire titled “Teacher Readiness and Capacity Building for AI Integration Questionnaire (TRCBAIQ)”. The instrument was structured into four sections. Section A contained demographic information of respondents such as gender, academic qualification, years of teaching experience, number of training attended and prior exposure to AI-related training. Section B focused on teacher readiness for AI integration. Section C examined capacity-building initiatives and professional development opportunities available to lecturers. Section D contained statement on influence of capacity building on teacher readiness while Section E addressed challenges while Section F contained information on strategies for enhancing AI integration in business education. Sections B, C, and D were structured on a four-point Likert scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD), with assigned values of 4, 3, 2, and 1 respectively.

The instrument was subjected to face and content validation by three experts in business education and educational technology to ensure clarity, relevance, and adequacy of the items in measuring the study variables. Their observations and recommendations were incorporated into the final version of the questionnaire. To determine the reliability of the instrument, a pilot test was conducted and the data obtained were analyzed using Cronbach’s Alpha which yielded a coefficient of 0.81, indicating that the instrument was reliable for the study.

The questionnaires were administered to respondents through both hard copy and online formats, depending on accessibility and convenience. All distributed copies were retrieved and used for analysis. Data collected were analyzed using descriptive statistics such as mean and standard deviation to answer the research questions. A mean score of 2.50 was used as the benchmark for decision-making, where mean score of 2.50 and above indicated agreement, while mean scores below 2.50 indicated disagreement. The results were presented in tables for clarity and ease of interpretation.

Result

Participants

The total of 32 business education lecturers participated in this study and a greater proportion of respondents were female (59.4%) compared to male with 40.6%. this indicates that there are more female business education lecturers in the selected tertiary institutions. In terms of academic qualification, the majority of respondents possessed a PhD (53.1%), followed by those with a Master’s degree (28.1%) and Bachelor’s degree (18.8%). This indicates a highly qualified academic workforce, and that most lecturers have attained advanced levels of education required for teaching in tertiary institutions. With respect to teaching experience, most respondents had between 6–10 years (31.3%) and 11–15 years (28.1%) of experience which indicate that the lecturers are relatively experienced. However, a smaller proportion (21.9%) had less than 5 years of experience, reflecting the presence of early-career academics. Based on numbers of training attended the majority of respondents had attended between 1–2 trainings (34.4%) and 3–5 trainings (28.1%), while 25.0% had not attended any training. This suggests moderate participation in professional development activities, though a significant proportion still lacks adequate training exposure. Finally, the results show that most respondents (65.6%) had no prior exposure to AI-related training, while only 34.4% had such exposure.

Research Question 1: What is the level of teacher readiness for AI integration in business education in Kwara State?

Table 1: Mean and Standard Deviation on Teacher Readiness for AI Integration (N = 32)

S/N	As far as I am concerned, I	Mean	SD	Decision
1	am fully prepared to integrate AI into my teaching	2.68	0.74	Agree
2	regularly use AI tools in lesson delivery	2.41	0.81	Disagree
3	can independently implement AI-based teaching strategies	2.55	0.76	Agree
4	am capable of training others on AI usage	2.38	0.79	Disagree
5	am ready to adapt to future AI developments	3.12	0.69	Agree
6	can confidently teach using AI tools.	2.47	0.83	Disagree
	Average Mean	***2.60***		

Decision Rule: 1.00 – 2.49 = Low readiness; 2.50 – 3.24 = Moderate Readiness; and 3.25 – 4.00 = High Readiness

The results in Table 1 indicate that teachers have a moderate level of readiness for AI integration, with an average mean score of 2.60, which falls within the range of 2.50–3.24. Item analysis shows that teachers feel somewhat prepared and are willing to adapt to future AI developments (Means = 2.55–3.12). However, they reported low readiness in practical areas such as regular use of AI tools (Mean = 2.41), ability to train others (Mean = 2.38), and confidence in teaching with AI (Mean = 2.47).

Research Question 2: What are the capacity building opportunities available for business educators in Kwara State?

Table 2:

Mean and Standard Deviation on Capacity-Building Opportunities for Business Educators

S/N	As far as I am concerned,	Mean ($\bar{x}$)	SD	Decision
1	my institution organizes workshops on emerging technologies such as AI.	2.36	0.82	Disagree
2	I have attended seminars or conferences on AI integration in education.	2.58	0.76	Agree
3	there are regular ICT training programmes for lecturers in my institution.	2.44	0.80	Disagree
4	I have access to online professional development courses on AI.	2.71	0.73	Agree
5	my institution provides technical support for integrating AI tools.	2.33	0.85	Disagree
6	there are collaborative learning communities for sharing AI knowledge among lecturers.	2.29	0.78	Disagree

The results in Table 2 indicate that capacity-building opportunities for business educators in Kwara State are generally limited and insufficient. Most items recorded mean scores below 2.50, which implies that respondents disagreed that their institutions provide workshops on AI, regular ICT training, technical support, and collaborative learning platforms. However, respondents agreed that they have attended seminars/conferences ($\bar{x}$ = 2.58) and have access to online AI courses ($\bar{x}$ = 2.71), suggesting that some opportunities exist but are likely self-initiated or externally sourced rather than institutionally driven.

Research Question 3: How does capacity building influence teacher readiness for AI integration in business education in Kwara State?

Table 3:

Mean and Standard Deviation on Influence of Capacity Building on Teacher Readiness

S/N	As far as I am concerned,	Mean ($\bar{x}$)	SD	Decision
1	participation in ai-related training improves my confidence in using ai tools.	3.18	0.66	Agree
2	workshops and seminars enhance my ability to integrate AI into teaching.	2.97	0.71	Agree
3	continuous professional development increases my readiness for AI adoption.	3.05	0.68	Agree
4	access to technical support strengthens my competence in AI integration.	2.89	0.74	Agree
5	collaborative learning with colleagues improves my AI teaching skills.	2.76	0.79	Agree
6	Capacity building programmes reduce my fear of adopting AI technologies.	3.10	0.70	Agree

Table 3 shows that capacity building positively influences teacher readiness for AI integration, as all items have mean scores above 2.50. Teachers generally agreed that training, workshops, and continuous professional development improve their confidence, competence, and readiness to use AI. The highest mean ($\bar{x}$ = 3.18) indicates that AI-related training strongly enhances confidence, while other items confirm that technical support and professional development contribute to readiness. Although collaborative learning has the lowest mean ($\bar{x}$ = 2.76), it is still considered beneficial. The low standard deviation values indicate consistency in respondents' view.

Research Question 4: What are the challenges hindering teacher readiness for AI integration in business education in Kwara State?

Table 4:

Mean and Standard Deviation on Challenges Hindering Teacher Readiness for AI Integration

S/N	As far as I am concerned, the challenges hindering teachers readiness for AI integration are as follows:	Mean ($\bar{x}$)	SD	Decision
1	Inadequate training on AI tools and applications.	3.21	0.64	Agree
2	Lack of institutional support for AI integration.	3.08	0.70	Agree

3	Insufficient digital infrastructure (internet, devices, software).	3.15	0.67	Agree
4	Limited technical support services.	2.94	0.75	Agree
5	Resistance to change among lecturers.	2.63	0.82	Agree
6	Concerns about ethical and privacy issues in AI use.	2.71	0.78	Agree

Table 4 shows that all the identified factors are perceived as challenges hindering teacher readiness for AI integration, as their mean scores are above the benchmark of 2.50. This indicates general agreement among respondents that multiple barriers affect AI adoption. Among the challenges, inadequate training on AI tools ($\bar{x}$ = 3.21) ranked highest, followed by insufficient digital infrastructure ($\bar{x}$ = 3.15) and lack of institutional support ($\bar{x}$ = 3.08), indicating that structural and capacity-building issues are the most critical barriers. Other factors such as limited technical support ($\bar{x}$ = 2.94), ethical concerns ($\bar{x}$ = 2.71), and resistance to change ($\bar{x}$ = 2.63) were also agreed upon, though to a lesser extent. The relatively low standard deviation values suggest consistency in respondents' view.

.

Research Question 5: What are the strategies that can enhance teacher readiness for AI integration in business education in Kwara State?

Table 5:

Mean and Standard Deviation on Strategies for Enhancing Teacher Readiness

S/N	As far as I am concerned,	Mean ($\bar{x}$)	SD	Decision
1	Regular AI-focused workshops and training programmes for lecturers.	3.34	0.58	Agree
2	Provision of adequate digital infrastructure and internet facilities.	3.29	0.62	Agree
3	Establishment of continuous professional development (CPD) schemes on AI integration.	3.18	0.66	Agree
4	Creation of institutional policies supporting AI adoption in teaching.	3.05	0.71	Agree
5	Provision of technical support units for AI-related challenges.	3.11	0.69	Agree
6	Encouraging peer collaboration and knowledge-sharing among lecturers.	2.97	0.74	Agree

The table shows that lecturers agree on all suggested strategies to enhance teacher readiness for AI integration in business education in Kwara State, with mean scores ranging from 2.97 to 3.34. Regular AI-focused workshops ($\bar{x}$ = 3.34) and adequate digital infrastructure ($\bar{x}$ = 3.29) were rated highest, indicating the importance of training and resources. Other strategies such as continuous professional development (CPD) schemes on AI integration. technical support, institutional policies, and peer collaboration also received agreement. Standard deviations (0.58–0.74) suggest moderate consensus among respondents.

Discussion of the Findings

The finding revealed that teachers have a moderate level of readiness for AI integration in business education in Kwara State. This means that, on average, these teachers are somewhat prepared but not fully equipped to adopt and implement artificial intelligence tools meaningfully in their teaching practice. The reasons for this finding could be that infrastructural and institutional barriers can constrain teachers' willingness or ability to advance beyond basic familiarity with AI. Also, teachers' attitudes and perceptions of AI's usefulness and ease of use influence their readiness; if they perceive AI as complex or only moderately beneficial, their preparedness for full integration remains limited. The finding supports the notion of moderate teacher readiness the study of Iddrisu and Iddrisu (2025) who found that teachers in Ghana demonstrated moderate self-efficacy regarding AI use. Conversely, Eke (2024) reported higher levels of readiness and positive attitudes toward AI adoption.

The finding showed that capacity-building opportunities for business educators in Kwara State are generally limited and insufficient. This means that teachers who specialise in business education are not getting enough professional development such as workshops, in-service training, seminars, conferences, mentoring, or refresher courses to improve their skills, knowledge, and teaching practices. This could be that many education systems in Nigeria struggle to allocate sufficient financial resources to regular and meaningful professional development programmes. When budgets are low, training may be held infrequently or cancelled, and educators have fewer chances to upgrade their skills. This finding aligns with prior research in Nigeria. Studies by Olowonefa (2026) and Oke and Pitan (2025) indicate that limited professional development opportunities are a systemic challenge across various educational fields, particularly in public institutions. Similarly, Umoeshiet (2025) reported that business

educators in Delta State face inadequate in-service training, especially in areas requiring updated technological and professional skills.

The finding showed that capacity building positively influences teacher readiness for AI integration. This means that when teachers receive adequate professional development such as training, workshops, mentoring, and technical support related to artificial intelligence (AI), they become more prepared, confident, and competent to incorporate AI tools into their teaching practices. One major reason for this finding is that capacity building improves teachers' technological knowledge and self-efficacy. Training programs help teachers understand how AI tools work, how they can be applied in teaching, and how they can enhance learning outcomes. The finding agrees with the study of Chiu et al. (2023) reported that teachers who participated in AI-related professional development programmes demonstrated significantly higher levels of readiness and competence in integrating AI tools into teaching and assessment. Similarly, Holmes and Tuomi (2022) found that capacity-building initiatives focusing on AI literacy improved teachers' technological readiness and confidence in using AI-supported learning systems.

The finding revealed that inadequate training on AI tools; insufficient digital infrastructure; lack of institutional support; limited technical support; ethical concerns; and resistance to change are some of the challenges hindering teacher readiness for AI integration in business education in Kwara State. This implies that several structural and institutional barriers prevent teachers from effectively adopting artificial intelligence in their teaching practices. One reason for this finding is the lack of adequate professional training on AI tools for teachers. Another reason could be that the effective use of AI in education requires reliable internet connectivity, modern computers, appropriate software, and digital learning platforms. However, many schools and institutions, particularly in developing regions, lack these essential resources. When technological facilities are inadequate or outdated, teachers may be unable to access or implement AI tools even if they are willing to do so. The finding is in line with the study of Aljemely (2024) who found that lack of technical skills, inadequate infrastructure, ethical concerns, and insufficient institutional support are among the most common challenges preventing effective AI adoption in educational institutions.

The finding showed that regular AI-focused workshops; adequate digital infrastructure continuous professional development schemes; technical support; institutional policies; and peer collaboration were strategies to enhance teacher readiness for AI integration in business education in Kwara State. This reflects a multidimensional understanding of what it takes for educators to meaningfully adopt and sustain artificial intelligence in their instructional practices. At its core, the finding communicates that teacher readiness for AI is not a singular or spontaneous phenomenon but rather a cumulative outcome shaped by both structural and social enablers within the educational environment. Regarding the role of workshops and professional development, the finding supports the study of Yue et al. (2024) who developed a professional development model supported by workshops, discussions, and resources within the Technological Pedagogical Content Knowledge (TPACK) framework, finding that structured workshops notably improved teachers' perceptions of their TPACK abilities and significantly motivated them to teach AI literacy in primary and secondary schools. This aligns closely with the emphasis on structured workshops in the Kwara State finding.

Conclusion

This study examined teacher readiness for AI integration in business education in Kwara State, with particular attention to capacity-building opportunities, challenges, and strategies for improvement. The findings show that most business educators in Kwara State sit at a moderate level of readiness for AI integration. They are not completely unfamiliar with the idea of AI in education, but they are also far from confident or equipped enough to make it a meaningful part of how they teach. This is not entirely their fault. A significant part of the problem lies in how little professional development support these teachers actually receive. Workshops, in-service training, mentoring sessions, and refresher courses are simply not available enough, and for many educators, they are barely available at all.

What gives reason for hope, however, is the finding that capacity building genuinely makes a difference. When teachers are given proper training and support around AI, something shifts, they become more confident, more capable, and more willing to explore what AI can offer their students. This tells us that the problem is not with the teachers themselves, but with the systems that are supposed to support them. Yet even with better training, teachers still face very real obstacles, outdated equipment, poor internet connectivity, little to no institutional backing, and an understandable hesitation toward change. These are not small hurdles. They are deeply rooted structural challenges that require deliberate and sustained attention from school administrators, policymakers, and education stakeholders alike. The path forward is clear, even if it is not easy. Regular AI-focused workshops, stronger institutional policies, investment in digital infrastructure, peer collaboration, and ongoing

technical support are not luxury additions, they are necessities if business education in Kwara State is to keep pace with a rapidly changing world. Teachers cannot be expected to prepare students for an AI-driven future if they themselves are left behind.

Recommendations

1. Kwara State Ministry of Education, in collaboration with school administrators and tertiary institutions, should organise periodic AI literacy programmes, hands-on training sessions, and practical workshops to strengthen teachers' technological competence, confidence, and pedagogical skills for AI integration.
2. Education authorities and policymakers should institutionalise regular professional development programmes, including seminars, conferences, mentoring schemes, and in-service training specifically focused on artificial intelligence and other emerging educational technologies.
3. School administrators and education planners should make continuous professional development a strategic institutional priority by providing sustained training opportunities and incentivising teachers' participation in AI-related capacity-building programmes.
4. Government and educational institutions should invest in upgrading digital infrastructure, establish dedicated technical support units, develop clear ethical guidelines for AI usage, and implement change-management initiatives that encourage teachers to embrace AI technologies.
5. Educational stakeholders should develop and implement a comprehensive AI integration framework that provides regular AI-focused workshops, adequate digital infrastructure, continuous professional development opportunities, technical support services, clear institutional policies, and platforms for peer collaboration to sustainably enhance teachers' readiness for AI integration in business education.
6. School administrators should institutionalise peer collaboration by creating professional learning communities through which business education teachers can continuously share knowledge, exchange best practices, and jointly develop solutions to challenges encountered in integrating AI into instructional practices.
7. Tertiary institutions should strengthen institutional support by establishing comprehensive AI policies and frameworks that promote ethical AI use, safeguard data privacy, and provide continuous professional support to enhance teachers' readiness for sustainable AI integration in business education.

Abstract

This study was carried out to investigate the perceived influence of teaching and learning TVET and entrepreneurship education in North - Central universities on economic transformation in Nigeria. The descriptive research type was adopted for the study. The study comprises two research questions and two research hypotheses. Two research hypotheses were formulated and tested at 0.05 level of significance. The population of the study comprises the entire staff and students of business education in public universities in the North-Central region of Nigeria. The instrument used for data collection was questionnaire and the instrument was validated by experts and the reliability of the instrument was tested and statistically analysed using the Cronbach Alpha method of reliability which yielded a reliability coefficient of 0.83and was considered adequate for the study. Descriptive statistics were used to answer research questions, and research hypotheses were tested at 0.05 level of significance. The results of the findings revealed that teaching and learning TVET as well as entrepreneurship education can significantly influence economic development of Nigeria. It was concluded that any nation of the world that expects real transformation and development in her economy must see TVET and entrepreneurship education as important instrument for economic booster. It was recommended among others that TVET and entrepreneurship programmes should be considered compulsory for Nigeria universities and its implementation should be facilitated at all levels of education

Keywords: Teaching, Learning, TVET, Entrepreneurship Education, Economic Transformation

Introduction

The world is moving (changing) fast and the need to transform the nations' economy has become necessary. Every nation is making efforts to make sure their economy is classified as one of the strongest or fast moving economy as the case may be. This therefore cannot be achieved unless the nations change their orientation from being a consuming nation to a productive and exporting nation. To attain this, there is need to introduce and improve the teaching and learning of Technical Vocational Education and Training (TVET) and Entrepreneurship Education in our schools curriculum.

Technical Vocational Education and Training (TVET) is an important part of our education. A nation that wants to improve her economy must first of all equip the Technical Vocational Education and Training centers and encourage citizens to enroll. This is because teaching and learning TVET is an avenue for turning a nation from a consuming nation to a producing nation. According to the Council for Technical and Vocational Education and Training (2024), TVET (Technical and Vocational Education and Training) is education and training which provides knowledge and skills for employment. TVET includes formal, non-formal and informal learning that prepares people with the knowledge and skills required in the world of work. This therefore indicates that TVET is a means through which youth of a nation can be equipped with practical and marketable skills that bring about economic transformation. According to Mohammed and Alhassan (2022), Technical and vocation education and training is a programme for the training of individual in a formal environment for the acquisition of occupational skills (trade) under the supervision of a technical officer or expert.

Abayomi and Adedayo (2020) noted that TVET focuses on providing students with practical skills and knowledge for a specific trade or vocation. This entails that if the aims and objectives of TVET is well pursued and followed, it can bring about economic development thereby causing economic

transformation within a short time. Well trained students will graduate with a specific skill that can add to the nation's growth and development in that they will not be job seekers but rather, employer of labour. TVET programmes have the capacity of offering hands-on training, industry-relevant skills development, and career pathways that address the evolving needs of the job market.

Salami (2024) concludes that Technical and Vocational Education Training (TVET) has been seen as a major programme that plays critical role in boosting the economic development of a nation. Therefore, the place of TVET in nation building cannot be written off. For the fact that TVET is a tool for productivity enhancement and poverty reduction, if the programme is well implemented, it will bring about better and sustained development which will eventually bring about economic transformation.

According to Okoli and Agada (2025), TVET is a type of education that seeks to close the gap between academic knowledge and practical application so that on completion, graduates are ready for employment. Ahmadu and Orisaremi (2025) also noted that TVET provides a direct response by equipping individuals with employable and entrepreneurial skills relevant to key sectors such as manufacturing, agriculture, construction, and ICT.

Umar (2024) identified the following as the strategies for enhancing youth employability and entrepreneurial skills in TVET:

1. Career Guidance and Counselling
2. Enhancing Skills Development TVET programmes
3. Encouraging Entrepreneurship
4. Public-Private Partnerships
5. Technical Teacher Education Development for Enhancing TVET
6. Strengthening Infrastructure
7. Expanding Apprenticeships and Internships

Similarly, Ogunsola (2017) posited that TVET can have many benefits for individuals, society, and the economy, such as increasing employability, productivity, innovation, and entrepreneurship.

Entrepreneurship

Entrepreneurship has been in existence before the colonisation. Initially, it was a form of apprenticeship training from well known craftsmen. In recent time, entrepreneurship education and training is acquired in our schools and colleges of higher learning with the intention of making each graduate a skill young man and woman who can always partake in the development of our dear country (Nigeria). According to Salami and Kehinde (2018), entrepreneurship is seen as the art which involves recognising a business opportunity, mobilizing resources and continuously exploiting that opportunity for the purpose of profit. This entails that any act of entrepreneurship will eventually lead to profit making and consequently bring about the improvement in the nation's gross domestic product (GDP) and overall growth and development.

One of the measures to accelerate nation's growth and development is the development and proper management of entrepreneurship education, this includes funding and proper monitoring for an expected output. It is important to emphasize that the development of entrepreneurship education in Nigeria's tertiary institutions is very vital to the overall development of Nigeria at large.

David, Ore and Shofolahan (2023) concluded that effective business education programme should implement relevant curriculum that is tailored towards the preparing students to fully acquire required entrepreneurial skills that can make them job providers rather than job seekers, thereby becoming successful entrepreneurs and also improving the nation's economy which invariably will bring about accelerated development of the nation. In line with this, Paul-Mgbeafulike and Onyeneke (2023) noted that the target of entrepreneurship education in Nigeria institutions of higher learning in this digital era is to turn the graduates into self reliant and job creating personnel. However the effort in the introduction of entrepreneurship education seems not to be yielding the desired results, which however call for great concern among the stakeholders in our society.

There is need to improve entrepreneurship education in schools and colleges so that its objectives of overall economic transformation will be attained. To this regard, Nwabufo and Mamman (2015) conclude that our educational system should be channeled to skills acquisition and entrepreneurial training which would engender mass job creators and not youths searching for white collar jobs. It can however be said that if well monitored, it can accelerate the nations growth and development. It was observed by James, Adamu and Opara (2018) that the fate of Nigeria and Nigerians will not only be determined by the way Nigeria addresses her economic and social problems, rather, it can have a significant impact on the success or failure of other sub-Sahara Africa. This entails that the success of Nigeria can accelerate the development of other neighbouring African countries.

Salihu, Audu, Ibrahim, and Mohammed (2020) has rightly noted and summarised the challenges of entrepreneurship education as follows:

- Unavailable fund
- Lack of teachers' motivation and specific training
- Inadequate facilities and equipment for teaching and learning
- High level of corruption and poor maintenance culture
- Poor enabling business environment
- Non-inclusion of entrepreneurship in the school subject curricular
- Poor societal attitude to entrepreneurship education development
- Unequal promotion of male and female in entrepreneurship education

If the above is well noted and adequately addressed, entrepreneurship education will not only accelerate the growth and development of a nation but will also sustain Nigeria's growth and development.

Statement of Problem

Teaching and learning TVET and entrepreneurship education in our schools, colleges and universities has been regarded as a means through which young ones can be a job provider rather than a job seeker. It has become very important that many refer to it as a means of turning the nations from a consuming nation to a productive nation. That is why the accrediting bodies in Nigeria (National Universities Commission (NUC)) in particular include vocational and entrepreneurship education in the university education, thereby making it paramount for every graduate to pass through entrepreneurship education before graduation.

As good as the objective of teaching TVET and entrepreneurship education in universities may look, its influence on economic development has not really been felt. This is why Paul-Mgbeafulike and Onyeneke (2023) noted that the target of entrepreneurship education in Nigeria institutions of higher learning in this digital era is to turn the graduates into self reliant and job creating personnel. Without which the expected growth and development may not be achieved. Therefore this study examined the perceived influence of teaching and learning TVET and entrepreneurship education in South-West universities on economic transformation in Nigeria.

Research Questions

The following research questions were raised for the study

1. What is the influence of teaching and learning TVET in South-Western Universities on economic development of Nigeria?
2. What is the influence of teaching and learning entrepreneurship education in South-Western Universities on economic development of Nigeria?

Research Hypotheses

The following hypotheses were formulated to guide the study:

$H_0$1 Teaching and learning TVET does not significantly influence economic development of Nigeria.

$H_0$2 Teaching and learning entrepreneurship education does not significantly influence economic development of Nigeria.

Methodology

The study adopted descriptive research design. The population of the study comprises the entire staff and students (200L and 300L) of business education in public universities in the North-central region of Nigeria. The sample for the study was drawn from all Universities in the North-Central region of Nigeria offering Business Education. Seven public Universities were purposefully chosen for the study, being the only Universities offering Business Education at the time of carrying out the research. Also, the research advisors' sample size table was used in determining a sample of 320 which was drawn proportionately from all the Universities in the study area, using probability proportional to size technique. A well structured questionnaire was used to collect data from the respondents. The instrument was validated by experts, and Cronbach Alpha method was used to determine the reliability coefficient of 0.83 which is considered adequate. Descriptive statistics (Chi-Square) was used to test the two null hypotheses at 0.05 level of significance.

Results of the Study

Research Question 1: What is the influence of teaching and learning TVET in North – Central Universities on economic development in Nigeria.

Table 1: Frequency distribution showing the influence of teaching and learning TVET in North – Central Universities on economic development in Nigeria.

S/N	Item	Agree		Disagree	
		Frequency	%	Frequency	%
1.	Economics transformation is a product of adequate teaching and learning TVET in North – Central Universities	280	87.6	40	12.5
2.	TVET is a major educational instrument for economic transformation in Nigeria	48	15	272	85
3	University students are highly interested and motivated in learning TVET	40	12.5	280	87.6
4	Graduate of TVET contribute immensely to the growth, development and economic transformation of a nation	252	78.8	68	21.3
5	Without teaching and learning TVET in universities nations' economics will be jeopardize	32	10	288	90
6	Teaching and learning TVET is a remedy for economy downturn	288	89.9	32	10.1
7	TVET is the major vocational course in universities that can bring about economic transformation,	104	32.5	216	67.6
8	No nation can grow or develop without the introduction of TVET in her university education	64	20.1	208	80.1
9	Graduate of TVET are not job seeker but job creators thereby contributing their quota to the nation's economic development.	76	23.8	244	76.3
10	Teaching and learning TVET should be made compulsory in our universities for economic transformation to take place	104	32.5	216	67.6

Research Question 2: What is the influence of entrepreneurship education in North – Central Universities on economic development in Nigeria.

Table 2: Frequency distribution showing the influence of teaching and learning entrepreneurship education in North – Central Universities on economic development in Nigeria.

S/N	Item	Agree		Disagree	
		Frequency	%	Frequency	%
1.	Nation's economy cannot survive without entrepreneurship education	288	90.1	32	10
2.	The way forward to economy buoyancy and transformation is through entrepreneurship	296	92.6	24	7.5
3.	education	244	76.3	64	20
4.	Entrepreneurship are the major participants in causing economic transformation in every nation,	296	92.5	24	7.6
5.	Graduate of entrepreneurship education are job creators thereby contributing their quota to nation's economic development and transformation,	292	91.3	28	8.8
6.	The purpose of teaching and learning entrepreneurship education in universities is to bring about economic growth, development and transformation.	280	87.6	40	12.5
7.	Teaching and learning entrepreneurship education should be made compulsory in universities.	276	86.3	44	13.8
8.	Nation's economy buoyancy and transformation is being determine by the capacity of entrepreneurship education graduate.	268	83.8	82	16.3
9.	University students are highly interested and motivated to learn entrepreneurship education.	296	92.5	24	7.6
10.	Entrepreneurship education is an economic booster and development facilitator. Teaching and learning entrepreneurship education will bring about self reliance thereby improving nation's economy.	216	67.6	104	32.5

Test of Hypotheses

$H_0$1: Teaching and learning TVET does not significantly influence economics development of Nigeria

Table 3: Chi-Square Tests showing the influence of teaching and learning TVET on economic development of Nigeria as perceived by North – central universities students and lecturers

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	21.467[a]	12	.001
Likelihood Ratio	31.836	12	.004
Linear-by-Linear Association	.112	1	.738
N of Valid Cases	320		

Sig level 0.05

The result of the chi – square test on the perception of both lecturers and students of the North – central universities on the influence of teaching and learning TVET on economic development of Nigeria shows the p – value of 0.001. Since this value is less than the 0.05 significant level, the null hypothesis which stated that: Teaching and learning TVET does not significantly influence economics development of Nigeria is therefore rejected. This is an indication that there is a statistically significant association between teaching and learning TVET on the economic development of Nigeria as perceived by both lecturers and students of the North – Central universities.

$H_0$2: Teaching and learning entrepreneurship education does not significantly influence economics development of Nigeria

Table 4: Chi Square Tests showing the influence of teaching and learning entrepreneurship education on economic development of Nigeria as perceived by North – central universities students and lecturers

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	32.216[a]	15	.000
Likelihood Ratio	40.678	15	.000
Linear-by-Linear Association	.154	1	.695
N of Valid Cases	320		

Sig level 0.05

The result of the chi – square test on the perception of both lecturers and students of the North – central universities on the influence of teaching and learning entrepreneurship education on economic development of Nigeria shows the p – value of 0.000. Since this value is less than the 0.05 significant level, the null hypothesis which stated that: Teaching and learning entrepreneurship education does not significantly influence economics development of Nigeria is therefore rejected. This is an indication that there is a statistically significant association between teaching and learning entrepreneurship education on the economic development of Nigeria as perceived by both lecturers and students of the North – Central universities.

Discussion of the Results

From the result of data analysis, it was revealed that there is a statistically significant association between teaching and learning TVET on the economic development of Nigeria as perceived by both lecturers and students of the North – Central universities. The findings of the study therefore indicate that teaching and learning TVET can significantly influence economic development of Nigeria. This is in line with Abayomi and Adedayo (2020) who noted that TVET focuses on providing students with practical skills and knowledge for a specific trade or vocation. This entails that if the aims and objectives of TVET is well pursued and followed, it can bring about economic development thereby causing economic transformation within a short time. Salami (2024) also agree with this when he concludes that Technical and Vocational Education Training (TVET) has been seen as a major programme that plays critical role in boosting the economic development of a nation. Therefore, the place of TVET in nation building cannot be written off.

The second null hypothesis of the study which stated that Teaching and learning entrepreneurship education does not significantly influence economic development of Nigeria was also rejected. This is an indication that there is a statistically significant association between teaching and learning entrepreneurship education on the economic development of Nigeria. This in line with Salami and Kehinde (2018) when they conclude that entrepreneurship is seen as the art which involves recognising a business opportunity, mobilizing resources and continuously exploiting that opportunity for the purpose of profit. This entails that any act of entrepreneurship will eventually lead to profit making and consequently bring about the improvement in the nation's gross domestic product (GDP) and overall growth and development. Also Mgbeafulike and Onyeneke (2023) noted that the target of entrepreneurship education in Nigeria institutions of higher learning in this digital era is to turn the graduates into self reliant and job creating personnel. This indicates that if a nation can have more employers than the employees, the economic development of such nation is likely to be better.

Conclusion

This paper assessed the perceived influence of teaching and learning TVET and entrepreneurship education in North - Central Universities on economic transformation in Nigeria. Based on the findings of the study, it was revealed that both TVET and entrepreneurship education are crucial to the economic transformation of any nation.

It can therefore be concluded that any nation of the world that expects real transformation and development in her economy must see TVET and entrepreneurship education as important instrument for economic booster. Therefore with good and well monitored TVET and entrepreneurship education programmes, nation's economic will be on the increase.

Recommendation

Based on the findings of the study, the following recommendations were made:

1. TVET programmes should be considered compulsory for Nigeria universities. Implementation of TVET programmes should be facilitated at all levels of education and be well monitored in order to achieve the objectives of its implementation.
2. For the fact that the world is more interested in what you can offer now, entrepreneurship education should not just be a classroom and written test, but rather practical. When many are trained towards how to make profit and be self reliance, they will be a plus to the nation's economic booster by increasing the GDP of such nation.

Abstract

Business education is being reshaped by technological change, advancing entrepreneurship ecosystems and evolving workplace expectations which has put continuous demands on university educators to update their knowledge, pedagogical skills and professional capabilities. This study examined the relationship between talent development and work engagement among business educators and considered its implication for building a future-ready workforce in Nigerian public universities. The study adopted a correlational survey design and used data obtained from 130 business educators across 12 public universities in South-South Nigeria through census sampling. Data were collected using the talent development sections of the Talent Management Strategies Scale and the adapted Work Engagement Scale. The instruments were validated by experts, while the main Talent Management Strategies Scale and Work Engagement Scale yielded Cronbach's alpha coefficient values of 0.85 and 0.77 respectively. Pearson Product Moment Correlation was used to determine the relationship between talent development and work engagement while simple linear regression tested the predictive effect of talent development on work engagement at the 0.05 significance level. Findings revealed a strong positive relationship between talent development and work engagement among business educators ($r = .64$). Talent development also significantly predicted work engagement, $\beta = .637$, $p < .05$, with an adjusted R^2 of .401, indicating that talent development explained 40.1% of the variance in work engagement. The study concludes that sustained opportunities for training, mentoring, coaching, research development, conference participation and career advancement can strengthen business educators' vigour, dedication and absorption in their work. It then recommends a systematic institutionalization of ongoing professional development aligned with digital pedagogy, innovation, and emerging workplace competencies among Nigerian public universities. Such investment can provide a strong foundation for developing engaged business educators who are better equipped for future work demand and support business education and entrepreneurial transformation in Africa.

Keywords: talent development, work engagement, business educators, future-ready workforce, public universities

1. Introduction

There is an emergence of a talent-driven economy which has led to an increasing expectation on business education to prepare graduates for digital, innovative and entrepreneurial workplaces. This has placed high responsibilities on business educators who must now be up to date in their subject expertise, pedagogical approaches and technological capabilities. A recent study reveals that the digital competence of lecturers has now expanded beyond basic technology use to digital teaching methods, professional learning, digital literacy and students' preparation for participation in a digital society (Tondeur et al., 2023). Systematic evidence also shows that many lecturers exhibit uneven or inadequate digital competence which creates a need for practical and personalized professional development programmes (Basilotta-Gomez-Pablos et al., 2022). In the same way, Scherer et al., (2021) reports major gaps in university teachers' readiness for online teaching. This implies that future readiness can not be assumed just because educators work in the university and working in the university environment alone does not guarantee future readiness.

For educators to respond well to these expectations, there is a need for continuous development. Talent development deals extensively with keeping employees by retraining and up-skilling, as well as other focused initiatives to get employees ready to advance in their careers. It involves organized opportunities for training, mentoring, coaching, career growth and continuous professional learning. According to Mahapatra and Dash (2022), contemporary talent development practices also entail virtual learning, career co-creation and continuous reskilling in order to respond technological and workplace emerging expectations. Ensuring inclusive talent development can promote educators' growth and help institutions retain vital expertise (Kaliannan et al., 2023). However, academic talent management within

African higher education system continues to face institutional, leadership and resources limitations (Musakuro & de Klerk, 2021). Awodiji et al., (2022) confirms that although Nigerian lecturers sometimes attend conferences, workshops and other development programmes, there is a need for further capacity building initiative to translate participation into productivity.

Talent development may be more valuable when combined with work engagement which is reflected in educators' vigour and dedication to work and absorption in the work activities. Work engagement is a sense of satisfaction and fulfillment derived from job roles and responsibilities. Kovács et al., (2025) reveals that development activities and management support are part of the job resources associated with stronger work engagement among university academics. Furthermore, empirical links have been established between work engagement and innovative work behaviour in environments that are rich in technology and artificial intelligent support (Zhou et al., 2025). However, limited evidence shows the relationship between talent development and work engagement, how talent development predicts work engagement among business educators and the implication on building a future-ready workforce of business educators. This study therefore examines the relationship between talent development and work engagement using evidence from public universities in South-South Nigeria and considers the implication for building business educators who are capable of responding to innovation, technology and the future of work.

2. Problem, Purpose and Hypothesis

2.1 Problem Statement

There is an increasing high expectation on business education to prepare and produce graduates who will fit into the technology-driven, innovative and entrepreneurial workplaces. Meeting these expectations is highly dependent on business educators who continually update their professional competencies and remain energetic, dedicated and absorbed in their academic responsibilities. However, systematic talent development opportunities for educators are not always guaranteed, and there is a need to find out whether available talent development initiatives relate with business educators' engagement. When there is deprivation of adequate training, mentoring, coaching, research support and development opportunities, educators' motivation deteriorates, reducing their capacity to respond to pedagogical, innovative and workplace demands. Therefore, this study examined whether talent development significantly predicts work engagement among business educators.

2.2 Purpose

The study determined the relationship between talent development and work engagement and established the extent to which talent development predicts work engagement among business educators.

2.3 Hypothesis

Talent development does not significantly predict work engagement among business educators in Nigerian public universities.

3. Review of Related Literature and Theoretical Framework

3.1 Future-ready Business Educators

Future-ready business educators are educators who can respond well to technological changes, use innovative pedagogies, maintain and impact industry-relevant knowledge while preparing students for evolving employment conditions. In the higher education context, digital competence entails the knowledge, skills and attitudes require to proficiently use technology, whereas the HeDiCom framework outlined teaching practice, empowering students for a digital society, digital literacy, and professional development as the four dimensions of educators' digital competencies (Basilotta-Gómez-Pablos et al., 2022; Tondeur et al., 2023). Furthermore, business/entrepreneurship education could enjoy the benefits of experiential and technology-supported approaches which are connected to practical economic activity (Carpenter & Wilson, 2022; Chen et al., 2021).

Future readiness here is an implication of the findings and not a measured variable.

3.2 Talent Development

Talent development is a strategic institutional investment in employees' knowledge, skills, career progression and capabilities through training and retraining, mentoring, coaching, workshops, research and publication support, industry exposure and development opportunities to make them more valuable assets. According to Kaliannan et al., (2023), inclusive talent development harmonizes individual development with institutional performance and ensure growth opportunities across the workforce. The world of work in not static, therefore, there is a need for continuous reskilling, virtual learning and shared responsibility for career development (Mahapatra & Dash, 2022). However, Musakuro & de Klerk, (2021) found inadequate funding and inconsistent staff development practices as factors that weaken academic talent development within the higher education. Effective development should be intentionally

structured to overcome these barriers, thereby enhancing educators' readiness for emerging responsibilities and work engagement.

3.3 Work Engagement

Work engagement is a positive state of work-related fulfillment derived from job roles and responsibilities. It is characterized by vigour, dedication and absorption (Schaufeli et al, 2006). Vigour describes energy and resilience; dedication means enthusiasm, pride and involvement; and absorption denotes deep concentration in work (Schaufeli & Bakker, 2004). Engaged business educators approach their work with energy and enduring focus, be it teaching, research, supervision and student development. While job resources basically foster motivation and engagement, empirical evidences reveal that engagement stimulate innovative work behaviour among university educators (Schaufeli & Bakker, 2004; Zhou et al., 2025). Consequently, engaged business educators use development opportunities to contribute to institutional evolution.

3.4 Theoretical Framework

Expectancy Theory of Motivation serves as the primary framework for explaining the relationship between talent development and work engagement. Vroom (1964) proposes that motivation is shaped by expectancy, instrumentality, and valence. Within this framework, business educators may be actively engaged in teaching, research, innovation and other duties if they anticipate that development initiatives will improve their performance/competence (expectancy) and that the improved performance will produce rewards or outcome which they greatly value, such as recognition, professional growth or advancement (instrumentality and valence). Therefore, talent development can be a motivational resource rather than a mere administrative activity. Resource-Based View theory also gives an additional justification that employees' skills and capabilities are valuable drivers of sustained competitive advantage (Barney, 1991). Consequently, universities should prioritize continuous development of business educators as strategic academic resources in response to changing educational and workplace demands (Kaliannan et al., 2023).

4. Methodology

4.1 Research Design

The study adopted a correlational survey design because it examined the predictive relationship between talent development and work engagement without manipulating either of the variable.

4.2 Population and Sample

The population consisted of the 130 business educators across the 12 public universities in South-South Nigeria. All the 130 business educators were included through census sampling because the population was manageable.

4.3 Instrument

Data were collected through relevant sections of the Talent Management Strategies, Work Engagement and Organizational Commitment Scale. Ten items measured talent development while seventeen adapted items measured work engagement. Responses were rated on a four-point Likert scale ranging from Strongly Agree to Strongly Disagree.

4.4 Validity and reliability

The instrument was validated by experts. Cronbach's alpha coefficient of 0.85 and 0.77 were obtained for the main Talent Management Strategies and Work Engagement Scales respectively.

4.5 Data Analysis

Mean and standard deviation described the variables. Pearson Product Moment Correlation was used to determine the relationship between talent development and work engagement, while simple linear regression tested the predictive effect of talent development on work engagement at the 0.05 level of significance using SPSS 25.

5. Results

Table 1: Relationship Between Talent Development and Work Engagement of Business Educators in Universities

Variables	N	$\bar{x}$	SD	r	Interpretation
Talent Development	130	3.06	0.48	0.64	Positively High
Work Engagement		3.12	0.38		

Note: 0.01-0.30=Low, 0.31-0.50=Moderate, 0.51-0.70=High; using the study's adopted correlation benchmark as correlation strength classification vary across methodological conventions (Akoglu, 2018).

Table 1 shows that the correlation coefficient of 0.64 is positive and high which indicates a strong positive relationship between talent development and work engagement. This means that strong talent development practices were associated with higher work engagement among business educators.

Table 2: Linear Regression Estimates of Talent Development Prediction on Work Engagement of Business Educators in Universities

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	1.555	.170		9.154	.000
Talent Development	.512	.055	.637	9.340	.000

Note: Dependent Variable = Work Engagement; R = .637; R-square = .405; Adjusted R-square = .401; p <.05; N = 130

Table 2 shows that talent development significantly predicted work engagement with (β =.637, t = 9.340, p < .05). The adjusted R square value is .401, which indicates that the 40.1% of the variance in work engagement is explained or predicted by business educators' talent development. From the overall model analysis, the null hypothesis was not retained.

6. Discussion

The findings revealed a strong positive relationship between talent development and work engagement among business educators. This suggests that access to development opportunities like training, retraining, mentoring, coaching, research and publication support is associated with greater academic work engagement. This supports the position of Kaliannan et al. (2023) that inclusive talent development enhances employees' growth and organizational outcomes. Development opportunities and management support have been identified as the vital job resources with management support emerging as the strongest predictor of work engagement (Kovács et al., 2025). However, within African higher education context, weaknesses in training and development have been identified as one of the challenges affecting academic talent management (Musakuro & de Klerk, 2021). Therefore, systematic development of business educators is important to ensure their participation in teaching, innovation, research and student supervision.

Furthermore, talent development significantly predicted work engagement with a variance of 40.1%. Although this indicates a significant predictive contribution, it does not establish causation and the remaining variance may be due to leadership, institutional support and other personal factors. According to Expectancy Theory, development opportunities may improve engagement when educators believe those will enhance their competence and that the enhanced competence will produce valued outcomes, such as recognition and career advancement (Vroom, 1964). Similarly, Mahapatra and Dash (2022) posit that changing workplace conditions require continuous development and greater employee involvement in career development. Thus, talent development can operate both as a capacity-building mechanism and proof that business educators' present contributions and future relevance are valued.

These findings have strategic implications for building future-ready business educators. Recent empirical evidences indicate that building future-ready business educators require building digital competencies by strengthening digital teaching practice, empowering students for a digital society, digital literacy, and continuous professional development; simultaneously, higher work engagement can enhance innovative work behaviour (Basilotta-Gómez-Pablos et al., 2022; Tondeur et al., 2023; Zhou et al., 2025). Therefore, public universities in Nigeria, and by implication Africa, should align talent development initiatives with digital pedagogy, entrepreneurship, industry collaboration and emerging workplace. However, since digital literacy and future readiness were not directly measured in this study, they should be interpreted as evidence that talent development and work engagement serve as foundations for future readiness rather than establishing that the surveyed educators were already future-ready.

6. Conclusion and Recommendation

6.1 Conclusion

The study established that talent development had a strong positive relationship with work engagement and significantly predict the engagement of business educators. Development opportunities such as training, retraining, coaching, mentoring, research development, conference participation and carer growth will therefore enhance business educators' vigour, dedication and absorption in their academic responsibilities. Building future-ready business educators therefore requires universities to invest not only in technology and curriculum reforms but also in continuous development of the educators responsible for the implementation of those reforms to match the reforms.

6.2 Recommendation

Nigerian public universities should:

1. Institutionalize strategic and regular talent development programmes for business educators;
2. Establish and sustain structured mentoring and coaching arrangements;
3. Provide research, publication and conference support;
4. Create transparent career development pathways
5. Align training with digital pedagogy and changing workplace competencies
6. Assess periodically the effectiveness of talent development initiatives in place to ensure participation reflects in expected productivity.

Abstract

The study examined the impact of E-office practice simulation on entrepreneurship outcomes of OTM students in Federal and State Universities in Abia State, Nigeria. Three research questions and three null hypotheses guided the study. Descriptive research design was used to achieve the specific aims of the study. The population comprised of 228 OTM undergraduate students in the two universities in Abia State, Nigeria. The entire population was used due to the manageable size of the population hence census sampling technique was adopted. A 24-items Questionnaire titled: "Impact of E-office practice simulation on Entrepreneurship outcomes of OTM Students" was used for data collection, with 0.86 reliability coefficient value. Data collated were analyzed using mean and standard deviation statistics to ascertain the homogeneity and closeness of the responses. The hypotheses were tested using t-test statistics at an alpha level of 0.05 significance. Findings of the study indicated that students in federal and State universities were of the opinion that electronic workflow and electronic file management of e-office practice simulation have impact on entrepreneurship outcomes of OTM students in public universities in Abia State while electronic signatures had no impact on entrepreneurship outcomes. Thus, there was a significant difference in the mean ratings of students between federal and state universities on the impact of electronic workflow while there was no significant difference in the mean ratings of students between federal and state universities on the impact of electronic file management and electronic signatures of e-office practice simulation on entrepreneurship outcomes of OTM students in Abia State. Findings of the study indicated that students in federal and State universities were of the opinion that electronic workflow and electronic file management of e-office practice simulation have impact on entrepreneurship outcomes of OTM students in public universities in Abia State while electronic signatures had no impact on entrepreneurship outcomes. Therefore, the study concluded that the use of electronic workflow and electronic file management of e-office practice simulation impact on entrepreneurial outcomes of OTM students in universities in Abia state while electronic signature did not have any impact. Based on the findings, it was recommended that university authorities and policy makers should standardize the implementation of electronic workflow in e-office practice simulation across federal and state universities in Abia State. In addition, both federal and state universities should receive equal attention in terms of ICT infrastructure, internet connectivity, and technical assistance to promote effective e-office practice simulation for OTM students.

Keywords: *Entrepreneurial Skills, Office Technology Management, E-office Practice Simulation, Electronic workflow, Digital file management, Digital signature*

Introduction

The global shift toward digital transformation has fundamentally altered office administration, demanding that graduates of Office Technology and Management (OTM) possess not only secretarial skills but also entrepreneurial competencies. E-office practice simulation a computer-based learning environment that replicates real-world office tasks, document management, and virtual collaboration has emerged as a critical instructional tool (Adebayo & Ogunleye, 2023). Hence, the modern workplace is increasingly shaped by digital systems, and this has made digital competence a core employability requirement rather than an added advantage. This trend matters for higher education because universities are expected to prepare students not only for paid employment but also for self-employment and entrepreneurial participation in a technology-driven economy (UNESCO, 2025; Emeasoba & Nwatarali, 2021). The Nigerian university system, particularly in the Office Technology and Management (OTM) domain, faces mounting pressure to produce graduates who are not merely employable but are also job creators (Okafor & Eze, 2023). With unemployment rates among young graduates exceeding 42% (National Bureau of Statistics, 2024), entrepreneurial outcomes defined as the ability to start, manage, and sustain a business have become a critical metric of educational success. E-office practice simulation, a pedagogical method that replicates real-world digital office environments (e.g., document management systems, virtual collaboration tools, and cloud-based workflows), offers a potential pathway to bridge classroom theory and market realities (Adebayo & Idowu, 2022). The Office Technology and Management (OTM) programme in Nigeria aims to equip students with the necessary skills to excel in the modern office environment (Maikudi, 2024).

The persistent mismatch between business education outcomes and labour market demands in Nigeria has intensified calls for entrepreneurship-driven pedagogy (Okeke & Nwankwo, 2024). In recent years, Nigeria has emphasized entrepreneurship education as a strategic response to growing youth unemployment, economic instability, and the limitations of a job-seeking culture (Chijioke, & Omofowa, 2024). Despite its inclusion in university curricula, many graduates still lack the practical competencies and real-world exposure needed to succeed as entrepreneurs. This shortcoming raises questions about the effectiveness of current pedagogical models, which often prioritize theoretical instruction over applied learning.In Nigerian universities, particularly in Abia State, OTM programmes aim to produce graduates who can either secure paid employment or create their own office management enterprises (Nwachukwu & Ibe, 2021). Recent studies in Nigerian higher institutions show that Office Technology and Management (OTM) education is expected to equip students for ICT-compliant office environments, while modern office competencies such as online information processing, digital communication, and software use are increasingly required for employability and workplace relevance (Edionwe, 2023;Emeasoba et al, 2025).

E-office practice simulation refers to a technology-driven instructional approach that replicates real office environments using electronic office tools, software applications, digital file management, digital signature, digital communication systems, and virtual administrative processes for teaching and learning purposes. It involves the practical demonstration and simulation of modern office operations such as electronic filing, virtual meetings, online communication, cloud computing, database management, digital scheduling, desktop publishing, electronic workflow and automated office procedures in a controlled learning environment. E-office practice simulation enables students to acquire hands-on experience and practical competencies that reflect contemporary workplace realities and entrepreneurial outcomes (Mfam, Okanazu, & Ogbuabor, 2025). An electronic workflow is the digital automation of standard business processes, replacing manual, paper-based tasks with streamlined routing and approvals. Electronic workflow is paperless production, where electronic recipes handle both the manual and the automated functions. It involves document management, form routing, and built-in electronic signatures. Electronic workflow involves the use of technology to streamline, manage, and execute tasks with minimal human intervention. Digital workflow systems are now central to academic administration, finance, human resources, and communication across institutional departments (Komba & Mlozi, 2022). This process will help our universities reduce red-tapism in our administrative processes and increase faster administrative procedures, staff coordination, effective communication, achievement of goals, and digital file management among others. Office Technology and Management students with electronic competencies are more likely to adopt electronic workflow in an office, handle automation tools, handle work efficiently and effectively, and contribute to this 21st century technology driven work culture.

Electronic file management is the process of organizing, storing, naming, and maintaining electronic files. It creates a logical hierarchy of folders to eliminate clutter, allowing you to quickly locate, back up, and secure your data using built-in tools or cloud services. According to Shoewu, Akinyemi and Adamu (2023) Electronic file management is defined as a collection of data that includes many sorts of documents that may be reside throughout a network and support multiple simultaneous accesses, updates, and modifications. Electronic document management systems are designed to make it easier to handle papers that are relevant to certain businesses, initiatives, and work groups within computer networks. Abdulkadhim et al., (2015) described it as a process to initiate, store, edit, retrieve, and displaying of data with several benefits, including budgetary, management, privacy, systems integration, security and performance. Electronic file or document management system reduces expenses for educational institutions and organizations by automating tasks, boosting document security, and reducing human error and gives users an easy way to view, share and manage their documents while adjusting some security and management elements (Shoewu, Akinyemi & Adamu, 2023).

An electronic signature (e-signature) is any digital sound, symbol, or process attached to a document that indicates your intent to agree to its terms. According to Rapoza (2021) electronic signatures help in removing manual and paper processes and enabling contracts and documents to be approved anywhere and anytime, they speed-up key processes like contract signing, and document approvals; help organizations get the most out of their entire document creation, deployment, management and sharing infrastructure; have more capable and optimized capabilities in every aspect of document and content management and security. It is evident that electronic commerce will not achieve its potential in Nigeria without the proper legal recognition of electronic signatures and the provision of the legal and institutional infrastructure needed to ensure the protection of electronic transactions (Onuoha, Agbadufishim & Jubril, 2020).

Entrepreneurial outcomes of e-office practice simulation broadly refer to the entrepreneurial skills, competencies, attitudes, innovative abilities, self-reliance capabilities, and business creation potentials developed by students through exposure to simulated electronic office practices and digital business environments (Adeshina, Derera, & Vangeli, 2022). It encompasses the extent to which participation in e-office simulations enhances students' entrepreneurial readiness, creativity, problem-solving ability, digital business competence, innovation capacity, and self-employment opportunities. Entrepreneurial outcomes may manifest in areas such as digital office consultancy, virtual assistant services, desktop publishing, online business management, document processing services, data management, and other ICT-related entrepreneurial ventures. Studies have shown that technology-based simulations and entrepreneurship oriented digital training significantly improve OTM students' entrepreneurial self-efficacy, innovation capability, and startup readiness.

Office Technology and Management (OTM) students are students undergoing professional training in Office Technology and Management programmes in universities, polytechnics, and other tertiary institutions. The OTM programme is designed to equip learners with knowledge, practical office skills, managerial competencies, technological proficiency, communication skills, and entrepreneurial capabilities needed for effective office administration and modern business operations. OTM students are trained in areas such as word processing, office automation, records management, business communication, desktop publishing, data processing, cloud computing, information management, and electronic office administration (Ezeahurukwe, & Ameh, 2017). According to Maikudi, (2024), Office Technology and Management (OTM) education is crucial for preparing students for the modern workplace. The transformation from traditional secretarial studies to Office Technology and Management was largely motivated by the increasing integration of ICT into office administration and business management practices. Modern organizations now require graduates who possess advanced digital competencies and entrepreneurial capabilities capable of adapting to emerging workplace technologies and digital business environments (Ezeahurukwe, & Ameh, 2017). In Nigerian higher education, scholars have similarly argued that entrepreneurship education should include experiential learning tasks such as simulation, project-based work, and mentorship if students are to develop competence for self-employment and innovation (Maikudi, 2024). However, the available literature is still fragmented. Some studies focus on general ICT resource utilization in OTM education, others on social media use, digital skills, or entrepreneurship skills, but few have examined the specific entrepreneurial outcome of e-office practice simulation among OTM students in federal and state universities in Abia State. Studies located in South-West Nigeria, Rivers State, South-East polytechnics,

and broader Nigerian higher institutions point to the value of ICT and experiential learning, but they do not sufficiently isolate e-office simulation as a distinct instructional variable within Abia State universities. Against this background, e-office practice simulation becomes a relevant pedagogical tool for OTM students because it combines digital office operations with entrepreneurial learning. The expectation is that students who engage in e-office simulations will not only acquire technical office skills, but also develop entrepreneurial outcomes such as self-reliance, confidence in service delivery, business opportunity awareness, and readiness for digital-office-based enterprise creation. This is important because recent Nigerian studies show that ICT integration can improve student engagement, productivity, employability, and employment opportunities, while OTM and business education studies continue to emphasize the need for graduates who can meet changing market demands (Maikudi, 2024). Therefore, this study seeks to examine the impact of e-office practice simulation on entrepreneurial outcomes of OTM students in Federal and State Universities in Abia State with a view to determining how electronic workflow, electronic file management and electronic signatures impact on entrepreneurial skills acquisition, digital competence, innovation capability, and self-employment readiness among OTM students.

Statement of the Problem

University graduates supposed to have received the right training that equipped them for job employability and ability to be self-employment. However, the current status of university graduates in Nigeria is pathetic and unemployable by the organization. Despite that, universities and other higher institutions continue to produce thousands of graduates yearly into the saturated labor market (Ojo, Owoeye, & Osime, 2024).

A second concern is that entrepreneurship education in many institutions still leans heavily toward theory. Yet recent work on experiential entrepreneurship argues that students need structured simulation, practical engagement, and problem-solving tasks to develop entrepreneurial confidence and capability. Without such exposure, OTM students may graduate with certificates but without the practical orientation needed to identify opportunities, offer digital office services, or create self-employment options (Chijioke, & Omofowa, 2024).

Despite the growing importance of digital office systems, many OTM programmes still struggle with weak practical exposure, underutilized ICT resources, and insufficient integration of modern technologies into teaching and learning. Evidence from Nigerian studies shows that ICT resources may be available but are often underused, while lecturers and students may lack adequate training and support. At the same time, studies have noted that OTM graduates need stronger competencies to function in modern offices and to remain employable in a paperless, technology-driven environment (Maikudi, 2024). The problem is twofold: first, most OTM instruction is theoretical or uses basic software tutorials rather than integrated simulations. Second, there is no empirical evidence linking the frequency and quality of E-office simulation exercises to specific entrepreneurial outcomes such as, electronic work flow, electronic file management, electronic signatures, business plan development among students in Abia State's federal and state universities.

In Abia State, there is still limited empirical evidence on whether e-office practice simulation actually improves entrepreneurial outcomes for OTM students in federal and state universities. There is also little comparative evidence showing whether students in federal universities differ from those in state universities in the entrepreneurial benefits they derive from simulation-based e-office instruction. This leaves a clear research gap in both pedagogy and graduate outcome studies, and the present study seeks to address that gap by examining the impact of E-office practice simulation on entrepreneurial outcomes of OTM students in Abia State universities.

Purpose of the Study

The purpose of this study is to investigate the impact of entrepreneurial outcomes of e-office practice simulation on OTM students in federal and state universities in Abia State. The specific purposes are to determine:

1. The impact of electronic workflow on entrepreneurial outcomes of OTM students in universities in Abia State.
2. The impact of electronic file management on entrepreneurial outcomes of OTM students in universities in Abia state.
3. The impact of electronic signature on entrepreneurial outcomes of OTM students in universities in Abia state.

Research Questions

The following research questions guided the study:

1. What is the impact of electronic workflow on entrepreneurial outcomes of OTM students in Universities in Abia State.?
2. What is the impact of electronic file management on entrepreneurial outcomes of OTM students in universities in Abia state?
3. What is the impact of electronic signature on entrepreneurial outcomes of OTM students in universities in Abia state?

Hypotheses

The following null hypotheses were formulated and tested at 0.05 level of significant:

H_{01}: There is no significant difference between the mean ratings of students of the Federal and State universities on the impact of electronic workflow on entrepreneurial outcomes of OTM students in Abia State.

H_{02}: There is no significant difference between the mean ratings of students of the Federal and State universities on the impact of electronic file management on entrepreneurial outcomes of OTM students in Abia State.

H_{03}: There is no significant difference between the mean ratings of students of the Federal and State universities on the impact of electronic signatures on entrepreneurial outcomes of OTM students' universities in Abia State.

Methodology

The study adopted the descriptive survey research design. A descriptive survey is that research design used to describe the characteristics of a population, situation, or phenomenon methodologically (Librarianship Studies and Information Technology, 2022). The design was appropriate because it enable the authors to establish the impact of e-office practice simulation on entrepreneurial outcomes of OTM students. The population for this study comprised 228 OTM undergraduate students in the two universities in Abia State offering business education. There was no sampling because the population was manageable, hence census sampling technique was adopted. The instrument for data collection was a structured questionnaire titled: Questionnaire of E-office Practice Simulation for entrepreneurial outcomes of OTM Students (QEOEPSEO). A structured questionnaire consisting of 8 items was used to elicit information from respondents. The instrument is structured on a four-point rating scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD). The instrument was validated by two experts in the Department of Technology and Vocational Education. To further determine the internal consistency of the instrument, a pilot study was conducted on 30 students in Department of Business Education, University of Nigeria, and Nsukka. Cronbach Alpha reliability method on the data obtained yielded reliability co-efficient value of 0.86. Data for the study was administered by the researcher with the help of two research assistants. The research assistants were briefed on the mode of instruments administration and retrieval. The instrument was administered and retrieved on the spot. Out of 228 copies of questionnaire administered, 215 copies were returned in good condition amounted to 94% questionnaire return rate and the 23 copies of questionnaire not returned amounted to 6% lose rate. The mean was used to answer the research questions; standard deviation was used to ascertain the closeness and homogeneity of the responses while the t-test statistics was used to test the hypotheses at a significance level of 0.05. Real limit of number was used to determine the level or extent of responses of each item on research questions only. The real limit value is as follows; 3.50-4.00= Strongly Agree, 2.50-3.49=Agree, 1.50-2.49=Disagree, 1.00-1.49=Strongly Disagreed. The null hypothesis was accepted when the t-calculated value is less than the t-table value at 0.05 level of significance while the hypothesis was rejected when the t-calculated value is greater than the t-table value at 0.05 level of significance.

Results

Research Question 1: What is the impact of electronic workflow on entrepreneurial outcomes of OTM students in public universities in Abia State?

Table 1: Mean and Standard deviation of response of Students On the impact of electronic workflow for entrepreneurial outcomes of OTM students in Federal and state Universities in Abia State. (N=215)

S/N	Items	Federal University			State University		
		Mean	SD	Remarks	Mean	SD	Remarks
1.	Ability to use electronic document processing software enhances entrepreneurial outcomes.	3.60	0.88	Agree	3.58	0.87	Agree
2.	Knowledge of electronic records management activities enhances entrepreneurial activities.	3.67	0.92	Agree	3.40	0.79	Agree
3	E-office simulation activities improve my electronic communication skills.	3.76	0.78	Agree	3.58	0.98	Agree
4	E-office practice simulation enhances my ability to participate in online meetings and presentations.	3.56	0.84	Agree	3.50	0.80	Agree
5	Ability to use electronic workflow approval systems during office simulation exercises has help me improve modern digital office work.	3.47	0.88	Agree	3.89	0.86	Agree
6	E-office workflow simulation improves my entrepreneurial opportunities.	3.64	0.89	Agree	3.47	0.98	Agree

8	Electronic workflow systems helps in office task coordination and approval processes.	3.58	0.91	Agree	3.61	0.70	Agree
	Grand Mean and SD	**3.63**	**0.86**		**3.51**	**0.84**	

Source: Field survey, 2026

Result of Table 1 indicates mean and standard deviation scores of respondents with a mean response of 3.11 to 3.89 which means that the respondents were of opinion that the use of electronic workflow impact on entrepreneurial outcomes of OTM students in universities in Abia state. However, average standard deviation of 0.70 to 0.98 of the respondents indicate that their mean did not vary on the impact of electronic workflow on entrepreneurial outcomes of OTM students. With a cutoff point of 2.5 a grand mean of 3.633.51 and grand standard deviation of 0.86-0.84, shows that all the respondents were of the opinion that electronic workflow impact on entrepreneurial outcomes of OTM students in public universities in Abia State.

Research Question 2: What is the impact of electronic file management on entrepreneurial outcomes of OTM students in public universities in Abia State?

Table 2: Mean and Standard deviation of response of Students in the impact of electronic file management on entrepreneurial outcomes of OTM students in Federal and state Universities in Abia State. (N=215)

Source: Field survey, 2026

Data analyzed on Table 2 indicates the mean and standard deviation scores of respondents in the impact of electronic file management on entrepreneurial outcomes of OTM students in Federal and state Universities. Additionally, Table 2 reveals that students in Federal and State Universities rated all the items above a mean score of 2.50. This implies that students in Federal and State Universities were in agreement that electronic file management of e-office practice simulation greatly enhance their practical office skills, managerial competencies, technological proficiency, communication skills, and entrepreneurial capabilities. However, standard deviation scores of 0.87 and 0.86 indicate that students in both Federal and State universities had similar view on the impact of electronic file management of e-office practice simulation on OTM students in Federal and state Universities in Abia State. The grand mean for federal and state universities are 3.41 and 3.43 indicated that students in federal and state Universities were in agreement that electronic file management has impact on entrepreneurial outcomes of OTM students in public university in Abia State.

Research Question 3: What is the impact of electronic signatures on entrepreneurial outcomes of OTM students in public universities in Abia State?

Table 3: Mean and Standard deviation of response of Students in the impact of electronic signatures on entrepreneurial outcomes of OTM students in Federal and state Universities in Abia State. (N=215)

S/N	Items	Federal University Mean	SD	Remarks	State University Mean	SD	Remarks
1.	Electronic signature simulation improves my entrepreneurial skills.	2.00	1.68	Disagree	2.29	1.05	Disagree
2.	Electronic signature practice enhances my readiness for electronic office business operations.	2.15	1.87	Disagree	2.17	1.72	Disagree
3	Participation in electronic signature simulation improves my confidence in managing digital transactions.	2.03	1.51	Disagree	2.37	1.78	Disagree
4	Electronic signature activities improve my ability to provide electronic document authentication services.	2.32	1.07	Disagree	2.18	1.01	Disagree
5	Electronic signature simulation enhances my employability in modern digital office environments.	2.16	1.09	Disagree	2.22	1.06	Disagree
6	Electronic signature simulation enhances my digital communication and business management skills.	2.19	1.02	Disagree	2.28	1.11	Disagree

8	Ability to use electronic signatures for virtual office communication and transaction processing enhances my business skills.	2.34	1.03	Disagree	2.24	1.00	Disagree
	Grand Mean and SD	**2.23**	**1.24**		**2.22**	**1.19**	

Source: Field survey, 2026

The data presented in Table 3 indicates mean and standard deviation scores of respondents in the impact of electronic signatures on entrepreneurial outcomes of OTM students in Federal and state Universities in Abia State. The data in Table 3 revealed that ten items were rated below a mean score of 2.50 by both academic staff of Federal and State universities with their mean responses ranging between 2.23 and 2.22 which means that the respondents were of opinion that the electronic signatures of e-office practice simulation does not enhance OTM students' entrepreneurship outcomes. However, grand standard deviation of 1.24 and 1.19 showed that all the respondents were in their agreement that the digital signatures of e-office practice simulation does not enhance OTM students' entrepreneurship outcomes. This implies that the students in Federal and State universities had the same view on the

impact of electronic on entrepreneurial outcomes of OTM students in Federal and state Universities in Abia State.

Test of Hypotheses

H_{01}: There is no significant difference between the mean ratings of students of the Federal and State universities on the impact of electronic workflow on entrepreneurial outcomes of OTM students in Abia State.

Table 4: Summary of t-test results of difference between the mean ratings of students of the Federal and State universities on the impact of electronic workflow on entrepreneurial outcomes of OTM students in Abia State.

University	N	X	SD	Df	t.cal	crit. t	Decision
Federal University	186	43.69	7.86	213	2.05	1.98	**Reject Ho**
State University	29	44.41	7.75				

Key: N=Number of respondents, X=Mean, SD=Standard Deviation, DF=Degree of Freedom, t.cal = t.calculate, crit.t = criteria value of t.

Table 4 reveals that the calculated t-value of 2.05 is greater than the criteria value of 1.96 at 213 degrees of freedom and at 0.05 level of significance. Since the calculate value is greater than the criteria value of table t, the null hypothesis is rejected. This implies that there was significant difference in the mean ratings of students between federal and state universities on the impact of electronic workflow of on entrepreneurial outcomes of OTM students in Abia State.

H_{02}: There is no significant difference between the mean ratings of students of the Federal and State universities on the impact of electronic file management on entrepreneurial outcomes of OTM students in Abia State.

Table 5: Summary of t-test results of difference between the mean ratings of students of the Federal and State universities on the impact of electronic file management on entrepreneurial outcomes of OTM students in Abia State.

University	N	X	SD	Df	t.cal	crit. t	Decision
Federal University	186	43.73	8.60	213	0.310	1.98	**Accept Ho**
State University	29	48.56	9.29				

Key: N=Number of respondents, X=Mean, SD=Standard Deviation, DF=Degree of Freedom, t.cal = t.calculate, crit.t = criteria value of t.

Table 5 reveals that the calculated t-value of 0.310 is less than the criteria value of 1.96 at 213 degrees of freedom and at 0.05 level of significance. Since the criteria value is greater than the calculated value. Therefore, null hypothesis is accepted. This implies that there was no significant difference in the mean ratings of students between federal and state universities on the impact of electronic file management on entrepreneurial outcomes of OTM students in Abia State.

H_{03}: There is no significant difference between the mean ratings of students of the Federal and State universities on the impact of electronic signatures on entrepreneurial outcomes of OTM students in public universities in Abia State.

Abia State.

Table 6: Summary of t-test results of difference between the mean ratings of students of the Federal and State universities on the impact of electronic signatures on entrepreneurial outcomes of OTM students in public universities in Abia State.

University	N	X	SD	Df	t.cal	crit. t	Decision
Federal University	186	43.16	7.95	213	0.089	1.98	**Accept Ho**
State University	29	44.29	8.94				

Key: N=Number of respondents, X=Mean, SD=Standard Deviation, DF=Degree of Freedom, t.cal = t.calculate, crit.t = criteria value of t.

Table 6 indicates that the calculated t-value of 0.089 is less than the criteria value of 1.96 at 213 degrees of freedom and at 0.05 level of significance. Since the criteria value is greater than the calculated value. Therefore, null hypothesis is accepted. This implies that there was no significant difference in the mean ratings of students between federal and state universities on the impact of electronic signatures on entrepreneurial outcomes of OTM students in public universities in Abia State.

Discussion of findings

Findings from research question one revealed that students in both federal and state universities were of the opinion that electronic workflow of e-office practice simulation has impact on OTM students' entrepreneurial outcomes in public universities in Abia State. This means that in entrepreneurship training: the use of electronic workflow of e-office practice simulation, records management, electronic communication skills, and modern digital office works improve their entrepreneurial skills, entrepreneurial readiness and entrepreneurial self- efficacy. However, hypothesis one in **table 4** reveals that there was significant difference in the mean ratings of students between federal and state universities on the impact of electronic workflow of e-office practice simulation on OTM students in Abia State on entrepreneurial outcomes. The finding was corroborated with the findings of Azih and Ama (2019) who noted that modern communication Skills enable students to develop manipulating skills, good communication skills and sound basis for specific and reflective thinking. Jones et al. (2020) have shown that proper management support, especially regarding infrastructure and training, leads to improved productivity in digital workflows. These studies showed that well-maintained infrastructure and digital support systems lead to more effective work flow in businesses thereby enhancing productivity. However, it may not be enough to provide resources; effective training, integration into work routines, and strategic utilization are essential for realizing entrepreneurial outcomes.

The finding of this study indicated that students in federal and state universities were in agreement that electronic file management of e-office practice simulation greatly enhance their practical office skills, managerial competencies, technological proficiency, communication skills, and entrepreneurial capabilities. In addition, hypothesis two in **table 5** reveals there was no significant difference in the mean ratings of students between federal and state universities on the impact of electronic file management on entrepreneurial outcomes of OTM students in Abia State. This result agrees with Egbeyemi, Enilolobo and Babayemi (2023) who found that saleable skills that make business education graduates self-employed include: computer literacy skills, file management among others, it was equally revealed that entrepreneurship training provides employment opportunities for final year students. Similarly, Shoewu, Akinyemi and Adamu (2023) noted that electronic document management system gives users an easy way to view, share and manage their documents while adjusting some security and management elements. Therefore, electronic file management gives OTM students the ability to alter, share, and synchronize and enable every activity taken within the system to be accounted for.

The **table 3** further revealed that all the respondents were in their agreement that the electronic signatures of e-office practice simulation does not enhance OTM students' entrepreneurship outcomes. This study is in line with the study of Onuoha et al (2020) which stated that in electronic signatures the legitimacy of the parties to the agreement cannot be remedied easily, no matter how sophisticated electronic signatures become. However, electronic signatures are legally valid when one party faces the prospect of finding a way to prove the identity of the original signatories in a situation where another person is not witnessing the signature, the difficulty of using an electronic signature becomes evident. The analysis of research hypothesis three ($\mathbf{H_{03}}$) revealed that there was no significant difference in the mean ratings of students between federal and state universities on the impact of electronic signatures of e-office practice simulation on OTM students in public universities in Abia State for entrepreneurship outcomes.

Conclusion

Based on the findings of this study, it was concluded that the use of electronic workflow of e-office practice simulation, records management, electronic communication skills, and modern digital office works improve their entrepreneurial skills, entrepreneurial readiness and entrepreneurial self-efficacy. However, digital file management of e-office practice simulation greatly enhance their practical office skills, managerial competencies, technological proficiency, communication skills, and entrepreneurial capabilities. Also, digital signatures of e-office practice simulation do not enhance OTM students' entrepreneurship outcome.

Recommendations

Based on the findings, it was recommended that:

i. The Federal and State Ministries of Education should provide standardized e-office facilities, internet infrastructure, and workflow software to reduce disparities between institutions. This will improve students' competence and prepare them for modern office environments.

ii. Curriculum planners and university management should ensure that digital records management, cloud storage, electronic archiving, and document retrieval systems are adequately taught and practiced in e-office simulation laboratories. This will enable students to gain hands-on experience in handling electronic documents and improve their employability and entrepreneurial competencies.

iii. Nigeria, through the National Assembly, must independently establish a legal framework governing electronic transactions and online contracts to ensure that electronic signatures are compatible.

Abstract

The study is to investigate impact of digital literacy and self-reliance of undergraduate business education students' entrepreneurial intentions in tertiary institutions. Two research questions and hypothesis guided the study. Correlational research design was used for the study. The population for the study consist of 250 students of Business Education students of Emmanuel Alayande University of Education and Business Education students of Federal College of Education, Special, Oyo. There was no sampling nor sampling technique hence the entire population of of 250 undergraduate business education students served as the sample size for the study. The distribution of the students are 80 and 170 respondents from the two tertiary institutions in Oyo State. Pearson Product Moment correlation was used to determine the reliability of the questionnaire distributed, 154 was retrieved and used for the study and a coefficient of 0.73 and 0.86 were obtained. The hypothesis formulated was used to answer the research questions at 0.05 level of significance. The findings of the study shows that imagination skill and mobile development skill acquisition enhance self-reliance of undergraduate business education students in tertiary institutions in Oyo State. Based on the findings, it was recommended amongst others that impact of digital literacy (imagination skill and mobile development skill) should be encouraged to close the gap between theory and practice to give business education students competitive advantage in the labour market.

Keywords: Digital Literacy, Self-reliance, Entrepreneurial intentions, Business Education, imagination Skill, Mobile Development Skill

Introduction

The development of digital technology over the past decade has become one of the most powerful driving forces behind fundamental transformations in almost every aspect of human life, including communication, employment, education, and economic activities. The shift toward the use of digital technology has not only changed patterns of social behavior and consumption but has also opened new opportunities in the field of entrepreneurship. International studies indicate that digitalization is now regarded as "the single most important force in entrepreneurship and innovation" (Berger et al., 2021), as it accelerates business processes, increases efficiency, and creates new business models that were previously unattainable. This global transformation has prompted many universities around the world to revise their curricula to ensure that students possess sufficient digital competence and are able to adapt to the increasingly complex demands of the digital economy.

Within this global context, digital literacy has emerged as one of the essential competencies required by the younger generation. Digital literacy is no longer limited to the ability to operate technological devices, but also encompasses the capacity to manage, evaluate, and utilize digital information effectively. According to Liang et al. (2025), digital

In the face of escalating youth unemployment and economic instability in Nigeria, fostering self-reliance among university graduates has become imperative. Business education programs are uniquely positioned to equip students with the entrepreneurial competencies necessary to navigate and thrive in this challenging landscape. However, the dynamic nature of the global economy necessitates a re-evaluation of these competencies to include digital proficiency, resilience, and

sustainability consciousness. In relation to the present study, Author (2018) emphasized that well-structured business education programs significantly enhance undergraduates' global competitiveness by equipping them with digital and entrepreneurial skills. This aligns with the current study's focus on digital entrepreneurial competencies as a driver of self-reliance. Similarly, Author (2020) found that although business education graduates in Nigeria possess theoretical knowledge, they often lack practical employability skills needed to manage businesses effectively. This reinforces the importance of integrating experiential learning and resilience-building into the curriculum to enhance graduates' readiness for self-directed and sustainable entrepreneurial ventures.

Concept of Entrepreneurship Education

The individual's attitude towards entrepreneurship education is a personal perception about entrepreneurship, motivated by assessment and inclination towards entrepreneurial behaviour (Alemu & Ashagre, 2015). Entrepreneurship education is practical education that cultivate innovative talents with basic literacy in entrepreneurship and continuously injects new power into the innovation and entrepreneurship in a country (Lv et al., 2021; Hahn et al., 2019). Entrepreneurship education seeks to establish and maintain a working economy that create jobs and fights poverty (Chukwuma & Ogbeide, 2017).

Olawolu and Kaegon (2012) provides that entrepreneurship education prepares youths to be responsible individuals and entrepreneurial thinkers by exposing them to real life learning experiences where they will be required to think, take risks, manage circumstances and learn from the outcome. Entrepreneurship education entails teaching students vital skills needed to build sustainable business enterprises, equipping learners with skills required for taking responsibility and developing initiatives (Ezeani, 2012).

Entrepreneurship education involves acquiring skills, ideas and management abilities necessary for job creation (Gartner, 2018; Mokaya et al., 2012). It increases human capacity development and results in greater number of new businesses (Drost, 2019). Scholars converge in the position that exposure to entrepreneurship education influence students' attitudes toward entrepreneurship and their capacity to sustain their own businesses (Vesper & McMullan, 2018; Drost, 2019). Hence, entrepreneurship education addresses the problem of unemployment and also ensure entrepreneurial human capacity for national development.

Entrepreneurial Intention

Intention is the predisposition to enact a given behaviour in the future. It describes readiness and willingness of individuals behave or act in a specified manner. Entrepreneurial intention is thus the mindset of a person that guides anticipated outcomes. Entrepreneurial intention is the motive in individuals developed towards becoming a job creator rather than a job seeker. This could be as a result of exposure on entrepreneurship. According to Krueger (2021), entrepreneurship anticipations ought to be considered in entrepreneurship research, in that career decisions are determined by deliberate mindset.

Entrepreneurship intention is the deliberate mindset that gives way for action and guides interest toward entrepreneurial behaviours such as establishing a business and becoming a job creator. Fridoline (2019) asserts that a person's tendency of becoming an entrepreneur is influenced by their entrepreneurial anticipations. Entrepreneurial intention is thus an individual's self-realized conviction to start a business and make conscious efforts to manifest that conviction (Thompson, 2019).

Entrepreneurship Education and Entrepreneurial Intention

The rationale behind entrepreneurship education is to motivate student to become entrepreneurs upon graduation. Hence, students' exposure to entrepreneurship education affect their entrepreneurial behaviour. Zhang and Huang (2021) states entrepreneurial intention is a prerequisite to entrepreneurial action. Therefore, high level of entrepreneurial intention effectively predicts entrepreneurial entry (Fayolle & Liñán, 2014).

Izedonmi and Okafor (2010) examined effect of entrepreneurship on students' entrepreneurial intentions and found that exposure to entrepreneurship education for a period of four years aggravates entrepreneurial intention of students. Similarly, Souitaris (2017) showed that attending entrepreneurial classes and training has a positive impact on students' entrepreneurial intentions; while Burke et al. (2002) found that cultivation of entrepreneurial ability through entrepreneurship education has a significant effect on individuals' decision to start a business.

Receiving entrepreneurship education is conducive to stimulating students' entrepreneurial inspiration, accumulating entrepreneurial knowledge, and cultivating entrepreneurial abilities and skills making it easier for them to enhance their entrepreneurial intentions and participate in entrepreneurship (Muñoz et al., 2020; Solomon et al., 2019; Nabi et al 2018). According to Ajufo (2013), entrepreneurship

education is a form of empowerment that influence the behaviour and mindset of individuals towards entrepreneurial activities.
Also, Owusu-Ansah (2004), report that majority of graduates who became entrepreneurs were motivated by their exposure to entrepreneurship education; while Kumara (2012) revealed that graduates who develop positive attitudes and beliefs towards self-employment are mostly those who have received entrepreneurship education.

Statement of the problem
Business education student in various institutions are prepared to acquire trending skills in the course of study and before graduation, these skills will give them edge for immediate paid job, establish their own business and be self -employ on graduation. This scenario keeps them above board to take care of their families and boost the gross domestic product of the nation. Unfortunately business education student who do not acquire the skill in app development, mobile development skill which may result to high-rate of unemployment among graduates in Nigeria, has cut across all discipline including business education. Chinwokwu (2016) lamented that most graduates of vocational education (including business education) in Nigeria are not establishing and running their own small business for self -reliance as expected due to inadequate digital literacy skills. Therefore, there is a need to take appropriate measure to curb the menace of the high rate of unemployment among graduates through digital literacy and self-reliance, which is expected that the end result will lead to self-reliance. The digital literacy skills is needed to enable students and graduate to establish and run their own small and medium scale business for self-reliance, once the necessary skill are acquired, it becomes very challenging in this digital era. It is based on the existing gap that the researchers embarking on this study was conceived.

Purpose of the study
The main purpose of this study is to examine the digital literacy skill and self-reliance of under graduate business education student entrepreneurial mentions in tertiary institution in oyo state
Specifically, the study sought to:
1. Determine how imagination skill relates to self-empowerment of undergraduate business education students in entrepreneurial intentions in tertiary institutions in oyo state
2.Determine how mobile development skill relates to self-reliance of undergraduate business education students entrepreneurial intensions in tertiary institution in oyo state

Research Questions
The following research question guided the study:
1. How imagination skill does relates to self-reliance of undergraduate business education students entrepreneurial intentions in tertiary in oyo state
2.How mobile development skill does relates to self-reliance of education students entrepreneurial intentional in tertiary institution in Oyo state

Hypotheses
The following hypotheses formulated were rested at 0.05 level of significance.
1. There is no significant relationship between imagination skill and self-reliance of undergraduate Business Education student entrepreneurial intentional in tertiary institutions in Oyo state.
2. There is no significance relationship between mobile development skill and self-reliance of undergraduate Business Education student enterpreneurial intentions in tertiary institution in oyo state.

Methodology
The correlational design was adopted for the study. The population of the study consisted 250 respondents, made up of 80 under-graduate business education students of 2025/2026 academic year at Emmauel Alayande university of education, oyo and 170 under-graduate student of business education 2025-2026 academic year at federal college of education, special, oyo, both in oyo. There was no sampling hence the entire population of 250 under graduate business education students was used as the sample size of the study. The instrument used for data collection were two sets of researchers made questionnaires titled “imagination skill and self-reliance’ (MASSR) and ‘mobile development skill and self-reliance (DVSASE)’. The two sets of questionnaires were validated by two lecturers from the Department of Business Education and one measurement and evaluation expert, all of Emmanuel alayande university of education. The questionnaire were structured on a four-point rating scale response patterned thus: Strongly Agree [SA-4points], Agree[A-3pionts], Disagree [DA-2pionts],

and strongly Disagree [SDA-1piont]. The pearson product moment correlation coefficient (PPMCC)was used to determine the reliability of the instruments and a coefficient index of 0.73 and 0.86 were obtained. Out of the 250 copies of the questionnaires distributed, 154 were retrieved and used for analysis. Pearson product moment correlation coefficient was used to answer the research question and test the formulated hypotheses at p>0.05 level of significance, and p-value test was used to test the strength of the hypotheses. The decision rule was that the null hypotheses were retain when the critical 'r' value is greater than the calculated 'r' value otherwise accepted.

Results

Research Question 1

How does imagination skill relate to self-reliance of under graduate business education in oyo state tertiary institution?

Table 1: Relationship between imagination skill and self-Reliance of undergraduate Business Education Student entrepreneurial intentions in Oyo tertiary institutions

(N=154)

		Imagination skill	Self-reliance of undergraduate Business education students
Imagination skill	Pearson Correlation Sig. (2-tailed) N	1 154	.301 .702 154
Self-reliance of Undergraduate Business Education Students	Pearson Correlation Sig. (2-tailed) N	.301 .702 154	1 154

Data presented in Table 1 shows the calculated coefficient (r) value of response of undergraduate business Education students to determine whether there is a relationship between imagination and self reliance. The table shows that the calculated r was 0.301, with a table value of 0.179. this means that since the calculated r-value is higher than the table value, a positive relationship exists between imagination skill and self-reliance of undergraduate Business Education students entrepreneur intentions in Oyo State Tertiary institution.

Research Question 2

How mobile Development skill does relates to self-reliance of undergraduate Business Education Students entrepreneurial intentions in Oyo State Tertiary Institutions?

Table 2: Relationship between Mobile Development skill and self-Reliance of postgraduate Business Education students entrepreneurial intentions in Oyo State Tertiary institution.

(N=154)

		Mobile Development	Self-reliance of undergraduate Business education students
Mobile Development skill	Pearson Correlation Sig. (2-tailed) N	1 154	.209 .180 154
Self-reliance of Undergraduate Business	Pearson Correlation Sig. (2-tailed) N	.209 .180 154	1 154

Education Students			

Data presented in Table 2 shows the calculated coefficient (r) value of responses from undergraduate Business Education students to determine whether there is a relationship between Mobile Development skills and self-reliance of undergraduate Business Education Students of Oyo State Tertiary institutions. The table shows that the calculated r was 0.209, with a table value of 0.179. This means that since the calculated r-value is higher than the table value, a positive relationship exists between mobile development skill and self-reliance of undergraduate Business Education students entrepreneurial intentions in Oyo State Tertiary Institutions.

Hypothesis 1
There is no significant relationship between imagination skill and self-reliance of undergraduate Business Education students' entrepreneurial intentions in Oyo state Tertiary institution.
Table 3: Relationship between imagination skill and self-reliance of undergraduate business educations students' entrepreneurial intentions in Oyo State Tertiary institution.

		Imagination skill	Self-reliance of undergraduate Business education students
Imagination skill	Pearson Correlation Sig. (2-tailed) N	1 154	.301 .702 154
Self-reliance of Undergraduate Business Education Students	Pearson Correlation Sig. (2-tailed) N	.301 .702 154	1 154

In Table 3 shows the calculated coefficient (r) value of the significant relationship between imagination skill and self-reliance of undergraduate Business Education students entrepreneurial intentions in Oyo State Tertiary institutions with N=154, df = 152, P>0.05, the calculated r-value was 0.301 with a critical value of 0.179 at the P > 0.005 level of significance, and since the calculated r value was statistically greater than the table value, the null hypothesis was therefore rejected, and the conclusion is the there is relationship between imagination skill and self-reliance of undergraduate Business Education students entrepreneurial intentions in Oyo State tertiary institutions.

Hypothesis 2
There is no significant relationship between mobile development skill and self-reliance of undergraduate Business Education students entrepreneurial intentions in Oyo state tertiary institution.
Table 4: Relationship between Mobile development skill and self-reliance of undergraduate business education students entrepreneurial intentions in Oyo State tertiary institutions.

(N=154)

		Mobile Development skill	Self-reliance of undergraduate Business education students
Mobile Development skill	Pearson Correlation Sig. (2-tailed) N	1 154	.209 .180 154

Self-reliance of Undergraduate Business Education Students	Pearson Correlation Sig. (2-tailed) N	.209 .180 154	1 154

Table 4 shows that the calculated r-value was 0.209 with a critical value of 0.179 at the P>0.05 level of significance, and since the calculated r value was statistically greater than the table value, the null hypothesis was therefore rejected, and the conclusion is that there is a relationship between mobile development skill and self reliance of undergraduate Business Education students entrepreneurial intentions in Oyo state tertiary institutions.

Discussion of Findings

The first findings revealed that imagination skills can make undergraduate Business Education Students more prepared for self-reliance, imagination skill and self-reliance through having efficient user interface skills can help you design application interfaces, the ability to develop applications across different platforms and operating systems is a self-reliance, imaginations often have extensive business skills, including business management, marketing and customer service skills. This finding is in agreement with the view of Philip and Amirn (2022) imagination is a crucial topic in the IT world that provides ample opportunities for growth and self-reliance of both students and students also in the view of Rahul and Sachin (2023) imagination development is a special skill that has helped many business and individual for self-reliance.

Based on the first findings, a hypothetical test was conducted which also indicated that a statistically significant relationship exists between imagination skill and self-reliance of Postgraduate Business Education students entrepreneurial intentions in Oyo state tertiary institution. The study concluded that there is a statistically significant relationship between imagination skill and self-reliance of undergraduate business education students entrepreneurial intention in Oyo state tertiary institution, since the calculated correlation coefficient (r) value was statistically greater than the table value P>0.05 level of significance. The null hypotheses, therefore, were rejected at the P>0.05 level of significance. The strength of the relationship exists between imagination skill and self-reliance of undergraduate Business Education students. The second finding revealed that the calculated r value was statistically greater than the table value, the null hypothesis was therefore rejected, and the skills can make ungraduated Business Education students more prepared for self-reliance. It is therefore concluded that there is a relationship between mobile development skill and self-reliance for undergraduate Business Education students entrepreneurial intentions in Oyo state tertiary institution. The findings is in agreement with the view of Okiridu and Smart (2024) which indicates that about 57% of businesses implement some form of mobile development skill as a way generating business insights, revenue and success. The study got the support of Simplilearn (2023) who asserts that mobile development skill takes advantages of this human instinct and offers an easier way for people to see the information clearly and draw more accurate conclusions faster.

Conclusion

Based on the findings of the study, the researchers concluded that digital literacy skills enable individuals' ability to translate ideas into action and reality. It encompasses creativity, innovativeness, pursuing opportunity, individual empowerment, taking calculated risks and responsibility. Digital literacy skills give entrepreneur the ability to share, find, and create content using the information and communication technologies and the internet anywhere at any time to sell products and services. The study reveals that knowledge of digital literacy skills would encourage practical skills among students and graduate.

Recommendations

Based on the findings and conclusions made in the study, it was recommended among others that:

xi. The teaching of digital literacy imagination skill and mobile development skills should be encouraged to link the gap between theory and practice to give Business Education Students competitive advantage in the labour market.

xii. Management of all tertiary institutions, should ensure that good policies and adequate implementation of such policies are provided to enhance students entrepreneurial intentions.

Abstract

This study examined the impact of digital entrepreneurship curriculum on startup intentions and entrepreneurial self-efficacy among Business Education students in tertiary institutions in Abia State, Nigeria. The increasing integration of digital technologies into business environments has made it essential for entrepreneurship education to equip students with relevant digital competencies required for technology-enabled venture creation. A survey research design was adopted for the study. The population comprised 402 Business Education students from four public tertiary institutions offering Business Education in Abia State: Abia State University, Uturu; Michael Okpara University of Agriculture, Umudike; Federal College of Education, Ofeme; and Abia State College of Education (Technical), Arochukwu. A sample of 40 students, representing 10% of the population, was selected using the simple random sampling technique. Data were collected using a structured questionnaire titled Digital Entrepreneurship Curriculum and Startup Intention Questionnaire (DECSIQ), structured on a four-point rating scale of Very High Extent (VHE), High Extent (HE), Low Extent (LE), and Very Low Extent (VLE). The instrument was validated by experts and tested for reliability using the Cronbach Alpha method, yielding an overall reliability coefficient of 0.83. Data were analyzed using mean to answer the research questions and standard deviation to determine the closeness of responses, while t-test statistics were used to test the hypotheses at a 0.05 level of significance. The findings revealed that exposure to the digital entrepreneurship curriculum influences students' startup intentions and enhances their entrepreneurial self-efficacy to a high extent. Students demonstrated high levels of confidence in identifying digital business opportunities, utilizing digital tools, and developing scalable online ventures. The t-test results confirmed that these effects were statistically significant, leading to the rejection of the null hypotheses. The study concluded that integrating practical and technology-driven digital entrepreneurship components into business education significantly strengthens students' motivation, confidence, and capability to establish digital ventures. Based on the findings, the study recommended that tertiary institutions should strengthen digital entrepreneurship curricula through practical and experiential learning approaches, foster partnerships with digital startups and innovation hubs, and provide supportive environments that enhance students' entrepreneurial self-efficacy and enable them to translate digital knowledge into viable ventures.

Keywords: Digital Entrepreneurship, Startup Intentions, Curriculum, Entrepreneurial Self-Efficacy, Business Education.

Introduction

The entrepreneurial landscape has undergone a profound transformation with the rapid expansion of digital technologies. Entrepreneurship is widely recognized as a fundamental engine of economic

growth, innovation, and structural transformation, particularly in emerging and developing economies. Beyond job creation, entrepreneurship facilitates technological diffusion, enhances productivity, and stimulates regional competitiveness. In Nigeria, persistent youth unemployment and graduate underemployment have intensified policy emphasis on entrepreneurship as a strategic pathway to inclusive growth (National Bureau of Statistics [NBS], 2023). Entrepreneurship remains an important means for economic development of any nation, as it enhances skills acquisition, creativity, confidence, and the capacity for self-employment and job creation (Emeasoba & Onunkwo, 2022). Consequently, entrepreneurship education was institutionalized across tertiary institutions through the National Policy on Education (Federal Republic of Nigeria, 2013), with the expectation that exposure to entrepreneurial training would stimulate venture creation and the integration of digital technologies among graduates.

Digital infrastructures—encompassing mobile connectivity, cloud computing, social media platforms, data analytics, and financial technologies—have fundamentally altered opportunity recognition, venture creation processes, and value capture mechanisms (Nambisan, 2017). Digital entrepreneurship differs from traditional entrepreneurship not merely in tools but in its architecture: it is platform-based, ecosystem-driven, scalable, and characterized by low marginal costs and accelerated innovation cycles (Autio et al., 2018). In response to these changes, digital entrepreneurship curriculum has emerged as a specialized component of entrepreneurship education, designed to equip students with competencies required for technology-enabled ventures. Such curricula typically include courses and modules such as e-commerce development, digital marketing, social media strategy, online business modeling, financial technology applications, cloud-based business tools, data analytics, and innovation management. These components are intended to develop students' ability to identify digital opportunities, design scalable business models, and effectively operate within digital ecosystems (World Bank, 2020).
A critical outcome of exposure to digital entrepreneurship curriculum is the development of entrepreneurial self-efficacy, which refers to an individual's belief in their capability to successfully perform entrepreneurial tasks (Bandura, 1997). Entrepreneurial self-efficacy has been identified as a key predictor of entrepreneurial intention and behavior, as it influences individuals' confidence in opportunity recognition, risk-taking, decision-making, and venture creation (Krueger et al., 2000). In the context of digital entrepreneurship, self-efficacy extends to technological competence, digital literacy, and the ability to utilize digital platforms for business growth. Students who are exposed to practical and experiential digital entrepreneurship training are more likely to develop higher levels of confidence, self-efficacy in performing tasks such as creating online ventures, managing digital tools, and implementing digital marketing strategies (Nambisan, 2017).

Self-efficacy is an individual's belief in their capacity to execute behaviors necessary to produce specific performance attainments. It enables choosing which environments are best suited for growth and development, and facilitates taking responsibility, creating opportunities and setting and achieving ambitious goal. Self-efficacy is an individual's belief in their capacity to execute behaviors necessary to produce specific performance attainments (Chen, Greene & Crick in OECD, 2024). Self-efficacy is the belief that one can oneself do something. In the context of taking responsibility, it also includes valuing goal orientation, purpose, a growth mindset and the self-regulation to keep focused, in order to motivate acquiring these attributes or skills (Moran, 2017). When an individual presented proper skills and was given appropriate stimulation, self-efficacy was the determinative factor in taking actions, willing to pay efforts under pressure, and supporting the effort in frustration (Marino & Crocco, 2020). Business Education plays a central role in preparing students for both employment and self-reliance by integrating business knowledge with practical skills.

Business Education undergraduates are expected to acquire competencies in areas such as accounting, marketing, management, and entrepreneurship, making them suitable candidates for digital entrepreneurship development. In recent years, there has been increasing recognition of the need to embed digital entrepreneurship components within Business Education programmes to align with evolving labour market demands and technological advancements. However, the extent to which Business Education undergraduates are exposed to comprehensive digital entrepreneurship curriculum and how such exposure influences their startup intentions and self-efficacy remains an area requiring further investigation.

Furthermore, gender has been identified as an important variable in entrepreneurship studies, particularly in relation to entrepreneurial intention and self-efficacy. Research suggests that male and

female students may differ in their perception of entrepreneurial opportunities, risk tolerance, and confidence levels due to socio-cultural and educational factors (Bae et al., 2014). While some studies indicate that males tend to exhibit higher entrepreneurial intentions, others show that appropriate educational interventions can bridge this gap by enhancing the self-efficacy of female students. Therefore, examining gender differences in the context of digital entrepreneurship education is essential to ensure inclusivity and effectiveness of curriculum design.

Despite these transformations, much of entrepreneurship education in developing economies remains anchored in traditional business models, often emphasizing small-scale, brick-and-mortar ventures rather than digitally enabled innovation. While empirical evidence consistently demonstrates that entrepreneurship education positively influences entrepreneurial intentions (Bae et al., 2014), limited attention has been devoted to understanding how digital entrepreneurship curricula specifically shape students' startup intentions and self-efficacy. This distinction is theoretically and practically significant, as digital venture creation requires competencies in platform strategy, digital marketing analytics, user-centered design, and virtual collaboration—skills not typically embedded in conventional entrepreneurship programs.

Theoretically, entrepreneurial intention is widely conceptualized through the Theory of Planned Behavior (TPB), which posits that intention is determined by attitudes toward the behavior, subjective norms, and perceived behavioral control (Ajzen, 1991). Entrepreneurship education influences these antecedents by enhancing opportunity recognition, skills acquisition, and entrepreneurial self-efficacy (Krueger et al., 2000). However, digital entrepreneurship introduces additional dimensions such as technological self-efficacy and innovation capability. The extent to which digital entrepreneurship curriculum strengthens these determinants of intention remains underexplored, particularly within subnational contexts in Africa.

At the regional level, Abia State presents a distinctive entrepreneurial ecosystem characterized by vibrant small and medium-scale enterprises, manufacturing clusters, and increasing participation in digital commerce. Higher education institutions such as Abia State University and Michael Okpara University of Agriculture play a critical role in shaping the entrepreneurial capabilities of Business Education students within the region. Nonetheless, it remains unclear whether existing curricula adequately integrate digital entrepreneurship components in ways that significantly influence students' startup intentions and self-efficacy.

Although Nigeria has experienced improvements in digital connectivity and mobile penetration (World Bank, 2020), structural constraints—including infrastructural deficits, limited incubation ecosystems, weak university–industry linkages, and insufficient experiential digital learning—may weaken the translation of curricular exposure into entrepreneurial action. Consequently, there is a need for context-specific empirical investigation into how digital entrepreneurship curriculum influences startup intentions and entrepreneurial self-efficacy among Business Education undergraduates, while also considering gender differences.

This study contributes to the literature in three important ways. First, it advances entrepreneurship education scholarship by distinguishing between general entrepreneurship education and digitally oriented entrepreneurial curriculum. Second, it extends the Theory of Planned Behavior by examining how digital competencies and self-efficacy interact with intention formation in an emerging economy context. Third, it provides subnational empirical evidence from southeastern Nigeria, thereby enriching the limited body of African-focused digital entrepreneurship research. By empirically examining the impact of digital entrepreneurship curriculum on startup intentions and entrepreneurial self-efficacy, the study offers evidence-based implications for curriculum reform, policy development, and institutional strategies aimed at strengthening digital entrepreneurial transformation within Nigerian higher education.

Statement of the Problem

Despite the institutionalization of entrepreneurship education in Nigerian universities, graduate unemployment remains persistently high, raising concerns about the effectiveness of existing curricula in fostering job creation through venture development (NBS, 2023). While entrepreneurship courses are widely offered, they are often criticized for being overly theoretical, insufficiently practical, and inadequately aligned with the realities of a rapidly digitizing economy. As business ecosystems

increasingly migrate toward digital platforms, there is growing concern that traditional entrepreneurship education may not sufficiently equip students with the digital competencies required to initiate and sustain technology-enabled ventures.

Empirical studies in Nigeria have established a positive relationship between general entrepreneurship education and entrepreneurial intentions. However, limited research has specifically examined how structured digital entrepreneurship curriculum components influence startup intentions, particularly at the state level. In Abia State, where entrepreneurial activity is culturally embedded and commercial activity is vibrant, it remains unclear whether business students' exposure to digital entrepreneurship content significantly enhances their intention to establish digital startups. The absence of context-specific empirical evidence creates a knowledge gap that hinders curriculum reform and policy improvement.

Furthermore, although digital technologies have reduced barriers to market entry, students may still face challenges related to limited practical exposure, inadequate digital infrastructure, insufficient mentorship, and weak incubation support systems. Without empirical assessment, it is uncertain whether digital entrepreneurship education meaningfully strengthens entrepreneurial self-efficacy, perceived feasibility, and desirability—core determinants of startup intention. Therefore, the central problem this study addresses is the lack of empirical evidence on the impact of digital entrepreneurship curriculum on startup intentions among business students in Abia State. Addressing this gap is essential for aligning business education with the demands of Nigeria's digital economy and for enhancing the capacity of graduates to contribute to sustainable entrepreneurial transformation.

Purpose of the Study

The main purpose of this study is to examine the impact of digital entrepreneurship curriculum on startup intentions among business education students in Abia State.

Specifically, the study seeks to determine:

1. the extent to which digital entrepreneurship curriculum impact on startup intentions among business education students in Abia State.
2. the extent digital entrepreneurship curriculum impact on students' entrepreneurial self-efficacy startup intentions among business education students in Abia state.

Research Questions

1. To what extent does digital entrepreneurship curriculum impact on startup intentions among business education students in Abia State?
2. To what extent does digital entrepreneurship curriculum impact on students' entrepreneurial self-efficacy startup intentions among business education students in Abia state?

Null Hypotheses (H_0)

Ho_1: There is no significant difference between the mean ratings of male and female students on the extent digital entrepreneurship curriculum impact on the startup intentions among business education students in Abia State.

Ho_2: There is no significant difference between the mean ratings of male and female Business education students on the extent digital entrepreneurship curriculum impact on students entrepreneurial self-efficacy startup intentions in Abia State.

Methodology

This study adopted a survey research design to investigate the impact of digital entrepreneurship curriculum on startup intentions among Business Education students in Abia State. According to Ali in Madu (2023), a survey research design is appropriate for studies that aim to document, describe, and explain the current status of a phenomenon. This design was considered suitable because it enabled the researcher to systematically collect self-reported data on students' exposure to digital entrepreneurship curricula and their intentions to establish digital ventures. The population of the study comprised 402 Business Education students from selected tertiary institutions in Abia State. Specifically, the population consisted of 53 students from Abia State University, Uturu; 217 students from Michael Okpara University of Agriculture, Umudike; 29 students from the Federal College of Education, Ofeme; and 103 students from Abia State College of Education (Technical), Arochukwu.

Using the guideline proposed by Madu (2023), which recommends that 10% of a small population can serve as an adequate sample, a total of 40 students were selected as the sample for the study. The

respondents were selected using the simple random sampling technique to ensure that every student in the population had an equal chance of being included in the study. This technique helped to minimize bias and improve the representativeness of the sample drawn from the four institutions.

Data were collected using a structured questionnaire developed by the researcher, titled the *Digital Entrepreneurship Curriculum and Startup Intention Questionnaire (DECSIQ)*. The instrument was validated by three experts: two from the Department of Business Education and one from the Department of Science Education (Measurement and Evaluation), all from the College of Education, Michael Okpara University of Agriculture, Umudike. The questionnaire employed a four-rating points of Very High Extent (VHE), High Extent (HE), Low Extent (LE) and Very Low Extent (VLE). A reliability test conducted using the Cronbach Alpha method yielded coefficients of 0.83 and 0.84 for the subscales, with an overall reliability of 0.83, indicating that the instrument was sufficiently reliable for the study. A total of 42 copies of the questionnaire were distributed with the assistance of two briefed research assistants. Of these, 40 copies were completed and returned, representing a response rate of 98.2%.

The data collected were analyzed using mean and standard deviation to address the research questions, with the standard deviation providing insight into the homogeneity of respondents' answers. The mean values were interpreted as follows: 1.00–1.49 as Very Low Extent (VLE), 1.50–2.49 as Low Extent (LE), 2.50–3.49 as High Extent (HE), and 3.50–4.00 as Very High Extent (VHE). To test the null hypotheses at a 0.05 level of significance, t-test statistics were employed. Decisions were based on comparing the calculated t-values with the critical t-values: null hypotheses were accepted if the t-calculated was less than the t-critical value and rejected if the t-calculated exceeded the t-critical value. This methodology ensured a systematic and rigorous approach to empirically examine the impact of digital entrepreneurship curriculum and startup intentions among business students in Abia State, providing reliable evidence for curriculum evaluation and policy recommendations.

Results

Research Question 1: *To what extent does digital entrepreneurship curriculum impact on startup intentions among business education students in Abia State?*

Table 1: Extent of Digital Entrepreneurship Curriculum on Business Education students startup intentions in Abia state.

S/N	Item Statement	Mean	SD	Extent Interpretation
1	The curriculum introduces students to online business models	3.62	0.48	VHE
2	Students are taught to leverage social media for business	3.55	0.52	VHE
3	E-commerce platforms are integrated into course projects	3.47	0.57	HE
4	Digital marketing strategies are covered in depth	3.38	0.61	HE
5	Students learn to use cloud-based tools for business management	3.30	0.64	HE
6	Practical exercises on website or app development are included	3.18	0.69	HE
7	Students are exposed to online financial management tools	3.10	0.66	HE
8	Courses include digital business ethics and cybersecurity	3.05	0.70	HE
9	Digital entrepreneurship projects are evaluated for scalability	3.00	0.72	HE
10	Collaboration with digital startups is part of the curriculum	2.95	0.75	HE

Overall Mean: 3.32

SD: 0.62 — Interpretation: High Extent (HE)

The results in table 1 suggest that business students in Abia State perceive the digital entrepreneurship curriculum as substantially influencing their startup intentions. Items such as exposure to online business models (M = 3.62) and the use of social media for business (M = 3.55) were rated at a very high extent, indicating strong curriculum coverage in these areas. Collaboration with digital startups (M = 2.95) received the lowest mean but still falls within the high extent range. Overall, the findings indicate that the curriculum provides relevant knowledge and digital skills that can stimulate students' interest in establishing digital ventures.

Hypothesis 1: There is no significant difference between the mean ratings of male and female students on the extent digital entrepreneurship curriculum impact on the startup intentions among business education students in Abia State.

Table 2: t-test analysis of significant difference between male and female Students on the extent Digital Entrepreneurship Curriculum impact on startup intentions among Students in Abia State

Variable	X̄	SD	N	Df	t-calculated	t-tabulated	Decision
Male	3.35	0.61	23				
Female	3.28	0.63	17	38	2.41	2.02	Significant

The data in Table 2 shows that the calculated t-value is 2.41, while the t-tabulated value is 2.02 at the 0.05 level of significance and 38 degrees of freedom. Since the calculated value is greater than the critical value, the null hypothesis is rejected. This implies that the digital entrepreneurship curriculum significantly influences startup intentions among business students in Abia State. Exposure to digital entrepreneurship courses therefore increases students' likelihood of developing intentions to establish digital ventures.

Research Question 2: *To what extent does digital entrepreneurship curriculum impact on business education students' entrepreneurial self-efficacy startup intentions in Abia state?*

Table 3: Extent Digital Entrepreneurship Curriculum impact on Business education students entrepreneurial self-efficacy startup intentions in Abia state

S/N	Item Statement	Mean	SD	Extent Interpretation
1	Students feel confident starting digital ventures	3.48	0.55	HE
2	Curriculum enhances students' decision-making skills	3.42	0.60	HE
3	Students can identify digital business opportunities	3.50	0.58	VHE
4	Students are able to manage digital tools for business operations	3.38	0.62	HE
5	Students feel capable of designing online marketing strategies	3.35	0.64	HE
6	Students can integrate digital payment solutions effectively	3.30	0.66	HE
7	Students are confident in creating scalable online business models	3.28	0.67	HE
8	Students can work collaboratively on digital projects	3.25	0.68	HE
9	Students are confident using analytics for business decision-making	3.20	0.70	HE
10	Students feel capable of sustaining digital startups long-term	3.18	0.72	HE

Overall Mean: 3.34
SD: 0.64 — Interpretation: High Extent (HE)

The results in table 3 indicate that the digital entrepreneurship curriculum positively influences students' confidence in performing entrepreneurial tasks. Identifying digital business opportunities (M = 3.50) and starting digital ventures (M = 3.48) received the highest ratings. Although sustaining digital startups long-term recorded a slightly lower mean (M = 3.18), it still indicates a high level of perceived capability. Overall, the findings show that exposure to digital entrepreneurship courses enhances entrepreneurial self-efficacy among business students.

Hypothesis 2: There is no significant difference between the mean ratings of male and female Business education students on the extent digital entrepreneurship curriculum impact on entrepreneurial self-efficacy startup intentions.

Table 4: t-test analysis of significant difference between male and female Business education students on the extent Digital Entrepreneurship Curriculum impact on students' entrepreneurial self-efficacy startup intentions in Abia State

Variable	X̄	SD	N	Df	t-calculated	t-tabulated	Decision
Male	3.36	0.65	23				

Variable	$\bar{X}$	SD	N	Df	t-calculated	t-tabulated	Decision
Female	3.32	0.63	17	38	2.18	2.02	Significant

The data in Table 4 shows that the calculated t-value is 2.18, while the t-tabulated value is 2.02 at the 0.05 level of significance and 38 degrees of freedom. Since the calculated value is greater than the critical value, the null hypothesis is rejected. This indicates that the digital entrepreneurship curriculum significantly enhances entrepreneurial self-efficacy among business students in Abia State.

Discussion of findings

The findings of this study provide empirical evidence on the influence of digital entrepreneurship curriculum on startup intentions and entrepreneurial self-efficacy among business students in Abia State.

The results indicated that exposure to the digital entrepreneurship curriculum significantly impact students' startup intentions. Students reported high exposure to curriculum components such as online business models, social media marketing, e-commerce platforms, digital marketing strategies, and the use of cloud-based business tools. These components appear to strengthen students' readiness to consider starting digital ventures. The t-test analysis revealed a t-calculated value of 2.41, which is greater than the critical t-value of 2.02 at the 0.05 level of significance with 38 degrees of freedom, leading to the rejection of the null hypothesis. This indicates that the digital entrepreneurship curriculum has a significant impact on students' startup intentions.

This finding is consistent with earlier studies which show that entrepreneurship education improves opportunity recognition, entrepreneurial motivation, and the likelihood of venture creation (Autio *et al.,* 2018, World Bank, 2020) In the Nigerian context, where youth unemployment remains a major concern, exposure to digital entrepreneurship education provides students with relevant technological and entrepreneurial skills needed for self-employment. The result also supports the Theory of Planned Behaviour (TPB) proposed by Ajzen (1991), which suggests that intention is the strongest predictor of entrepreneurial behavior. Exposure to digital entrepreneurship courses may strengthen students' attitudes toward digital business creation and increase their confidence in starting online ventures.

The findings revealed that the digital entrepreneurship curriculum to high extent significantly affects students' entrepreneurial self-efficacy. Students reported high levels of confidence in performing entrepreneurial tasks such as identifying digital business opportunities, using digital tools for business operations, developing online marketing strategies, and planning scalable online ventures. The t-test analysis showed a t-calculated value of 2.18, which exceeded the t-tabulated value of 2.02 at the 0.05 level of significance and 38 degrees of freedom, leading to the rejection of the null hypothesis. My findings indicate that the digital entrepreneurship curriculum impact students' entrepreneurial self-efficacy to a high extent as reflected in their improved confidence across key digital entrepreneurial tasks. This result may be due to the curriculum's emphasis on practical exposure, interactive learning, and the use of relevant digital tools that align with real-world business practices. I also believe that continuous engagement and hands-on experiences provided by the programme contributed to high extent of confidence demonstrated by some students.

This finding is consistent with previous studies which indicate that entrepreneurship education enhances entrepreneurial self-efficacy by equipping students with practical knowledge and experience needed for venture creation (Autio et al., 2018; Nambisan, 2017). Entrepreneurial self-efficacy plays a critical role in shaping individuals' willingness to take entrepreneurial risks, identify opportunities, and mobilize resources to start new businesses. In the context of Abia State, the findings highlight the importance of integrating practical digital entrepreneurship modules into business education programmes. Such integration can help prepare graduates with the necessary technological and entrepreneurial competencies required to succeed in the rapidly evolving digital economy.

Conclusion

In conclusion, the study established that exposure to the digital entrepreneurship curriculum significantly impact students' startup intentions and entrepreneurial self-efficacy. The findings showed that students developed strong confidence and readiness to engage in digital business activities due to their exposure to practical components such as e-commerce, digital marketing, and online business tools. The significant t-test results further confirmed that the curriculum plays a vital role in shaping both students' intentions to start ventures and their belief in their entrepreneurial capabilities. Therefore, integrating practical and technology-driven entrepreneurship education into academic programmes is essential for equipping students with the skills and mindset required for success in the digital economy.

Recommendations

Based on the findings, the following recommendations are made:

1. Curriculum Strengthening for Self-Efficacy Development: Tertiary institutions should design digital entrepreneurship curricula that deliberately build students' entrepreneurial self-efficacy through practical, task-oriented activities such as opportunity identification, digital business simulations, and real-life venture creation projects.
2. Experiential Learning Opportunities: Institutions should provide more hands-on learning experiences, including internships, live digital projects, and incubation programmes, to enhance students' confidence in applying digital entrepreneurial skills in real-world contexts.
3. Capacity Building for Educators: Lecturers should be trained in both digital tools and experiential teaching strategies that promote active learning, problem-solving, and confidence-building among students.
4. Integration of Digital Tools and Platforms: Schools should ensure access to relevant digital technologies (e.g., e-commerce platforms, social media marketing tools, and analytics software) that enable students to practice and master entrepreneurial tasks, thereby strengthening their self-efficacy.
5. Supportive Entrepreneurial Environment: Institutions should create an enabling environment that nurtures students' confidence and willingness to start ventures by providing mentorship, funding opportunities, and access to startup support systems.

Abstract

Young people in emerging African economies are still struggling with endemic unemployment, increasing digital gaps, and an ever-expanding gap between labour market requirements informed by the Fourth Industrial Revolution (4IR) and the few digital skills instilled in most Technical and Vocational Education and Training (TVET) frameworks. The ability of digitalised TVET to stimulate inclusive economic growth is further limited by structural rigidities, poor infrastructure, and poor industry alignment. It is against this background that the research investigated how the digital skills training in TVET institutions can be used as a driver of inclusive economic development, especially the efficacy of enterprise-TVET relationships and curriculum changes in incorporating 4IR skills to promote employability and workforce preparedness. The research design was a qualitative study based on the Human Capital Theory. The secondary sources were used to obtain data, such as peer-reviewed journal articles, policy documents, textbooks, and credible institutional reports. Content analysis was applied to these data in a systematic manner to determine prevailing themes associated with the integration of digital skills, partnership models, infrastructural constraints, and inclusive growth outcomes. The results showed that enterprise-TVET partnerships enhanced graduate employability when collaboration entailed curriculum co-design, structured apprenticeships, and common infrastructure. Curriculum changes enhanced the incorporation of digital literacy, AI awareness, and industry standards. Nevertheless, fragmentation in governance, poor digital infrastructure, lecturer capacity disparities, and socio-economic disparities restricted fair access and extended economic influence. The paper has found that digital skills training in TVET has a considerable yet conditional potential to drive inclusive economic growth, provided that there is coherent policy alignment and institutional investment. It suggested the institutionalisation of enterprise partnerships, faster curriculum innovation through ongoing lecturer upskilling, and structural and socio-economic barriers to achieve inclusive and sustainable results.

Keywords: Digital skills training; TVET; Inclusive economic growth; 4IR; emerging economies

Introduction

The concept of digital skills summarizes the skills needed to be able to successfully implement digital technologies throughout the range of learning, occupational activity, innovations, and active engagement in the digital economy. They include basic ICT literacy, data manipulation, digital communication, automation consciousness, and, increasingly, artificial intelligence and the functionality of the Fourth Industrial Revolution (4IR). Technical and Vocational Education and Training (TVET) is defined as structured programmes that aim at imparting practical and occupation-specific skills to learners that are aligned to current imperatives of the labor market. Inclusive economic growth on the other hand refers to a developmental pathway whereby economic growth creates equal job opportunities, curbs inequality, and assimilates the marginalised groups into productive models. In the emerging African economies, where the population is young, the level of informal employment is high, and the pace of digitalisation is rapid, these ideas have an intersection, which is strategically important. The recent evidence shows that the adoption of digital competencies in TVET curricula improves

graduate employability and strengthens the competitiveness of local businesses (Irungu, 2025; Ajeniweni & Bamgbowu, 2024).

Within the framework of shifting the African economies to knowledge-based and technology-driven economies, the traditional craft-based models of vocational training are not sufficient to meet the modern requirements. Online enhancement of TVET systems is becoming more and more considered as the boost that can be used to fill skills gaps and to spur micro-, small-, and medium-sized enterprises. Empirical evidence on sub-Saharan Africa shows that inclusive TVET reforms have increased the rate of workforce participation and reduced structural unemployment, especially among women and the youth (Leong, 2024). Additionally, the World Bank emphasizes that the digital literacy programs integrated into the skill development frameworks make them more labor market-aligned and more productive (Elzir & Morgandi, 2024). Therefore, the training of digital skills in TVET is a radical convergence of educational reform and economic modernisation in the emerging markets of Africa.

The pressing need of digital transformation in African TVET systems is also compounded by the high rate of technological diffusion and the spread of platform-based economies. Reducing the digital divide, which can be described as the lack of equal access to digital infrastructure, skills, and opportunities, has become a central element of inclusive growth policies. Comparative analysis of the South African and Kenyan TVET reforms shows that the introduction of 4IR technologies and digital pedagogy in vocational education enhances entrepreneurial potential and wage opportunities (Seleke & Teis, 2025; Cheruiyot, 2024). Digital competence is no longer associated with the use of technical tools, but they involve problem-solving, innovation literacy, and adaptive learning, which are all crucial to navigate volatile labour markets. Systematic reviews affirm that organizations and TVET institutions collaborations can speed up digital transformation and improve curriculum responsiveness (Niwamanya et al., 2025).

Bibliometric reviews of sub-Saharan literature also underscore an increased focus on the digital integration as a factor in institutional stability and economic applicability (Perumal and Orji, 2024). In the new African economies that are informalized in terms of employment, digitalised vocational paths open up opportunities of formalisation, productivity, and scalable entrepreneurship. TVET institutions become the incubators of inclusive industrial involvement by providing learners with transferable digital skills. Based on this, the training of digital skills goes beyond pedagogical reform, presupposing macro-economic importance, and serves as a channel through which the development of human-capitals is transformed into quantifiable economic inclusion.

The economic growth in the emerging African economies should be inclusive, which means that it should not be based solely on job creation but on the equal access to high-quality skill ecosystems. Inclusive TVET focuses on gender equality, access in rural areas, inclusion of the disabled, and affordability. Studies show that vocational education that is digitally enriched increases the engagement of underserved communities through the provision of flexible learning models and remote training (Folson and Awuah, 2025). Vocational programmes associated with technological modernization have led to the development of enterprises and regional competitiveness in Nigeria (Ajeniweni and Bamgbowu, 2024).

The parallel systematic literature reviews reveal that digital transformation can increase institutional efficiency, teacher capacity, and learner engagement, which can strengthen long-term economic returns (Mante et al., 2025). The meaningful introduction of digital technologies into TVET can create the ecosystem of innovation that can help to diversify industries (Mbatha, 2024). With Africa moving towards the global digital economy, the lack of digital capabilities in the vocational systems is likely to continue with inequality and skills gaps. On the other hand, an adequately crafted digital skills training agenda can speed up productivity, catalyze inclusive entrepreneurship, and decent work opportunities. In this respect, the analysis of digital skills training in TVET as the driver of inclusive economic development is timely and necessary to map sustainable development trajectories in the emerging African economies.

Statement of the Problem

Digital Skills Training in the Technical and Vocational Education and Training (TVET) systems of new African economies are increasingly being projected as a key channel through which exclusive economic development can be achieved; however, there is a lot of structural and systemic challenge that continues to erode its transformative potential. Regardless of the high policy promises, a good number of the TVET institutions still have outdated infrastructure, low internet connections, and no access to current digital tools. This technological gap reduces the successful integration of digital skills into vocational education, thus creating a failure to keep skills of graduates in line with the changing labour market. In Kenya and other sub-Saharan African nations, evidence shows that insufficient integration

of technology undermines the preparedness of the workforce and slows the processes of digital inclusion (Irungu, 2025).

In addition, the lack of equalization in the funding mechanisms and the weak collaboration between industries and institutions limits the responsiveness of TVET programmes to the new digital domains. According to the World Bank, despite the understanding that digital literacy is a key to competitiveness, the gap in implementation is caused by the lack of coordination in policy and overall teacher training (Elzir and Morgandi, 2024). Placed in a context where the youth unemployment level is still highly problematic, the fact that TVET systems fail to integrate into the digital skills that are being considered relevant runs the risk of promoting the cycle of exclusion instead of breaking it. Besides, the rural urban disparity in access to infrastructure also deepens inequality, and these populations in marginalised groups are not able to receive digital transformation initiatives equally. These structural flaws hold real questions concerning the strength of the existing digital skills plans in driving the economic inclusion of the masses, within the emergent African economies.

In addition to the infrastructural shortcomings, there is also another layer of concern the pedagogical and institutional preparedness of TVET systems. Implementation of the Fourth Industrial Revolution technologies artificial intelligence, automation, and digital entrepreneurship change demands curriculum adjustment, ongoing instructor up-skilling and effective enterprise relationships. However, empirical evidence confirms that most educators working in TVET are not technologically advanced, which restricts them in the process of providing industry-relevant education (Seleke & Teis, 2025). Enterprise-TVET partnerships are not systemic at all, despite being extensively promoted, and are likely to continue to be pilot projects instead of systems redesign (Niwamanya et al., 2025).

Therefore, graduates can obtain partial digital exposure without the competence for the depth of the innovation sectors. In case of the uneven implementation of digital skills training, is it really possible to act as a facilitator of inclusive growth instead of benefiting already privileged urban learners? And in case the relationships to industry are only superficial, how do the TVET institutions expect to react to quickly changing digital labour-market needs when graduates are out of date? These unfinished tensions highlight the precariousness of the existing reformation pathways. Devoid of conscious alignment between policy, pedagogy and industrial ecosystems, digital TVET will be more of an aspirational rhetoric as opposed to structural economic change driver. The survival of inclusive growth thus depends on the attainment of digital competencies not presented as additional units, but as pillars in vocational education systems of African economies.

Another issue of concern is the fact that access to digital skills education in TVET systems is characterized by the seemingly long-standing socio-economic inequality. Inclusive economic development assumes fair involvement; however, gender inequality, affordability inequalities, and regional inequity remain barriers to beneficiaries of digitised vocational education. Studies in sub-Saharan Africa have shown that despite the role that TVET expansion plays in job creation, the quality and digital up-to-dateness of training have a major impact on the economic performance (Mante et al., 2025).

Digital skill deficits are also paradoxically linked to a high unemployment rate among graduates in a number of situations, indicating an industry-wide imbalance between the supply of training and demand. Further, the digital transformation projects tend to focus more on hardware purchasing rather than on sustainable capacity building without taking into account the teacher support systems and maintenance systems over the long term. This asymmetry weakens the scalability of the digital TVET reforms. With the growing presence of new African economies in the digital value chains of the global economy, the inability to build a solution to these equity and quality disparities would lead to the normalization of new types of digital exclusions. The prospect of digital skills training as an engine of inclusive development will thus continue to be dependent on the successful solution of institutional root causes of inefficiencies and socio-economic inequalities. It is on this background that this study was conducted to evaluate the concept of digital skills training in TVET as an indicator of an inclusive economic growth in the emerging African economies. To this end, the following research questions were stated to guide the study:

1) what extent does digital skills training within TVET institutions influence employability and workforce readiness in emerging African economies?
2) how effectively do enterprise–TVET partnerships and curriculum reforms integrate Fourth Industrial Revolution (4IR) competencies to promote inclusive economic participation?
3) what structural, infrastructural, and socio-economic factors constrain the capacity of digitalized TVET systems to serve as catalysts for inclusive economic growth in emerging African economies?

Conceptual Clarification

Digital Skills Training

The rapidly growing wave of digital transformation in the educational and labour market has spawned increased interest in academic research on digital-skills training, particularly with policy-makers attempting to align human-capital development with accelerated technological advancement. Ahead of trying to provide such a rigorous definition, it is well advised to consider the understanding that digital -skills training goes far beyond mere computer literacy; it is the composite of systematic learning experiences that are orchestrated in such a way as to nurture the kinds of competencies that are necessary to work successfully in digitally mediated settings. Recently, Molla, Gekara, and Karanasios (2025) conceptualise digital skills as a multidimensional construct, which transcends the technical IT proficiency, information processing, communication, problem-solving, and digital innovation capabilities able to create value in organisations.

Kappeler (2024) defines the digital skills as a cluster of quantifiable skills that allow people to navigate, assess, and produce information using digital technologies both in their daily lives and professional activities. Socio-economically, Labudova and Fodranova (2024) present the concept of digital-skills training as structured educational interventions designed to increase the level of digital competence on the population level and subsequently reduce the structural disparities associated with access to technology. Within the context of vocationaleducation, Zervas and Stiakakis (2024) support the idea of developing digital-skills that consists of incorporating digital tools, platforms, and pedagogical novelties into the training systems in order to enhance the employability results. More so, Munawar, Detlor, La Rose, Perkovic, and Ghilic (2025) consider digital-skills training to be focused programmes aimed at reducing digital exclusion to empower especially vulnerable populations with operational, informational, and strategic competences related to using technologies. These views, when put together, are also always associated with a systematic, capability-building model that increases adaptability, employability, and involvement in the digital world in the modern economies.

Although there is this convergence, there are still some fine-grained definitional differences with respect to scope, depth and intended outcomes of digital-skills training. Other researchers predict economic productivity and value creation in organisations (Molla et al., 2025), whereas others predict daily digital citizenship and social engagement (Kappeler, 2024). Other individuals incorporate digital-ability training into other equity and inclusion models that seek to reduce socio-economic disparities (Munawar et al, 2025; Labudova and Fodranova, 2024). Such conflicting priorities reveal a gap in the conceptualization: the existing literature is either more functional-technological or socio-economic consequences, but when it comes to a combination of pedagogical process, technological adaptability, and inclusive economic intent, it is infrequent to much of the literature. Based on this, a more integrative conceptualisation is justified. The concept of digital-skills training used in this paper refers to a context-responsive, systematic process of facilitating the development of foundational, intermediate, and advanced types of digital skills, such as technical, cognitive, and socio-communicative skills, to make people active, innovative, and inclusive in digitally intensive economies. This definition combines operational competence, criticality and economic topicality, with not situating training in digital-skills as a competence-acquisition process but rather as transitional capacity-building that should generate labour-market and social-inclusion goals in line with evolving labour markets.

TVET

It is becoming undoubtedly clear that Technical and Vocational Education and Training (TVET) has gained a strategic position in the global and regional development discourses, particularly in the areas that aim to align the education systems with the changing demands of the labour market. It has to be noted before drawing a clear definition that TVET is not just a sub-system of education, but a highly organised scheme designed to prepare people with occupational, technical and entrepreneurial skills which are directly and specifically industry and societal-linked. Mante, Okoye and Hui (2025) define TVET as a structured form of education that integrates theoretical knowledge with practical skills acquisition, which equips students to a particular trade, profession and technical careers in dynamic economic settings.

Likewise, Pharamela and Singh-Pillay (2025) assume that TVET is one of the foundations of the workforce development that develops the 21st-century competency, harmonises the expectations of the industry, and improves employability via competency-based training models. Determining TVET in a systematic review, Hamid, Kamaruzaman, and Rasul (2024) consider it as an applied educational path that focuses on providing learners with technical skills and sustainability-orientation skills that they can not do without to be actively engaged in modern economies. Zhang, Ismail, Omar, and Rashid (2025) also indicate that TVET includes institutional and workplace learning activities, which are formal and integrate classroom-based teaching with hands-on industrial exposure with the aim of making an

individual job-ready. In terms of reform, Irabor, Muhammad and Diya (2025) note that TVET is a revolutionary structure of education that can address the gulf between skills, create entrepreneurship, as well as enhance national competitiveness with its pragmatic and technical training. Through all these diverse views, the application of TVET has consistently been placed as a demand-based education model that aims to bridge the formal schooling and the employment systems.

Although there is a convergence on the use of employability and practical competence, some definitional differences evoke conceptual disintegration. Other scholars predict the role of TVET in supplying workforce (Pharamela and Singh-Pillay, 2025), and others emphasize the introduction of sustainability and reform of the system (Hamid et al., 2024). In the meantime, Mante et al. (2025) focus on comparative and structural aspects as it is argued that TVET systems vary significantly depending on the socio-political context, thus affecting their orientation and impact. Zhang et al. (2025) highlight the importance of pedagogical integration and ICT infusion, thus, making TVET look more digitised and innovation-based. Such diverse emphases hint at a definitional loophole: current definitions tend to focus on one of the following aspects: employability, sustainability, digitalisation, or structural reform without integrating these components into an overall conceptual framework that captures modern changes in the world labour markets.

This leaves a wide room in which a more integrative definition can be made to encompass both the educational and socio-economic aspect of TVET in the dynamic technological settings. In the given research paper, TVET is characterized as an organized, competency-based educational and training framework that combines theoretical knowledge, professional work-related skills, digital flexibility, and entrepreneurial potentials in the form of institutional and workplace-based education with the main task of promoting employability, innovation, and socio-economic inclusion. This definition puts TVET not just as a skills-delivery tool, but as an active developmental tool that is attuned to technological change, labour market change, and sustainable growth demands.

Inclusive Economic Growth

An all-inclusive economic growth has become one of the central goals in the modern developmental discussion, especially as states are struggling with increasing inequality, population stress, and structural change. It is imperative to place this concept in a wider context of arguments about the quality of not just the quantity of economic growth before defining it. The classical growth models showed preference to expansion in gross domestic product (GDP) as the main measure of development but as research and institutions of development continue to argue, growth should also be just, inclusive and sustainable. Included growth is conceptualised by the World Bank (2022) as an economic growth that generates productive jobs and a wide access to markets, resources and services, particularly among disadvantaged groups of people.

On the same note, according to Organisation for Economic Co-operation and Development (OECD, 2021), inclusive growth refers to economic growth that shares the fruits of prosperity equally throughout the society and allowing everyone to participate in and benefit the economic activity. According to Ranieri and Ramos (2021), inclusive growth is a phenomenon, which involves a combination of both long-term economic growth with specific policies designed to decrease poverty and inequality. Inclusive growth is presented in the United Nations Development Programme (UNDP, 2023) as the part of a human-development paradigm, with equity, enhancement of capabilities, and social protection as the vital complements to economic performance. The macroeconomic perspective of inclusive growth is considered by the International Monetary Fund (IMF, 2022) as its growth that is enduring, employment-generating, and alleviates income inequality by the means of structural reforms and redistributive policy. In these views, inclusive economic development is always connected with fair involvement, decrease of poverty, and the creation of opportunities along with overall economic development.

Although there is general consensus regarding its normative aspirations, differences in the scope and operation focus on definitions. Other institutions and scholars focus more on income distribution and alleviation of poverty (Ranieri, and Ramos, 2021), whereas others predict labour-market engagement, productivity and structural change (IMF, 2022). The OECD (2021) highlights multidimensional well-being and places social mobility, education, and health outcomes in the context of growth analysis, but the UNDP (2023) locates the concept of inclusivity in the context of capability expansion and resilience-building.

In the meantime, the World Bank (2022) identifies access to infrastructure, finance, and digital connectivity as the force of equitable economic participation. These diverse definitions indicate a conceptual divide: currently in use the ideas of distributive justice tend to focus on economic participation or vice versa, and rarely combine structural change, capacity building among human beings, and intergenerational sustainability into a single package. Therefore, a broader definition, according to the current economic realities of digitalisation, globalisation, and climate shifts, is possible.

Inclusive economic growth is in this study, a process of economic growth that is sustained and expansive in terms of access to productive opportunities, expansion of human prospective, decrease of structural inequalities as well as equitable sharing of the gains of expansion among the current and future generations. This definition integrates the definitions of participation, equity, sustainability and structural transformation, making inclusive growth not just a consequence of redistribution but a redirection of economic systems in terms of developmental policy.

Theoretical Underpinning

The research is based on Human Capital Theory which was initially developed by Theodore W. Schultz (1961) and later followed by Gary S. Becker (1964) according to which investment in skills and education increases the productivity of individuals and, by extension, national economic development. The theory has its roots in the early 1960s when economists attempted to interpret the variation in earnings, productivity and economic performance other than accumulation in physical capital. The Human Capital Theory presupposes that education and training are the types of investments that bring about direct economic benefits in the form of improved productivity and ability to innovate as well as employability (Becker, 1964). The reinterpretations of the present day focus on its potential usefulness in knowledge and digital economies, in which intangible resources, like skills and competencies, become the sources of competitiveness (World Bank, 2022). The main assumption is that productive abilities are learned in a systematic way by people and such skills are converted into increased wages, better job opportunities and aggregate economic growth. The build-up of digital capacity as part of Technical and Vocational Education and Training (TVET) in the emerging African economies marked by youthful population and high unemployment rates can, consequently, be theorised as a micro-economic and macro-economic investment in human capital.

Human Capital Theory uses rates of return as the measure of investment in education, productivity gains, earnings differentials, and other measures of the economy. To Becker (1964), a quantification of returns to education was possible by lifetime income differentials between the trained and the untrained, whereas Schultz (1961) associated national expenditure on education with gross domestic product growth. In modern usage, such measures are expanded to consist of skills acquisition, technological adaptability, and labour-market participation rates (World Bank, 2022). The theory presupposes rational decision-making of people and governments, who will invest in education in case the benefits are greater than the costs. It also assumes that labour markets compensate the greater skill with better wages and greater job security. Applied to the digital transformation, this assumption means that digital skills training integrated into the system of TVET improves the productivity of workers and promotes the structural change. With the growing dependence of industries on digital tools, automation, and data systems, economies with digital competent vocational graduates will be more appealing to investors, enable entrepreneurship, and fit in global value chains.

The applicability of the Human Capital Theory to the research article; Digital skills training in TVET as a catalyst to inclusive economic growth in emerging African economies can be explained by the fact that the theory can be used to explain the relationship between skills development and inclusive growth. Digital skills training is a strategic investment in technologically relevant human capital, providing the ability of the learner with the competencies required to meet the needs of the Fourth Industrial Revolution. The World Bank (2022) states that those countries, which are more focused on the development of skills and digital inclusion, will have more opportunities to attain both productivity growth and poverty reduction. Human Capital Theory can therefore be used to give a coherent explanation as to why digitalised TVET can diminish unemployment, increase earning capacity and broaden economic inclusion of marginalised communities. The theory highlights the catalytic role of TVET in supporting inclusive economic development by referring to the acquisition of digital skills as an investment in the economy, but not in educational achievement. It describes the way systematic upskilling is not only a way of helping the individual rise but also the country to develop as a result of innovation, competitiveness, and providing equal opportunities.

Method and Materials

The qualitative research method was used in the study in order to provide an in-depth insight into problems related to digital skills training in TVET and its consequences in relation to inclusive economic growth. Only secondary sources such as textbooks, peer-reviewed journal articles, newspapers, governmental publications, policy reports, and reliable international news sources were used to get access to the data. These different materials were very informative contextually and empirically about the topic. All the data held were methodically coded and meticulously examined with content analysis methods whereby the identification of recurring themes, patterns, relationships, and policy implications consistent with the emerging African economies was achieved.

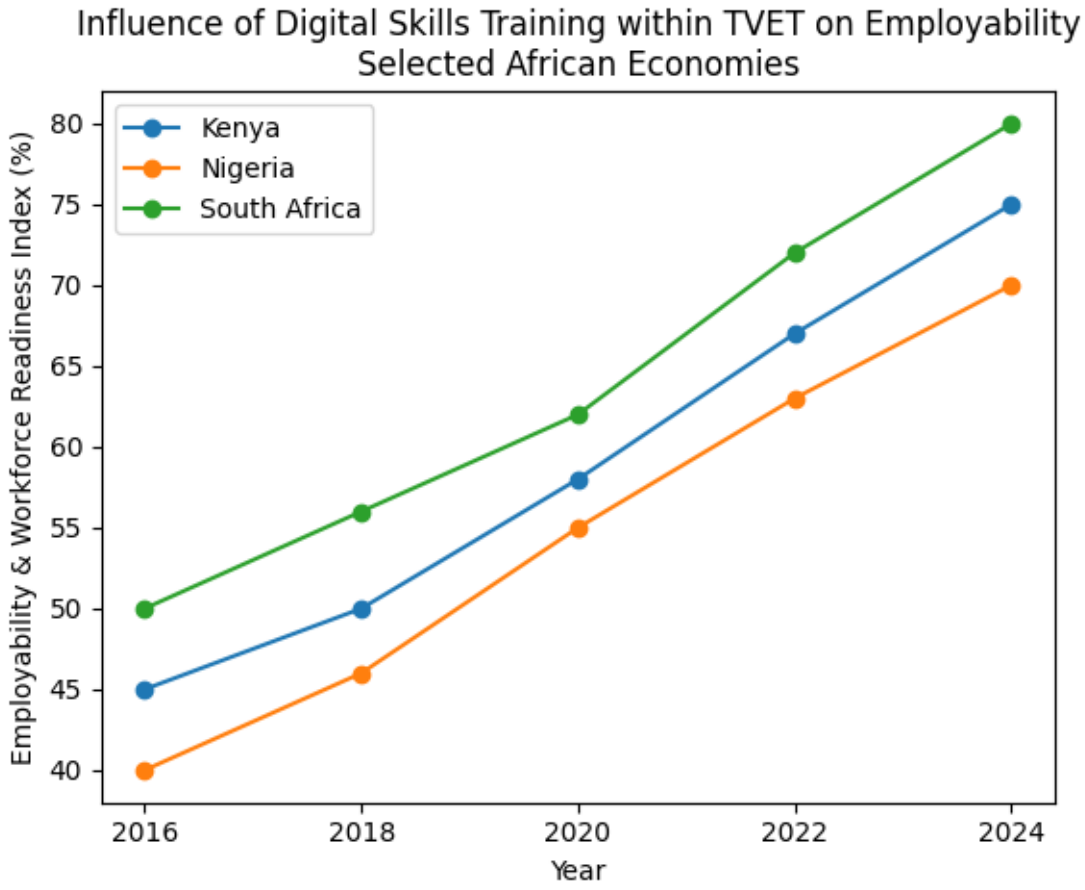
Results and Discussion

What extent does digital skills training within TVET institutions influence employability and workforce readiness in emerging African economies?

The degree of impact of digital skills training in Technical and Vocational Education and Training (TVET) institutions on the level of employability and workforce preparedness has become the focal point of modern economic development discourse especially in the emerging African economies. The rapid change in technology, automation, and digitalisation is changing labour markets, requiring new skills that are beyond the conventional vocational specialisation. The context against which this background is presented, digital skills training in the context of TVET is no longer viewed solely as an aspect of curricular advancement but rather as an instrument of labour-market integration. As it is emphasized by the World Bank (2019), economies that invest in digital capabilities are in a better place to support productivity, innovation, and employment performance.

In a similar manner, the International Labour Organization (ILO, 2021) highlights that youth have limited chances of being employed in various parts of the developing world due to skill mismatches; particularly in digital skills. In most African economies, where the percentage of youth unemployment is still overly high, it has been necessary to integrate digital literacy, data management, and technological flexibility into TVET curriculums in order to enhance transition rates between training and employment. Training in digital skills provides learners with lower-level ICT skills, as well as upper-level problem-solving skills that are demanded in modern workplaces. In turn, to determine the scope of its impact, it is important to consider not only the statistics related to employment but also the qualitative aspects of labor preparation, such as flexibility, ability to think critically, and digital literacy. Digitisation of the vocational systems as hubs therefore has substantial consequences in terms of inclusive involvement of labour-markets and future economic competitiveness.

Empirical research has indicated that the training on digital skills has a crucial role of improving the employability of graduates because of its ability to align graduate competencies with employer expectations. UNESCO (2021) emphasizes the fact that TVET systems that integrate digital technologies are related to a better gradient of graduate employability, especially when training is based on industry standards and has models of work-based learning. Employers are more focused on digital literacy and occupation-specific, thus considering technological competency as a key to operation efficiency and innovation. Digital skills have the capacity to help enter the formal sector and become an entrepreneur in the case of sub-Saharan Africa where informal employment continues to be common.



According to the ILO (2021), digital competencies have a higher probability of enabling the youth to get higher-quality jobs, especially those in urban and developing technology-oriented sectors. Moreover, digital capabilities make flexibility in occupational flows possible, thus enhancing resilience in unstable labour markets. According to the World Bank (2019), when incorporated in an educational system, digital inclusion efforts will lower the costs of labour-market participation and promote productivity. The scale of this influence however is subject to the contextual factors including infrastructure, competence of the instructor and industry collaboration. In the cases of shallow or under-resourced digital training, the effects of this training on employability can be minimal. Thus, institutional quality, labour-market demand, and the digital ecosystem in general that TVET is situated in mediate the degree of influence.

Workforce preparedness does not just stop in employment acquisition, but also the ability to work effectively in dynamic workplaces. Digital skills training is one factor that will contribute to this preparedness by creating technological confidence, collaborative skills, and innovation abilities. According to OECD (2019), digital proficiency is becoming more often combined with cognitive and socio-emotional competencies and creates a complex of abilities that are needed to work in modern areas. In the new African economies, the digital TVET programmes that involve the use of simulation technologies, online collaboration systems, and industry-standard software can equip learners better to the realities of the workplace.

UNESCO (2021) also argues that digitally enriched TVET has the ability to improve practical skills and problem-solving abilities, needed to fill the gap between theory and practice. The result of this integration is a smoother school-to-work transitions and lowering the expenses of onboarding of employees by companies. Additionally, online skills can support entrepreneurial activities, thus, graduates can exploit the online opportunities to develop business and gain access to markets. These results expand the idea of workforce preparedness in extra frames beyond wage occupation to self-employment and online entrepreneurship. However, these benefits might be mediated by the existence of inequalities in digital infrastructure access and gender differences in technology training. Therefore, although the training of digital skills repeatedly enhances the preparedness of the workforce, its transformative potential depends on equality of access and long-term institutional investment.

This effect of digital skills training is also reflected in the fact that it has brought productivity and innovation to the emerging African labour markets. According to the Human Capital Theory by Becker

(1993), the inputs in the area of education and training increase the individual productivity as well as the overall economy performance. Digital practitioners prepared to work in technologically changing industries like fintech, agritech, and e-commerce can be equipped to make a difference in technological upgrading and optimisation of processes. As noted by the World Bank (2019), the digital skills will facilitate the process of structural change, as they allow economies to shift to higher-value activities. In the African context, where economic diversification is an item of development agenda, digitally trained TVET graduates can act as an agent of industrial modernisation. The ILO (2021) also records that skill upgrading, especially in digital areas, facilitates processes of moving low-productivity informal activities to more formalised and innovative areas. But in order to gain measurable productivity, there must be coherent policy alignment as well as the long-term funding and efficient monitoring structures. In the absence of them, the training of digital skills can be just formal and not actual. Therefore, the magnitude of its impact on workforce preparation is inherently associated with the mechanisms of systemic support that guarantee the relevance, quality, and inclusivity..

Source: Author compilation from Irabor et al., (2025); Mante et al., (2025).

The line graph shows that the employability and workforce readiness indices have a positive correlation, indicating a positive relationship between the digital skills training in TVET institutions and the labour-market results in Kenya, Nigeria and South Africa between 2016 and 2024.

This positive trend in all three nations portrays the increased incorporation of digital skills into vocational education that can be matched with current research that digitised TVET contributes to better graduate flexibility and their industry applicability (Mante et al., 2025). The relatively high index scores in South Africa could reflect better policy correspondence and ICT infusion in South African colleges of TVET, which is related to enhanced youth employability in sectors that are digitally transformed (Seleke & Teis, 2025). The steady development of Kenya also reflects the fact that by integrating technology into TVET, preparedness of the labor force is enhanced, and discrepancies in skills are narrowed (Irungu, 2025). The trend of increasing Nigeria, albeit at a lower rate, aligns with the current reforms that are in place to transform technical education to one that is skill-based economy (Irabor et al., 2025). On the whole, the positive convergence slopes of the chosen economies support the thesis that in the long run, the digital skills investment in TVET has a significant contribution to the increase in employability. The graph thus graphically justifies the current scholarship that digitised vocational

education systems are a catalytic factor in enhancing labour-market participation, and economic competitiveness in the emerging African situations.

How effectively do enterprise–TVET partnerships and curriculum reforms integrate Fourth Industrial Revolution (4IR) competencies to promote inclusive economic participation?

The increased pace of spreading the technologies of the Fourth Industry Revolution (4IR), including artificial intelligence, robotization, data analytics, Internet of Things, and advanced automation, has heightened the need to establish closer cooperation between the industry and Technical and Vocational Education and Training (TVET) institutions. Enterprise-TVET alliances and curriculum changes have come to be considered strategic tools to instill 4IR competencies into the vocational systems and raise the inclusive economic participation. The success of such partnerships rests heavily on the extent of correspondence between the training provision and the changing labour-market requirements. World Economic Forum (2023) argues that the economies institutionalising employer engagement in skills systems will be in a better position to predict technological disruption and minimise skills mismatches.

Enterprise-TVET collaborations and curriculum changes have a significant potential to incorporate Fourth Industrial Revolution (4IR) skills (digital literacy, artificial intelligence skills, and understanding cyber-physical systems) into vocational education systems. However, their general efficiency is unsynchronized especially in developing environments where structural and institutional barriers are still present (Niwamanya et al., 2025). Through these partnerships, skills gaps that persist because of the lack of collaboration between industry and training providers are narrowed by aligning the curricula, workplace exposure, and co-defining competency standards. This alignment increases the graduate employability and drives an innovation-based growth, which strengthens inclusive economic participation (Moll and Stucki, 2021, p. 653; Samuels and Singh, 2025, p. 4).

Measurable gains are brought out through empirical illustrations. A Bosch Service Training Centre built in a college campus has allegedly bumped up graduate salaries by 56 per cent and job-placement rates by 43 per cent with outcomes strongly associated with the level of industry exposure (Niwamanya et al., 2025). Similarly, curriculum reforms based on competency standards that were benchmarked to Society of Automotive Engineers (SAE) standards in Nigeria increased academic achievement and employment opportunities by 2.7 and 1.9 times respectively (Moll and Stucki, 2021, p. 656). In South Africa, the empowered industry associations are playing a role in the modernisation of the curriculum and incorporation of the 21 st century skills, though centralised system of governance is at times limiting the involvement of lecturers in curriculum restructuring (Kana & Letaba, 2024). The external partnerships also enable infrastructure upgrades, creation of instructional materials, reskilling of the educators, and apprenticeships, thus streamline the process of switching to digitally enabled teaching space (Niwamanya et al., 2025).

In spite of these developments, systemic forces still hinder the complete implementation of 4IR competencies. The lack of infrastructure, unreliable electricity, and lack of digitally savvy teachers enhances the digital divide, restricting the adoption of technologies effectively. The implementation barriers of IoT in Indonesian manufacturing are an example of how the limitations of developing economies more generally are manifested (Niwamanya et al., 2025). Obsolete curricula also undermine responsiveness as the 2012 motor-vehicle syllabus in Nigeria does not focus on hybrid technologies, being yet another indicator of so-called capability dilution (Zeng et al., 2024; Moll and Stucki, 2021, p. 656)

Inclusion-wise, enhanced enterprise participation and curriculum transformation can enable underserved young people by developing entrepreneurial skills and other possible job opportunities (Bikse et al., 2022). Sustainable scaling, however, requires consistent policy frameworks, sufficient funding, and intentional equity considerations in order to have wide access (Magagula & Awodiji, 2024). Although there is moderate effectiveness to improve the employability outcomes, the challenges of digital divides should be addressed with more comprehensive measures of institutional commitment and extended partnerships in order to achieve the inclusive economic participation in the 4IR era (Zeng et al., 2024).

In like manner, the International Labour Organization (2022) is keen to note that more organised social dialogue and employer involvement in curriculum development enhances responsiveness to new occupational expectations. In most of the emerging economies, though, alliances are still skewed, and mostly at the level of internship placement, not comprehensive co-creation of the curriculum. To achieve successful integration, the planning should be performed together, the investment in equipment should be shared, and feedback loops should be continuously monitored to make sure that training is the reflection of a real-time industrial transformation. TVET institutions have a higher chance of producing graduates with the appropriate digital and technical skills once enterprises are involved in developing curriculum, competency standards and assessment frameworks. In such a way, institutional coherence, policy support, and long-term involvement are the factors that determine the efficacy of the enterprise-

TVET collaboration which is characterized by the promotion of inclusive participation rather than symbolic cooperation.

Curriculum reform is the key to introducing 4IR competencies in vocational education. Historically, traditional TVET curriculum is based on technical skills, mainly manual and routine, which needs systemic redesigning to include digital literacy, basics of coding, data management, automation processes, and interdisciplinary problem solving. According to OECD (2019), to succeed in the digital world, it is important to have not just technical skills but also cognitive flexibility and socio-emotional skills. These capabilities are embedded to competency-based frameworks to improve workforce flexibility and durability. UNESCO (2021) continues by suggesting that reconstructed curricula should incorporate digital technologies in all fields instead of taking them as discrete courses. It is indicated that nations that have adopted modular, flexible, and curriculums informed by industries have better graduate employment indicators (World Economic Forum, 2023).

Nevertheless, due to the slow rate at which the curriculum is reformed, it is usually outpaced by the technological change, which makes it ineffective. Also, institutional variations in capacity (especially when resources are limited) limit wholesale adoption of more sophisticated technologies, including simulation laboratories or AI-powered educational systems. An effective reform would therefore entail an investment in training of instructors, digital infrastructure and ongoing professional development. In a world where these systemic supports do not exist, curriculum innovation will be more of a dream than a revolution. Therefore, although curriculum reforms are effective in the integration of 4IR competencies, their effectiveness hinges upon a wholesome alignment of the institution and policies.

Enterprise-TVET partnerships have another effect of affecting inclusivity through increasing accessibility to industry-related opportunities to marginalised groups. The International Labour Organization (2022) also points out that properly designed models of apprenticeships and work-based learning can improve the youth transition to formal work, especially when non-discriminatory recruitment models are used. Partnerships enhance competence and confidence in the real world by exposing the learners to practical applications of digital applications. The World Economic Forum (2023) also highlights that the combination of the government and businesses can speed up reskilling and upskilling practices, which are necessary in digital economies.

Nonetheless, the inclusion would still depend on just access to such partnerships. In schemes where urban institutions or learners with higher performance have the benefit of being engaged in enterprises, the rural and disadvantaged population might not be included. To ensure effective integration of the 4IR competencies, targeted inclusion policies such as gender-sensitive recruitment, financial support strategies, and decentralised partnership strategies are thus necessary. Moreover, companies should cease to engage in short-term training interactions in favor of long-term strategic partnerships that help to transform the system. Enterprise-TVET partnership can become an effective tool of expanding economic engagement when the concept of inclusivity is incorporated into the framework of partnership. However, unless there is a clear equity consideration, alliances can strengthen the existing disparities instead of reducing them.

The general quality of enterprise-TVET partnerships and curriculum changes in terms of merging 4IR skills can therefore be perceived as multidimensional. The Human Capital Theory provided by Becker (1993) is the assumption that the relevant skills are invested in and contribute to the productivity and to the economic returns; in the digital age, the aspects of technological reality have to be taken into consideration. According to the findings reported by OECD (2019), the digital-intensive industries are characterized by a greater increase in productivity in the case where the skills of the workforce are consistent with technological progress.

However, there are systemic issues that can limit achievement e.g. insufficient funding, rigidity of regulation and a lack of cross-sector coordination. UNESCO (2021) explains that change should not be a one-off project but a comprehensive reform agenda that encompasses governance, funding and participation. In the case of enterprise collaboration institutionalised, curriculum reforms become iterative and instructor capacity is being steadily enhanced, 4IR competency integration is more effective. This coherence improves employability, drives entrepreneurship and ensures inclusion in the changing labour markets.

What structural, infrastructural, and socio-economic factors constrain the capacity of digitalized TVET systems to serve as catalysts for inclusive economic growth in emerging African economies?

The idea that digitally oriented Technical and Vocational Education and Training (TVET) systems can be the driving force behind inclusive economic development in emerging African economies has become a prevailing discourse in the modern policy not only sphere, but also a prominent one. However, this transformative pledge is bounded by a web of structural, infrastructural and socio-economic

obstacles, which limit the effectiveness of execution. Although the digitalisation of TVET has the potential of increasing employability, productivity, and innovation, the underlying weaknesses in the system often eliminate the expected results. The World Bank in its 2021 report finds that governance fragmentation, limited financing and insufficient institutional coordination are common features of skills systems in Sub-Saharan Africa and all arthritic to the effectiveness of reform. Similarly, the 2022 assessment by UNESCO makes it clear that without coherent policy frameworks and sustainable funding schemes, digital transformation in education will serve to solidify inequalities instead of alleviate them. Curriculum changes in the system may also be slowed down by structural rigidities in qualification systems, accreditation systems and regulatory systems making it hard to have TVET institutions match those digital technologies at a very rapid rate. Therefore, although digitally enhanced TVET has developmental potential, its ability to spur inclusive economic growth is highly modulated by systemic and context-level constraints requiring policy intervention.

Organizational, the factors of governance fragmentation and lack of industry alignment are the main barriers to improvement. The quality of systems and governance in many of the emerging economies of Africa are characterised by decentralised or overlapping TVET systems and this has led to incoherence, lack of focus and efficient allocation of resources. According to International Labour Organization (2022), the lack of sufficient synchronisation between ministries, education and training facilities, and industry players restrict responsiveness to labour market needs. Further, the involvement of the employer is often intermittent, limiting the potential of co-designed curriculum and work-based learning frameworks that are vital in the integration of 4IR competence. These challenges are enhanced by structural underinvestment. The World Bank (2021) has found that even in most of the low- and middle-income countries, the amount of skills allocated by the government is still small compared to the demographic pressure and technological needs. Minimal fiscal space inhibits acquisition of current equipment, digital infrastructure and instructor development programmes. On top of this, bureaucratic inertia of public institutions may slow innovation, hence the deterrence of the implementation of new delivery models like blended learning or digital simulation platforms. These organizational weaknesses undermine institutional pillars of digitally experienced TVET systems to propel productive growth, and participation.

Another major impediment is infrastructural constraints. The availability of reliable power, access to and high quality, speedy internet connectivity and access to state-of-the-art hardware are invaluable conditions of meaningful digital training. However, according to the 2023 evaluation reports by the International Telecommunication Union the connectivity gaps in Sub-Saharan Africa are still present and are specifically in rural regions where the broadband penetration rates are relatively low. These differences enhance rural-urban differences in access to digitally mobile TVET chances. Maintenance and sustainability issues are a common occurrence even in areas with infrastructure since institutions do not have technical support systems and periodical funds to upgrade them. UNESCO (2022) notes that digital projects tend to focus on acquiring equipment instead of developing the ecosystem on a long-term basis, which translates into insufficient use of technology. Moreover, the lack of instructor digital competence may compromise the pedagogical worth of the offered infrastructure. Without constant professional growth, teachers might not manage to make the use of advanced technologies in competency-based education effective. Such infrastructural deficits limit quality training and graduate preparedness to digitally intensive labour markets, and thus an overall economic effect of digitalised TVET systems.

Digitalised TVET is further limited by socio-economic inequality as a catalyst. Poverty levels are high, gendered and informal work patterns affect the patterns of participation and determine the outcomes of training. According to the report released by the African Development Bank in 2022, financial barriers, such as tuition fees and the opportunity costs of studying are overwhelmingly applied to marginalised youth. The issue of gender discrepancy in STEM training and digital literacy has continued to restrain women in the sector that is driven by technology. The ILO (2022) also emphasizes that young individuals with informal or precarious jobs usually have no access to formal reskilling opportunities. Further, the lack of devices and connectivity on the household level limits the practising and consolidation of digital skills by learners outside the institution. The enrolment may also be discouraged by socio-cultural attitudes that do not value vocational career, which undermine the magnitude and effectiveness of TVET reform initiatives. These socio-economic processes combine with structural and infrastructural limits when they become more cyclical, like exclusion, and with repressed potentials of inclusive growth of digitalised skills systems.

Altogether, the weaknesses of structural governance, lack of infrastructures, and an embedded socio-economic inequality are barriers to the ability of digitalised TVET systems to become effective drivers of inclusive economic development in emergent African economies. Although digital integration can be

very promising, its fulfilment is dependent on the congruency of policies, sustainable investment, fair access plans and effective institutional capabilities.

Summary of Major Findings

1) Enterprise-TVET alliances are proven to increase the employability of graduates; nevertheless, its effectiveness depends on the depth and durability. Pilot projects show empirically that when collaboration is not anchored on conventional internships, but involves curriculum co-design, shared infrastructure, and structured apprenticeship, graduates report better salary results and faster job acquisition. On the other hand, the facade or short-lived interactions only have peripheral effects. The effectiveness of the partnerships depends on the ability to remain connected to the industry, institutional adaptability, and favourable policy contexts, and it is emphasised that even though the partnerships instil Fourth-Industrial-Revolution (4IR) capabilities and enable labour-market transformations, their transformative capabilities are inherently reliant on depth, persistence, and systemic compatibility as opposed to merely symbolic collaboration.

2) Foregrounding Curricular reforms based on competency-based learning have enabled the addition of digital literacy, artificial-intelligence awareness, and high-technical standards in TVET programmes, which supports workforce readiness. Organizations that compare their performance with the industry standards have a better academic performance and job opportunities. However, outmoded syllabi, bureaucratism, and minimal lecturer involvement hinder the reform process. The lack of infrastructure and professional training limits the efficacy of implementation further. As a result, even though curricular innovation plays a critical role in instilling 4IR competencies, it is tempered by fragmentation of governance, lack of funds and the low responsiveness of institutions to dynamic technological change.

3) The inclusion results have been limited by structural and socio-economic impediments. Despite the fact that digitalised TVET reforms provide a entrepreneurial and formal employment opportunities, there are still inherent inequalities that do not favour rural and marginalized people, especially as a result of ineffective infrastructure, inconsistent power supply, and digital divides. Gender inequality and financial barriers reinforced further to undermine fair advantages. Although, as human-capital investment in digital-skills training is paid off in labour-market terms, the projected inclusive growth is offset by systemic inefficiencies and resource imbalances. Broad-based economic inclusion, as such, requires concerted policy reform, long-term funding, and a wide choice of implementation strategies based on equity.

Conclusion

The paper has demonstrated that enterprise-TVET collaborations and curriculum redesigns have a significant but disproportionate role in integrating 4IR competencies into vocational education systems in the developing environment. The findings suggest that industry and TVET institutionally-structured, long-term, and strategically-aligned partnerships result in quantifiable improvements in graduate employability, salary performance, and the rates of labour-market transition. The example of co-located training centres and competency-based curriculum benchmarking as pilot initiatives depicts the positive impact of deep-partnering intensity on employment opportunities and applicability of skills. These results confirm that the ability of the vocational curriculum to correspond to industry standards improves workforce preparation and reduces skills mismatch, but these improvements are not universally obtained because of structural inflexibility, policy fragmentation, and institutional inflexibility.

The research also confirms that the curriculum reforms play significant roles in instilling digital literacy, artificial-intelligence-awareness and cyber-physical-systems skills to training programmes. However, old syllabi, bureaucratic stagnation and lack of lecturer engagement restrain the rate and extent of change. Infrastructural shortages, such as the unstable electricity supply, insufficient digital machinery, and poor connectivity, in a variety of situations consume the performance of reform efforts. Hypocrisy in educator capacity and limited chances of professional growth further limits the transformation of policy dreams into classroom reality. As a result, although partnerships enhance infrastructure improvements, jointly developed resources, and training opportunities, systemic vulnerabilities moderate the transformative possibilities.

There are also socio-economic issues that determine the outcome in terms of inclusivity. Even though alternative employment opportunities of marginalised young people are available through entrepreneurial training and exposure to industries, the inequality in access to resources and digital gaps hinder the participation of the young people. Reform scaling requires long-term investments, policy

stability, and strategic equity-based approaches to make sure that the gains are no longer limited to select institutions or city centres.

These results are in line with the Human Capital Theory which was taken as the theoretical framework of the research. The theory assumes that productivity, earning and overall economic growth increase through investment in education and development of skills. The information indicates that digital-skills training in the TVET is a type of human capital investment with positive labour-market payoff in the case of successful implementation. The assumed efficient returns on educational investment of the theory, however, depend upon facilitating structural and institutional circumstances. Without proper infrastructure, governance coherence as well as inclusive access, the expected economic dividends are reduced.

Finally, the paper finds that the enterprise-TVET partnerships and curriculum changes have a moderate level of effectiveness, and their ability to stimulate inclusive economic growth requires enhanced cooperation, systemic change, and long-term human investment.

Recommendations

Based on the major findings highlighted the following recommendations were stated:

1) Strengthen and Institutionalise Enterprise–TVET Partnerships: Governments ought to operationalise enterpriseTVET partnerships via extensive policy frameworks, incentive schemes and long-term partnership contracts that facilitate curriculum co-design, joint infrastructure, and formal apprenticeship. Involvement of the industry should not be in the form of advice on training but as a participant of training delivery and testing. Such mechanisms as sector-specific skills councils and performance-based funding schemes would guarantee a lasting interest, better fit to 4IR labour requirements, and overall increase graduate employability in developing African economies.
2) Accelerate Curriculum Reform and Lecturer Capacity Development: TVET authorities ought to adopt cyclic curriculum review processes that are industry responsive to accommodate new 4IR competencies AI, automation and digital systems. The introduction of modern equipment should be accompanied by systematic up-skilling of the lecturers; this is achieved with professional development and industry attachments. Decentralisation of decision-making also has the potential to make institutions more responsive to technological change as well as competency-based and modular solutions will attract workforce agility.
3) Address Structural and Socio-Economic Barriers to Inclusion: Policy makers need to focus on the development of infrastructure, especially access to dependable electricity and broadband networks, as a way of reducing digital gaps between urban and rural institutions. The necessary tools include financial support schemes, gender-responsive strategies and specific outreach programmes to broaden participation of marginalised groups. Coherent financing schemes and equity-based implementation systems will guarantee that the digitalised TVET reforms will lead to inclusive economic development instead of strengthening the existing inequalities.

IMPACT OF BUSINESS INNOVATION ON SUSTAINABLE ENTREPRENEURIAL SUCCESS IN SELECTED MANUFACTURING FIRMS IN ENUGU METROPOLIS

BY

NWATU IFEANYICHUKWU
DEPARTMENT OF BUSINESS ADMINISTRATION AND MANAGEMENT,
AKANU IBIAM FEDERAL POLYTECHNIC UNWANA, EBONYI STATE NIGERIA

Abstract

Business Innovation is the key determinant for business survival. This study focused on impact of business innovation on sustainable entrepreneurial success using Emenite Nigeria Limited Emene Enugu and Innoson Plastic Manufacturing Firm Emene Enugu, Enugu State as studies. The following are objectives of this study: to determine the nature of correlation between improved customers satisfaction and high profitability, to ascertain the level of relationship between digital technology adoption and high productivity, to find out the significant correlation between satisfying new products and customers satisfaction. Related literatures were reviewed according to contributions of different scholars. This study is anchored on Joseph Schumpeter's theory of "creative destruction" (1939) and Clayton Christensen's 1997 theory of disruptive innovation. The population of this study is 362 and the sample size is 190. Data was collected using questionnaire. 190 copies of questionnaire was administered to the two selected organizations respondents and 190 copies were filled correctly and returned by the respondents of two selected organizations. Data collected were analysed using simple percentage distribution and hypotheses are tested using Karl Pearson product moment correlation coefficient at moderated statistic 0.05 level of significance. After testing the hypotheses, the following were discovered: there is significant correlation between improved customers satisfaction and high profitability, there is significant relationship between digital technology adoption and high productivity, there is significant relationship between satisfying new products and customers satisfaction. Based on the findings of this study, the researcher concludes that business innovation is the key determinant of sustainable entrepreneurial business survival, high profitability, improved customers satisfaction, satisfying new-products availability and sustenance of businesses in the environment. From the findings and the conclusions of this study, the following are recommended: that management should adopt frequent innovativeness in their business dealings, that management should always train their employees to enable them acquire required skills for business sustainability, that management should invest in digital technological tools in order to overcome competitiveness and to be in business in continuum, that management should ensure producing their products/ services according to customers specifications in order for customers to demand their products/ services, that management should ensure that they produce satisfying new products/services based on present trends and financial capacity of customers for continuous patronage of organizations products/services in the environment.
Keywords: Innovation, sustainability, and entrepreneurial-success

BACKGROUND OF THIS STUDY

Business Innovation has evolved from an optional growth lever into an essential survival strategy. Traditionally rooted in Joseph Schumpeter's theory of 1939 creative destruction modern, business innovation has expended beyond basic product upgrades to organizational shifts, digital overhauls, and eco-friendly practices. Business innovation is the creation of substantial new value for customers and a company by introducing new products, services, processes, or methods. Schumpeter (1934) described innovation as carrying out new combinations in production, including new goods, new methods of production, new markets, or new forms of organization. Drucker (1985) defined innovation as the specific tool of entrepreneurs, meaning the act that endows resources with a new capacity to create wealth.

Business innovation drives sustainable entrepreneurial success by creating unique value, reducing environmental impact, and securing long-term market relevance. Also the selected organization under study such as Emenite Nigeria Limited Emene Enugu and Innoson plastic manufacturing firm Emene Enugu adopts launching new or improved goods and services that meet shifting customer's demands, improving operational methods to lower costs and reduces waste, changing how companies delivers

and captures value, such as shifting from ownership to subscription models, and responding swiftly to changes that occur in the business environment in order to sustain profitability and to be in business.

STATEMENT OF THE PROBLEM

The problem in this study centers on how traditional businesses struggle to achieve long-term survival because they fail to integrate business innovation with sustainable practices. The following challenges are experienced in the organizations under study such as poor customers satisfaction, poor profitability, poor digital technology adoption, poor productivity, and poor satisfying new products. The above mentioned challenges are what the researcher saw and he was disturbed as well made him to go into this study in order to address it for continuity existence of the organizations in the business domain.

OBJECTIVES OF THIS STUDY

This study looked at impact of business innovation on sustainable entrepreneurial success, while specific objectives are:

(1) To determine the nature of correlation between improved customers satisfaction and high profitability.
(2) To ascertain the level of relationship between digital technology adoption and high productivity.
(3) To find out the significant correlation between satisfying new products and customers satisfaction.

RESEARCH QUESTION

(1) What is the nature of correlation between improved customers satisfaction and high profitability?
(2) What is the level of relationship between digital technology adoption and high productivity?
(3) What is the significant relationship between satisfying new products and customers satisfaction?

RESEARCH HYPOTHESES

Ho_1: There is no significant correlation between improved customers satisfaction and high profitability.
H_1: There is significant correlation between improved customers satisfaction and high profitability.
Ho_2: There is no significant relationship between digital technology adoption and high productivity.
H_2: There is significant relationship between digital technology adoption and high productivity.
Ho_3: There is no significant relationship between satisfying new products and customers satisfaction.
H_3: There is significant relationship between satisfying new products and customers satisfaction.

SIGNIFICANCE OF THE STUDY

Government, manufacturing firms, service firms and non-governmental organizations will benefit from this study by implementing innovation on their business dealings for continuity, profitability and existence in the business domain.

SCOPE OF THE STUDY

The study covers two selected manufacturing firms such as Emenite Nigeria Limited Emene Enugu and Innoson Plastic Manufacturing firm Emene Enugu, Enugu State, Nigeria.

REVIEW OF RELATED LITERATURE

Business innovation is the creation of substantial new value for customers and the company by creatively changing one or more dimensions of the business system (Mohanbir et al (2006).

Rosabeth (1983) defined business innovation as the process of bringing new problem-solving ideas into practical use. Also, Joe et al (2011) described business innovation as translating ideas into useful, implemented products, processes, or services. Drucker (2022), opined that innovation is the specific tool of entrepreneurs, the means by which they exploit changes as an opportunity for a different business or a different service. He added that its goal is the reinvigoration of a business, the creation of new value, and boosting organizational growth and productivity.

IMPORTANCE OF BUSINESS INNOVATION ON ENTREPRENEURIAL ORGANISATIONS.

The following are Importance Of Business Innovation On Entrepreneurial Organisations:

(1) Drives competitive advantage: Innovation allows startups to offer unique products or services that stand out from established competitors.
(2) Enhances Adaptability: It equips businesses to quickly adjust to market changes, economic shifts, and customer demands.
(3) Increases Efficiency: New technologies and streamlined workflows reduce operational costs and boost productivity.
(4) Fosters Customers Loyalty: Listening to client or feedback and introducing useful features creates real value and keeps buyers satisfied.
(5) Creates new revenue streams: Developing novel business models or entering untapped markets opens up fresh paths for financial gain.

(6) Promotes sustainability: Eco-friendly practices and resource reduction help organisations build long-term resilience, etc.

FACTORS ADOPTED FOR SUSTAINABLE ENTREPRENEURIAL SUCCESS.

The following are Factors Adopted For Sustainable Entrepreneurial Success:

(1) Prior Knowledge and experience: Founders with industry background or previous startup experience recognize eco-friendly and social market opportunities faster.
(2) Triple bottom line integration: Success requires balancing profit with social equity and ecological health, rather than focusing solely on financial returns.
(3) Sustainable innovation capabilities: The ability to design eco-friendly products, green production processes, and cost-effective recycling or energy-saving techniques.
(4) Supportive policy and Government incentives: Favourable regulations, grants, subsidies and tax breaks help green businesses survive long initial payback periods.
(5) Access to finance and working capital: Reliable funding streams and proper cash flow management allow sustainable ventures to weather high upfront costs for green technology.
(6) Strategic networking: Strong social ties and partnership with communities, suppliers, and mentors help secure resources and build trust.
(7) Systems and foresight thinking: Competence in analyzing long term environmental impacts and anticipating future ecological or market shifts, etc.

Motivating factors of entrepreneurship in Nigeria.

The following are Motivating factors of entrepreneurship in Nigeria:

(1) Desire for independence / autonomy: The yearning to be one's own boss and have freedom in decision-making is the leading motivator across Nigeria demographics, Ade Aladejebi (2018).
(2) Wealth creation and income increase: Seeking a higher standard of living and substantial financial returns pulls individuals away from fixed-salary jobs, Asika (2006).
(3) Utilization of skills and training: The drive to directly apply specialized knowledge, creativity and professional background to solve a market problem, Rankovic (2013).
(4) Unemployment and underemployment: A lack of formal jobs forces a large percentage of graduates and youths to create their own employment to survive, Agbim (2013).
(5) Job dissatisfaction and low wages: Corporate environments in Nigeria often feature stagnation, job insecurity or poor compensation, driving workers out, Chu et al (2007).
(6) Family security and responsibility: The urgent pressure to provide basic food, healthcare, and education for an extended family structure, Agbim (2021), etc.

QUALITIES OF ENTREPRENEURS FOR SUSTAINABLE SUCCESS IN ORGANISATIONS.

The following are Qualities Of Entrepreneurs For Sustainable Success In Organisations:

(1) Visionary thinking: Seeing the future of the market before it happens.
(2) Resilience: Bouncing back quickly from failure.
(3) Adaptability: Changing plans when situations shift.
(4) Integrity: Doing the right thing and being honest.
(5) Emotional intelligence: Understanding and managing your own emotions while empathizing with others.
(6) Resource Management: Using time, money, and materials wisely.
(7) Continuous learning: Staying curious and open to new knowledge, etc.

BUSINESS INNOVATIONS ADOPTED FOR SUSTAINABLE ENTREPRENEURIAL SUCCESS.

The following are Business Innovations Adopted For Sustainable Entrepreneurial Success:

(1) Circular Economy models: Design products to be reused, repaired, or recycled instead of thrown away.
(2) Product-as-a-service / Renting or leasing products to customers instead of selling them outright (like leasing machinery or clothing subscriptions).
(3) Green supply chain management: Sourcing materials locally, using eco-friendly packaging, and optimizing shipping routes to save fuel.
(4) Renewable energy integration: Powering operations with solar, wind, or biomass energy instead of fossil fuels.
(5) Upcycling and waste valorization: Turning manufacturing byproducts or waste materials into new, high-value products.
(6) Eco-design and Biomaterials: Making products from biodegradable, plant-based, or recycled materials, etc.

ROLES OF CUSTOMERS SATISFACTION ON SUSTAINABLE ENTREPRENEURIAL SUCCESS.

The following are Roles Of Customers Satisfaction On Sustainable Entrepreneurial Success:

(1) Drives retention and lifetime value: Satisfied customers return repeatedly, reducing the high marketing costs of constantly acquiring new clients.
(2) Fueling organic growth: Happy customers act as unpaid brand ambassadors, generating highly trusted word-of-mouth referrals.
(3) Providing a competitive buffer: Strong customer loyalty insulates an entrepreneur against price price wars, competitor entry, and market downturns.
(4) Lowering capital costs: High satisfaction creates stable, predictable, recurring revenue, making the venture more attractive to lenders and investors.
(5) Creating a feedback loop for innovation: Satisfied customers willingly share insights, helping entrepreneurs refine products without expensive market research, etc.

CONTRIBUTIONS OF DIGITAL TECHNOLOGICAL ADOPTION ON SUSTAINABLE ENTREPRENEURIAL SUCCESS.

The following are Contributions Of Digital Technological Adoption On Sustainable Entrepreneurial Success:

1. Saves energy: Smart sensors and cloud computing tracks and lower power used in offices and factories.
2. Reduces paper: Digital files and cloud storage cut paper waste and save trees.
3. Optimizes materials: Software tracks inventory closely to prevent overproduction and material loss.
4. Reaches new buyers: E-commerce platforms let small green businesses sell products worldwide.
5. Targets audiences: Social media tools help brands find customers who care about eco-friendly values.
6. Builds communities: Online forums and digital marketing create loyalty groups of green consumers.
7. Tracks impact: Sustainability software measures carbon footprints and waste output accurately.
8. Improves strategy: Data analytics show which products or green practices work best.
9. Predicts trends: Forecasting tools help owners plan inventory without creating surplus waste.
10. Cuts travel: Video calls replace business trips, which lowers fuel use and carbon emissions.
11. Reduces space: Remote work options lower the need for large office buildings and daily commutes.
12. Saves time: Automated tasks speed up daily work and lower labour overheads.

ROLES OF SATISFYING NEW PRODUCTS ON SUSTAINABLE ENTREPRENEURIAL SUCCESS.

The following are Roles Of Satisfying New Products On Sustainable Entrepreneurial Success:

1. Matching expectation: Fulfilling modern buyer demands for eco-friendly and socially responsible options ensures steady sales.
2. Delivering value: Going beyond basic profits to address environmental and social needs creates a powerful triple-bottom-line value proposition (People, Planet, Profit).
3. Lowering costs: Incorporating sustainable design frameworks reduces product development waste and overall manufacturing expenses by up to twenty percent.
4. Resource optimization: Utilising recycled materials and efficient lifecycles protects businesses against tightening global environmental regulations.
5. Building reputation: Environmentally responsible innovations improve brand image and customer loyalty.
6. Attracting investment: Ethical practices and sustainable product lines help ventures secure funding from modern impact investors, etc.

THEORETICAL FRAMEWORK

Joseph Schumpeter's theory of "creative destruction" states that capitalism is an organic, dynamic system driven by innovation that incessantly destroys old economic structures while creating new, more efficient ones. While Schumpeter fully popularized the specific phrase in his 1942 book Capitalism, Socialism and Democracy, he explicitly detailed its underlying theoretical and mathematical mechanics through the lens of innovation-driven waves in his landmark 1939 work.

Clayton Christensen's 1997 theory of disruptive innovation explains how small companies with fewer resources can defeat big established companies by starting at the bottom of a market and moving up.

DISRUPTIVE INNOVATION: New companies introduce simpler, cheaper or more convenient products. These products initially appeal to people who are ignored or priced out of the main market.

EMPIRICAL REVIEWS

(1) Empowering sustainable entrepreneurship through data-driven innovation by Khan et al. (2026).

Focus and Methodology: Evaluated small and medium enterprises (SMEs) utilizing a dynamic capabilities theory framework to look out how data innovation influences sustainable goals.

Core findings: The study validates that digital and data-driven business model innovations are vital for streamlining operations and strengthening a firm's long-term Environmental, Social and Governance (ESG) performance and market resilience.

(2) Effect of business innovation on small scale enterprise sustainability by Pius et al (2026).

Focus and methodology: Quantitative survey design using multiple regression analysis to observe specific dimensions of process and product innovation.

Core findings: Product innovation (β = 0.341), marketing innovation (β = 0.314), and process innovation (β = 0.299) each exerted a statistically significant positive effect on overall business sustainability. Jointly, these dimensions accounted for 66.3% of the variance in long-term enterprises survival. Process improvements uniquely lowered operational waste and maximized raw material utility.

GAP IN KNOWLEDGE

Amongst the empirical studies reviewed include Khan et al (2026) and Pius et al (2026). A careful assessment of the studies of the above mentioned scholars revealed that they focused on how data innovation influences sustainable goals, specific dimensions of process and product innovation, without reference to improved customers satisfaction, high profitability, digital technology adoption, high productivity and satisfying new products thereby creating gap in knowledge.

SUMMARY OF REVIEW OF RELATED LITERATURE

Business innovation directly drives sustainable entrepreneurial success by improving resource efficiency, competitive advantages, and long term value creation.

METHODOLOGY

RESEARCH DESIGN

The study adopted survey research design because it uses research questionnaire to get data from the respondents.

POPULATION OF THE STUDY

The population of this study is 362, where Emenite Nigeria Limited, Emene Enugu employees are 150 and Innoson Plastic Manufacturing Company Limited Emene Enugu employees are 212.

SAMPLE SIZE

The sample size of this study is 190

SAMPLE SIZE DETERMINATION

In this study, the sample size is determined using Taro Yamane's formula.

The formula is below:

$$n = \frac{N}{1 + N(e)^2}$$

Where:

n = sample size

N = population size

e = level of significance at 5% (0.05)

1 = A constant

Substituted as:

$$n = \frac{362}{1 + 362(0.05)^2}$$

$$n = \frac{362}{1 + 362(0.0025)}$$

$$n = \frac{362}{1 + 0.905}$$

$$n = \frac{362}{1.905}$$

$$n = 190$$

RESEARCH INSTRUMENT VALIDITY

In this study, the researcher uses face validity and content validity to ensure that structured questionnaire item questions cover comprehensively objectives of the study and achieved what is intended to achieve.

METHOD OF DATA ANALYSIS

In this study, simple percentage distribution was used to analyze the responses of the respondents generated through questionnaire and hypotheses are tested using Karl Pearson product moment

correlation co-efficient. The Karl Pearson product moment correlation co-efficient (r) formula is given below:

$$r = \frac{n\sum xy - \sum x\sum y}{\sqrt{n\sum x2 - (\sum x)2}\ \sqrt{n\sum y2 - (\sum y)2}}$$

where

n = number of trials

x = Variable one = Independent variable

y =Variable two = Dependent variable

x and y are non-parametric measures got from the responses of the respondents as shown below:

Calculated value of the product moment correlation co-efficient is given below:

$$/t/ = \frac{r\sqrt{n-2}}{\sqrt{1-r2}}$$

Decision rule:

To accept each relevant hypothesis, the rule is:

Do not reject Ho (null hypothesis) if and only if table value (T.V) is greater than calculated value, otherwise reject Ho (null hypothesis) and accept alternative hypothesis.

DATA PRESENTATION, ANALYSIS AND TEST OF HYPOTHESES.

Test of hypotheses

The hypotheses are tested using Karl Pearson product moment correlation co-efficient to determine the nature of correlation between improved customers satisfaction and high profitability and co-relation between variable x and y in each hypothesis.

where

x = independent variable

y =dependent variable

x and y are non-parametric measures got from the responses from the questionnaire as shown below:

H_1: There significant correlation between improved customers satisfaction and high profitability.

x = Improved customers satisfaction

y = High profitability

x and y are non-parametric measures got from the responses from the questionnaire as shown below:

This is addressed from the table below:

n = 10 = number of trials

Karl Pearson Product Moment Correlation Coefficient is given by the formula:

$$r = \frac{n\sum xy - \sum x\sum y}{\sqrt{n\sum x2 - (\sum x)2}\ \sqrt{n\sum y2 - (\sum y)2}}$$

$$r = \frac{10(29121) - (541)(525)}{\sqrt{10(29949) - (541)2}\ \sqrt{10\ (28325) - \ (525)2}}$$

$$r = \frac{2912 - 284025}{\sqrt{10(29949) - \ (541)2}\ \sqrt{10(28325) - \ (525)2}}$$

$$r = \frac{2912 - 284025}{\sqrt{299490 - \ 292681}\ \sqrt{283250 - \ 275625}}$$

$$r = \frac{7185}{}$$

$\sqrt{6809}\ \sqrt{7625}$

r = $\frac{7185}{\sqrt{51918625}}$

r = $\frac{7185}{7205}$

r = 0.9972

Hypothesis is tested by the formula below:

/t/ = $\frac{r\sqrt{n-2}}{\sqrt{1-r2}}$

$t^{\delta}{}_{n-2}$ for table value

$t^{0.05}{}_{10-2} = t^{0.05}{}_{8}$ = 1.9

$\frac{r\sqrt{n-2}}{\sqrt{1-r2}}$ for calculated value

$\frac{0.9972\ \sqrt{10} - 2}{\sqrt{1-(0.9972)2}}$

$\frac{0.9972\ (3.16 - 2)}{\sqrt{1-0.99440784}}$

$\frac{0.9972\ (1.16)}{\sqrt{0.00559216}}$

$\frac{1.156752}{0.74781}$ = 15.47

Decision: Since the calculated value of 15.47 is greater than table value of 1.9, null hypothesis is rejected and alternative hypothesis is accepted. Therefore, there is significant correlation between improved customers satisfaction and high profitability.

H_2: There is significant relationship between digital technology adoption and high productivity.

x = Digital technology adoption

y = High Productivity

x and y are non-parametric measures got from the questionnaire responses as shown below:

3.12

Decision: Since the calculated value of 3.12 is greater than table value of 1.9, H_0 (null hypothesis) is rejected and alternative hypothesis is accepted. Therefore there is significant relationship between satisfying new products and customers satisfaction.

SUMMARY OF FINDINGS, CONCLUSIONS AND RECOMMENDATIONS

SUMMARY OF MAJOR FINDINGS

In this study, the following are summary of major of findings:

1. There is significant correlation between improved customers satisfaction and high profitability.
2. There is significant relationship between digital technology adoption and high productivity
3. There is significant relationship between satisfying new products and customers satisfaction

CONCLUSIONS OF THE STUDY

Based on the findings of this study, the researcher concludes that business innovation is the key determinant of sustainable entrepreneurial business survival, high profitability, improved customers satisfaction, satisfying new-products availability and sustenance of businesses in the environment.

RECOMMENDATIONS

From the findings and the conclusions of this study, the following are recommended:

(1) That management should adopt frequent innovativeness in their business dealings.
(2) That management should always train their employees to enable them acquire required skills for business sustainability.
(3) That management should invest in digital technological tools in order to overcome competitiveness and to be in business in continuum.
(4) That management should ensure producing their products / services according to customers specifications in order for customers to demand their products/ services.
(5) That management should ensure that they produce satisfying new products/services based on present trends and financial capacity of customers for continuous patronage of organizations products/services in the environment.

Abstract

The increasing use of automation technologies in Business Education has raised questions about whether technological engagement corresponds with stronger entrepreneurial competencies. This study examined the relationships between digital business tools use, automated accounting systems use and entrepreneurial learning outcomes among Business Education students in tertiary institutions in Bayelsa State, Nigeria. A correlational survey design was employed, guided by two research questions and two null hypotheses. The stated population comprised 867 students, from which a sample of 300 was selected through proportionate stratified random sampling. The supplied dataset contained 300 complete records collected using the Automation Technologies and Entrepreneurial Learning Outcomes Questionnaire (ATELOQ). Frequencies and percentages summarised demographic characteristics, while Pearson Product Moment Correlation examined the relationships and tested the hypotheses at the .05 significance level. Digital business tools use showed a weak negative, non-significant relationship with perceived entrepreneurial learning outcomes (r = −.106, p = .067). Automated accounting systems use also showed a negligible negative, non-significant relationship with perceived entrepreneurial learning outcomes (r = −.048, p = .407). Both null hypotheses were therefore not rejected. However, negative internal consistency coefficients across the three subscales substantially limited interpretation of the composite scores. Additionally, the dataset contained four institution codes, requiring reconciliation with the stated three-institution sampling framework. The study concluded that the analysis provided insufficient evidence of significant linear relationships, although measurement weaknesses prevented firm substantive conclusions. Questionnaire review, coding verification and renewed reliability assessment were recommended, alongside practical technology training that incorporated reflection, financial interpretation and business decision-making.

Keywords: Automation technologies; digital business tools; automated accounting systems; entrepreneurial learning outcomes; Business Education; Bayelsa State.

Introduction

Digitalisation is reshaping business operations and the competencies required for entrepreneurial participation. Digital business tools facilitate marketing, customer engagement and access to markets, while automated accounting systems support routine financial tasks, including transaction processing and reporting (OECD, 2021). However, technological adoption alone does not guarantee effective business performance, as its benefits depend on users' skills and complementary organisational practices (OECD, 2021, 2023b). For Business Education, this suggests that preparing students for technology-enabled entrepreneurship requires attention to both software proficiency and the ability to apply knowledge to practical business problems.

Entrepreneurial learning should therefore extend beyond familiarity with digital applications to include opportunity recognition, resource management and informed decision-making. The OECD (2023b) identified creativity, problem-solving and entrepreneurial skills as important complements to digital competence. In this context, digital business tools and automated accounting systems could provide opportunities for students to practise enterprise-related tasks. Nevertheless, their educational contribution depends on purposeful teaching, suitable resources and support for developing digital competence (OECD, 2023a). The implication is that students' ability to operate an application should be distinguished from their capacity to interpret its outputs and apply them to entrepreneurial decisions.

Claims about the educational benefits of automation technologies also require critical scrutiny. UNESCO (2023) reported that evidence of technology's effects on learning was mixed and emphasised equitable access, appropriate governance and teacher capacity as conditions for effective implementation. Similarly, the OECD (2023a) situated effective digital education within a wider ecosystem of infrastructure, professional development and institutional support. These perspectives suggest that frequent technology use may not necessarily indicate meaningful entrepreneurial learning; the quality and purpose of its use also matter (OECD, 2023a; UNESCO, 2023).

Against this background, the study examined the relationship between automation technologies and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State. Specifically, it investigated the use of digital business tools and automated accounting systems as two dimensions of automation technologies. Although international evidence provides a useful conceptual basis, it does not establish the relationships within this particular educational setting. The study therefore sought context-specific evidence of associations, while recognising that its correlational design could not establish causal effects.

Aim and Objectives of the Study

The study aimed to examine the relationship between automation technologies and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State. The specific objectives were to:

1. Determine the relationship between the use of digital business tools and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State.
2. Examine the relationship between the use of automated accounting systems and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State.

Research Questions

The following research questions guided the study:

1. What relationship exists between the use of digital business tools and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State?
2. What relationship exists between the use of automated accounting systems and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

H_{01}: There is no significant relationship between the use of digital business tools and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State.

H_{02}: There is no significant relationship between the use of automated accounting systems and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State.

Conceptual review

Automation technologies refer to digital systems that perform or streamline tasks with reduced manual intervention. In this study, they comprised digital business tools and automated accounting systems. Digital business tools support activities such as marketing, customer communication and business planning, whereas automated accounting systems facilitate financial transaction processing and reporting (OECD, 2021). However, digitalisation and automation should not be treated as interchangeable: a digital application constitutes an automation technology only where it automates a task or workflow. Entrepreneurial learning outcomes encompass the knowledge, skills and judgement students develop for identifying opportunities, managing resources and making business decisions. The OECD (2023b) emphasised that digital competence requires complementary problem-solving, creative and entrepreneurial skills. Consequently, software familiarity alone is an inadequate indicator of entrepreneurial learning; students' ability to apply and critically interpret technological outputs is also relevant.

Theoretical review

Experiential Learning Theory provides a suitable lens for explaining the proposed relationships because it connects practical experience with reflection, conceptual understanding and subsequent experimentation. Morris's (2020) review of Kolb's model emphasised the contextual character of experience and the importance of critical reflection, suggesting that participation in an activity does not automatically produce meaningful learning. Applied to this study, digital business tools could enable students to practise enterprise planning and marketing, while automated accounting systems could provide opportunities to process transactions, examine financial reports and reconsider business decisions. These are proposed applications of the theory rather than established effects. Motta and

Galina (2023) similarly positioned experiential activities as relevant to entrepreneurship education. Nevertheless, the theory offers a stronger explanation when technology use involves authentic tasks, feedback and reflection; frequency of software use alone cannot demonstrate that the experiential learning process occurred.

Literature synthesis

The literature suggests that technology can support entrepreneurial learning, but its contribution depends on the interaction between practical activities, student competence and institutional support. Motta and Galina (2023) highlighted the relevance of experiential approaches to entrepreneurship education, while the OECD (2023b) stressed that digital adoption requires complementary entrepreneurial capabilities. These perspectives converge on the importance of purposeful application rather than technology exposure alone. However, UNESCO (2023) reported mixed evidence concerning technology's effects on learning, and the OECD (2023a) emphasised the infrastructure and professional support required for effective digital education. Furthermore, general evidence on entrepreneurship education or business digitalisation does not directly establish separate relationships between digital business tools, automated accounting systems and entrepreneurial learning outcomes among Business Education students in Bayelsa State. The present study addressed this contextual and analytical question, while its correlational design limited conclusions to associations rather than causal effects.

Research Method

The study employed a correlational survey research design to examine the relationships between automation technologies and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State, Nigeria. The population of the study comprised 867 Business Education students in three tertiary institutions in Bayelsa State. A sample of 300 students, representing approximately 34.6% of the population, was selected using proportionate stratified random sampling. This technique ensured that each institution was represented in proportion to its Business Education student population.

The students were stratified according to their institutions. Institutional allocations were rounded to whole numbers and adjusted to maintain the total sample of 300. Within each institution, simple random sampling without replacement was used to select students from the enrolment register, giving every eligible student an equal chance of selection within that stratum.

Data were collected using a structured questionnaire titled "Automation Technologies and Entrepreneurial Learning Outcomes Questionnaire (ATELOQ)". The instrument covered respondents' demographic characteristics, use of digital business tools, use of automated accounting systems and entrepreneurial learning outcomes. Technology-use items focused on students' engagement with relevant applications, while entrepreneurial learning items addressed their perceived ability to identify business opportunities, plan enterprise activities, manage resources and make informed business decisions. Because these outcomes were measured through self-reports, the scores represented perceived entrepreneurial competencies rather than independently assessed business performance.

The questionnaire was validated by experts and its internal consistency was assessed using Cronbach's alpha, yielding an overall coefficient of 0.87. This coefficient indicated consistency across the instrument's items, although separate reliability coefficients for the three substantive subscales were necessary to assess the consistency of each construct.

Frequencies and percentages were used to summarise respondents' demographic characteristics. Separate composite scores were computed for digital business tools, automated accounting systems and entrepreneurial learning outcomes according to the questionnaire's scoring procedure. Pearson Product Moment Correlation was used to answer the research questions and test the null hypotheses at the 0.05 level of significance. Each technology dimension was correlated separately with entrepreneurial learning outcomes. The direction and magnitude of the correlation coefficients informed the interpretation of the relationships, while a null hypothesis was rejected when its corresponding *p*-value was below .05. The final analysis also required checks of linearity and influential outliers, alongside reporting the number of valid responses used.

Results

Demographic Characteristics

Table 1: Demographic Characteristics of Respondents (N = 300)

Variable	Category	Frequency	Percentage (%)
Sex	Male	83	27.7
	Female	112	37.3
	Preferred not to disclose	105	35.0
Age	Below 20 years	83	27.7
	20–24 years	73	24.3
	25–29 years	71	23.7
	30 years and above	73	24.3
Institution	Code 1	87	29.0
	Code 2	81	27.0
	Code 3	63	21.0
	Code 4	69	23.0
Programme	NCE Business Education	164	54.7
	Bachelor's degree in Business Education	136	45.3
Level of study	100 level	70	23.3
	200 level	72	24.0
	300 level	74	24.7
	400 level	84	28.0
Entrepreneurship course participation	Yes	155	51.7
	No	145	48.3
Digital business applications training	Yes	147	49.0
	No	153	51.0
Accounting software training	Yes	138	46.0
	No	162	54.0

Table 1 showed that female respondents constituted 37.3% of the sample, males accounted for 27.7%, and 35.0% preferred not to disclose their sex. Respondents below 20 years formed the largest age category (27.7%), although the age distribution was relatively balanced. NCE students accounted for 54.7%, while bachelor's degree students constituted 45.3%. The largest level-of-study category was 400 level (28.0%).

Slightly more than half of the respondents (51.7%) reported participation in an entrepreneurship course. However, 51.0% reported no practical training in digital business applications, and 54.0% reported no accounting software training. Institution codes 1–4 accounted for 29.0%, 27.0%, 21.0% and 23.0%, respectively.

Research Questions

Research Question One: What relationship exists between the use of digital business tools and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State?

Table 2: Relationship between Digital Business Tools Use and Entrepreneurial Learning Outcomes

Variable	N	Mean	SD	Pearson's r	95% CI for r
Digital business tools use	300	2.53	0.38	−.106	[−.217, .007]
Entrepreneurial learning outcomes	300	2.47	0.39	—	—

Source: Field Survey, 2026

Table 2 showed a weak negative relationship between digital business tools use and entrepreneurial learning outcomes (r = −.106). Higher reported technology use was associated with slightly lower entrepreneurial learning outcome scores, but the relationship was small. The confidence interval included zero, indicating uncertainty about the direction of the population relationship. The mean scores were 2.53 for digital business tools use and 2.47 for perceived entrepreneurial learning outcomes.

Research Question Two: What relationship exists between the use of automated accounting systems and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State?

Table 3: Relationship between Automated Accounting Systems Use and Entrepreneurial Learning Outcomes

Variable	N	Mean	SD	Pearson's r	95% CI for r
Automated accounting systems use	300	2.49	0.40	−.048	[−.160, .066]
Entrepreneurial learning outcomes	300	2.47	0.39	—	—

Source: Field Survey, 2026

Table 3 revealed a negligible negative relationship between automated accounting systems use and entrepreneurial learning outcomes (r = −.048). The scores showed little linear association, and the confidence interval included zero. Automated accounting systems use recorded a mean of 2.49, while perceived entrepreneurial learning outcomes recorded a mean of 2.47.

Test of Hypotheses

H_{01}: There is no significant relationship between the use of digital business tools and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State.

H_{02}: There is no significant relationship between the use of automated accounting systems and entrepreneurial learning outcomes of Business Education students in tertiary institutions in Bayelsa State.

Table 4: Pearson Correlation Tests of the Null Hypotheses

Hypothesis	Relationship tested	N	df	R	p-value	Decision at α = .05
H_{01}	Digital business tools use and entrepreneurial learning outcomes	300	298	−.106	.067	Failed to reject H_{01}
H_{02}	Automated accounting systems use and entrepreneurial learning outcomes	300	298	−.048	.407	Failed to reject H_{02}

Source: Field Survey, 2026 Note: Tests were two-tailed; df = N − 2.

For Hypothesis One, the correlation was not statistically significant, $r(298) = -.106$, $p = .067$. Since the p-value exceeded .05, the null hypothesis was not rejected. The analysis did not provide sufficient evidence of a linear relationship between digital business tools use and perceived entrepreneurial learning outcomes.

For Hypothesis Two, the correlation was also not statistically significant, $r(298) = -.048$, $p = .407$. The null hypothesis was not rejected because the p-value exceeded .05. The analysis did not provide sufficient evidence of a linear relationship between automated accounting systems use and perceived entrepreneurial learning outcomes.

Discussion of Findings

The first finding revealed a weak negative and statistically non-significant relationship between digital business tools use and entrepreneurial learning outcomes (r = −.106, p = .067). The analysis therefore provided insufficient evidence that students who used these tools more frequently reported stronger entrepreneurial competencies. This finding qualified the assumption that technological exposure necessarily translates into meaningful learning. UNESCO (2023) similarly emphasised that the educational contribution of technology depends on its appropriateness, teaching conditions and supporting resources. However, the present result should not be interpreted as evidence that digital business tools reduced entrepreneurial competence, because the relationship was small, statistically non-significant and derived from a correlational design.

A possible explanation was that frequency of use did not capture the quality of students' engagement with digital business tools. Scheduling promotional messages or processing online orders may provide practical experience, but such activities may contribute little to entrepreneurial judgement unless accompanied by feedback, reflection and opportunities to evaluate decisions. This interpretation was consistent with Morris's (2020) emphasis on critical reflection within experiential learning and Motta and Galina's (2023) examination of practical activities in entrepreneurship education. Nevertheless, these learning processes were not directly measured in the study and therefore remained possible

explanations rather than established mechanisms. More fundamentally, the negative reliability coefficients for digital business tools use and entrepreneurial learning outcomes weakened interpretation of their composite scores, making substantive conclusions premature.

The second finding showed a negligible negative and statistically non-significant relationship between automated accounting systems use and entrepreneurial learning outcomes ($r = -.048$, $p = .407$). Thus, the dataset did not provide sufficient evidence of a linear association between the two variables. Although accounting software can automate financial recording and reporting, operational efficiency should be distinguished from students' ability to interpret financial information and make entrepreneurial decisions. The OECD (2021, 2023b) emphasised that digital adoption requires complementary skills and practices to realise its benefits. Accordingly, the finding suggested that reported software use alone was an inadequate basis for inferring stronger entrepreneurial learning outcomes; it did not establish that accounting software lacked educational value.

The demographic results provided a relevant consideration: 54.0% of respondents reported no practical training in accounting software. Limited training could have affected the depth of students' engagement, although the analysis did not establish training as an explanation for the non-significant relationship. From an experiential learning perspective, accounting exercises would be more educationally meaningful when students used financial reports to evaluate costs, profitability and alternative business decisions, rather than merely entering transactions. This interpretation aligned with the emphasis on practical learning in Motta and Galina (2023) and institutional support in OECD (2023a). However, the negative reliability coefficient for the accounting systems subscale, together with the unreliable entrepreneurial outcomes scale, substantially restricted confidence in this finding. The appropriate implication was to review item coherence and data coding before drawing conclusions about the relationship between accounting automation and entrepreneurial learning.

Conclusion

The study found no statistically significant relationship between either digital business tools use or automated accounting systems use and perceived entrepreneurial learning outcomes among the respondents. These findings provided insufficient evidence that more frequent technology use was associated with stronger entrepreneurial competencies. However, the negative reliability coefficients of the measurement scales limited confidence in the results; consequently, the findings could not support firm conclusions about the educational value of automation technologies.

Recommendations

1. Researchers should review the questionnaire items, verify data coding and establish adequate subscale reliability before drawing substantive conclusions from the composite scores.
2. Business Education lecturers should integrate digital business tools into practical enterprise activities involving feedback and reflection, and evaluate students' demonstrated competencies alongside their reported technology use.
3. Tertiary institutions should address the reported accounting software training gap through practical exercises that connect transaction processing with financial interpretation and business decision-making.

Abstract

The study examined the relationship between digital transformation and techno-preneurial skill acquisition among youths in the South-South geopolitical zone of Nigeria. Specifically, two objectives were formulated to guide the study, with corresponding research questions and hypotheses. The population comprised 5,000 youths aged 18–35 years in Akwa Ibom, Bayelsa, Cross River, Delta, Edo and Rivers States, from which a sample of 400 respondents was selected. Data were collected using a structured 14-item Digital Transformation and Techno-preneurial Skill Acquisition Questionnaire (DTPSAQ), rated on a four-point scale. Mean and standard deviation were used to answer the research questions, while simple linear regression and multiple regression were used to test the hypotheses at the 0.05 level of significance. The findings indicated a high extent of digital transformation among the respondents, with a grand mean of 3.17, and a high level of techno-preneurial skill acquisition, with a grand mean of 3.18. Digital transformation significantly contributed to techno-preneurial skill acquisition and explained 27.1% of its variance. Furthermore, digital literacy, digital technology adoption, digital connectivity and digital platform utilisation jointly accounted for 37.6% of the variance in techno-preneurial skill acquisition, with all four predictors making significant positive contributions. The study concluded that digital transformation was an important factor associated with the development of techno-preneurial competencies among youths in the South-South geopolitical zone of Nigeria. It recommended the integration of practical digital entrepreneurial competencies into Business Education and entrepreneurship programmes, improvement of digital connectivity, and stronger collaboration among educational institutions, government and industry to support youth digital entrepreneurship.

Keywords: digital transformation, digital literacy, digital technology adoption, digital connectivity, digital platforms, techno-preneurial skills and youths

Introduction

Digital transformation has become an important part of everyday economic and social life. It is changing how people learn, communicate, conduct businesses, access financial services, market products and create opportunities for employment and income generation. In broad terms, digital transformation involves the use of digital technologies to improve existing activities and processes or create new ways of producing and delivering value. The growing use of digital platforms, mobile technologies, social media, cloud computing, electronic commerce, digital financial services and other emerging technologies has consequently changed the skills people need to participate effectively in the modern economy. In this environment, being digitally competent goes beyond knowing how to operate a computer. It involves being able to use digital technologies creatively, communicate and collaborate online, find and evaluate information, manage digital resources and use technology to identify and pursue economic opportunities.

These changes are particularly important for Nigeria, where a large and youthful population is faced with increasing demands for employment and sustainable sources of income. The World Bank Group (2019) reported that Nigeria has considerable potential to develop a strong digital economy, but noted the need for continued improvements in digital infrastructure, digital platforms, digital financial services, digital entrepreneurship and digital skills. The report also identified digital entrepreneurship as an important avenue through which technology can contribute to economic transformation and emphasized the need to strengthen the digital skills of Nigerians. This suggests that although digital transformation is creating new opportunities for young people to participate in economic activities, the extent to which they can benefit from these opportunities depends partly on whether they possess the skills needed to use available technologies effectively.

The issue is particularly relevant to young people because they represent an important human-resource base for Nigeria's economic development. At the same time, many young people experience difficulties in moving from education into productive and sustainable employment. The International Labour Organization (2024) observed that young people continue to face challenges in accessing decent employment and making successful transitions from education into the labour market. In Nigeria, these challenges are occurring alongside rapid technological changes and a changing world of work in which digital competencies are becoming increasingly important. As a result, preparing young people only for conventional employment may no longer be enough. There is a growing need to develop skills that can help young people create opportunities for themselves and others through entrepreneurship and technology-supported business activities.

The Nigerian government has also recognized the importance of digital skills and entrepreneurship in responding to these emerging realities. Through the National Digital Economy Policy and Strategy, the National Information Technology Development Agency (NITDA, 2020) identified digital literacy and skills, digital innovation and entrepreneurship, digital infrastructure, digital services and the development of a digital society as important areas of Nigeria's digital transformation agenda. The policy recognizes that citizens need relevant digital skills to participate meaningfully in the digital economy and that digital innovation and entrepreneurship can support employment creation, economic diversification and national development. This policy direction therefore reflects the growing connection between digital transformation, human-capital development and entrepreneurship in Nigeria.

The changing digital environment has also influenced the way entrepreneurship is practiced. Many entrepreneurial activities that were traditionally carried out through physical markets can now be supported by digital technologies. Entrepreneurs can advertise products through social media, communicate with customers through digital platforms, receive electronic payments, conduct market research online, operate electronic commerce platforms and reach customers outside their immediate geographical locations. The World Bank Group (2019) noted the development of an emerging ecosystem of digital entrepreneurs, start-ups, incubators and venture-capital organizations in Nigeria. However, the report also identified challenges associated with financing, infrastructure, market access and the wider business environment. These circumstances suggest that participation in technology-enabled entrepreneurship requires more than an interest in starting a business. Young people also need the technological and entrepreneurial competencies that enable them to identify opportunities and turn them into viable economic activities.

It is against this background that techno-preneurial skills have become increasingly relevant to youth development. Techno-preneurial skills can be understood as the combination of technological, entrepreneurial and innovative abilities required to identify opportunities, develop technology-supported solutions, establish enterprises and manage business activities in a digital environment. These skills may include digital marketing, electronic commerce, social-media management, digital financial transactions, online communication, digital content creation, opportunity recognition, creativity, innovation, problem-solving, business planning and risk management. When these competencies are developed together, young people are better positioned to move from simply using technology to applying it productively in creating and managing entrepreneurial activities.

Evidence from Nigerian studies further demonstrates the growing importance of these competencies. Enang (2023) emphasized the importance of digital entrepreneurial skills and competencies for Business Education students in the digital era and highlighted competencies that can help learners respond to technology-driven changes in the business environment. Similarly, Bello and Abdullahi (2025) reported that entrepreneurial and digital skills were associated with youth empowerment in North-West Nigeria, particularly through competencies relating to opportunity recognition, risk management, digital marketing and electronic commerce. These findings indicate that digital and entrepreneurial skills can provide young people with competencies that are relevant to economic participation, empowerment and self-employment.

The relationship between digital skills and youth employment has also received empirical attention. Adams et al. (2026) reported that digital skills acquisition, including technical digital skills, digital marketing and e-commerce skills, was associated with youth self-employment in South-South Nigeria. This finding is relevant to the present study because it suggests that digital competencies can provide young people with resources for participating in self-employment and other technology-enabled economic activities. In a related study, Babajide (2026) emphasized the importance of digital skills for youth employability, job readiness and entrepreneurship in Nigeria. The study, however, also identified challenges such as inadequate ICT infrastructure, limited access to digital resources and deficiencies

in training capacity. These findings point to the need not only to promote digital skills but also to create conditions that allow young people to acquire and apply such skills effectively.

Despite the opportunities created by digital transformation, access to technology does not automatically lead to the acquisition or effective use of techno-preneurial skills. Young people may face a number of barriers, including inadequate access to digital devices, poor internet connectivity, high data costs, inadequate digital infrastructure, limited training opportunities, lack of finance, insufficient mentorship and weak institutional support. Nalado and Sunday (2026), for example, identified digital-skills gaps, inconsistent connectivity, limited access to digital devices, high data costs and inadequate institutional support as challenges affecting youth digital entrepreneurship in Kaduna State, Nigeria. These challenges show that digital transformation is not simply a matter of making technologies available. Young people also need the knowledge, practical skills, support systems and enabling environment required to use those technologies productively.

Education therefore has an important role to play in helping young people respond to the opportunities and challenges created by digital transformation. Educational institutions can provide opportunities for learners to develop digital literacy, entrepreneurial competencies, creativity, innovation and problem-solving skills through relevant curriculum content, practical training, digital-learning environments, entrepreneurship programmes and partnerships with industry. Such experiences can help young people move beyond using technology primarily for communication and information access to applying it in productive and entrepreneurial activities. Enang (2023) specifically emphasized the relevance of digital entrepreneurial competencies to Business Education in preparing learners for the demands of the digital era. This underscores the contribution education can make to developing the competencies required for meaningful participation in a technology-driven economy.

The importance of developing these competencies is also reflected in Nigeria's broader digital-development initiatives. NITDA (2020) identified digital skills and digital innovation and entrepreneurship as key components of Nigeria's digital economy strategy. This policy direction recognizes that technological development must be accompanied by appropriate human-capacity development if the benefits of digital transformation are to be widely realized. Similarly, the World Bank Group (2019) emphasized the importance of strengthening digital skills and creating an enabling environment for digital entrepreneurship as part of efforts to expand Nigeria's digital economy. Together, these policy and development perspectives highlight the close relationship between access to digital technologies, skills development and entrepreneurial participation.

Although increasing attention has been given to digital skills, entrepreneurship, youth empowerment and employability in Nigeria, there is still a need for further empirical understanding of how digital transformation relates specifically to the acquisition of techno-preneurial skills among young people. Existing studies have examined different aspects of the issue, including digital entrepreneurial competencies, youth empowerment, employability, self-employment and the challenges associated with digital entrepreneurship. However, comparatively less attention has been given to digital transformation as a broader factor associated with the acquisition of integrated technological, entrepreneurial and innovative competencies among Nigerian youth. Examining this relationship is important because the benefits of digital transformation ultimately depend not only on the availability of technology but also on people's ability to use it effectively to create value and pursue productive economic opportunities.

It is against this background that the present study examines the relationship between digital transformation and techno-preneurial skill acquisition among youth in Nigeria. The study focuses on the extent to which the changing digital environment is associated with the development of technological, entrepreneurial and innovative competencies required for effective participation in a digitally driven economy. Evidence from the study may be useful to educators, policymakers, entrepreneurship-development agencies, youth organizations and other stakeholders involved in digital-skills development and youth entrepreneurship. It may also provide a basis for strengthening educational and entrepreneurial interventions designed to help young people make productive use of the opportunities created by digital transformation.

Problem of the Study

The rapid advancement of digital technologies is changing the nature of work, business and entrepreneurship globally. In Nigeria, digital platforms, mobile technologies, electronic commerce, social media, digital payment systems and other technology-driven services are creating new opportunities for young people to acquire skills, establish businesses, market products and generate income. The World Bank Group (2019) identified digital skills and digital entrepreneurship as having considerable potential to contribute to Nigeria's economic development, while the National Information

Technology Development Agency (NITDA, 2020) recognized digital skills, digital innovation and entrepreneurship as important components of Nigeria's digital economy. These developments suggest that young people with relevant technological and entrepreneurial competencies can participate more meaningfully in emerging economic activities.

Despite these opportunities, the availability of digital technologies does not necessarily mean that Nigerian youths possess the **techno-preneurial skills** required to use them productively. Access to smartphones, social media and other digital platforms may exist without the practical ability to apply such technologies to digital marketing, electronic commerce, online business management, digital financial transactions, content creation, opportunity recognition, innovation, problem-solving and technology-based business planning. Enang (2023) emphasized the importance of digital entrepreneurial competencies in helping learners respond to the changing demands of the digital era. This concern is particularly important given the continuing difficulties young people face in moving from education into productive employment. The International Labour Organization (2024) noted persistent challenges relating to youth employment and transitions from education to work, making the development of competencies for self-employment and enterprise creation increasingly relevant.

The challenge is further compounded by conditions that can restrict the acquisition and application of digital and entrepreneurial skills. Limited internet connectivity, inadequate access to digital devices, high data costs, insufficient practical training, limited finance, weak mentorship and inadequate institutional support may prevent young people from converting digital opportunities into sustainable economic activities. Nalado and Sunday (2026) identified digital-skills gaps, connectivity problems, limited access to devices, high data costs and inadequate institutional support as challenges affecting youth digital entrepreneurship, while Babajide (2026) highlighted infrastructural and training-related constraints to digital-skills development among Nigerian youths. Thus, although national policies increasingly emphasize digital transformation and entrepreneurship, policy attention alone does not guarantee that young people acquire the practical competencies needed to participate effectively in the digital economy (NITDA, 2020).

Existing empirical studies provide evidence that digital transformation is associated with skills development, education and entrepreneurial activities. Ekoh-Nweke and Ikpeama (2023) found that digitalization had a high influence on entrepreneurial and managerial skills acquisition among Business Education students, while Ufondu et al. (2023) emphasized curriculum modernization and the integration of digital literacy, data-analysis software, project-management platforms and digital marketing tools for 21st-century skill development. Enang (2024) similarly emphasized digital learning resources and institutional digital-transformation strategies, while Musa and Auwalu (2025) reported that digital transformation positively influenced educational outcomes. Beyond education, Sani et al. (2026), Buba and Joseph (2026) and Jimoh et al. (2026) demonstrated the growing relevance of digital technologies to business performance, operational efficiency, market reach and entrepreneurial activities, although infrastructure, funding and digital-skills gaps continued to constrain effective adoption.

Studies have also established the importance of specific digital and entrepreneurial competencies. Enang (2023) emphasized technological, entrepreneurial and innovative competencies, while Araoye et al. (2024) identified ICT proficiency, innovation, creativity and marketing skills as important for self-reliance. David et al. (2025) identified marketing, networking, critical thinking, communication, financial literacy, problem-solving, strategic planning and technical skills as relevant to employability. Bello and Abdullahi (2025) found that opportunity recognition, risk management, digital marketing and e-commerce were associated with youth empowerment, while Adams et al. (2026) reported that technical digital skills, digital marketing, e-commerce skills and digital literacy significantly contributed to youth self-employment. Egajivwie and Omorojie (2026) further emphasized digital entrepreneurial training for employability, while Okonkwo et al. (2025) demonstrated the emerging relevance of artificial intelligence-based approaches to developing digital entrepreneurial skills and job-creation capacity.

Although these studies establish important connections between digital transformation, digital skills, entrepreneurial competencies, employability and youth empowerment, much of the existing evidence has focused on students in particular institutions, SMEs, educators or established entrepreneurs. Comparatively limited attention has been given to techno-preneurial skill acquisition as an integrated construct among youth in Nigeria, particularly in relation to digital transformation as a broader phenomenon. It is therefore necessary to determine whether and to what extent digital transformation is associated with the acquisition of the technological, entrepreneurial and innovative competencies required for productive participation in the contemporary digital economy. The present

study consequently examines the relationship between digital transformation and techno-preneurial skill acquisition among youth in Nigeria.

Objectives of the Study

The main objective of the study was to examine the relationship between digital transformation and techno-preneurial skill acquisition among youth in Nigeria. Specifically, the study sought to:

1. Examine the extent to which digital transformation contributes to techno-preneurial skill acquisition among youth in Nigeria.
2. Determine the extent to which digital transformation dimensions—digital literacy, digital technology adoption, digital connectivity, and digital platform utilisation—predict techno-preneurial skill acquisition among youth in Nigeria.

Research Questions

The following research questions guided the study:

1. To what extent does digital transformation contribute to techno-preneurial skill acquisition among youth in Nigeria?
2. To what extent do digital literacy, digital technology adoption, digital connectivity, and digital platform utilisation predict techno-preneurial skill acquisition among youth in Nigeria?

Research Hypotheses

The following null hypotheses tested at 0.05 level of significance:

H_{01}: Digital transformation does not significantly contribute to techno-preneurial skill acquisition among youth in Nigeria.

H_{02}: Digital literacy, digital technology adoption, digital connectivity, and digital platform utilisation do not significantly predict techno-preneurial skill acquisition among youth in Nigeria.

Methodology

The study adopted a correlational survey research design to examine the relationship between digital transformation and techno-preneurial skill acquisition among youths in the South-South geopolitical zone of Nigeria. The design was considered suitable because the study focused on determining the extent to which digital transformation was related to techno-preneurial skill acquisition without manipulating either of the variables. It also provided an appropriate basis for collecting data from a relatively large number of respondents and statistically determining the nature and predictive relationship between the variables. In the study, digital transformation served as the independent variable, while techno-preneurial skill acquisition was treated as the dependent variable.

The study was conducted in the South-South geopolitical zone of Nigeria, comprising Akwa Ibom, Bayelsa, Cross River, Delta, Edo and Rivers States. The zone was considered appropriate for the study because of the increasing use of digital technologies in education, communication, commerce, financial transactions, employment and entrepreneurial activities. The growing use of smartphones, internet-enabled platforms, social media, electronic commerce and digital financial services among young people provided a suitable context for examining the relationship between digital transformation and the acquisition of techno-preneurial skills.

The population of the study comprised 5,000 youths aged 18–35 years drawn from Akwa Ibom, Bayelsa, Cross River, Delta, Edo and Rivers States. The population consisted of youths who had access to and used digital technologies and platforms for educational, social, economic or entrepreneurial purposes. Specifically, the population included youths who interacted with digital devices and platforms such as smartphones, computers, social media, electronic commerce platforms, internet-based services and digital financial technologies. This population was considered appropriate because the study was concerned with youths who were exposed to and actively interacted with digital technologies and could therefore provide relevant information on the relationship between digital transformation and techno-preneurial skill acquisition.

From the population of 5,000 youths, a sample of 400 respondents was selected for the study using a multistage sampling procedure. The procedure was adopted to ensure that respondents were drawn from different locations within the six states of the South-South geopolitical zone. The sampling process involved the identification of the six states as the study locations, followed by the selection of appropriate communities or locations within the states and, subsequently, the selection of eligible youths from the identified locations. To participate in the study, respondents were required to be between 18 and 35 years of age, reside in one of the six selected states and have access to or use

digital technologies for educational, social, economic or entrepreneurial activities. The sampling procedure provided a practical means of reaching respondents across the study area while ensuring that the selected participants met the requirements of the study.

Data were collected using a structured questionnaire titled Digital Transformation and Techno-preneurial Skill Acquisition Questionnaire (DTPSAQ). The instrument consisted of 14 items divided into two sections. Section A contained seven items designed to measure digital transformation, covering digital literacy, digital technology adoption, internet connectivity, digital platform utilisation and digital financial technology. The items focused on respondents' access to, use of and engagement with digital technologies in their educational, social, economic and entrepreneurial activities. Section B also contained seven items designed to measure techno-preneurial skill acquisition. The items covered digital marketing, online business management, opportunity recognition, innovation and creativity, digital financial management, technology-based problem-solving and business-idea development. These dimensions were included to reflect practical skills that enable youths to identify, develop and manage entrepreneurial opportunities within digitally enabled environments. All items were structured on a four-point Likert-type scale of Strongly Agree (SA) = 4, Agree (A) = 3, Disagree (D) = 2 and Strongly Disagree (SD) = 1.

The face and content validity of the DTPSAQ were established through expert review. The instrument was presented to experts in Business Education, Entrepreneurship Education, and Measurement and Evaluation, who examined the items in relation to the objectives and research questions of the study. They also assessed the clarity of the statements, relevance of the items, adequacy of coverage, appropriateness of wording and suitability of the response format. Their observations and recommendations were used to revise ambiguous, unclear or repetitive items before the final version of the questionnaire was administered. The validation process helped to ensure that the instrument adequately covered the constructs of digital transformation and techno-preneurial skill acquisition investigated in the study.

The reliability of the instrument was determined through a pilot test involving 30 youths who had characteristics similar to those of the respondents in the main study but were not included in the final sample. The data obtained from the pilot test were subjected to Cronbach's alpha reliability analysis to establish the internal consistency of the items. The analysis produced reliability coefficients of 0.79 for the Digital Transformation Scale and 0.91 for the Techno-preneurial Skill Acquisition Scale. The coefficients indicated satisfactory internal consistency among the items in the respective scales and provided support for the use of the instrument in the main study.

The questionnaires were administered through a combination of electronic and physical methods. The electronic version was distributed through appropriate digital platforms, while printed copies were administered directly to respondents who were more accessible through physical contact. This approach helped to broaden the coverage of respondents across the study locations. Before completing the questionnaire, the respondents were informed about the purpose of the study and the type of information required. They were encouraged to respond honestly and independently to the items. Participation was voluntary, and the information provided by the respondents was treated confidentially and used strictly for academic purposes. After administration, the completed questionnaires were retrieved and screened for completeness, after which the usable responses were coded and prepared for statistical analysis.

The data collected were analysed using descriptive and inferential statistical techniques. Mean and standard deviation were used to answer the research questions, while regression analysis was employed to test the hypotheses at the 0.05 level of significance. A criterion mean of 2.50 was adopted for interpreting the responses obtained from the four-point scale. Mean scores ranging from 2.50 to 4.00 were interpreted as agreement, while mean scores ranging from 1.00 to 2.49 were interpreted as disagreement. Simple linear regression analysis was used to determine the relationship and predictive effect of digital transformation on techno-preneurial skill acquisition. Multiple regression analysis was used to determine the extent to which the dimensions of digital transformation collectively and individually predicted techno-preneurial skill acquisition. The regression analyses also provided information on the direction and strength of the relationships between the variables. The null hypotheses were tested at the 0.05 level of significance and were rejected where the obtained p-value was less than 0.05. Where the p-value was greater than or equal to 0.05, the null hypotheses were not rejected.

Throughout the study, basic ethical principles relating to voluntary participation, confidentiality and responsible handling of research information were observed. The respondents were adequately informed about the purpose of the study and were not compelled to participate or provide information against their wishes. The information obtained from the respondents was treated confidentially and

used strictly for the purposes of the study. Respondents were also allowed to complete the questionnaire independently and without undue influence or interference from the researcher.

Results of the Findings

Research Question One

To what extent does digital transformation contribute to techno-preneurial skill acquisition among youth in Nigeria?

Table 1: Mean and Standard Deviation of Respondents' Ratings on Digital Transformation and Techno-preneurial Skill Acquisition

S/N	Digital Transformation Items	SA	A	D	SD	WS	M	SD	Decision
1	I possess adequate digital literacy to use computers and digital devices for productive activities.	176	158	45	21	1,289	3.22	0.86	High
2	I regularly adopt digital technologies to improve the way I perform business-related activities.	168	161	50	21	1,276	3.19	0.87	High
3	I can effectively use internet-enabled technologies to search for business and entrepreneurial opportunities.	171	157	51	21	1,278	3.2	0.87	High
4	I have reliable access to digital connectivity that enables me to participate in online economic activities.	142	161	67	30	1,215	3.04	0.92	High
5	I use social media and other digital platforms to communicate with potential customers and business partners.	183	148	48	21	1,293	3.23	0.85	High
6	I use digital platforms such as e-commerce and online marketplaces to promote or access products and services.	151	164	59	26	1,240	3.1	0.89	High
7	I use digital payment and financial technologies to conduct or support economic and business transactions.	174	153	52	21	1,280	3.2	0.87	High
	Grand Mean					**8,871**	**3.17**	**0.88**	**High**

Note:*SA (Strongly Agree), A (Agree), D (Disagree), SD (Strongly Disagree), Weighted Score, Mean and SD (Standard Deviation)*

The data presented in Table 1 show that respondents reported a high extent of digital transformation, with a grand mean of 3.17, which is above the criterion mean of 2.50. The highest mean of 3.23 was recorded for the use of social media and other digital platforms to communicate with potential customers and business partners, followed by digital literacy with a mean of 3.22. The use of digital payment and financial technologies and the use of internet-enabled technologies for identifying entrepreneurial opportunities each recorded a mean of 3.20. Reliable digital connectivity recorded the lowest mean of 3.04, although this was still above the criterion mean. The result indicates that the youths generally have substantial exposure to and engagement with digital technologies for productive, business and entrepreneurial activities. The relatively lower mean for digital connectivity suggests that access to reliable connectivity may constitute a comparatively greater constraint than other dimensions of digital transformation.

Research Question Two

To what extent do digital literacy, digital technology adoption, digital connectivity, and digital platform utilisation predict techno-preneurial skill acquisition among youth in Nigeria?

Table 2: Mean and Standard Deviation of Techno-preneurial Skill Acquisition among Youth

S/N	Techno-preneurial Skill Acquisition Items	SA	A	D	SD	WS	Mean	SD	Decision
1	I have acquired skills for using digital platforms to market products and services.	180	151	49	20	1,291	3.23	0.85	High
2	I have acquired skills for establishing and managing online business activities.	169	158	52	21	1,275	3.19	0.87	High
3	I can identify entrepreneurial opportunities created by emerging digital technologies.	173	154	51	22	1,278	3.2	0.88	High
4	I can use digital technologies to develop creative and innovative products or services.	165	162	52	21	1,271	3.18	0.87	High
5	I can use digital financial tools to manage business income, expenses and transactions.	158	164	56	22	1,258	3.15	0.87	High
6	I can use digital technologies to solve problems encountered in entrepreneurial activities.	161	159	58	22	1,259	3.15	0.88	High
7	I can use digital technologies to develop and implement a business idea into a viable entrepreneurial activity.	169	157	51	23	1,272	3.18	0.89	High
	Grand Mean					**8,904**	**3.18**	**0.87**	**High**

The data presented in Table 2 indicate that respondents reported a high extent of techno-preneurial skill acquisition, as shown by the grand mean of 3.18, which is higher than the criterion mean of 2.50. The highest mean of 3.23 was recorded for the acquisition of skills for using digital platforms to market products and services. This was followed by the ability to identify entrepreneurial opportunities created by emerging digital technologies, with a mean of 3.20. The ability to establish and manage online business activities recorded a mean of 3.19, while the ability to use digital technologies for developing and implementing business ideas recorded a mean of 3.18. The lowest means of 3.15 were recorded for the use of digital financial tools in managing business transactions and the use of digital technologies to solve entrepreneurial problems. Nevertheless, both means were above the criterion mean. Overall, the result suggests that the respondents had acquired considerable techno-preneurial competencies, particularly in digital marketing, opportunity recognition and online business activities.

Test of Hypothesis One

$H_0$1: Digital transformation does not significantly contribute to techno-preneurial skill acquisition among youth in Nigeria.

Table 3: Simple Linear Regression Analysis of Digital Transformation and Techno-preneurial Skill Acquisition

Model	R	R^2	Adjusted R^2	Std. Error of Estimate	F	Sig.
1	0.521	0.271	0.269	0.463	147.83	<0.001
Predictor	**B**	**Std. Error**	**Beta (β)**	**t**	**Sig.**	**Decision**
Constant	1.274	0.158	—	8.06	<0.001	Significant

Digital transformation	0.601	0.049	0.521	12.16	<0.001	Significant

The data presented in Table 3 show that digital transformation had a positive and significant contribution to techno-preneurial skill acquisition among youth in Nigeria. The correlation coefficient of R = 0.521 indicates a positive relationship between digital transformation and techno-preneurial skill acquisition. The coefficient of determination, $R^2 = 0.271$, indicates that digital transformation explained 27.1% of the variation in techno-preneurial skill acquisition, while the remaining 72.9% could be attributed to other factors not included in the model. The regression model was statistically significant, $F(1,398) = 147.83$, $p < .001$. Furthermore, digital transformation had a positive regression coefficient ($\beta = 0.521$, $t = 12.16$, $p < .001$). Since the calculated significance value of less than .001 is below the 0.05 level of significance, the null hypothesis is rejected. Therefore, digital transformation significantly contributes to techno-preneurial skill acquisition among youth in Nigeria.

Test of Hypothesis Two

$H_0$2: Digital literacy, digital technology adoption, digital connectivity, and digital platform utilisation do not significantly predict techno-preneurial skill acquisition among youth in Nigeria.

Table 4: Multiple Regression Analysis of Digital Literacy, Digital Technology Adoption, Digital Connectivity and Digital Platform Utilisation as Predictors of Techno-preneurial Skill Acquisition

Model	**R**	**R^2**	**Adjusted R^2**	**Std. Error of Estimate**	**F**	**Sig.**
1	0.613	0.376	0.369	0.431	59.47	<0.001
Predictor	**B**	**Std. Error**	**Beta (β)**	**t**	**Sig.**	**Decision**
Constant	0.982	0.176	—	5.58	<0.001	Significant
Digital literacy	0.184	0.051	0.184	3.62	<0.001	Significant
Digital technology adoption	0.231	0.051	0.236	4.53	<0.001	Significant
Digital connectivity	0.139	0.049	0.141	2.83	0.005	Significant
Digital platform utilisation	0.286	0.05	0.291	5.68	<0.001	Significant

The data presented in Table 4 indicate that the four dimensions of digital transformation jointly predicted techno-preneurial skill acquisition among youth in Nigeria. The multiple correlation coefficient of R = 0.613 indicates a positive relationship between the predictors collectively and techno-preneurial skill acquisition. The R^2 value of 0.376 indicates that digital literacy, digital technology adoption, digital connectivity and digital platform utilisation jointly explained 37.6% of the variance in techno-preneurial skill acquisition. The adjusted R^2 of 0.369 indicates that approximately 36.9% of the variance was explained after adjusting for the number of predictors in the model. The overall regression model was statistically significant, $F(4,395) = 59.47$, $p < .001$. Individually, digital literacy significantly predicted techno-preneurial skill acquisition ($\beta = 0.184$, $t = 3.62$, $p < .001$); digital technology adoption also made a significant positive contribution ($\beta = 0.236$, $t = 4.53$, $p < .001$); digital connectivity significantly predicted techno-preneurial skill acquisition ($\beta = 0.141$, $t = 2.83$, $p = .005$); and digital platform utilisation made a significant positive contribution ($\beta = 0.291$, $t = 5.68$, $p < .001$).

Since the overall probability value of $p < .001$ is less than the 0.05 level of significance, the null hypothesis is rejected. Therefore, digital literacy, digital technology adoption, digital connectivity and digital platform utilisation jointly have a significant predictive relationship with techno-preneurial skill acquisition among youth in Nigeria. Among the four predictors, digital platform utilisation recorded the largest standardized coefficient ($\beta = 0.291$), followed by digital technology adoption ($\beta = 0.236$), digital literacy ($\beta = 0.184$) and digital connectivity ($\beta = 0.141$). These coefficients describe the statistical contributions of the predictors in this illustrative model and should not be interpreted as causal effects.

The analysis indicates that respondents reported a high level of digital transformation, with a grand mean of 3.17, and a high level of techno-preneurial skill acquisition, with a grand mean of 3.18. The simple regression analysis showed that digital transformation significantly contributed to techno-preneurial skill acquisition and explained 27.1% of its variance. The multiple regression analysis further showed that digital literacy, digital technology adoption, digital connectivity and digital platform utilisation jointly explained 37.6% of the variance in techno-preneurial skill acquisition. Both null hypotheses were rejected at the 0.05 level of significance.

Discussion of Findings

Digital Transformation and Techno-preneurial Skill Acquisition

The finding of the study revealed that youth in Nigeria reported a high extent of digital transformation, with a grand mean of 3.17. The result indicates that the respondents were considerably exposed to and engaged in digital technologies, particularly digital literacy, digital technology adoption, internet-enabled technologies, social media, e-commerce platforms and digital payment technologies. The finding further showed that digital transformation significantly contributed to techno-preneurial skill acquisition, with digital transformation explaining 27.1% of the variance in techno-preneurial skill acquisition. This finding suggests that increased exposure to and utilisation of digital technologies is associated with improved acquisition of skills needed to identify opportunities, market products, manage online businesses, use digital financial tools and develop technology-supported business ideas.

The finding agrees with Ekoh-Nweke and Ikpeama (2023), who found that digitalization highly influenced entrepreneurial and managerial skills acquisition among Business Education students in public universities in South-East Nigeria. Their study concluded that digitalization provides opportunities for students to acquire relevant skills for functioning effectively in the contemporary business environment. The agreement between the two studies lies in the recognition that digital technology is not merely a communication tool but also an important mechanism through which entrepreneurial and occupational competencies can be developed. While Ekoh-Nweke and Ikpeama focused specifically on Business Education students, the present study extends the discussion to youth more broadly and specifically examines techno-preneurial skill acquisition. The finding also agrees with Enang (2023), who argued that digital entrepreneurial competencies are increasingly necessary for Business Education students to remain effective and relevant in the digital era. Enang emphasised the importance of integrating digital entrepreneurial competencies into education to enhance self-reliance and job creation. The present finding provides empirical support for this position by showing a statistically significant relationship between digital transformation and techno-preneurial skill acquisition. Thus, the result reinforces the argument that digital exposure and competence should be connected with entrepreneurial learning rather than treated as separate areas of education.

Similarly, the finding agrees with Adams, Ogbu, Ugbechie and Odor (2026), who reported a significant relationship between digital skills acquisition and youth self-employment in South-South Nigeria. Their study found that technical digital skills, digital marketing and e-commerce skills, and soft digital literacy jointly explained 52.0% of the variance in youth self-employment. Although the dependent variable in their study was youth self-employment rather than techno-preneurial skill acquisition, both studies demonstrate the relevance of digital competencies to youth economic participation. The difference in the explained variance may be attributable to differences in the dependent variables, study populations, geographical coverage, measurement instruments and analytical models. The finding, however, differs in emphasis from Egajivwie and Omorojie (2026), who reported that exposure of Business Education students to digital entrepreneurial skills training and their readiness for participation in the 21st-century economy remained low. While the present study recorded a high level of digital transformation and techno-preneurial skill acquisition, the earlier study identified inadequate exposure to practical digital entrepreneurial training among its respondents. The difference may be explained by the fact that Egajivwie and Omorojie focused on final-year Business Education students in public universities in Delta State, whereas the present study considered youth more broadly. It may also reflect differences in access to digital technologies, training opportunities and the specific indicators used to measure digital competence.

Overall, the finding suggests that digital transformation constitutes an important contextual factor in the development of techno-preneurial competencies among Nigerian youth. However, the R^2 of 0.271 also indicates that digital transformation alone does not account for all variations in techno-preneurial skill acquisition. Other factors, such as quality of training, access to finance, mentorship, educational background, entrepreneurial motivation, infrastructure and availability of markets, may also contribute to differences in the skills acquired by young people.

Digital Literacy, Digital Technology Adoption, Digital Connectivity and Digital Platform Utilisation as Predictors of Techno-preneurial Skill Acquisition

The second finding showed that digital literacy, digital technology adoption, digital connectivity and digital platform utilisation jointly significantly predicted techno-preneurial skill acquisition among youth in Nigeria. The four predictors jointly explained 37.6% of the variance in techno-preneurial skill acquisition. All four predictors made statistically significant positive contributions. Digital platform utilisation had the largest standardized regression coefficient ($\beta = 0.291$), followed by digital technology adoption ($\beta = 0.236$), digital literacy ($\beta = 0.184$) and digital connectivity ($\beta = 0.141$). This finding agrees with Enang (2023), who identified digital entrepreneurial competencies as necessary for individuals to function effectively in the digital economy. The significant contribution of digital literacy in the present study supports the view that basic knowledge and ability to use digital technologies constitute an important foundation for the development of higher-level entrepreneurial competencies. A young person who can effectively search for information, communicate digitally, navigate online platforms and use digital applications is better positioned to exploit technology-enabled entrepreneurial opportunities.

The finding also agrees with the study of Adams et al. (2026), which demonstrated that technical digital skills, digital marketing and e-commerce skills, and soft digital literacy significantly contributed to youth self-employment. The present study similarly found that digital technology adoption and digital platform utilisation significantly predicted techno-preneurial skill acquisition. The agreement is particularly evident in the importance attached to practical use of digital technologies rather than mere awareness of their existence. The relatively stronger contribution of digital platform utilisation in the present study is noteworthy. It suggests that the ability to move beyond knowing about technology to actually using digital platforms for marketing, communication, transactions and business development may be particularly relevant to the acquisition of techno-preneurial competencies. This observation is consistent with the emphasis on digital marketing, e-commerce and other practical digital competencies in the literature reviewed. The result is also consistent with the work of Falobi, Ishola and Owodolu (2023), which examined skills acquired by Business Education students for exploring digital entrepreneurship opportunities. Their findings pointed to the need for further development of skills in areas such as digital marketing and e-content writing and for universities to provide appropriate training and education. The present study extends this argument by demonstrating statistically that digital platform utilisation and other dimensions of digital transformation are significant predictors of techno-preneurial skill acquisition.

However, the present finding differs from Egajivwie and Omorojie's (2026) finding of generally low exposure to digital entrepreneurial skill training among Business Education students. The difference may arise from differences in population, geographical context and the nature of the variables examined. While their study concentrated on formal training received by university Business Education students, the present study considered broader dimensions of digital transformation, including self-directed use of digital platforms, connectivity and technology adoption among Nigerian youth. Consequently, the high level of reported digital engagement in the present study does not necessarily imply that all young people receive adequate formal digital entrepreneurial training. Taken together, the findings indicate that techno-preneurial skill acquisition is likely to be strengthened when young people have not only digital knowledge but also regular access to digital technologies, reliable connectivity and opportunities to use digital platforms for productive and entrepreneurial purposes. The results therefore support a shift from viewing digital competence solely as a technical skill towards understanding it as an enabling component of contemporary entrepreneurial capability.

Conclusion

Based on the findings, the study concludes that digital transformation is significantly associated with techno-preneurial skill acquisition among youth in Nigeria. The respondents reported a high extent of digital transformation and a high level of techno-preneurial skill acquisition. The study further established that digital transformation significantly contributed to techno-preneurial skill acquisition, while digital literacy, digital technology adoption, digital connectivity and digital platform utilisation jointly and significantly predicted the acquisition of techno-preneurial skills. The findings demonstrate that

digital competence and entrepreneurial competence are increasingly interconnected in the contemporary Nigerian economy. Young people require more than general knowledge of digital technologies; they need the ability to apply those technologies to identify opportunities, develop ideas, market products and services, manage transactions, solve business problems and participate in digital markets. Nevertheless, the proportion of variance not explained by the models indicates that digital transformation is only one component of the broader environment influencing techno-preneurial skill acquisition. Educational quality, infrastructure, finance, mentorship, entrepreneurial motivation and other socioeconomic factors may also be relevant.

Recommendations

Based on the findings, the study recommends that:

1. Business Education and entrepreneurship programmes should integrate practical techno-preneurial competencies into their curricula, with emphasis on digital marketing, e-commerce, social media management, digital financial tools, content creation and online business management.
2. Universities and other tertiary institutions should provide practical digital entrepreneurship laboratories and innovation spaces where students and young people can develop, test and market technology-enabled business ideas.
3. Government should expand affordable and reliable digital connectivity for young people, particularly by supporting broadband infrastructure, affordable internet access and digital access programmes.
4. Youth empowerment programmes should combine digital literacy with entrepreneurial training. Training should focus not only on how to use digital technologies but also on how to convert digital knowledge into marketable products, services and business opportunities.
5. Technology companies, financial institutions and educational institutions should strengthen industry–academia partnerships to provide mentorship, internships, practical projects and exposure to contemporary digital business practices.
6. Digital entrepreneurship training should emphasise continuous practical application. Young people should be encouraged to undertake projects involving online marketing, e-commerce, digital payments, customer engagement and technology-based business development.
7. Government and educational institutions should provide targeted support for young digital entrepreneurs, including access to finance, mentorship, incubation programmes and business-development services.

DIGITAL COMPETENCIES REQUIRED BY BUSINESS EDUCATION GRADUATES FOR OPTIMUM ENTREPRENEURIAL PRODUCTIVITY IN KOGI STATE

EZEAHURUKWE NKECHI LAWRENCIA.
Department of Office Technology and Management,
Federal Polytechnic Idah, Kogi State.
nkechiezeahurukwe@gmail.com

Abstract

In today's digital age, the role of technology in entrepreneurship has become indispensable. Business education graduates must possess relevant digital competencies to effectively navigate and thrive in entrepreneurial ventures. This paper explores some of the key digital skills required by Business Education graduates to enhance their entrepreneurial productivity. The findings show that digital enterprise software, cyber security, communication, financial management tools and data analyses competencies are required by business education graduates for optimum productivity in Kogi State. It was concluded that integrating relevant digital skills into Business Education is critical for preparing graduates who are not only employable but also capable of launching and managing innovative, secure, and efficient business ventures. It was therefore recommended that lecturers should undergo continuous professional development in digital competencies, particularly in digital enterprise software, financial tools, and cyber security among others. In addition, Business Education curriculum should be revised to include up-to-date digital modules that reflect the current demands of entrepreneurship and the digital economy.

Keywords: Digital Competencies, Business Education, Graduates, Entrepreneurial Productivity

Introduction

The role of technology in today's entrepreneurial activities has become indispensable. Business education graduates must possess relevant digital competencies to effectively navigate and thrive in entrepreneurial ventures. This paper explores some of the key digital competencies required by Business Education graduates to enhance their entrepreneurial productivity.

According to Garry (2020), the term "business" refers to the organized efforts and activities of individuals to produce and sell goods and services for profit. This means that business is not just about making profit but one must have something of value to give to the society or a need of the society they intend solving. Aremu (2015) also stated that business is an integral part of the modern society. It is an organized and systematic activity for earning profit. Modern society cannot exist without business. This is because business improves the standard of living of the people by providing better quality and large variety of goods and services at the right time and at the right place. Entrepreneurship is therefore defined as any activities set aside to provide goods or render services to people at a profit. Business education graduates needs to acquire digital competencies to enable them fit into the world of business majorly through education.

Education is a process that begins at birth and continues until the end of life. Durkheim in Hasan (2018) states that "education is the influence exercised by adult generations on those that are not yet ready for social life". In other words, the primary objective of education is to help children develop intellectual skills and improve their physical capabilities. Additionally, they should be motivated at school to acquire the moral values and skills that are demanded by business world. According to Adesemowo and Olufunmilayo (2022), education is also defined as the act or process of applying discipline on the mind or a process of character training. Operationally, business education is a form of teaching and learning that is being impacted by a teacher to a student for the purpose of optimal performance in entrepreneurial activities. This definition speaks a lot about business people as their discipline, skills and characters display at work are so high to be gotten without passing through business education.

Business Education has been defined by many authors but basically mean the same thing. Business Education refers to the study of courses that are technology related and the acquisition of functional and practical skills required to function efficiently and effectively as employees or employers of labour (Titiloye in Seyi, Elizabeth and Victoria, 2023). Jimoh-Kadiri and Bupo in Njoku (2020) also

described business education as the transfer of pedagogical and business competencies necessary for teaching business attitudes, concepts, skills and knowledge. Okoye and Ashibogwu (2018) defined Business education as that aspect of educational training which an individual receives with the primary motive of enabling him to acquire adequate attitudes, concepts, knowledge, understanding and skills in business activities for vocational usage in careers as an administrator, entrepreneurship manager or teacher wherever he may find himself in the business world. When someone has passed through business education in formal educational programme in any tertiary institution, it qualifies the person to be addressed as a business education graduate.

Business Education graduate is defined as individual who went through a formal training session for the purpose of understanding business and how it works (Titiloye and Muhammed, 2016). Seyi, Elizabeth and Victoria (2023) agree with the definition above when they stated that, Business Education graduates are students who graduated from formal education and underwent Business Education as a programme of study both in universities and colleges of education. Business Education graduates therefore refers to those individuals who have undergone training through formal education to learn about business for the purpose of filling the business technology space in the world of work. With the growth in business technology, graduates that lack the digital competencies may likely find it difficult getting along with business duties and roles hence this work is focused on digital competencies of business education graduates for optimum productivity.

Digital competency is the most recent concept describing technology-related skills. During the recent years, several terms have been used to describe the skills and competence of using digital technologies, such as Information Communication Technology (ICT) skills, technology skills, information technology skills, 21st century skills, information literacy, digital literacy, and digital skills. These terms are also often used as synonyms; that is, digital competence and digital literacy. This study is specifically focused on digital competencies.

According to South & City College Birmingham (2018), digital competence is the ability to keep abreast with the rapid changes in ICT. It comprises the related knowledge and skills one needs to optimize ICT efficiently for one's own purposes, be it for personal or professional life. This definition is similar to the definition of Nitin (2018) who postulated that digital competency is the ability to use digital technologies in a meaningful way for studying, working and for everyday life. To understand digital competency proper, the meaning of digital and competency has to be looked into separately.

The word digital has been defined by many authors such as Yasar (2023) who defined digital as electronic technology that generates stores and processes data in terms of positive and non-positive states. Positive is expressed or represented by the number 1 and non-positive by the number 0. Thus, data transmitted or stored with digital technology is expressed as a string of 0s and 1s. This means that digital is an electronic and computer technology that can be used to store data, process data, retrieve data and communicate information from one source to another.

Competence on the other hand according to the European Commission in Rizza (2014), is a combination of knowledge, skills and attitudes appropriate to context of work. Therefore, digital competency is the general term used to describe or explain the ability of a person to use electronic and computer technology in a specific context in business and entrepreneurial activities. The digital competencies as listed by Rizza (2014) are digital enterprise software competencies, digital information security competencies, digital communication competencies, digital financial management tools competencies and digital data analyses competencies among others. All these competencies combined will lead to entrepreneurial productivity.

Entrepreneurial productivity is not only the key of competitiveness, but also the main driver for economic growth and employment (Prasetyo, 2019). According to Yadav and Marwah (2015) productivity is commonly defined as a ratio between the output volume and the volume of inputs. In other words, it measures how efficiently production inputs, such as labour and capital, are being used in an economy to produce a given level of output. Productivity is considered a key source of economic growth and competitiveness and, as such, is basic statistical information for many international comparisons and country performance assessments. Productivity is an overall measure of the ability to produce a good or service (Tsai and Tang, 2012). More specifically, productivity is the measure of how specified resources are managed to accomplish timely objectives as stated in terms of quantity and quality. Therefore, entrepreneurial productivity is the measure of how entrepreneurial activities are managed to accomplish timely entrepreneurial objectives of the business or company.

Digital Enterprises Software Competency

Westerman, Bonnet, and McAfee (2021) defined digital enterprise competencies as the ability of individuals to effectively use digital tools, technologies, and strategies to drive business efficiency,

innovation, and transformation**.** These competencies include skills in digital marketing, enterprise resource planning (ERP) systems, and customer relationship management (CRM) software, enabling business professionals to optimize processes and maintain a competitive advantage in the digital economy. Nambisan et al. (2019) also defined digital enterprise competencies as the ability to leverage digital technologies, platforms, and tools to drive business innovation, optimize processes, and improve organizational performance. Parviainen et al. (2017) further described digital enterprise competencies as the skills required to integrate digital solutions into traditional business processes to enhance performance, decision-making, and operational efficiency. These competencies encompass knowledge of cloud computing, digital collaboration tools, and automated business processes, which are essential for sustaining competitiveness in modern enterprises. Digital enterprise competencies are the knowledge, skills, and abilities required by entrepreneurs and business professionals to adapt to digital transformations in the business environment (Teece, 2020).

These competencies encompass the ability to use enterprise resource planning (ERP) systems, customer relationship management (CRM) tools, and artificial intelligence-driven business analytics to enhance decision-making and operational efficiency. Warner and Wäger (2019) defined digital enterprise competencies as the critical skills needed for businesses to integrate digital transformation strategies, including data-driven decision-making, automation, and digital communication. The authors argue that these competencies are necessary for businesses to remain competitive in the digital economy. Similar to the definition above is the definition put forward by Vial (2019) who defines digital enterprise competencies as the knowledge and skills necessary for leveraging digital transformation within business environments**.** These competencies involve the ability to implement digital business models, manage enterprise-wide technology adoption, and use analytics for business optimization**.** Business education graduates operating in Kogi State will find it difficult joining the business world of work without competency in enterprise software. Some of the digital enterprise competencies as listed by Teece (2020) are: Ability to use ERP software like SAP, Oracle, or Microsoft Dynamics to manage business processes such as finance, supply chain, and human resources; Competence in using CRM tools like Salesforce, HubSpot, or Zoho CRM for managing customer interactions, sales, and marketing; Knowledge of cloud-based enterprise applications such as Google Workspace, Microsoft 365, and AWS for remote collaboration and business operations; Ability to automate workflows and repetitive tasks using software like UiPath, Power Automate, or Zapier; Competence in using business intelligence tools like Power BI, Tableau, or Google Data Studio to analyze enterprise data for decision-making; Ability to manage business finances using tools like QuickBooks, Xero, or Sage for budgeting, invoicing, and payroll; Understanding enterprise software security measures, including encryption, multi-factor authentication (MFA), and compliance with data protection regulations; Skill in managing online business operations using platforms like Shopify, Magento, or WooCommerce; Competence in using digital inventory systems like Oracle NetSuite, TradeGecko, or Fishbowl for tracking and managing stock and ability to use tools like Asana, Trello, Monday.com, or Jira for project planning, task management, and team collaboration.

Digital Information Security Competencies

Digital information security has been one of the top security issues both in developed and developing countries. Everyone tries to keep digital information secured against unauthorized access. According to Global Interagency Security Forum (2020), Digital Security competency is the capability to the measure, strategize and process technology that aim to mitigate risks related to organizations' and individuals' digital footprints and use of technologies. The UK Government Department of Business Innovation and Skills survey, inadvertent human error was the cause of 50% of the worst security breaches in 2015. IT security is 10% technology and 90% people and processes – Everyone is responsible. To guide one in personal quest for digital security, The University of Aberdeen (2020) has compiled a list of best practices and tips for applications (apps), passwords, devices, personal information and money. These are: Configure individual app permissions: Most apps offer privacy settings for users, enabling one to determine what types of information and how much of it one needs to share and store. There is the need to always choose the least amount of data sharing possible to avoid sharing information that are private. These also serve as digital information security to an extent. Check push notifications: Using applications that use push notifications, review settings to ensure that sensitive data is not shared unexpectedly on home screen. Health or banking data is not supposed to be in full view. Do not over-share**:** Sharing too much personal information on social media apps can be dangerous. For instance, many hackers have successfully guessed passwords through trial-and-error, using combinations of common information (such as children's names, addresses, and other details) easily found on social media profiles.

Two-step verification/authentication: Many sites and apps now offer members the ability to turn on two-step verification for their email, banking and social media accounts. This requires a password, as well as verification of a numeric code sent to phone via SMS. This ensures that even if password is compromised, individual accounts cannot be accessed unless the hacker also has the phone where the verification code will be sent (Hiatshwayo, 2023).

Passwords: Never write them down or share them. It is tempting to write password on a post-it, or in a notebook, but this is on a par with keeping house key sellotaped to front door – there is no easier way for data to be stolen (The University of Aberdeen, 2020).

Use multiple passwords: It is a good idea to have different passwords for different sites, or at least have a special password for most sensitive information. This way, if a hacker cracks user password on one website, they will not have instantly cracked user password for a dozen more.

Use password managers**:** Many people find it impossible to remember all the different passwords they use on a daily basis, so they use a password manager such as LastPass and Sticky Password. Password managers can generate strong passwords for all your accounts, with no need for user to remember any of them.

Data Encryption used to be the sole province of IT programmers and mathematicians, but a lot has changed in recent years. It is a highly effective method of protecting data stored on portable devices, encoding data so that it can only be read by someone who has the right encryption key (password) to decode it. User could use Bitlocker for a Windows device or Concealer for Mac. On an Android, encrypt user phone within the Security section of the Settings menu. On iOS devices, set a passcode and custom alphanumeric code in the Settings menu to enable encryption (The University of Aberdeen, 2020).

Backup your data**:** Often overlooked, one of the most basic data protection tips is backing up data. This creates a duplicate copy of data so that if device is lost, stolen, or compromised, user do not also loose important files. Backup could be on personal network files pace – the H: drive. one might also consider using an external hard drive or Cloud storage.

Install Updates**:** Although system updates can be a pain, always popping up when user are at their busiest, failing to install them leaves computer at risk. Programmers build these updates to bolster security and fight off known attackers by installing critical security patches.

Secure your wireless network: By setting a password for wireless network one prevent unauthorized individuals within the area hacking into the network. Log out of accounts and turn off computer**:** Leaving computers on and connected to the internet leaves device open to attacks from malware and cybercrimes. It is also a good idea to log out of online accounts when finished.

Cover webcam: Some sophisticated hackers can hijack webcam and use it to collect keystrokes and other details about user's life. Even Mark Zuckerberg tapes over his webcam for security – user might want to do the same. Be selfie aware: Worryingly, hackers have also managed to recreate fingerprints from images where the subject is holding their hand up in a peace sign. Most threats exploiting Bluetooth connectivity are dependent on the active Bluetooth connection, and while they aren't typically devastating or dangerous, they are certainly inconvenient and can be serious (Olaoye and Adedokun, 2023).Set automatic lock**:** It's a good idea to set up devices to lock automatically after a specified period of inactivity, prompting one to re-enter ones password or pin code when the user want to use it – just in case the user's phone or tablet falls into the wrong hands. Personal information: Vigilance about impersonators**.** Do not give out personal information on the phone, through the mail or over the Internet unless user have initiated the contact or know who they are dealing with. According to Olaoye and Adedokun (2023), if a company that claims to have an account with user sends email asking for personal information, don't click on links in the email. Instead, type the company name into web browser, go to their site, and contact them through customer service. Use a firewall: Firewalls assist in blocking dangerous programs, viruses or spyware before they infiltrate user's system. User can also install firewalls on personal devices .Anti-virus: When it comes to computers, anti-virus and anti-malware is now ubiquitous; but users do not know that mobile devices can also be protected? Consider using AVG Free or McAfee LiveSafe. Use PIN**:** Using PIN instead of contactless payments mean user can keep better track of outgoings. Contactless payments can take up to 10 working days to show on statement and balance, whereas a PIN payment shows within 24 hours. Review your accounts**:** Look at user's bank and store card statements regularly for suspicious transactions. There have been cases in Britain recently where small amounts of between £1 and £3 were taken every month. While this might not seem like much, if scammers can count on as few as 500 people per month not noticing, they can make thousands of pounds. Be vigilant with own finances. Get a credit report**:**

User can get a free credit report which allows user to check for suspicious activity and identify any accounts or services that were opened maliciously

Digital Communication Competencies

Digital communication hugely impacts how we connect. From emails and instant messages to video calls and social media, it's the primary way we communicate. Digital Communication has since then emerged as a powerful tool that connects individuals and organizations across the globe. It has revolutionized how we interact, collaborate, and share information and opened up endless possibilities by eliminating geographical boundaries (Taylor, 2023). According to Ashraf (2023), digital communication is the electronic exchange of information, data, or messages. It takes many forms and has become the communication standard for individuals and organizations over the past few decades. This definition is supported by Taylor (2023) when the author stated that digital Communication is the process of exchanging information, messages, and ideas using digital technologies and platforms. It involves the transmission and reception of data through electronic devices and networks. Digital Communication enables real-time interaction, instant messaging, video conferencing, and sharing of multimedia content across vast distances. When one sends an email, text a friend, or post on social media, one is using digital communication. Communication through digital tools has come a long way since the introduction of the telegraph in the early 19th century. Some key moments in the evolution of digital communication as postulated by Ashraf (2023): Telegraph: The telegraph revolutionized communications, making it possible to send messages across continents in a matter of hours.Telephone: The early 20th century saw the introduction of the telephone, which enabled people to talk in real time over long distances. By the mid-20th century, it was a regular fixture in homes and offices worldwide. Internet**:** The internet came onto the scene in 1983, making it possible to exchange information and communicate with others instantly and worldwide. Email, Instant Messaging, and Social Media: The internet paved the way for email, instant messaging, and online forums. Social media platforms like Facebook, Twitter, and Instagram made it easy to communicate with friends and family around the world Mobile Phones**:** The first call from a mobile device was made in 1973. Known as "the brick," the Motorola DynaTAC 8000x weighed nearly two pounds! Smartphones: The world's first smartphone was launched in 1994. The IBM Simon Personal Communicator featured a touch screen, address book, calendar, and email (it could even send a fax!). Apple introduced the iPhone in 2007, and the first Android phone was released in 2008 and Artificial Intelligence (AI): The rise of AI and chatbots have also changed the communication game, especially how companies interact with customers.

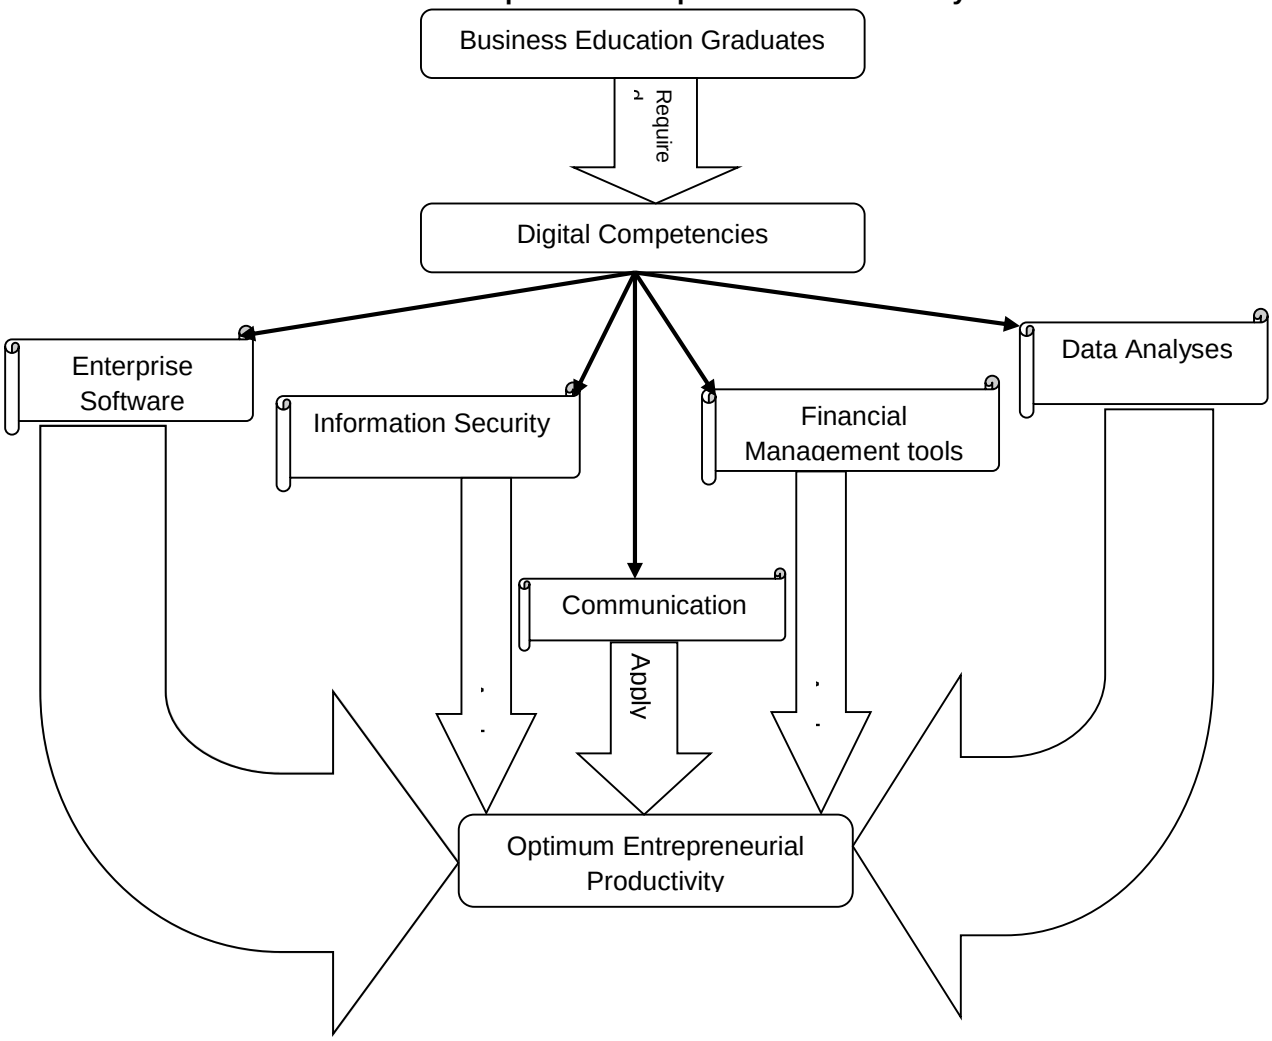
Types of Digital Communication: Digital medium are used as communication channels every day. According to Doyle (2019), here are some of the most common types of digital communication — bound to recognize most (if not all) of them: Email: Email is one of the most popular digital communication mediums, allowing users to send and receive messages, documents, and other files over the internet. Even if user don't use email in personal life, it's probably one of the primary ways one can communicate at work. Instant Messaging: One can probably also received an instant message (IM) or two. Instant messaging enables users to send and receive messages over the internet using apps like WhatsApp, Facebook Messenger, and iMessage.Video Conferencing: With the rise of remote work, video conferencing tools have become absolutely essential. Remote workers, businesses, educational institutions, and more use video conferencing to collaborate and communicate across time zones. Social Media: 59% of the world's population uses social media. Facebook, Instagram, and Twitter are just a few examples of social media platforms where users share information, photos, and videos with friends and followers. VoIP: WhatsApp, Skype, or Zoom are apps that use VoIP (Voice over Internet Protocol) technology, which allows user to place and receive calls over the internet — a cost-effective alternative to long-distance telephone calls.

Chatbots: One must have probably noticed that many of all these favorite brands have a chat feature. These are often powered by AI chatbots that use instant messaging to provide customer service support.SMS (Short Text Message Service): The technical difference between SMS and instant messaging is that it uses user cellular data rather than the internet to send and receive messages. According to Ashraf (2023), digital communication competencies are essential skills for effectively navigating and utilizing digital platforms for communication. These competencies typically include: ***Digital Literacy***: Understanding how to use digital tools and platforms, including basic computer skills, internet navigation, and familiarity with digital devices. ***Information Literacy*****:** Ability to find, evaluate, and use information from digital sources responsibly and ethically. This includes understanding how to assess the credibility of online information. ***Media Literacy***: Understanding how media content is created, distributed, and interpreted. This includes recognizing biases, understanding the impact of

media on public opinion, and creating media content responsibly. ***Technical Proficiency*****:** Skills in using specific digital communication tools and software, such as word processors, presentation software, social media platforms, video conferencing tools, and content management systems.

Communication Skills: Effective written and verbal communication tailored for digital contexts, including email etiquette, social media communication, and professional online interactions. ***Collaboration****:* Ability to work effectively with others using digital tools, such as cloud-based collaboration platforms, project management software, and online meeting tools. ***Creativity***: Using digital tools to create engaging and innovative content, such as multimedia presentations, videos, graphics, and interactive media. ***Critical Thinking***: Analyzing and evaluating digital content, understanding digital footprints, and making informed decisions based on digital data. ***Ethical Understanding***: Awareness of ethical issues related to digital communication, such as privacy, intellectual property, and cyber security. ***Adaptability***: Ability to quickly learn and adapt to new digital tools and platforms as technology evolves. ***Interpersonal Skills*****:** Managing digital relationships and understanding digital etiquette, including maintaining professionalism in online interactions and understanding cultural differences in digital communication. ***Digital Well-being***: Managing one's own digital presence and mental health, understanding the impact of digital communication on well-being, and promoting healthy digital habits. These competencies are crucial for personal, academic, and professional success in today's digital world

Digital Financial Management Tools Competencies



Schermann, Sonnenberg, and Bucher (2021) defined digital financial management tools competencies as the ability to use financial software and digital solutions to analyze, track, and manage business finances**.** According to Brynjolfsson and McElheran (2019) who describe digital financial management tools competencies **as** the technical and analytical skills required to effectively manage digital financial systems, including budgeting software, financial forecasting applications, and AI-driven accounting tools**.** They argue that these competencies are essential for improving financial decision-making and risk management in business enterprises. Tiron-Tudor and Deliu (2022) defined digital financial management tools competencies **as** the expertise required to utilize digital financial platforms for real-time transaction processing, financial reporting, and strategic financial planning. They emphasize that businesses leveraging these competencies can enhance operational efficiency, reduce financial errors, and improve cash flow management**.** Digital financial management tools competencies is the ability to utilize cloud-based financial applications, fintech solutions, and automated accounting software for efficient business operations (Puschmann, 2020). These competencies include proficiency in using platforms such as QuickBooks, SAP, and blockchain-based financial systems. Some of the digital financial management tools competencies as listed by Gomber et al. (2018) are ability to use financial tools like QuickBooks, Xero, or FreshBooks for bookkeeping, payroll, and tax management; Competence in using apps like Mint, YNAB (You Need a Budget), or Microsoft Excel for managing business finances and forecasting; Knowledge of processing transactions through digital banking platforms, PayPal, Stripe, and Square; Awareness of how blockchain technology and digital currencies like Bitcoin and Ethereum impact financial management; Ability to use tools like Power BI, Google Sheets, or SAP Financials to analyze business financial data and generate reports; Skills in creating and managing invoices digitally using software like Wave, Zoho Invoice, or Payoneer; Proficiency in managing finances through cloud accounting software for real-time financial tracking and collaboration; Ability to use digital tools to calculate taxes, file returns, and ensure compliance with financial regulations; Competence in using digital tools to monitor and control business expenses, ensuring financial stability and Understanding cyber security measures in financial transactions, such as fraud detection software and two-factor authentication.

Digital Data Analysis Competencies

Provost and Fawcett (2021) define digital data analysis competencies as the skills required to collect, process, and interpret large volumes of data using digital tools and statistical methods. These competencies include proficiency in programming languages such as Python and R, as well as expertise in machine learning and artificial intelligence for data-driven decision-making. Witten et al. (2020) describe digital data analysis competencies as the technical and analytical skills necessary for handling structured and unstructured data to derive business insights. McKinney (2018) defines digital data analysis competencies as the ability to manipulate and analyze data using digital tools such as SQL, Excel, and business intelligence software. He emphasizes that these competencies are crucial for making data-driven decisions in business and entrepreneurship. According to Wamba et al. (2017) the Digital Data Analysis Competencies are: ability to gather and organize structured and unstructured

data using databases like MySQL, PostgreSQL, and Google Sheets; Competence in using tools like Python (Pandas), OpenRefine, or Microsoft Excel to remove inconsistencies and prepare data for analysis; Proficiency in using statistical tools such as SPSS, R, or STATA to analyze business data (Brynjolfsson and McAfee, 2021); Ability to use visualization tools like Tableau, Power BI, or Google Data Studio for creating reports and dashboards; Understanding AI-driven analytics using platforms like TensorFlow, Scikit-learn, or IBM Watson for business forecasting; Knowledge of handling large datasets using Apache Hadoop, Spark, or Google BigQuery; Competence in using Google Analytics, Hotjar, and SEMrush to track online customer behaviour (Gandomi and Haider,2019); Awareness of best practices for securing business data, including GDPR compliance and encryption techniques; ability to analyze online trends and customer feedback using tools like Brandwatch, Hootsuite, or Sprout Social and skills in handling streaming data for immediate business insights using Apache Kafka or AWS Kinesis.

Figure 1: Diagrammatical Presentation of Digital Competencies Required by Business Education Graduates for Optimum Entrepreneurial Productivity

Source: Researcher

The above diagram is a schematic representation of the conceptual framework. From the diagram, one can see how the flow goes using the arrows. It depicts that business education graduates requires digital competencies. These digital competencies were further discussed one after another from the left side to the right. Then when entrepreneurs apply these digital competencies, it leads to

optimum entrepreneurial productivity. This is because, the level of technological growth in Nigeria and Kogi State in particular are so high that the population of those with online presents are far higher than those offline. Therefore, to increase productivities, customers are required and are mostly online. Using these digital technologies in the diagram above, business tends to have more potential customers and more people to know about the product they offer or the services they render.

Conclusion

This study was conducted to determine the digital competencies required by Business Education graduates for optimum entrepreneurial productivity in Kogi State, Nigeria. Specifically, it explored the competencies related to enterprise software, information security, communication, financial management tools, and data analysis.

The findings revealed that digital competencies are indeed essential for enhancing the entrepreneurial productivity of Business Education graduates. Although digital enterprise software competencies were found to be moderately required, competencies in digital information security, communication, financial management tools, and data analysis were mostly required. These results highlight a significant shift in the demands of the modern entrepreneurial and business landscape, where digital literacy and technical proficiency are becoming a necessity for success.

The study, therefore, concludes that integrating relevant digital skills into Business Education is critical for preparing graduates who are not only employable but also capable of launching and managing innovative, secure, and efficient business ventures. This calls for a collaborative effort among lecturers, curriculum planners, and students to embrace the digital transformation currently shaping the world of work and entrepreneurship.

Recommendations

From the related literature reviewed under this discourse, the researchers made the following recommendations:

1. Lecturers should undergo continuous professional development in digital competencies, particularly in enterprise software, financial tools, and cyber security. This will enable them to effectively teach and guide students in applying these tools for entrepreneurial purposes.

2. Students should take advantage of digital learning platforms and certifications to enhance their competencies in the key areas identified in this study especially digital communication, data analysis, and financial management tools. Developing these skills will improve their readiness for entrepreneurial ventures and employment.

3. Business Education curriculum should be revised to include up-to-date digital modules that reflect the current demands of entrepreneurship and the digital economy.

4. Educational institutions and policymakers should invest in ICT infrastructure, provide access to relevant digital tools, and support initiatives that promote digital literacy and entrepreneurship among students.

5 Business Education Graduates should engage in continuous self-development by seeking training in emerging digital tools and trends.

LOCAL BUSINESS EDUCATION PRACTICES AND COOPERATIVE SKILL DEVELOPMENT FOR GLOBAL IMPACT IN TERTIARY INSTITUTIONS IN SOUTHEAST, NIGERIA

Okonkwo, Mary U. (PhD)
University of Delta state, Agbor
Faculty of Education
Department of VTE
mary.okonkwo@unidel.edu.ng
&
Dr Cyprian Akhere Okoduwa
cyprian.okoduwa@unidel.edu.ng

ABSTRACT

This study examined business education practices and cooperative skill development for global impact in tertiary institutions in Southeast, Nigeria. The objective was to determine how collaborative pedagogies influence students' teamwork, communication competencies and global employability. Three research questions guided the study and corresponding hypotheses were tested. A mixed-methods design was employed, integrating quantitative surveys and qualitative interviews to generate comprehensive evidence on educational practices and outcomes. The population consists of 1,260 respondents (1,200 final-year business education students and 60 lecturers) who represents key stakeholders in business education within tertiary institutions in Southeast, Nigeria. The sample size of 380 respondents (350 students and 30 lecturers) were determined using Cochran's formula for proportionate sampling, ensuring statistical reliability. Experts in business education and educational research reviewed the instruments. Cronbach Alpha was used to test the reliability of the instruments and coefficient values of 0.83, 0.89 and 0.81 were obtained. Quantitative findings revealed a strong positive relationship between business education practices and cooperative skill development ($r = 0.68$, $p < 0.05$), indicating that experiential and collaborative learning strategies enhance professional competencies. Regression analysis further demonstrated that cooperative skills significantly predict global employability ($\beta = 0.53$, $p < 0.05$). Qualitative results supported these findings, with participants reporting that group-based activities and experiential learning improve communication, problem-solving, and interpersonal skills. However, institutional constraints such as large class sizes and limited learning resources were identified as barriers to effective skill development. The study concludes that business education practices play a critical role in fostering cooperative competencies and preparing students for global workplaces. Curriculum reform, industry partnerships and investment in experiential learning infrastructure are recommended to enhance educational outcomes and graduate employability. These interventions will strengthen human capital development and improve professional readiness in competitive labour markets.

Keywords: Business education, cooperative skills, experiential learning, global employability, tertiary institutions.

Introduction

Business education is a strategic discipline designed to equip individuals with the knowledge and competencies required for effective participation in modern economic systems. In contemporary labour markets, success is determined not only by technical expertise but also by soft skills such as teamwork, communication, problem-solving, and adaptability (Adeniji & Osibanjo, 2020). These competencies enable professionals to collaborate effectively within organisations and contribute to innovation and economic growth (World Economic Forum, 2020).

In Nigeria, tertiary institutions play a central role in human capital development and professional preparation. Universities and polytechnics offering business education programmes are expected to produce graduates who can function in diverse organisational settings and compete in international markets (Igwe & Eze, 2021). However, persistent concerns exist regarding the extent to which these institutions foster cooperative skills and global readiness. Empirical studies indicate that many graduates experience deficiencies in teamwork, communication and collaborative problem-solving competencies that employers increasingly regard as essential for organisational effectiveness (Chukwu & Amadi, 2024).

The demands of globalisation further underscore the importance of cooperative competencies. Modern workplaces operate within interconnected and multicultural environments that require professionals to

work collaboratively across cultural and organisational boundaries (UNESCO, 2020). Graduates who possess strong cooperative skills are better positioned to engage in international business activities, adapt to diverse professional contexts, and contribute to organisational innovation (Okeke, 2022). Consequently, educational institutions must align pedagogical practices with global competency standards to enhance student employability and professional success.

Business education programmes are uniquely positioned to foster these competencies through experiential and collaborative learning strategies. Pedagogies such as group projects, case studies, internships, and business simulations enable students to apply theoretical knowledge in practical settings and develop interpersonal skills (Eze & Obi, 2023). Such approaches encourage active learning, critical thinking, and teamwork—skills that are transferable to professional environments. Nevertheless, traditional lecture-based instruction remains prevalent in many institutions, limiting opportunities for interactive learning and practical skill development (Nwankwo, 2021).

The relationship between local business education practices and cooperative skill development therefore warrants systematic investigation. While theoretical knowledge remains fundamental, the absence of practical and collaborative learning experiences may hinder students' ability to acquire competencies required in contemporary workplaces (Olalekan & Chika, 2022). Understanding how pedagogical strategies influence skill acquisition and global readiness is essential for educational reform and curriculum development. This study examines business education practices in tertiary institutions in Southeast Nigeria and their impact on cooperative skill development and global employability. By analyzing pedagogical strategies and identifying challenges, the research seeks to generate evidence-based recommendations for enhancing educational outcomes. The findings are expected to contribute to academic discourse and inform policy initiatives aimed at strengthening business education and human capital development.

The significance of this investigation extends beyond academic inquiry. Cooperative skills are indispensable for professional success and organizational innovation in global economies. Graduates with strong collaborative competencies are better equipped to secure employment, advance in their careers, and contribute to economic development (Chukwu & Amadi, 2024). Educational institutions must therefore prioritize teaching strategies that foster teamwork and practical problem-solving. This study provides insights that can guide curriculum reform, pedagogical innovation, and policy development aimed at improving business education and global competitiveness. Business education remains a vital instrument for human capital development and economic progress. However, gaps in cooperative skill acquisition and global readiness persist within many tertiary institutions. By exploring the relationship between pedagogical practices and skill development, this research contributes to understanding how education can better prepare students for contemporary professional environments.

Statement of the Problem

Although business education programmes aim to prepare students for economic participation and professional success, empirical evidence indicates persistent skill gaps among graduates. Employers frequently report deficiencies in cooperative competencies such as teamwork, communication and problem-solving. These deficiencies hinder graduates' ability to function effectively in organizational and global business environments. Several factors may contribute to these challenges. First, traditional lecture-based teaching methods dominate many tertiary institutions, limiting opportunities for collaborative learning and practical engagement. Second, outdated curricula may not adequately reflect modern workplace requirements or global competency standards. Third, insufficient industry partnerships and experiential learning opportunities restrict students' exposure to real-world business challenges.

In Southeast Nigeria, these issues raise questions about the effectiveness of local business education practices in developing cooperative skills. If graduates are to compete successfully in global markets, educational institutions must prioritize teaching strategies that foster collaboration and practical skill acquisition. This study addresses the problem by systematically examining the relationship between business education practices and cooperative skill development. It seeks to determine whether existing pedagogical approaches contribute to global readiness and identify strategies for improvement.

Purpose of the Study

The purpose of this study is to examine the local business education practices and cooperative skill development for global impact in tertiary institutions in Southeast Nigeria. Specifically, the study sought to:

10. Examine local business education practices in tertiary institutions in Southeast Nigeria and their contribution to cooperative skill development.
11. Determine the relationship between cooperative skill development and students' readiness for global opportunities.

12. Identify challenges affecting the effective development of cooperative skills through business education.

Research Questions

The following research questions guided the study:

37. What business education practices are implemented in tertiary institutions in Southeast Nigeria, and how do they contribute to cooperative skill development?
38. What is the relationship between cooperative skill development and students' readiness for global opportunities?
39. What challenges hinder the effective development of cooperative skills through business education?

Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

1. There is no significant relationship between local business education practices and cooperative skill development among students in tertiary institutions in Southeast Nigeria.
2. Cooperative skill development does not significantly influence students' readiness for global opportunities.
3. There are no significant challenges affecting cooperative skill development in business education.

Literature Review

Business Education Practices in Tertiary Institutions

Business education is a component of human capital development that prepares individuals for professional and entrepreneurial roles. Human capital theory advanced by Gary Becker posits that investment in education enhances productivity and economic opportunities (Becker, 1993). Recent studies reinforce this perspective by demonstrating that business education programmes improve employability and professional competencies (Adebayo & Mutula, 2022; Dacre Pool & Sewell, 2020). Business education practices refer to the instructional strategies, curricular structures and pedagogical methods used in teaching business-related disciplines in tertiary institutions. These practices shape how students acquire both theoretical knowledge and practical competencies necessary for professional success. In tertiary institutions within Nigeria, business education programmes aim to prepare learners for careers in management, entrepreneurship, accounting, and organizational administration (Adeniji & Osibanjo, 2020).

Traditional business education practices in many institutions remain predominantly lecture-based and teacher-centred. This approach emphasizes knowledge transmission rather than active student participation and experiential learning (Eze & Obi, 2023). While lectures facilitate theoretical understanding, they often limit opportunities for interaction, collaboration and practical application. Consequently, students may graduate with sufficient academic knowledge but inadequate competencies for professional environments where problem-solving and teamwork are essential.

Modern perspectives on business education advocate for experiential and student-centred pedagogies. Experiential learning enables students to apply theoretical concepts in real-world contexts through simulations, case studies, internships and project-based tasks (Kolb, 2014). These strategies encourage critical thinking and active engagement, allowing learners to develop practical competencies alongside academic understanding (Okeke, 2022). For instance, business simulations provide opportunities for students to manage virtual enterprises and make strategic decisions, mirroring professional organizational environments.

Collaborative pedagogies further enhance learning outcomes by promoting teamwork and interpersonal interaction. Group projects and team-based assignments encourage students to share ideas, negotiate perspectives, and solve problems collectively (Johnson & Johnson, 2019). Such activities mirror workplace environments where cooperation and collective decision-making are essential. Research indicates that students engaged in collaborative learning demonstrate improved communication skills and higher academic achievement compared to those in traditional instructional settings (Olalekan & Chika, 2022).

Despite the recognized benefits of experiential and collaborative pedagogies, implementation challenges persist. Large class sizes, inadequate resources, and limited infrastructure constrain the delivery of interactive learning activities (Nwankwo, 2021). Overcrowded classrooms reduce opportunities for meaningful student participation and group work, limiting skill development. Additionally, insufficient access to technological tools and business laboratories restricts experiential learning opportunities.

Curriculum design also influences the effectiveness of business education practices. Effective curricula should balance theoretical content with practical skill development to meet industry expectations (World Economic Forum, 2020). However, some programmes prioritize academic knowledge at the expense

of experiential learning, creating gaps between educational outcomes and workplace requirements. Curriculum reforms that integrate practical competencies and industry engagement can enhance the relevance of business education programmes and improve graduate employability.

Teacher competence and professional development further impact pedagogical effectiveness. Educators require training in innovative instructional strategies that promote active learning and student participation (Igwe & Eze, 2021). Professional development programmes can equip teachers with skills in collaborative pedagogy, technology integration and experiential learning. Such initiatives improve instructional quality and support the implementation of modern educational practices.

Industry collaboration is another critical dimension of business education. Partnerships between educational institutions and businesses provide students with opportunities for internships, mentorship, and workplace learning (Chukwu & Amadi, 2024). Industry engagement exposes learners to professional environments and enhances their understanding of organisational practices. These experiences bridge the gap between academic learning and practical application, improving graduate preparedness for employment.

Business education practices significantly influence student learning outcomes and skill development. Traditional lecture-based instruction, while useful for theoretical understanding, may limit opportunities for experiential learning and practical engagement. Modern pedagogical strategies that emphasise collaboration and real-world application are essential for preparing students for professional success and global competitiveness. Addressing implementation challenges and strengthening industry partnerships can enhance the effectiveness of business education programmes in tertiary institutions.

Cooperative Skill Development in Business Education

Cooperative skill development refers to the acquisition of competencies that enable individuals to collaborate effectively, communicate ideas, and achieve shared objectives. These skills include teamwork, interpersonal communication, leadership, and problem-solving attributes that are essential for professional success and organisational productivity (Olalekan & Chika, 2022). In contemporary workplaces, employers increasingly prioritise soft skills alongside technical knowledge because teamwork and collaboration enhance organizational innovation and efficiency (World Economic Forum, 2020).

Business education programmes are uniquely positioned to foster cooperative skill development because they emphasize practical application and experiential learning. Activities such as group projects, case studies, business simulations and internships provide opportunities for students to work collaboratively and apply theoretical knowledge in real-world contexts (Eze & Obi, 2023). For example, group assignments require students to divide responsibilities, communicate ideas and coordinate efforts to achieve shared objectives. These experiences mirror professional environments where teamwork and collective problem-solving are essential.

Educational research demonstrates that cooperative learning strategies enhance both academic performance and skill acquisition. Students who participate in collaborative learning activities exhibit higher levels of engagement and critical thinking compared to those in traditional instructional settings (Johnson & Johnson, 2019). Group-based tasks encourage learners to evaluate diverse perspectives, negotiate solutions and develop interpersonal competencies. These processes contribute to holistic learning and professional preparedness.

Cooperative skill development also improves employability and career advancement. Employers report that graduates with strong interpersonal competencies are better equipped to function in team-oriented workplaces and contribute to organizational success (Chukwu & Amadi, 2024; Holmes & Tran, 2021). Skills such as communication, leadership, and conflict resolution enhance professional effectiveness and adaptability. Educational institutions therefore have a responsibility to integrate skill development into business education curricula to improve graduate outcomes.

Despite the recognized benefits of cooperative learning, implementation challenges remain. Large class sizes and limited instructional resources restrict opportunities for interactive learning and group activities (Nwankwo, 2021). Overcrowded classrooms may hinder meaningful participation and reduce the effectiveness of collaborative tasks. Additionally, insufficient access to technological tools and learning infrastructure limits opportunities for experiential skill development.

Teacher competence and pedagogical strategies also influence cooperative skill acquisition. Educators require training in student-centred instructional methods that promote active learning and collaboration (Igwe & Eze, 2021). Professional development programmes can equip teachers with skills in facilitating group activities, integrating technology, and assessing collaborative outcomes. Such initiatives enhance instructional quality and support the effective implementation of cooperative learning strategies.

Assessment methods further shape skill development outcomes. Traditional examination-based assessments prioritize theoretical knowledge and may neglect practical competencies (Chukwu &

Amadi, 2024). Alternative assessment strategies such as project-based evaluations, group presentations, and portfolio assessments provide more comprehensive measures of student learning. These methods encourage learners to demonstrate collaborative competencies and practical application of knowledge.

Cooperative skill development is a fundamental objective of business education that enhances professional readiness and organizational effectiveness. Collaborative learning strategies promote interpersonal competencies and prepare students for team-oriented workplaces. However, challenges such as resource constraints and traditional pedagogical practices may limit skill acquisition. Addressing these barriers through curriculum reform, teacher training, and innovative assessment strategies can improve educational outcomes and graduate employability.

Global Competency and Educational Outcomes

Global competency refers to the knowledge, skills, and attitudes that enable individuals to engage effectively in diverse cultural, social, and professional environments. In an increasingly interconnected world, global competency encompasses cross-cultural communication, adaptability, critical thinking, and collaborative problem-solving competencies that enhance professional effectiveness and societal engagement (UNESCO, 2020). Educational systems play a central role in developing these competencies by equipping learners with the skills required to navigate global challenges and contribute to international cooperation.

In tertiary institutions, global competency is increasingly recognized as a critical component of educational outcomes. Graduates are expected not only to possess discipline-specific knowledge but also to demonstrate the ability to work in multicultural teams and adapt to dynamic professional environments (World Economic Forum, 2020). Business education programmes are particularly well positioned to foster global competency because they integrate theoretical knowledge with practical applications that reflect real-world economic and organizational contexts (Chukwu & Amadi, 2024). Through experiential learning and collaborative pedagogies, students acquire competencies that enhance their readiness for global engagement.

Global competency is closely linked to educational outcomes because it influences graduate employability and professional success. Employers increasingly prioritize candidates who can operate effectively in diverse teams and respond to complex workplace challenges (Olalekan & Chika, 2022). Skills such as communication, teamwork and cultural awareness enable employees to collaborate across organizational boundaries and contribute to innovation. Research indicates that graduates with strong global competencies are more likely to secure employment and progress in their careers compared to peers lacking such skills (Eze & Obi, 2023). These findings underscore the importance of integrating global perspectives into educational curricula.

Educational outcomes refer to the knowledge, skills, and competencies acquired by learners as a result of instructional processes. In contemporary education systems, outcomes extend beyond academic achievement to include transferable skills that enhance professional and social participation (Yorke & Knight, 2006). Global competency represents an important dimension of educational outcomes because it prepares students for participation in international economies and multicultural workplaces. Institutions that prioritize global learning experiences contribute to the development of graduates who are adaptable and socially responsible.

Business education programmes contribute to global competency by exposing students to international business practices and cross-cultural perspectives. Courses in management, entrepreneurship, and organizational behaviour often incorporate case studies and simulations that reflect global economic realities (Igwe & Eze, 2021). These learning experiences encourage students to analyze diverse business environments and develop solutions to complex problems. For example, case studies involving multinational corporations expose learners to organizational strategies and cultural considerations that influence decision-making. Such pedagogies enhance critical thinking and global awareness.

Experiential learning strategies further support the development of global competencies. Internships, industry placements, and collaborative projects provide opportunities for students to engage with professional environments and apply theoretical knowledge (Eze & Obi, 2023). These experiences bridge the gap between academic learning and workplace expectations by exposing learners to real-world challenges. Students who participate in internships often report improved professional confidence and skill acquisition (Johnson & Johnson, 2019). Such findings demonstrate the value of experiential learning in promoting educational outcomes and global readiness.

Global competency also enhances educational outcomes by fostering personal and social development. Cross-cultural interactions and collaborative learning experiences encourage empathy and interpersonal understanding. Students who engage with diverse perspectives develop social

awareness and emotional intelligence attributes that contribute to professional and societal engagement (UNESCO, 2020). These competencies enable individuals to navigate complex social environments and contribute to community development. Despite its importance, the integration of global competency into educational systems faces challenges. Traditional curricula may prioritize discipline-specific knowledge at the expense of transferable skills (Nwankwo, 2021). Limited opportunities for international exposure and cross-cultural learning can restrict the development of global awareness. Addressing these challenges requires curriculum reform and institutional investment in global learning initiatives. Educational programmes that incorporate international perspectives and collaborative learning experiences enhance student competencies and educational outcomes.

Teacher competence and pedagogical strategies also influence global competency development. Educators require training in instructional methods that promote critical thinking and cultural awareness (Olalekan & Chika, 2022). Professional development programmes can equip teachers with skills in experiential learning and collaborative pedagogy. Such initiatives improve instructional quality and support the implementation of global learning strategies. Institutions that prioritize teacher development contribute to enhanced educational outcomes and student preparedness. Global competency is increasingly recognized as a determinant of national economic development. Economies with skilled and adaptable workforces are better positioned to compete in international markets and attract investment (World Economic Forum, 2020). Educational systems that prioritize global competencies contribute to human capital development and economic growth. By equipping learners with skills relevant to global challenges, institutions support national development and international cooperation.

Global competency is a critical dimension of educational outcomes because it enhances employability and professional effectiveness. Business education programmes provide opportunities for global learning through experiential pedagogies and international perspectives. However, challenges such as traditional curricula and limited cross-cultural exposure may hinder competency development. Addressing these barriers through curriculum reform and institutional investment can strengthen educational outcomes and global readiness.

Theoretical Framework

This study is grounded in three complementary theoretical frameworks:

Experiential Learning Theory (David A. Kolb). Knowledge is constructed through practical engagement and reflection. Experiential strategies enhance skill development and professional competencies (Kolb, 2014).

Human Capital Theory (Gary Becker). Investment in education increases productivity and career opportunities. Skill development improves employability and economic outcomes (Becker, 1993).

Social Learning Theory (Lev Vygotsky). Knowledge is constructed through social interaction and peer learning. Collaborative environments enhance cognitive development and interpersonal skills (Vygotsky, 1978).

These frameworks provide explanatory insights into the relationships between business education practices, cooperative skills and employability.

Methods

A mixed-methods approach is employed to capture both quantitative and qualitative dimensions of the research problem, enabling comprehensive understanding of pedagogical practices and educational outcomes. The quantitative component examined relationships among variables using statistical techniques, while the qualitative component explored participants' experiences and perceptions through interviews and thematic analysis. The population consists of 1,260 respondents (1,200 final-year business education students and 60 lecturers) who represents key stakeholders in business education within tertiary institutions in Southeast, Nigeria. Final-year students are selected because they have completed most of their coursework and are best positioned to evaluate the effectiveness of business education practices and cooperative skill development. Lecturers and administrators are included because they implement pedagogical strategies and possess insights into curriculum delivery and institutional challenges. A stratified random sampling technique was employed to ensure representation across institutions and demographic categories. Stratification reduces sampling bias and enhances generalisability (Bryman, 2016). The sample size of 380 respondents (350 students and 30 lecturers) were determined using Cochran's formula for proportionate sampling, ensuring statistical reliability.

Data were obtained from primary sources- questionnaires and interviews and secondary sources- academic journals, institutional reports and curriculum documents. Two instruments were used for data collection. A structured questionnaire measured business education practices, cooperative skill development and perceptions of global employability. Semi-structured interview explored lecturers' perspectives on pedagogical strategies, challenges in implementing collaborative learning and

recommendations for curriculum improvement. Experts in business education and educational research reviewed the instruments. Cronbach Alpha was used to test the reliability of the instruments and coefficient values of 0.83, 0.89 and 0.81 were obtained. Quantitative data were analyzed using descriptive statistics (mean, standard deviation), correlation analysis to examine relationships among variables and regression analysis to predict outcomes. Qualitative data were analyzed using thematic analysis to identify recurring patterns and insights.

Results

Quantitative Results

Research Question 1

What business education practices are implemented in tertiary institutions and how do they contribute to cooperative skill development?

Table 1: Business Education Practices

Variable	Mean	SD	Interpretation
44. Emphasis on theoretical instruction	4.12	0.78	High
45. Use of group projects for collaboration	3.98	0.85	High
46. Case studies for problem-solving	3.87	0.92	High
47. Internship programmes for professional skills	3.75	0.89	Moderate
48. Traditional methods limit skill acquisition	4.05	0.81	High
Grand Mean	**3.95**		**High**

The high grand mean in (3.95) Table 1 indicated that business education practices emphasized both theoretical instruction and collaborative learning. Group projects and case studies were rated highly, suggesting that pedagogical strategies promote cooperative skill development. However, internship programmes received a moderate rating (mean = 3.75), implying limited practical exposure.

Research Question 2

What is the relationship between cooperative skill development and students' readiness for global opportunities?

Table 2: Cooperative Skills and Global Readiness

Variable	Mean	SD	Interpretation
49. Teamwork improves problem-solving	4.20	0.74	High
50. Communication skills enhance employability	4.15	0.79	High
51. Collaborative learning promotes global readiness	4.05	0.83	High
52. Cross-cultural understanding improves professional success	3.92	0.88	High
53. Students possess adequate global skills	3.68	0.91	Moderate
Grand Mean	**4. 00**		**High**

The results in Table 2 show a strong positive relationship between cooperative skills and global readiness. High ratings for teamwork and communication competencies indicate that students perceive these skills as essential for professional success. However, the moderate rating for global skill adequacy (mean = 3.68) suggests the need for additional training in international competencies.

Research Question 3

What challenges affect cooperative skill development through business education?

Table 3: Challenges to Skill Development

Variable	Mean	SD	Interpretation
54. Large class sizes hinder collaboration	4.18	0.76	High
55. Limited resources restrict experiential learning	4.10	0.81	High
56. Traditional teaching methods reduce participation	4.05	0.84	High
57. Lack of industry partnerships limits exposure	3.97	0.88	High

58. Assessment focuses on theoretical knowledge	4.12	0.79	High
Grand Mean	**4.08**		**High**

The high grand mean (4.08) in Table 3 indicated significant institutional challenges. Large class sizes and resource limitations restrict opportunities for interactive learning. Traditional assessment methods that prioritize theory over practice further limit experiential learning.

Test of Hypotheses

Hypothesis 1

There is no significant relationship between business education practices and cooperative skill development.

Table 4: Pearson Correlation Analysis

Variable	r-value	p-value	Decision
Business education practices and cooperative skills	0.68	0.000	Significant

The correlation coefficient ($r = 0.68$, $p < 0.05$) in Table 4 indicated a strong positive relationship between business education practices and cooperative skill development. Collaborative pedagogies enhance teamwork and problem-solving competencies. The null hypothesis is therefore rejected.

Hypothesis 2

Cooperative skill development does not significantly influence students' readiness for global opportunities.

Table 5: Regression Analysis

Variable	Beta (β)	t-value	p-value	Decision
Cooperative skills → global readiness	0.53	6.72	0.000	Significant

The regression result ($\beta = 0.53$, $p < 0.05$) in Table 5 shows that cooperative skill development significantly predicts global readiness. Students with teamwork and communication competencies are better prepared for professional environments. The null hypothesis is therefore rejected.

Hypothesis 3

There are no significant challenges affecting cooperative skill development.

Table 6: Mean Scores of Challenges

Variable	Mean	SD	Decision
Institutional challenges	4.08	0.79	Significant

The mean score (4.08) in Table 6 indicated that institutional challenges significantly affect skill development. Large class sizes and limited resources reduce opportunities for experiential learning. The null hypothesis is therefore rejected. Institutional investment and curriculum reform are required to address these barriers and enhance educational outcomes.

Qualitative Results

Theme 1: Experiential Learning and Skill Development

Participants consistently reported that experiential learning strategies—such as group projects, simulations, and case studies enhance cooperative skills and professional competencies. Lecturers emphasized that practical engagement enables students to apply theoretical knowledge in real-world contexts. One lecturer remarked:

"When students work in groups and solve problems together, they become more confident and better prepared for workplace challenges."

This perspective aligns with experiential learning theory advanced by David A. Kolb, which posits that knowledge is constructed through active participation and reflection. Students reported that collaborative tasks improved their ability to share ideas, negotiate solutions, and work in teams. A student participant stated:

"Group assignments teach us how to communicate and work with others. It helps us understand different perspectives."

These findings corroborate empirical studies demonstrating that experiential learning enhances skill acquisition and employability (Eze & Obi, 2023; Adeyemi & Ojo, 2022). Collaborative activities foster critical thinking and problem-solving competencies, which are essential for professional success. However, participants noted that experiential opportunities are not uniformly available across institutions. Some programmes rely heavily on theoretical instruction, limiting practical skill

development. This inconsistency underscores the need for curriculum reform that prioritizes experiential strategies.

Theme 2: Institutional Constraints

Institutional barriers emerged as a significant challenge to effective skill development. Participants identified large class sizes, inadequate learning resources, and limited technological infrastructure as constraints. A lecturer explained:

"It is difficult to engage students in group activities when classes are overcrowded. Individual attention becomes impossible."

This observation supports quantitative findings indicating that institutional constraints reduce opportunities for interactive learning. Nwankwo (2021) similarly reported that overcrowded classrooms hinder pedagogical innovation and student participation in Nigerian institutions. Large class sizes restrict meaningful interaction and limit the effectiveness of collaborative pedagogies.

Resource limitations further exacerbate these challenges. Participants noted that insufficient access to digital tools and learning materials reduces experiential learning opportunities. One student stated:

"We rarely use technology for learning. If we had more digital tools, group work and simulations would be easier."

Technology-enabled learning environments can enhance skill development by providing interactive experiences and collaborative platforms. Investment in educational infrastructure is therefore essential for improving learning outcomes. Institutional policies should prioritize resource allocation and infrastructure development to address these barriers.

Theme 3: Global Competency and Employability

The theme of global competency highlights the importance of skills required for international and multicultural workplaces. Participants agreed that teamwork, communication, and adaptability enhance employability. A lecturer observed:

"Employers value students who can work in teams and communicate effectively. These skills are essential in global workplaces."

This perspective aligns with human capital theory, which asserts that skill development increases productivity and career opportunities (Gary Becker). Global competencies enable graduates to participate in professional environments and international collaborations. Empirical studies support this view, demonstrating that teamwork and communication skills improve employment outcomes (Chukwu & Amadi, 2024).

However, participants indicated that additional training in cross-cultural competencies is needed. Global workplaces require cultural awareness and adaptability, skills that may not be fully developed through traditional curricula. A student noted:

"We learn teamwork, but we need more exposure to different cultures and international practices."

Educational programmes should therefore integrate global perspectives and experiential opportunities that expose students to multicultural contexts. Industry partnerships and international collaborations can enhance global readiness by providing practical exposure to diverse professional environments.

Theme 4: Pedagogical Effectiveness

Participants emphasized the importance of student-centred pedagogies in promoting skill development. Collaborative learning strategies were perceived as more effective than traditional lecture-based instruction. A lecturer stated:

"Students learn better when they participate actively. Group discussions and problem-solving activities improve understanding."

This finding aligns with social learning theory advanced by Lev Vygotsky, which emphasizes knowledge construction through social interaction. Group activities encourage peer learning and critical thinking, enhancing educational outcomes. Johnson and Johnson (2019) similarly reported that cooperative learning improves academic performance and interpersonal competencies.

Despite these benefits, participants acknowledged variability in pedagogical effectiveness. Some lecturers lack training in modern teaching strategies, limiting the implementation of experiential learning. A lecturer remarked:

"Professional development is necessary. Many educators need training in collaborative teaching methods."

Professional development programmes can equip educators with skills in student-centred pedagogy and technology integration. Such initiatives enhance instructional quality and support educational innovation. Institutions should prioritize educator training to improve teaching effectiveness and learning outcomes.

Integration of Themes

The qualitative themes complement quantitative results by providing contextual insights. Experiential learning enhances cooperative skills, while institutional constraints hinder skill development. Global competencies improve employability and pedagogical effectiveness depends on modern teaching strategies. Participants' experiences underscore the importance of curriculum reform and educational investment. Addressing institutional challenges and promoting experiential learning will strengthen professional competencies and global readiness. Educational institutions must adopt pedagogical innovations that enhance student engagement and skill acquisition.

Discussion of Findings

The findings of this study on business education practices and cooperative skill development for global impact in tertiary institutions in Southeast Nigeria, Nigeria, demonstrate that experiential and collaborative pedagogies significantly enhance students' professional competencies and employability. Quantitative results revealed a strong positive relationship ($r = 0.68$, $p < 0.05$) between business education practices and cooperative skill development. This finding supports experiential learning theory advanced by David A. Kolb, which posits that knowledge is constructed through active engagement and reflection (Kolb, 2014). Students exposed to group projects, case studies, and simulations reported improved teamwork and problem-solving abilities- skills essential for workplace success (Eze & Obi, 2023). Similar studies confirm that experiential pedagogies strengthen professional competencies and critical thinking (Adeyemi & Ojo, 2022; Bahrami & Rabie, 2021).

Qualitative findings reinforced quantitative results by highlighting participants' perceptions of collaborative learning as a catalyst for skill development. Lecturers and students reported that group activities promote communication and interpersonal competencies. One lecturer observed that "students learn better when they work in teams and solve problems together," reflecting the pedagogical value of peer learning. This aligns with social learning theory advanced by Lev Vygotsky, which emphasizes knowledge construction through social interaction (Vygotsky, 1978). Research further demonstrates that cooperative learning enhances academic engagement and interpersonal skills (Din & Higgins, 2021; Sarikaya & Erdoğan, 2022). Participants' experiences therefore validate the importance of student-centred pedagogies in business education.

The study also established a significant relationship between cooperative skill development and global employability ($\beta = 0.53$, $p < 0.05$). Students with teamwork and communication competencies are better prepared for professional environments and international workplaces. Human capital theory advanced by Gary Becker explains this relationship by asserting that investment in education increases productivity and career opportunities (Becker, 1993). Employers increasingly prioritise soft skills because they enhance organisational performance and adaptability (World Economic Forum, 2020). Recent empirical studies support this perspective, demonstrating that graduates with cooperative competencies experience improved employment outcomes (Chukwu & Amadi, 2024; Holmes & Tran, 2021). These findings confirm that skill development is essential for employability in competitive labour markets.

Global competencies emerged as an important dimension of educational outcomes. Quantitative data revealed moderate ratings for global skill adequacy (mean = 3.68), indicating the need for additional training in international competencies. Qualitative participants emphasised cross-cultural learning as critical for professional success. A lecturer stated that "students need more exposure to international practices," highlighting gaps in global readiness. This aligns with global education frameworks advocated by UNESCO, which emphasized global citizenship and multicultural engagement (UNESCO, 2020). Research further demonstrates that international exposure and virtual collaboration enhance cross-cultural competencies (Han & Wang, 2023; Laing & Frost, 2021). Educational programmes must therefore integrate global perspectives and experiential opportunities to strengthen employability.

Institutional challenges were identified as significant barriers to skill development. Quantitative results indicated that large class sizes (mean = 4.18) and limited resources (mean = 4.10) restrict experiential learning opportunities. Qualitative participants reported that overcrowded classrooms reduce student participation and limit collaborative activities. These findings corroborate research by Nwankwo (2021), which highlights resource constraints as impediments to pedagogical innovation in Nigerian institutions. Similar studies emphasized that institutional investment in learning infrastructure is necessary for effective skill development (Adebayo & Mutula, 2022; Pegg et al., 2020). Technology-enabled pedagogies and smaller class sizes can enhance interactive learning and educational outcomes.

The integration of quantitative and qualitative evidence supports the study's central argument that business education practices significantly influence cooperative skill development and global employability. Collaborative pedagogies enhance professional competencies, while institutional challenges require targeted interventions. Curriculum reform and industry partnerships are essential for bridging the gap between academic learning and workplace requirements (Barraket & Loosemore,

2021). Experiential learning opportunities such as internships and simulations provide practical exposure that strengthens skill acquisition (Nguyen & Doctor, 2022). Institutions must therefore prioritize pedagogical innovation and industry engagement.

The findings also reinforce theoretical frameworks underpinning the study. Experiential learning theory explains knowledge construction through practical engagement (Kolb, 2014), while human capital theory demonstrates the economic value of skill development (Becker, 1993). Social learning theory further highlights the importance of collaborative environments for skill acquisition (Vygotsky, 1978). These frameworks provide explanatory insights into the relationships observed and validate the study's conclusions. Recent empirical studies support the study's findings. Cooperative learning enhances academic success and interpersonal competencies (Sarikaya & Erdoğan, 2022). Industry-linked learning improves employability and professional readiness (Adewale & Usman, 2021). Global competencies are essential for professional success in interconnected economies (Sharif & Sharif, 2023). These studies reinforce the importance of experiential pedagogies and curriculum alignment with labour market demands.

Finally, the discussion demonstrates that business education practices significantly influence cooperative skill development and global employability. Quantitative evidence established strong statistical relationships, while qualitative insights contextualized participants' experiences. Institutional challenges must be addressed through curriculum reform and infrastructure investment. Global competencies and experiential learning are essential for professional success in modern workplaces. Educational institutions should adopt pedagogical innovations that enhance skill development and employability.

Conclusion

This study concludes that business education practices play a crucial role in developing cooperative skills and enhancing global employability. Collaborative pedagogies such as group projects and experiential learning significantly improve teamwork and problem-solving competencies. Quantitative results confirmed a strong relationship between business education practices and skill development, while qualitative findings highlighted participants' positive perceptions of experiential learning. Institutional challenges remain significant barriers to educational outcomes. Large class sizes and limited resources restrict opportunities for interactive learning. Addressing these constraints through curriculum reform and infrastructure investment will enhance skill development and professional readiness. Global competencies are essential in modern workplaces, and educational programmes must integrate international perspectives to prepare students for professional success.

The integration of quantitative and qualitative evidence supports the study's theoretical frameworks. Experiential learning theory explains knowledge construction through active engagement, while human capital theory demonstrates the economic value of skill development. Social learning theory further highlights the importance of collaborative environments. These frameworks provide explanatory insights into the relationships observed. In summary, business education practices significantly influence cooperative skill development and global employability. Educational reforms that prioritise experiential learning and institutional investment will strengthen graduate competencies and professional outcomes.

Recommendations

Based on the findings, the following recommendations are proposed:

1. Business education curricula should prioritize collaborative pedagogies and experiential strategies. Group projects, simulations and problem-based learning enhance skill development and professional competencies.
2. Institutions should collaborate with businesses to provide internships and practical exposure. Industry engagement bridges the gap between academic knowledge and workplace requirements.
3. Educational institutions must invest in technology-enabled learning environments. Digital simulations and collaborative platforms enhance student engagement and experiential learning.
4. Lecturers require training in modern pedagogical strategies. Professional development programmes should focus on student-centred learning and technology integration.
5. Business education programmes must incorporate international perspectives and cross-cultural learning. Global competencies enhance students' readiness for international workplaces.
6. Smaller class sizes promote interactive learning and student participation. Institutions should adopt policies that improve teacher-student engagement.
7. Evaluation methods should measure both theoretical knowledge and practical competencies. Portfolio assessments and group evaluations encourage skill development.

Abstract
Young people in emerging African economies are still struggling with endemic unemployment, increasing digital gaps, and an ever-expanding gap between labour market requirements informed by the Fourth Industrial Revolution (4IR) and the few digital skills instilled in most Technical and Vocational Education and Training (TVET) frameworks. The ability of digitalised TVET to stimulate inclusive economic growth is further limited by structural rigidities, poor infrastructure, and poor industry alignment. It is against this background that the research investigated how the digital skills training in TVET institutions can be used as a driver of inclusive economic development, especially the efficacy of enterprise-TVET relationships and curriculum changes in incorporating 4IR skills to promote employability and workforce preparedness. The research design was a qualitative study based on the Human Capital Theory. The secondary sources were used to obtain data, such as peer-reviewed journal articles, policy documents, textbooks, and credible institutional reports. Content analysis was applied to these data in a systematic manner to determine prevailing themes associated with the integration of digital skills, partnership models, infrastructural constraints, and inclusive growth outcomes. The results showed that enterprise-TVET partnerships enhanced graduate employability when collaboration entailed curriculum co-design, structured apprenticeships, and common infrastructure. Curriculum changes enhanced the incorporation of digital literacy, AI awareness, and industry standards. Nevertheless, fragmentation in governance, poor digital infrastructure, lecturer capacity disparities, and socio-economic disparities restricted fair access and extended economic influence. The paper has found that digital skills training in TVET has a considerable yet conditional potential to drive inclusive economic growth, provided that there is coherent policy alignment and institutional investment. It suggested the institutionalisation of enterprise partnerships, faster curriculum innovation through ongoing lecturer upskilling, and structural and socio-economic barriers to achieve inclusive and sustainable results.
Keywords: Digital skills training; TVET; Inclusive economic growth; 4IR; emerging economies

Introduction
The concept of digital skills summarizes the skills needed to be able to successfully implement digital technologies throughout the range of learning, occupational activity, innovations, and active engagement in the digital economy. They include basic ICT literacy, data manipulation, digital communication, automation consciousness, and, increasingly, artificial intelligence and the functionality of the Fourth Industrial Revolution (4IR). Technical and Vocational Education and Training (TVET) is defined as structured programmes that aim at imparting practical and occupation-specific skills to learners that are aligned to current imperatives of the labor market. Inclusive economic growth on the other hand refers to a developmental pathway whereby economic growth creates equal job opportunities, curbs inequality, and assimilates the marginalised groups into productive models. In the emerging African economies, where the population is young, the level of informal employment is high, and the pace of digitalisation is rapid, these ideas have an intersection, which is strategically important. The recent evidence shows that the adoption of digital competencies in TVET curricula improves graduate employability and strengthens the competitiveness of local businesses (Irungu, 2025; Ajeniweni & Bamgbowu, 2024).
Within the framework of shifting the African economies to knowledge-based and technology-driven economies, the traditional craft-based models of vocational training are not sufficient to meet the modern requirements. Online enhancement of TVET systems is becoming more and more considered

as the boost that can be used to fill skills gaps and to spur micro-, small-, and medium-sized enterprises. Empirical evidence on sub-Saharan Africa shows that inclusive TVET reforms have increased the rate of workforce participation and reduced structural unemployment, especially among women and the youth (Leong, 2024). Additionally, the World Bank emphasizes that the digital literacy programs integrated into the skill development frameworks make them more labor market-aligned and more productive (Elzir & Morgandi, 2024). Therefore, the training of digital skills in TVET is a radical convergence of educational reform and economic modernisation in the emerging markets of Africa.

The pressing need of digital transformation in African TVET systems is also compounded by the high rate of technological diffusion and the spread of platform-based economies. Reducing the digital divide, which can be described as the lack of equal access to digital infrastructure, skills, and opportunities, has become a central element of inclusive growth policies. Comparative analysis of the South African and Kenyan TVET reforms shows that the introduction of 4IR technologies and digital pedagogy in vocational education enhances entrepreneurial potential and wage opportunities (Seleke & Teis, 2025; Cheruiyot, 2024). Digital competence is no longer associated with the use of technical tools, but they involve problem-solving, innovation literacy, and adaptive learning, which are all crucial to navigate volatile labour markets. Systematic reviews affirm that organizations and TVET institutions collaborations can speed up digital transformation and improve curriculum responsiveness (Niwamanya et al., 2025).

Bibliometric reviews of sub-Saharan literature also underscore an increased focus on the digital integration as a factor in institutional stability and economic applicability (Perumal and Orji, 2024). In the new African economies that are informalized in terms of employment, digitalised vocational paths open up opportunities of formalisation, productivity, and scalable entrepreneurship. TVET institutions become the incubators of inclusive industrial involvement by providing learners with transferable digital skills. Based on this, the training of digital skills goes beyond pedagogical reform, presupposing macro-economic importance, and serves as a channel through which the development of human-capitals is transformed into quantifiable economic inclusion.

The economic growth in the emerging African economies should be inclusive, which means that it should not be based solely on job creation but on the equal access to high-quality skill ecosystems. Inclusive TVET focuses on gender equality, access in rural areas, inclusion of the disabled, and affordability. Studies show that vocational education that is digitally enriched increases the engagement of underserved communities through the provision of flexible learning models and remote training (Folson and Awuah, 2025). Vocational programmes associated with technological modernization have led to the development of enterprises and regional competitiveness in Nigeria (Ajeniweni and Bamgbowu, 2024).

The parallel systematic literature reviews reveal that digital transformation can increase institutional efficiency, teacher capacity, and learner engagement, which can strengthen long-term economic returns (Mante et al., 2025). The meaningful introduction of digital technologies into TVET can create the ecosystem of innovation that can help to diversify industries (Mbatha, 2024). With Africa moving towards the global digital economy, the lack of digital capabilities in the vocational systems is likely to continue with inequality and skills gaps. On the other hand, an adequately crafted digital skills training agenda can speed up productivity, catalyze inclusive entrepreneurship, and decent work opportunities. In this respect, the analysis of digital skills training in TVET as the driver of inclusive economic development is timely and necessary to map sustainable development trajectories in the emerging African economies.

Statement of the Problem

Digital Skills Training in the Technical and Vocational Education and Training (TVET) systems of new African economies are increasingly being projected as a key channel through which exclusive economic development can be achieved; however, there is a lot of structural and systemic challenge that continues to erode its transformative potential. Regardless of the high policy promises, a good number of the TVET institutions still have outdated infrastructure, low internet connections, and no access to current digital tools. This technological gap reduces the successful integration of digital skills into vocational education, thus creating a failure to keep skills of graduates in line with the changing labour market. In Kenya and other sub-Saharan African nations, evidence shows that insufficient integration of technology undermines the preparedness of the workforce and slows the processes of digital inclusion (Irungu, 2025).

In addition, the lack of equalization in the funding mechanisms and the weak collaboration between industries and institutions limits the responsiveness of TVET programmes to the new digital domains. According to the World Bank, despite the understanding that digital literacy is a key to competitiveness, the gap in implementation is caused by the lack of coordination in policy and overall teacher training

(Elzir and Morgandi, 2024). Placed in a context where the youth unemployment level is still highly problematic, the fact that TVET systems fail to integrate into the digital skills that are being considered relevant runs the risk of promoting the cycle of exclusion instead of breaking it. Besides, the rural urban disparity in access to infrastructure also deepens inequality, and these populations in marginalised groups are not able to receive digital transformation initiatives equally. These structural flaws hold real questions concerning the strength of the existing digital skills plans in driving the economic inclusion of the masses, within the emergent African economies.

In addition to the infrastructural shortcomings, there is also another layer of concern the pedagogical and institutional preparedness of TVET systems. Implementation of the Fourth Industrial Revolution technologies artificial intelligence, automation, and digital entrepreneurship change demands curriculum adjustment, ongoing instructor up-skilling and effective enterprise relationships. However, empirical evidence confirms that most educators working in TVET are not technologically advanced, which restricts them in the process of providing industry-relevant education (Seleke & Teis, 2025). Enterprise-TVET partnerships are not systemic at all, despite being extensively promoted, and are likely to continue to be pilot projects instead of systems redesign (Niwamanya et al., 2025).

Therefore, graduates can obtain partial digital exposure without the competence for the depth of the innovation sectors. In case of the uneven implementation of digital skills training, is it really possible to act as a facilitator of inclusive growth instead of benefiting already privileged urban learners? And in case the relationships to industry are only superficial, how do the TVET institutions expect to react to quickly changing digital labour-market needs when graduates are out of date? These unfinished tensions highlight the precariousness of the existing reformation pathways. Devoid of conscious alignment between policy, pedagogy and industrial ecosystems, digital TVET will be more of an aspirational rhetoric as opposed to structural economic change driver. The survival of inclusive growth thus depends on the attainment of digital competencies not presented as additional units, but as pillars in vocational education systems of African economies.

Another issue of concern is the fact that access to digital skills education in TVET systems is characterized by the seemingly long-standing socio-economic inequality. Inclusive economic development assumes fair involvement; however, gender inequality, affordability inequalities, and regional inequity remain barriers to beneficiaries of digitised vocational education. Studies in sub-Saharan Africa have shown that despite the role that TVET expansion plays in job creation, the quality and digital up-to-dateness of training have a major impact on the economic performance (Mante et al., 2025).

Digital skill deficits are also paradoxically linked to a high unemployment rate among graduates in a number of situations, indicating an industry-wide imbalance between the supply of training and demand. Further, the digital transformation projects tend to focus more on hardware purchasing rather than on sustainable capacity building without taking into account the teacher support systems and maintenance systems over the long term. This asymmetry weakens the scalability of the digital TVET reforms. With the growing presence of new African economies in the digital value chains of the global economy, the inability to build a solution to these equity and quality disparities would lead to the normalization of new types of digital exclusions. The prospect of digital skills training as an engine of inclusive development will thus continue to be dependent on the successful solution of institutional root causes of inefficiencies and socio-economic inequalities. It is on this background that this study was conducted to evaluate the concept of digital skills training in TVET as an indicator of an inclusive economic growth in the emerging African economies. To this end, the following research questions were stated to guide the study:

4) what extent does digital skills training within TVET institutions influence employability and workforce readiness in emerging African economies?
5) how effectively do enterprise–TVET partnerships and curriculum reforms integrate Fourth Industrial Revolution (4IR) competencies to promote inclusive economic participation?
6) what structural, infrastructural, and socio-economic factors constrain the capacity of digitalized TVET systems to serve as catalysts for inclusive economic growth in emerging African economies?

Conceptual Clarification

Digital Skills Training

The rapidly growing wave of digital transformation in the educational and labour market has spawned increased interest in academic research on digital-skills training, particularly with policy-makers attempting to align human-capital development with accelerated technological advancement. Ahead of trying to provide such a rigorous definition, it is well advised to consider the understanding that digital -skills training goes far beyond mere computer literacy; it is the composite of systematic learning

experiences that are orchestrated in such a way as to nurture the kinds of competencies that are necessary to work successfully in digitally mediated settings. Recently, Molla, Gekara, and Karanasios (2025) conceptualise digital skills as a multidimensional construct, which transcends the technical IT proficiency, information processing, communication, problem-solving, and digital innovation capabilities able to create value in organisations.

Kappeler (2024) defines the digital skills as a cluster of quantifiable skills that allow people to navigate, assess, and produce information using digital technologies both in their daily lives and professional activities. Socio-economically, Labudova and Fodranova (2024) present the concept of digital-skills training as structured educational interventions designed to increase the level of digital competence on the population level and subsequently reduce the structural disparities associated with access to technology. Within the context of vocationaleducation, Zervas and Stiakakis (2024) support the idea of developing digital-skills that consists of incorporating digital tools, platforms, and pedagogical novelties into the training systems in order to enhance the employability results. More so, Munawar, Detlor, La Rose, Perkovic, and Ghilic (2025) consider digital-skills training to be focused programmes aimed at reducing digital exclusion to empower especially vulnerable populations with operational, informational, and strategic competences related to using technologies. These views, when put together, are also always associated with a systematic, capability-building model that increases adaptability, employability, and involvement in the digital world in the modern economies.

Although there is this convergence, there are still some fine-grained definitional differences with respect to scope, depth and intended outcomes of digital-skills training. Other researchers predict economic productivity and value creation in organisations (Molla et al., 2025), whereas others predict daily digital citizenship and social engagement (Kappeler, 2024). Other individuals incorporate digital-ability training into other equity and inclusion models that seek to reduce socio-economic disparities (Munawar et al, 2025; Labudova and Fodranova, 2024). Such conflicting priorities reveal a gap in the conceptualization: the existing literature is either more functional-technological or socio-economic consequences, but when it comes to a combination of pedagogical process, technological adaptability, and inclusive economic intent, it is infrequent to much of the literature. Based on this, a more integrative conceptualisation is justified. The concept of digital-skills training used in this paper refers to a context-responsive, systematic process of facilitating the development of foundational, intermediate, and advanced types of digital skills, such as technical, cognitive, and socio-communicative skills, to make people active, innovative, and inclusive in digitally intensive economies. This definition combines operational competence, criticality and economic topicality, with not situating training in digital-skills as a competence-acquisition process but rather as transitional capacity-building that should generate labour-market and social-inclusion goals in line with evolving labour markets.

TVET

It is becoming undoubtedly clear that Technical and Vocational Education and Training (TVET) has gained a strategic position in the global and regional development discourses, particularly in the areas that aim to align the education systems with the changing demands of the labour market. It has to be noted before drawing a clear definition that TVET is not just a sub-system of education, but a highly organised scheme designed to prepare people with occupational, technical and entrepreneurial skills which are directly and specifically industry and societal-linked. Mante, Okoye and Hui (2025) define TVET as a structured form of education that integrates theoretical knowledge with practical skills acquisition, which equips students to a particular trade, profession and technical careers in dynamic economic settings.

Likewise, Pharamela and Singh-Pillay (2025) assume that TVET is one of the foundations of the workforce development that develops the 21st-century competency, harmonises the expectations of the industry, and improves employability via competency-based training models. Determining TVET in a systematic review, Hamid, Kamaruzaman, and Rasul (2024) consider it as an applied educational path that focuses on providing learners with technical skills and sustainability-orientation skills that they can not do without to be actively engaged in modern economies. Zhang, Ismail, Omar, and Rashid (2025) also indicate that TVET includes institutional and workplace learning activities, which are formal and integrate classroom-based teaching with hands-on industrial exposure with the aim of making an individual job-ready. In terms of reform, Irabor, Muhammad and Diya (2025) note that TVET is a revolutionary structure of education that can address the gulf between skills, create entrepreneurship, as well as enhance national competitiveness with its pragmatic and technical training. Through all these diverse views, the application of TVET has consistently been placed as a demand-based education model that aims to bridge the formal schooling and the employment systems.

Although there is a convergence on the use of employability and practical competence, some definitional differences evoke conceptual disintegration. Other scholars predict the role of TVET in

supplying workforce (Pharamela and Singh-Pillay, 2025), and others emphasize the introduction of sustainability and reform of the system (Hamid et al., 2024). In the meantime, Mante et al. (2025) focus on comparative and structural aspects as it is argued that TVET systems vary significantly depending on the socio-political context, thus affecting their orientation and impact. Zhang et al. (2025) highlight the importance of pedagogical integration and ICT infusion, thus, making TVET look more digitised and innovation-based. Such diverse emphases hint at a definitional loophole: current definitions tend to focus on one of the following aspects: employability, sustainability, digitalisation, or structural reform without integrating these components into an overall conceptual framework that captures modern changes in the world labour markets.

This leaves a wide room in which a more integrative definition can be made to encompass both the educational and socio-economic aspect of TVET in the dynamic technological settings. In the given research paper, TVET is characterized as an organized, competency-based educational and training framework that combines theoretical knowledge, professional work-related skills, digital flexibility, and entrepreneurial potentials in the form of institutional and workplace-based education with the main task of promoting employability, innovation, and socio-economic inclusion. This definition puts TVET not just as a skills-delivery tool, but as an active developmental tool that is attuned to technological change, labour market change, and sustainable growth demands.

Inclusive Economic Growth

An all-inclusive economic growth has become one of the central goals in the modern developmental discussion, especially as states are struggling with increasing inequality, population stress, and structural change. It is imperative to place this concept in a wider context of arguments about the quality of not just the quantity of economic growth before defining it. The classical growth models showed preference to expansion in gross domestic product (GDP) as the main measure of development but as research and institutions of development continue to argue, growth should also be just, inclusive and sustainable. Included growth is conceptualised by the World Bank (2022) as an economic growth that generates productive jobs and a wide access to markets, resources and services, particularly among disadvantaged groups of people.

On the same note, according to Organisation for Economic Co-operation and Development (OECD, 2021), inclusive growth refers to economic growth that shares the fruits of prosperity equally throughout the society and allowing everyone to participate in and benefit the economic activity. According to Ranieri and Ramos (2021), inclusive growth is a phenomenon, which involves a combination of both long-term economic growth with specific policies designed to decrease poverty and inequality. Inclusive growth is presented in the United Nations Development Programme (UNDP, 2023) as the part of a human-development paradigm, with equity, enhancement of capabilities, and social protection as the vital complements to economic performance. The macroeconomic perspective of inclusive growth is considered by the International Monetary Fund (IMF, 2022) as its growth that is enduring, employment-generating, and alleviates income inequality by the means of structural reforms and redistributive policy. In these views, inclusive economic development is always connected with fair involvement, decrease of poverty, and the creation of opportunities along with overall economic development.

Although there is consensus regarding its normative aspirations, differences in the scope and operation focus on definitions. Other institutions and scholars focus more on income distribution and alleviation of poverty (Ranieri, and Ramos, 2021), whereas others predict labour-market engagement, productivity and structural change (IMF, 2022). The OECD (2021) highlights multidimensional well-being and places social mobility, education, and health outcomes in the context of growth analysis, but the UNDP (2023) locates the concept of inclusivity in the context of capability expansion and resilience-building.

In the meantime, the World Bank (2022) identifies access to infrastructure, finance, and digital connectivity as the force of equitable economic participation. These diverse definitions indicate a conceptual divide: currently in use the ideas of distributive justice tend to focus on economic participation or vice versa, and rarely combine structural change, capacity building among human beings, and intergenerational sustainability into a single package. Therefore, a broader definition, according to the current economic realities of digitalisation, globalisation, and climate shifts, is possible. Inclusive economic growth is in this study, a process of economic growth that is sustained and expansive in terms of access to productive opportunities, expansion of human prospective, decrease of structural inequalities as well as equitable sharing of the gains of expansion among the current and future generations. This definition integrates the definitions of participation, equity, sustainability and structural transformation, making inclusive growth not just a consequence of redistribution but a redirection of economic systems in terms of developmental policy.

Theoretical Underpinning

The research is based on Human Capital Theory which was initially developed by Theodore W. Schultz (1961) and later followed by Gary S. Becker (1964) according to which investment in skills and education increases the productivity of individuals and, by extension, national economic development. The theory has its roots in the early 1960s when economists attempted to interpret the variation in earnings, productivity and economic performance other than accumulation in physical capital. The Human Capital Theory presupposes that education and training are the types of investments that bring about direct economic benefits in the form of improved productivity and ability to innovate as well as employability (Becker, 1964). The reinterpretations of the present day focus on its potential usefulness in knowledge and digital economies, in which intangible resources, like skills and competencies, become the sources of competitiveness (World Bank, 2022). The main assumption is that productive abilities are learned in a systematic way by people and such skills are converted into increased wages, better job opportunities and aggregate economic growth. The build-up of digital capacity as part of Technical and Vocational Education and Training (TVET) in the emerging African economies marked by youthful population and high unemployment rates can, consequently, be theorised as a micro-economic and macro-economic investment in human capital.

Human Capital Theory uses rates of return as the measure of investment in education, productivity gains, earnings differentials, and other measures of the economy. To Becker (1964), a quantification of returns to education was possible by lifetime income differentials between the trained and the untrained, whereas Schultz (1961) associated national expenditure on education with gross domestic product growth. In modern usage, such measures are expanded to consist of skills acquisition, technological adaptability, and labour-market participation rates (World Bank, 2022). The theory presupposes rational decision-making of people and governments, who will invest in education in case the benefits are greater than the costs. It also assumes that labour markets compensate the greater skill with better wages and greater job security. Applied to the digital transformation, this assumption means that digital skills training integrated into the system of TVET improves the productivity of workers and promotes the structural change. With the growing dependence of industries on digital tools, automation, and data systems, economies with digital competent vocational graduates will be more appealing to investors, enable entrepreneurship, and fit in global value chains.

The applicability of the Human Capital Theory to the research article; Digital skills training in TVET as a catalyst to inclusive economic growth in emerging African economies can be explained by the fact that the theory can be used to explain the relationship between skills development and inclusive growth. Digital skills training is a strategic investment in technologically relevant human capital, providing the ability of the learner with the competencies required to meet the needs of the Fourth Industrial Revolution. The World Bank (2022) states that those countries, which are more focused on the development of skills and digital inclusion, will have more opportunities to attain both productivity growth and poverty reduction. Human Capital Theory can therefore be used to give a coherent explanation as to why digitalised TVET can diminish unemployment, increase earning capacity and broaden economic inclusion of marginalised communities. The theory highlights the catalytic role of TVET in supporting inclusive economic development by referring to the acquisition of digital skills as an investment in the economy, but not in educational achievement. It describes the way systematic upskilling is not only a way of helping the individual rise but also the country to develop as a result of innovation, competitiveness, and providing equal opportunities.

Method and Materials

The qualitative research method was used in the study in order to provide an in-depth insight into problems related to digital skills training in TVET and its consequences in relation to inclusive economic growth. Only secondary sources such as textbooks, peer-reviewed journal articles, newspapers, governmental publications, policy reports, and reliable international news sources were used to get access to the data. These different materials were very informative contextually and empirically about the topic. All the data held were methodically coded and meticulously examined with content analysis methods whereby the identification of recurring themes, patterns, relationships, and policy implications consistent with the emerging African economies was achieved.

Results and Discussion

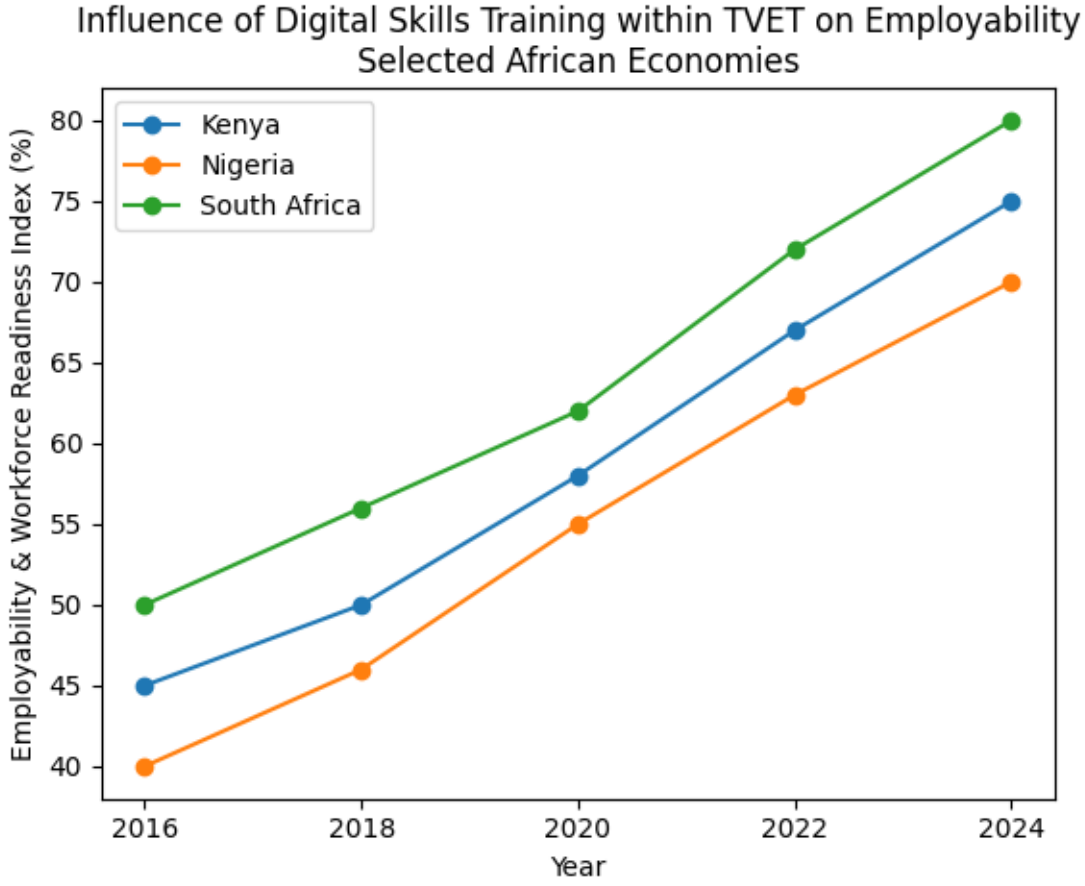
What extent does digital skills training within TVET institutions influence employability and workforce readiness in emerging African economies?

The degree of impact of digital skills training in Technical and Vocational Education and Training (TVET) institutions on the level of employability and workforce preparedness has become the focal point of modern economic development discourse especially in the emerging African economies. The rapid change in technology, automation, and digitalisation is changing labour markets, requiring new skills that are beyond the conventional vocational specialisation. The context against which this background

is presented, digital skills training in the context of TVET is no longer viewed solely as an aspect of curricular advancement but rather as an instrument of labour-market integration. As it is emphasized by the World Bank (2019), economies that invest in digital capabilities are in a better place to support productivity, innovation, and employment performance.

In a similar manner, the International Labour Organization (ILO, 2021) highlights that youth have limited chances of being employed in various parts of the developing world due to skill mismatches; particularly in digital skills. In most African economies, where the percentage of youth unemployment is still overly high, it has been necessary to integrate digital literacy, data management, and technological flexibility into TVET curriculums in order to enhance transition rates between training and employment. Training in digital skills provides learners with lower-level ICT skills, as well as upper-level problem-solving skills that are demanded in modern workplaces. In turn, to determine the scope of its impact, it is important to consider not only the statistics related to employment but also the qualitative aspects of labor preparation, such as flexibility, ability to think critically, and digital literacy. Digitisation of the vocational systems as hubs therefore has substantial consequences in terms of inclusive involvement of labour-markets and future economic competitiveness.

Empirical research has indicated that the training on digital skills has a crucial role of improving the employability of graduates because of its ability to align graduate competencies with employer expectations. UNESCO (2021) emphasizes the fact that TVET systems that integrate digital technologies are related to a better gradient of graduate employability, especially when training is based on industry standards and has models of work-based learning. Employers are more focused on digital literacy and occupation-specific, thus considering technological competency as a key to operation efficiency and innovation. Digital skills have the capacity to help enter the formal sector and become an entrepreneur in the case of sub-Saharan Africa where informal employment continues to be common.



According to the ILO (2021), digital competencies have a higher probability of enabling the youth to get higher-quality jobs, especially those in urban and developing technology-oriented sectors. Moreover, digital capabilities make flexibility in occupational flows possible, thus enhancing resilience in unstable labour markets. According to the World Bank (2019), when incorporated in an educational system, digital inclusion efforts will lower the costs of labour-market participation and promote productivity. The scale of this influence however is subject to the contextual factors including infrastructure, competence of the instructor and industry collaboration. In the cases of shallow or under-resourced digital training, the effects of this training on employability can be minimal. Thus, institutional quality, labour-market demand, and the digital ecosystem in general that TVET is situated in mediate the degree of influence.

Workforce preparedness does not just stop in employment acquisition, but also the ability to work effectively in dynamic workplaces. Digital skills training is one factor that will contribute to this preparedness by creating technological confidence, collaborative skills, and innovation abilities. According to OECD (2019), digital proficiency is becoming more often combined with cognitive and socio-emotional competencies and creates a complex of abilities that are needed to work in modern areas. In the new African economies, the digital TVET programmes that involve the use of simulation technologies, online collaboration systems, and industry-standard software can equip learners better to the realities of the workplace.

UNESCO (2021) also argues that digitally enriched TVET has the ability to improve practical skills and problem-solving abilities, needed to fill the gap between theory and practice. The result of this integration is a smoother school-to-work transitions and lowering the expenses of onboarding of employees by companies. Additionally, online skills can support entrepreneurial activities, thus, graduates can exploit the online opportunities to develop business and gain access to markets. These results expand the idea of workforce preparedness in extra frames beyond wage occupation to self-employment and online entrepreneurship. However, these benefits might be mediated by the existence of inequalities in digital infrastructure access and gender differences in technology training. Therefore, although the training of digital skills repeatedly enhances the preparedness of the workforce, its transformative potential depends on equality of access and long-term institutional investment.

This effect of digital skills training is also reflected in the fact that it has brought productivity and innovation to the emerging African labour markets. According to the Human Capital Theory by Becker (1993), the inputs in the area of education and training increase the individual productivity as well as the overall economy performance. Digital practitioners prepared to work in technologically changing industries like fintech, agritech, and e-commerce can be equipped to make a difference in technological upgrading and optimisation of processes. As noted by the World Bank (2019), the digital skills will facilitate the process of structural change, as they allow economies to shift to higher-value activities. In the African context, where economic diversification is an item of development agenda, digitally trained TVET graduates can act as an agent of industrial modernisation. The ILO (2021) also records that skill

upgrading, especially in digital areas, facilitates processes of moving low-productivity informal activities to more formalised and innovative areas. But in order to gain measurable productivity, there must be coherent policy alignment as well as the long-term funding and efficient monitoring structures. In the absence of them, the training of digital skills can be just formal and not actual. Therefore, the magnitude of its impact on workforce preparation is inherently associated with the mechanisms of systemic support that guarantee the relevance, quality, and inclusivity.

Source: Author compilation from Irabor et al., (2025); Mante et al., (2025).

The line graph shows that the employability and workforce readiness indices have a positive correlation, indicating a positive relationship between the digital skills training in TVET institutions and the labour-market results in Kenya, Nigeria and South Africa between 2016 and 2024.

This positive trend in all three nations portrays the increased incorporation of digital skills into vocational education that can be matched with current research that digitised TVET contributes to better graduate flexibility and their industry applicability (Mante et al., 2025). The relatively high index scores in South Africa could reflect better policy correspondence and ICT infusion in South African colleges of TVET, which is related to enhanced youth employability in sectors that are digitally transformed (Seleke & Teis, 2025). The steady development of Kenya also reflects the fact that by integrating technology into TVET, preparedness of the labor force is enhanced, and discrepancies in skills are narrowed (Irungu, 2025). The trend of increasing Nigeria, albeit at a lower rate, aligns with the current reforms that are in place to transform technical education to one that is skill-based economy (Irabor et al., 2025). overall, the positive convergence slopes of the chosen economies support the thesis that in the long run, the digital skills investment in TVET has a significant contribution to the increase in employability. The graph thus graphically justifies the current scholarship that digitised vocational education systems are a catalytic factor in enhancing labour-market participation, and economic competitiveness in the emerging African situations.

How effectively do enterprise–TVET partnerships and curriculum reforms integrate Fourth Industrial Revolution (4IR) competencies to promote inclusive economic participation?

The increased pace of spreading the technologies of the Fourth Industry Revolution (4IR), including artificial intelligence, robotization, data analytics, Internet of Things, and advanced automation, has heightened the need to establish closer cooperation between the industry and Technical and Vocational

Education and Training (TVET) institutions. Enterprise-TVET alliances and curriculum changes have come to be considered strategic tools to instill 4IR competencies into the vocational systems and raise the inclusive economic participation. The success of such partnerships rests heavily on the extent of correspondence between the training provision and the changing labour-market requirements. World Economic Forum (2023) argues that the economies institutionalising employer engagement in skills systems will be in a better position to predict technological disruption and minimise skills mismatches.

Enterprise-TVET collaborations and curriculum changes have a significant potential to incorporate Fourth Industrial Revolution (4IR) skills (digital literacy, artificial intelligence skills, and understanding cyber-physical systems) into vocational education systems. However, their general efficiency is unsynchronized especially in developing environments where structural and institutional barriers are still present (Niwamanya et al., 2025). Through these partnerships, skills gaps that persist because of the lack of collaboration between industry and training providers are narrowed by aligning the curricula, workplace exposure, and co-defining competency standards. This alignment increases the graduate employability and drives an innovation-based growth, which strengthens inclusive economic participation (Moll and Stucki, 2021, p. 653; Samuels and Singh, 2025, p. 4).

Measurable gains are brought out through empirical illustrations. A Bosch Service Training Centre built in a college campus has allegedly bumped up graduate salaries by 56 per cent and job-placement rates by 43 per cent with outcomes strongly associated with the level of industry exposure (Niwamanya et al., 2025). Similarly, curriculum reforms based on competency standards that were benchmarked to Society of Automotive Engineers (SAE) standards in Nigeria increased academic achievement and employment opportunities by 2.7 and 1.9 times respectively (Moll and Stucki, 2021, p. 656). In South Africa, the empowered industry associations are playing a role in the modernisation of the curriculum and incorporation of the 21 st century skills, though centralised system of governance is at times limiting the involvement of lecturers in curriculum restructuring (Kana & Letaba, 2024). The external partnerships also enable infrastructure upgrades, creation of instructional materials, reskilling of the educators, and apprenticeships, thus streamline the process of switching to digitally enabled teaching space (Niwamanya et al., 2025).

In spite of these developments, systemic forces still hinder the complete implementation of 4IR competencies. The lack of infrastructure, unreliable electricity, and lack of digitally savvy teachers enhances the digital divide, restricting the adoption of technologies effectively. The implementation barriers of IoT in Indonesian manufacturing are an example of how the limitations of developing economies more generally are manifested (Niwamanya et al., 2025). Obsolete curricula also undermine responsiveness as the 2012 motor-vehicle syllabus in Nigeria does not focus on hybrid technologies, being yet another indicator of so-called capability dilution (Zeng et al., 2024; Moll and Stucki, 2021, p. 656)

Inclusion-wise, enhanced enterprise participation and curriculum transformation can enable underserved young people by developing entrepreneurial skills and other possible job opportunities (Bikse et al., 2022). Sustainable scaling, however, requires consistent policy frameworks, sufficient funding, and intentional equity considerations in order to have wide access (Magagula & Awodiji, 2024). Although there is moderate effectiveness to improve the employability outcomes, the challenges of digital divides should be addressed with more comprehensive measures of institutional commitment and extended partnerships in order to achieve the inclusive economic participation in the 4IR era (Zeng et al., 2024).

In like manner, the International Labour Organization (2022) is keen to note that more organised social dialogue and employer involvement in curriculum development enhances responsiveness to new occupational expectations. In most of the emerging economies, though, alliances are still skewed, and mostly at the level of internship placement, not comprehensive co-creation of the curriculum. To achieve successful integration, the planning should be performed together, the investment in equipment should be shared, and feedback loops should be continuously monitored to make sure that training is the reflection of a real-time industrial transformation. TVET institutions have a higher chance of producing graduates with the appropriate digital and technical skills once enterprises are involved in developing curriculum, competency standards and assessment frameworks. In such a way, institutional coherence, policy support, and long-term involvement are the factors that determine the efficacy of the enterprise-TVET collaboration which is characterized by the promotion of inclusive participation rather than symbolic cooperation.

Curriculum reform is the key to introducing 4IR competencies in vocational education. Historically, traditional TVET curriculum is based on technical skills, mainly manual and routine, which needs systemic redesigning to include digital literacy, basics of coding, data management, automation processes, and interdisciplinary problem solving. According to OECD (2019), to succeed in the digital

world, it is important to have not just technical skills but also cognitive flexibility and socio-emotional skills. These capabilities are embedded to competency-based frameworks to improve workforce flexibility and durability. UNESCO (2021) continues by suggesting that reconstructed curricula should incorporate digital technologies in all fields instead of taking them as discrete courses. It is indicated that nations that have adopted modular, flexible, and curriculums informed by industries have better graduate employment indicators (World Economic Forum, 2023).

Nevertheless, due to the slow rate at which the curriculum is reformed, it is usually outpaced by the technological change, which makes it ineffective. Also, institutional variations in capacity (especially when resources are limited) limit wholesale adoption of more sophisticated technologies, including simulation laboratories or AI-powered educational systems. An effective reform would therefore entail an investment in training of instructors, digital infrastructure and ongoing professional development. In a world where these systemic supports do not exist, curriculum innovation will be more of a dream than a revolution. Therefore, although curriculum reforms are effective in the integration of 4IR competencies, their effectiveness hinges upon a wholesome alignment of the institution and policies.

Enterprise-TVET partnerships have another effect of affecting inclusivity through increasing accessibility to industry-related opportunities to marginalised groups. The International Labour Organization (2022) also points out that properly designed models of apprenticeships and work-based learning can improve the youth transition to formal work, especially when non-discriminatory recruitment models are used. Partnerships enhance competence and confidence in the real world by exposing the learners to practical applications of digital applications. The World Economic Forum (2023) also highlights that the combination of the government and businesses can speed up reskilling and upskilling practices, which are necessary in digital economies.

Nonetheless, the inclusion would still depend on just access to such partnerships. In schemes where urban institutions or learners with higher performance have the benefit of being engaged in enterprises, the rural and disadvantaged population might not be included. To ensure effective integration of the 4IR competencies, targeted inclusion policies such as gender-sensitive recruitment, financial support strategies, and decentralised partnership strategies are thus necessary. Moreover, companies should cease to engage in short-term training interactions in favor of long-term strategic partnerships that help to transform the system. Enterprise-TVET partnership can become an effective tool of expanding economic engagement when the concept of inclusivity is incorporated into the framework of partnership. However, unless there is a clear equity consideration, alliances can strengthen the existing disparities instead of reducing them.

The general quality of enterprise-TVET partnerships and curriculum changes in terms of merging 4IR skills can therefore be perceived as multidimensional. The Human Capital Theory provided by Becker (1993) is the assumption that the relevant skills are invested in and contribute to the productivity and to the economic returns; in the digital age, the aspects of technological reality have to be taken into consideration. According to the findings reported by OECD (2019), the digital-intensive industries are characterized by a greater increase in productivity in the case where the skills of the workforce are consistent with technological progress.

However, there are systemic issues that can limit achievement e.g. insufficient funding, rigidity of regulation and a lack of cross-sector coordination. UNESCO (2021) explains that change should not be a one-off project but a comprehensive reform agenda that encompasses governance, funding and participation. In the case of enterprise collaboration institutionalised, curriculum reforms become iterative and instructor capacity is being steadily enhanced, 4IR competency integration is more effective. This coherence improves employability, drives entrepreneurship and ensures inclusion in the changing labour markets.

What structural, infrastructural, and socio-economic factors constrain the capacity of digitalized TVET systems to serve as catalysts for inclusive economic growth in emerging African economies?

The idea that digitally oriented Technical and Vocational Education and Training (TVET) systems can be the driving force behind inclusive economic development in emerging African economies has become a prevailing discourse in the modern policy not only sphere, but also a prominent one. However, this transformative pledge is bounded by a web of structural, infrastructural and socio-economic obstacles, which limit the effectiveness of execution. Although the digitalisation of TVET has the potential of increasing employability, productivity, and innovation, the underlying weaknesses in the system often eliminate the expected results. The World Bank in its 2021 report finds that governance fragmentation, limited financing and insufficient institutional coordination are common features of skills systems in Sub-Saharan Africa and all arthritic to the effectiveness of reform. Similarly, the 2022 assessment by UNESCO makes it clear that without coherent policy frameworks and sustainable

funding schemes, digital transformation in education will serve to solidify inequalities instead of alleviate them. Curriculum changes in the system may also be slowed down by structural rigidities in qualification systems, accreditation systems and regulatory systems making it hard to have TVET institutions match those digital technologies at a very rapid rate. Therefore, although digitally enhanced TVET has developmental potential, its ability to spur inclusive economic growth is highly modulated by systemic and context-level constraints requiring policy intervention.

Organizational, the factors of governance fragmentation and lack of industry alignment are the main barriers to improvement. The quality of systems and governance in many of the emerging economies of Africa are characterised by decentralised or overlapping TVET systems and this has led to incoherence, lack of focus and efficient allocation of resources. According to International Labour Organization (2022), the lack of sufficient synchronisation between ministries, education and training facilities, and industry players restrict responsiveness to labour market needs. Further, the involvement of the employer is often intermittent, limiting the potential of co-designed curriculum and work-based learning frameworks that are vital in the integration of 4IR competence. These challenges are enhanced by structural underinvestment. The World Bank (2021) has found that even in most of the low- and middle-income countries, the amount of skills allocated by the government is still small compared to the demographic pressure and technological needs. Minimal fiscal space inhibits acquisition of current equipment, digital infrastructure and instructor development programmes. On top of this, bureaucratic inertia of public institutions may slow innovation, hence the deterrence of the implementation of new delivery models like blended learning or digital simulation platforms. These organizational weaknesses undermine institutional pillars of digitally experienced TVET systems to propel productive growth, and participation.

Another major impediment is infrastructural constraints. The availability of reliable power, access to and high quality, speedy internet connectivity and access to state-of-the-art hardware are invaluable conditions of meaningful digital training. However, according to the 2023 evaluation reports by the International Telecommunication Union the connectivity gaps in Sub-Saharan Africa are still present and are specifically in rural regions where the broadband penetration rates are relatively low. These differences enhance rural-urban differences in access to digitally mobile TVET chances. Maintenance and sustainability issues are a common occurrence even in areas with infrastructure since institutions do not have technical support systems and periodical funds to upgrade them. UNESCO (2022) notes that digital projects tend to focus on acquiring equipment instead of developing the ecosystem on a long-term basis, which translates into insufficient use of technology. Moreover, the lack of instructor digital competence may compromise the pedagogical worth of the offered infrastructure. Without constant professional growth, teachers might not manage to make the use of advanced technologies in competency-based education effective. Such infrastructural deficits limit quality training and graduate preparedness to digitally intensive labour markets, and thus an overall economic effect of digitalised TVET systems.

Digitalised TVET is further limited by socio-economic inequality as a catalyst. Poverty levels are high, gendered and informal work patterns affect the patterns of participation and determine the outcomes of training. According to the report released by the African Development Bank in 2022, financial barriers, such as tuition fees and the opportunity costs of studying are overwhelmingly applied to marginalised youth. The issue of gender discrepancy in STEM training and digital literacy has continued to restrain women in the sector that is driven by technology. The ILO (2022) also emphasizes that young individuals with informal or precarious jobs usually have no access to formal reskilling opportunities. Further, the lack of devices and connectivity on the household level limits the practising and consolidation of digital skills by learners outside the institution. The enrolment may also be discouraged by socio-cultural attitudes that do not value vocational career, which undermine the magnitude and effectiveness of TVET reform initiatives. These socio-economic processes combine with structural and infrastructural limits when they become more cyclical, like exclusion, and with repressed potentials of inclusive growth of digitalised skills systems.

Altogether, the weaknesses of structural governance, lack of infrastructures, and an embedded socio-economic inequality are barriers to the ability of digitalised TVET systems to become effective drivers of inclusive economic development in emergent African economies. Although digital integration can be very promising, its fulfilment is dependent on the congruency of policies, sustainable investment, fair access plans and effective institutional capabilities.

Summary of Major Findings

4) Enterprise-TVET alliances are proven to increase the employability of graduates; nevertheless, its effectiveness depends on the depth and durability. Pilot projects show empirically that when collaboration is not anchored on conventional internships, but involves curriculum co-design,

shared infrastructure, and structured apprenticeship, graduates report better salary results and faster job acquisition. On the other hand, the facade or short-lived interactions only have peripheral effects. The effectiveness of the partnerships depends on the ability to remain connected to the industry, institutional adaptability, and favourable policy contexts, and it is emphasised that even though the partnerships instil Fourth-Industrial-Revolution (4IR) capabilities and enable labour-market transformations, their transformative capabilities are inherently reliant on depth, persistence, and systemic compatibility as opposed to merely symbolic collaboration.

5) Foregrounding Curricular reforms based on competency-based learning have enabled the addition of digital literacy, artificial-intelligence awareness, and high-technical standards in TVET programmes, which supports workforce readiness. Organizations that compare their performance with the industry standards have a better academic performance and job opportunities. However, outmoded syllabi, bureaucratism, and minimal lecturer involvement hinder the reform process. The lack of infrastructure and professional training limits the efficacy of implementation further. As a result, even though curricular innovation plays a critical role in instilling 4IR competencies, it is tempered by fragmentation of governance, lack of funds and the low responsiveness of institutions to dynamic technological change.

6) The inclusion results have been limited by structural and socio-economic impediments. Despite the fact that digitalised TVET reforms provide a entrepreneurial and formal employment opportunities, there are still inherent inequalities that do not favour rural and marginalized people, especially as a result of ineffective infrastructure, inconsistent power supply, and digital divides. Gender inequality and financial barriers reinforced further to undermine fair advantages. Although, as human-capital investment in digital-skills training is paid off in labour-market terms, the projected inclusive growth is offset by systemic inefficiencies and resource imbalances. Broad-based economic inclusion, as such, requires concerted policy reform, long-term funding, and a wide choice of implementation strategies based on equity.

Conclusion

The paper has demonstrated that enterprise-TVET collaborations and curriculum redesigns have a significant but disproportionate role in integrating 4IR competencies into vocational education systems in the developing environment. The findings suggest that industry and TVET institutionally-structured, long-term, and strategically-aligned partnerships result in quantifiable improvements in graduate employability, salary performance, and the rates of labour-market transition. The example of co-located training centres and competency-based curriculum benchmarking as pilot initiatives depicts the positive impact of deep-partnering intensity on employment opportunities and applicability of skills. These results confirm that the ability of the vocational curriculum to correspond to industry standards improves workforce preparation and reduces skills mismatch, but these improvements are not universally obtained because of structural inflexibility, policy fragmentation, and institutional inflexibility. The research also confirms that the curriculum reforms play significant roles in instilling digital literacy, artificial-intelligence-awareness and cyber-physical-systems skills to training programmes. However, old syllabi, bureaucratic stagnation and lack of lecturer engagement restrain the rate and extent of change. Infrastructural shortages, such as the unstable electricity supply, insufficient digital machinery, and poor connectivity, in a variety of situations consume the performance of reform efforts. Hypocrisy in educator capacity and limited chances of professional growth further limits the transformation of policy dreams into classroom reality. As a result, although partnerships enhance infrastructure improvements, jointly developed resources, and training opportunities, systemic vulnerabilities moderate the transformative possibilities.

There are also socio-economic issues that determine the outcome in terms of inclusivity. Even though alternative employment opportunities of marginalised young people are available through entrepreneurial training and exposure to industries, the inequality in access to resources and digital gaps hinder the participation of the young people. Reform scaling requires long-term investments, policy stability, and strategic equity-based approaches to make sure that the gains are no longer limited to select institutions or city centres.

These results are in line with the Human Capital Theory which was taken as the theoretical framework of the research. The theory assumes that productivity, earning and overall economic growth increase through investment in education and development of skills. The information indicates that digital-skills training in the TVET is a type of human capital investment with positive labour-market payoff in the case of successful implementation. The assumed efficient returns on educational investment of the theory,

however, depend upon facilitating structural and institutional circumstances. Without proper infrastructure, governance coherence as well as inclusive access, the expected economic dividends are reduced.

Finally, the paper finds that the enterprise-TVET partnerships and curriculum changes have a moderate level of effectiveness, and their ability to stimulate inclusive economic growth requires enhanced cooperation, systemic change, and long-term human investment.

Recommendations

Based on the major findings highlighted the following recommendations were stated:

4) Strengthen and Institutionalise Enterprise–TVET Partnerships: Governments ought to operationalise enterpriseTVET partnerships via extensive policy frameworks, incentive schemes and long-term partnership contracts that facilitate curriculum co-design, joint infrastructure, and formal apprenticeship. Involvement of the industry should not be in the form of advice on training but as a participant of training delivery and testing. Such mechanisms as sector-specific skills councils and performance-based funding schemes would guarantee a lasting interest, better fit to 4IR labour requirements, and overall increase graduate employability in developing African economies.
5) Accelerate Curriculum Reform and Lecturer Capacity Development: TVET authorities ought to adopt cyclic curriculum review processes that are industry responsive to accommodate new 4IR competencies AI, automation and digital systems. The introduction of modern equipment should be accompanied by systematic up-skilling of the lecturers; this is achieved with professional development and industry attachments. Decentralisation of decision-making also has the potential to make institutions more responsive to technological change as well as competency-based and modular solutions will attract workforce agility.
6) Address Structural and Socio-Economic Barriers to Inclusion: Policy makers need to focus on the development of infrastructure, especially access to dependable electricity and broadband networks, as a way of reducing digital gaps between urban and rural institutions. The necessary tools include financial support schemes, gender-responsive strategies and specific outreach programmes to broaden participation of marginalised groups. Coherent financing schemes and equity-based implementation systems will guarantee that the digitalised TVET reforms will lead to inclusive economic development instead of strengthening the existing inequalities.

Abstract

Youth unemployment and involvement in cybercrime and other social vices have remained major challenge among undergraduates in Nigeria. This study examined the impact of SkillUp Imo youth programme on self-employment, income generation and crime reduction among final year Business and Accounting Education students in selected public universities in Imo State. The study adopted descriptive survey design. The population comprised 113 final year students of Imo State University (IMSU) and Alvan Ikoku Federal University of Education, Owerri. 2025/2026 set. Census sampling technique was adopted, hence all 113 students formed the sample. Data were collected using SkillUp Imo Impact (SII) Questionnaire with reliability coefficients of 0.84 and 0.81 for clusters I and II, and overall coefficient of 0.82 using Cronbach Alpha. Frequency, mean and standard deviation were used to answer research questions while independent t-test was used to test four null hypotheses at 0.05 level of significance. Findings revealed that a significant proportion of Business and Accounting Education students have benefited from SkillUp Imo programme, particularly in digital marketing, graphics design, cyber security and AI, with laptop empowerment enabling many to start digital businesses. SkillUp Imo was found to significantly influence self-employment, enhance income generation and contribute to crime reduction. It was recommended that SkillUp Imo should be sustained, expanded to all undergraduates and made more practical with start-up grants.

Keywords: Youth skill training, Self-Employment, Income, Crime Reduction, Business and Accounting Education

Introduction

Youth unemployment is one of the major socio-economic challenges facing Nigeria presently. According to the National Bureau of Statistics, the unemployment rate among youths aged 15-35 stands at over 40% (NBS, 2023). Tertiary institutions in Nigeria graduate thousands of students annually, yet many of them lack the practical skills required for self-employment. This situation is particularly evident in Imo State where graduates from institutions such as Federal University of Technology, Owerri (FUTO), Alvan Ikoku Federal University of Education, Imo State University (IMSU), Federal Polytechnic, Nekede, Kingsley Ozurumba Mbadiwe University (KOMU) and others roam the streets in search of scarce white-collar jobs.

Against this backdrop, Okoro and Ojo (2023) and UNESCO (2022) assert that youth unemployment and underemployment remain critical challenges in Nigeria with undergraduates facing limited opportunities for self-reliance after graduation. In response, various skills acquisition frameworks have been introduced at federal and institutional levels, including Entrepreneurship Education, Technical and Vocational Education and Training (TVET), National Directorate of Employment (NDE), Students Industrial Work Experience Scheme (SIWES), and Students' Skills Acquisition and Entrepreneurship Development (SAED) to equip students with practical skills for future self-employment (Adeyemo & Ogunleye, 2021).

However, among all interventions in Imo State, the SkillUp Imo Programme of the Imo State Government has made an overwhelming impact. The programme is a youth digital skills empowerment initiative

implemented by the Ministry of Digital Economy and E-Government in partnership with Zinox Technologies to transform Imo citizens into global citizens with relevant digital skills (Addeh 2023, Techeconomy, 2023, and Ministry of Digital Economy & E-Government 2023). Under the programme, youths are trained in high-demand areas such as digital marketing, coding and software development, UI/UX design, data analysis, graphics design, cybersecurity, Artificial Intelligence, blockchain, fintech and online freelancing skills.

What makes SkillUp Imo different from other theoretical programmes is its practical empowerment model. Unlike many training programmes that stop at theory, SkillUp Imo equips graduates with practical tools needed to begin their tech journeys immediately, including brand new laptops, internet-enabled devices and software packs. In Cohort 2 alone, 15,000 youths graduated and each received either a brand-new Zinox or HP laptop equipped with cutting-edge specifications (Techeconomy, 2023). The state has so far trained over 50,000 youths across the 27 LGAs, with training centres established in IMSU, FUTO, Alvan Ikoku, Federal Polytechnic Nekede and other institutions to democratize access (Ekeh, 2025, Imo APC Diaspora, 2024). Cohort four (4) concluded their training in July 2026. Participants in this cohort are currently awaiting the disbursement of the start-up kits to enable them to start their businesses.

Reports indicate that about 40% of trainees have become digital entrepreneurs, while over 5,000 alumni have secured remote jobs and gigs, with many now into graphics design and digital marketing businesses (Ekeh, 2025). This reports supports Nwankwo and Chukwuma (2023) who noted that undergraduates who participated in practical skills services reports a higher likelihood of starting micro-ventures such as e-commerce and freelance services. SkillUp Youth Programme has attracted both indigenes and non-indigenes in Imo State and has quietly reduced youth restiveness by replacing despair with enterprise. With 50,000 youth trained in Cohort 1, 2, 3 and 4 in this programme, Imo State has positioned herself to become the digital hub of Nigeria. This initiative is in line with UNDP (2022) where it noted that effective youth skills development programe use a combination of interventions to equip youth with different types of skills necessary for accessing the world of work.

Business Education and Accounting Education are entrepreneurship-driven programmes. Final year students of these departments in Imo State University (IMSU) and Alvan Ikoku Federal University of Education, Owerri are expected to be major beneficiaries of SkillUp Imo and other federal programmes. Many are already running graphics design, digital marketing and POS businesses with laptops received from the programme. It is therefore imperative to empirically assess the extent to which this programme has impacted this specific academic group.

Statement of the Problem

Despite the massive investment in SkillUp Imo, where government partnered with Zinox to equip 15,000 youths with digital skills and brand-new laptops in a single cohort, and over 50,000 youths trained in digital skills including software engineering, AI and digital marketing, (Tech economy, 2023). There is a paucity of empirical evidence on its impact on undergraduate self-employment in the state

While anecdotal reports show that many beneficiaries now work as coders, graphic designers and digital entrepreneurs ready to compete globally, it is not clear how many Business and Accounting Education students, who are the core entrepreneurship students, have been impacted. Existing studies focused on general youths or NDE/TVET programmes, leaving a gap on SkillUp Imo's effect on undergraduates' income generation, self-employment and crime reduction.

Furthermore, even though the state government claims the programme transforms participants from curious learners to innovators and is reducing youth restiveness, some final year students still show over-dependence on parents and engage in criminal activities. The question is: To what extent has SkillUp Imo and other complementary programmes (Entrepreneurship Education, TVET, NDE, SIWES) actually translated to self-employment, income and crime reduction among final year Business and Accounting Education students in IMSU and Alvan Ikoku Federal University of Education? This study seeks to fill this gap.

Research Questions

The following research questions guided the study:

1. To what extent does SkillUp Imo youth programme influence self-employment and income generation among final year Business and Accounting Education students in Imo State?
2. To what extent does SkillUp Imo youth programme contribute to crime reduction among final year Business and Accounting Education students in Imo State?

Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

1. There is no significant difference in the mean responses of Business Education and Accounting Education students on the extent SkillUp Imo programme influences self-employment and income generation.
2. There is no significant difference in the mean responses of Business Education and Accounting Education students on the extent SkillUp Imo programme contributes to crime reduction.
3. There is no significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent SkillUp Imo programme influences self-employment and income generation.
4. There is no significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent SkillUp Imo programme contributes to crime reduction.

Methods

Descriptive survey research design was used for the study. The area was Imo State Nigeria.

Population of the study consisted of one hundred and thirteen (113) business and accounting education students in Imo State University (IMSU) and Alvan Ikoku Federal University of Education, 2025/2026 set. The entire population was studied without sampling because the size was not too large. The instrument for data collection was a four - point rating scale questionnaire titled SkillUp Imo Impact (SII).

The instrument was validated by three experts; two from Business Education Department and one in measurement and evaluation unit of Education psychology/ G&C faculty of Education, Alvan Ikoku Federal University of Education, Owerri. Internal consistency method was used to test the reliability of the instrument by administering it to twenty (20) final year Business Education students of Michael Okpara University of Agriculture, Umudike Abia State, which is outside the study area and using Cronbach alpha. Reliability coefficient values of 0.84 and 0.81 were obtained for cluster "I and II" of the instrument with an overall reliability coefficient value of 0.82. Data for study were collected by the researchers with the help of two research assistants through on the spot completion and retrieval method.

Only one Hundred and Eight (108) copies of the instrument distributed were completed, retrieved and used for analysis. Mean and standard deviation were used to answer the research questions and determine whether respondents were homogeneous in their views while the t- test was used to test the null hypotheses at 0.5 level of significance.

Decisions on the research questions was based on cluster mean scores using a cut-off mean score of 2.50. A cluster mean score that is below 2.50 is disagreed while 2.50 and above is agreed. A null hypothesis was accepted where the p-value was equal to or greater than the alpha level of 0.05 and rejected where the p-value was less than the alpha level. The analysis was done with the statistical package for social science (SPSS)

Results

Research Question 1: To what extent does skill-up Imo youth programme influence self-employment and income generation among final year Business and Accounting education students in Imo State.

Table 1: Mean responses on extent of influence on self-employment and income generation

S/N	Item statement	X	SD	Remarks
1	Skill-Up Imo training equips you with digital skills to start your own business	3.53	0.58	Very High extent
2	Laptop empowerment through skill-up Imo enables you to start graphics design business	3.15	0.79	High extent
3	Skill-up Imo training enables you to earn income through digital marketing services	3.56	0.58	Very high extent
4	Training in AI, cybersecurity and data analytics makes you self-employed	2.83	0.85	High extent
5	Skill-up Imo makes you financially self-reliant to support academic expenses	2.70	0.87	High extent
6	Skil-up Imo improves your monthly income level compared to before the training	3.06	0.98	High extent
7	Skill-up Imo enables Business/Accounting Education students	3.28	0.85	Very High extent

	to own digital businesses			
8	Skill-up Imo enables Business/Accounting Education students become employers of labour rather than job seekers	3.13	0.69	High extent
	Cluster Mean	**3.16**		**High extent**

The analysis in Table 1 reveals that the highest mean scores were recorded for the item on Skill-Up Imo training enabling students to earn income through digital marketing services ($\bar{X}$ = 3.56), Skill-Up Imo training equipping students with digital skills to start their own business ($\bar{X}$ = 3.53), and Skill-Up Imo enabling Business/Accounting Education students to own digital businesses ($\bar{X}$ = 3.28), all rated Very High Extent. In contrast, the lowest mean scores were observed for Skill-Up Imo making students financially self-reliant to support academic expenses ($\bar{X}$ = 2.70) and training in AI, cybersecurity and data analytics making students self-employed ($\bar{X}$ = 2.83), both rated High Extent. The cluster mean of 3.16 summarized that the Skill-Up Imo Youth Programme influences self-employment and income generation among final year Business and Accounting Education students in Imo State to a High Extent. Standard deviations ranged from 0.58 to 0.98, indicating moderate variability in responses, which implies some disparity in how students perceive the influence of the Skill-Up Imo Youth Programme on self-employment and income generation.

Research Question 2: To what extent does skill-up Imo youth programme contribute to crime reduction among final year Business and Accounting education students in Imo State

Table 2: Mean responses on extent of contribution to crime reduction

S/N	Item statement	X	SD	Remarks
9	Engagement in skill-up Imo reduces idleness among undergraduates	3.18	0.83	High extent
10	Income from skill-up Imo digital business reduces temptation for internet fraud	3.23	0.73	High extent
11	skill-up Imo reduces students' involvement in stealing and cultism	2.60	0.93	High extent
12	Having legitimate income through skill-up Imo discourages criminal activities	3.36	0.72	Very high extent
13	skill-up Imo promotes responsible citizenship among undergraduate	3.49	0.72	Very high extent
14	skill-up Imo reduces youth restiveness in Imo State by engaging youth meaningfully	3.28	0.83	Very high extent
15	skill-up Imo can drastically reduce crime rate if extended to all undergraduates	3.53	0.71	Very high extent
	Cluster Mean	**3.24**		**Very high extent**

The analysis in Table 2 reveals that the highest mean scores were recorded for the item on Skill-Up Imo drastically reducing crime rate if extended to all undergraduates ($\bar{X}$ = 3.53), Skill-Up Imo promoting responsible citizenship among undergraduates ($\bar{X}$ = 3.49), and having legitimate income through Skill-Up Imo discouraging criminal activities ($\bar{X}$ = 3.36), SkillUp Imo reduces youth restiveness in Imo State by engaging youth meaningful ($\bar{X}$ = 3.28), all rated Very High Extent. In contrast, the lowest mean scores were observed for Skill-Up Imo reducing students' involvement in stealing and cultism ($\bar{X}$ = 2.60) and engagement in Skill-Up Imo reducing idleness among undergraduates ($\bar{X}$ = 3.18), with the former rated High Extent and the latter also rated High Extent. The cluster mean of 3.24 summarized that the Skill-Up Imo Youth Programme contributes to crime reduction among final year Business and Accounting Education students in Imo State to a Very High Extent. Standard deviations ranged from 0.71 to 0.93, indicating moderate variability in responses, which implies some disparity in how students perceive the contribution of the Skill-Up Imo Youth Programme to crime reduction.

Hypothesis 1: There is no significant difference in the mean responses of Business Education and Accounting Education students on the extent Skill-Up Imo programme influences self-employment and income generation.

Table 3: t-test analysis on the significant difference in the mean responses of Business Education and Accounting Education students on the extent Skill-Up Imo programme influences self-employment and income generation

Variables	N	X	SD	df	t-cal	p-value	α-value	Remark
Business	76	14.83	4.96					
				106	0.694	0.491	0.05	Not significant
Accounting	32	13.14	4.14					

The result in Table 3 shows that there is no significant difference in the mean responses of Business Education and Accounting Education students on the extent to which the Skill-Up Imo programme influences self-employment and income generation, t(106) = 0.694, p = 0.491. Since the p-value (0.491) is greater than the alpha value (0.05), the null hypothesis is not rejected. This means that there is no significant difference in the mean responses of Business Education and Accounting Education students on the extent to which Skill-Up Imo programme influences self-employment and income generation.

Hypothesis 2: There is no significant difference in the mean responses of Business Education and Accounting Education students on the extent Skill-Up Imo programme contributes to crime reduction.

Table 4: t-test analysis on the significant difference in the mean responses of Business Education and Accounting Education students on the extent Skill-Up Imo programme contributes to crime reduction

Variables	N	X	SD	df	t-cal	p-value	α-value	Remark
Business	76	12.96	5.47					
				106	1.008	0.318	0.05	Not significant
Accounting	32	15.19	5.18					

The result in Table 4 shows that there is no significant difference in the mean responses of Business Education and Accounting Education students on the extent to which the Skill-Up Imo programme contributes to crime reduction, t(106) = 1.008, p = 0.318. Since the p-value (0.318) is greater than the alpha value (0.05), the null hypothesis is not rejected. This means that there is no significant difference in the mean responses of Business Education and Accounting Education students on the extent to which Skill-Up Imo programme contributes to crime reduction.

Hypothesis 3: There is no significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent Skill-Up Imo programme influences self-employment and income generation.

Table 5: t-test analysis on the significant difference in the mean responses of IMSU and Alvan Students on the extent Skill-Up Imo programme influences self-employment and income generation

Variables	N	X	SD	df	t-cal	p-value	α-value	Remark
IMSU	32	12.44	4.41					
				106	4.802	0.001	0.05	Significant
Alvan	76	15.02	3.18					

The result in Table 5 shows that there is a significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent to which the Skill-Up Imo programme influences self-employment and income generation, t(106) = 4.802, p = 0.001. Since the p-value (0.001) is less than the alpha value (0.05), the null hypothesis is rejected. This means that there is a significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent to which Skill-Up Imo programme influences self-employment and income generation.

Hypothesis 4: There is no significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent Skill-Up Imo programme contributes to crime reduction.

Table 6: t-test analysis on the significant difference in the mean responses of Business Education and Accounting Education students on the extent Skill-Up Imo programme contributes to crime reduction

Variables	N	X	SD	df	t-cal	p-value	α-value	Remark
IMSU	32	14.92	4.51					
				106	8.224	0.000	0.05	Significant
Alvan	76	15.64	4.92					

The result in Table 6 shows that there is a significant difference* in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent to which the Skill-Up Imo programme contributes to crime reduction, t(106) = 8.224, p = 0.000. Since the p-value (0.000) is less than the alpha value (0.05), the null hypothesis is rejected. This means that there is a significant difference in the mean responses of students from IMSU and Alvan Ikoku Federal University of Education on the extent to which Skill-Up Imo programme contributes to crime reduction.

Discussion of Findings

The result of Table 1 revealed that SkillUp Imo youth programme influences self-employment and income generation among final year Business and Accounting Education students to a high extent with a cluster mean of 3.16. Items 1, 3 and 7 had the highest mean scores indicating that laptop empowerment and training in digital marketing, graphics design, AI cybersecurity and data analytics equips students with skills to start their own digital businesses and earn legitimate income. This implies that students are no longer dependent on white-collar jobs but are now creators of jobs.

This finding is in agreement with Okoro & Nwosu (2024) who found that digital skill acquisition significantly predicts self-employment intention among business education students in South-East Nigeria. It also corroborates Eze & Okonkwo (2023) and Ojo & Adeyemi (2024) who reported that digital empowerment programmes coupled with laptop distribution enhance graduate employability and enable undergraduates to establish sustainable businesses while in school. The findings of this study relates with that of Adasu (2026), Olukemi and Ukpabi (2026), and Aremu and Egunjobi (2025) which revealed that digital skills improve undergraduates economic well-being, promote economic and financial independence, combat students poverty and youth unemployment. The finding further supports the World Bank (2023) Digital Economy report which stressed that digital skills are critical for income generation in the 21st century economy. The high extent recorded could be attributed to the practical nature of SkillUp Imo programme and the fact that Imo State Ministry of Digital Economy (2023) ensured every trainee was empowered with a laptop and start-up support, which removed the initial capital barrier for students. The result of hypothesis one and three shows that there is no significant difference in the mean responses of Business and Accounting Education Students and IMSU and Alvan students on the extent SkillUp Imo programme influence self-employment and income generation.

Findings in Table 2 showed that SkillUp Imo youth programme contributes to crime reduction to a high extent with a cluster mean of 3.24. Items 10, 12, 13, 14 and 15 had mean scores of 3.23, 3.36, 3.49, 3.28 and 3.53 indicating that having a legitimate source of income through digital business reduces temptation for internet fraud (yahoo yahoo), discourages criminal activities, promotes responsible citizenship among undergraduates, reduce youth restiveness. This means that when students are meaningfully engaged and financially self-reliant, their involvement in criminal activities reduces drastically.

This finding is in consonance with Okafor & Uzochukwu (2023) who established that youth unemployment is positively correlated with crime rate, and that skills acquisition programmes mediate this relationship. Similarly, Adebayo & Oluwole (2022), Uche & Amadi (2024) and Mutahir (2019) found that digital entrepreneurship significantly reduces cybercrime and youth restiveness among undergraduates. Supporting this finding also the study by Ojo, Liadi, Ganiyo, Alatise, Kazeem, Abdullateef, Olakunle, Aremu and Rasak (2026) revealed that a reported decrease in junivile criminal conduct was positively correlated with having access to digital technologies, participating in online endeavours, earning money, and taking part in government or non-governmental organization programme. The National Bureau of Statistics (2023) also identified idleness and lack of legitimate income as major drivers of social vices among Nigerian youths. Therefore, the contribution of SkillUp Imo to crime reduction could be explained by the fact that the programme keeps students busy, provides income, and promotes responsible citizenship as noted in items 9 and 13. The result of hypothesis two revealed that the mean responses of

Business and Accounting education students did not differ significantly on the extent SkillUp Imo programme contribute to crime reduction while the result of hypothesis four shows that there is a significant difference in the mean responses of students from IMSU and Alvan on the extent SkillUp Imo programme contributes to crime reduction. The significant difference in mean responses could be attributed to variation in institutional culture, level of sensitization and students participation rate in the SkillUp Imo programme.

Conclusion

Based on the findings, it was concluded that skillUp Imo is an effective model for promoting self-employment, generate income and reduce crime among undergraduates. It should be sustained and adopted by other States

Recommendations

1. Since skillUp Imo programme promotes self-employment and income generation, Imo State Government should sustain and expand SkillUp Imo programme beyond its present coverage to ensure all youths across the State have equal access.
2. The Imo State Ministry of Digital Economy and Youths development should establish a post-training incubation system where SkillUp beneficiaries are linked to SMEDAN and start-up support, to ensure continuous engagement and reduction of youth involvement in crime.
