Table of Contents

SUB-THEME 1: INNOVATION, TECHNOLOGY AND THE FUTURE OF WORK

DIGITAL ENTREPRENEURSHIP THROUGH UNIVERSITY-BASED INNOVATION HUBS IN AFRICA. A SCOPING REVIEW OF CHALLENGES AND POLICY IMPLICATIONS Eugene Owusu-Acheampong, Magdalene Bartrop Abakah, Solomon Tawiah Yeboah & Emelia Ohene Afriyie	2-21
READINESS AND PERCEPTIONS TOWARDS TECHNOLOGY INTEGRATION IN BUSINESS EDUCATION: A STUDY OF STUDENTS WITHOUT PRIOR EXPOSURE TO AI, SIMULATION AND VIRTUAL REALITY IN TERTIARY INSTITUTIONS IN RIVERS STATE Emeka G. Nwokocha PhD	22-32
INNOVATION AND EMERGING TECHNOLOGIES AS PREDICTORS OF WORKFORCE READINESS AMONG BUSINESS EDUCATION STUDENTS IN THE UNIVERSITY OF CALABAR Dr. Mercy Nkiruka Godwin Akeke, Dr. Cletus Akpo Atah & Francis Ejue Otu	33-46
INNOVATIVE PEDAGOGIES IN BUSINESS AND ENTREPRENEURSHIP EDUCATION: IMPLICATIONS FOR KNOWLEDGE TRANSFERS AND GLOBAL COMPETITIVENESS Daniel Osamwonyi Iyoha, PhD, Francisca Ogor Moseri, PhD & Prof. Chinwe Sussan Oguejiofor, PhD	47-60
ARTIFICIAL INTELLIGENCE-BASED AUTOMATION OF OFFICE TECHNOLOGY TASKS AND ENTREPRENEURIAL SKILL DEVELOPMENT AMONG OTME STUDENTS Obi Jennifer Ifeoma	61-68
FOSTERING ECO-INNOVATION THROUGH BUSINESS EDUCATION: A COLLABORATIVE APPROACH TO COE-INDUSTRY PARTNERSHIP IN SOUTH-SOUTH, NIGERIA. Dr Kemebaradikumo Ndiomu	69-83
TECHNOVATION PROGRAMME AND ENTREPRENEURIAL INTENTION AMONG FEMALE SECONDARY SCHOOL STUDENTS IN RIVERS STATE Igwe, Constance Kelechi & Nnaji Obiageli	84-93
INFLUENCE OF EMERGING TECHNOLOGIES IN REPOSITIONING BUSINESS EDUCATION PROGRAMME FOR THE FUTURE Salami, Vivian Akhere & Oluwadare, Ayodeji Abraham	94-98
INNOVATION, TECHNOLOGY AND THE FUTURE OF WORK: REPOSITIONING BUSINESS EDUCATION FOR THE DIGITAL ECONOMY Inuwa Shehu Yusuf	99-103
INNOVATION, TECHNOLOGY AND THE FUTURE OF HEALTH CARE SERVICES Abubakar Alhassan, Ibrahim Rabiu, Yahaya Dattijo Abubakar, Hussaini Magaji Adamu & Muhammad B. Muhammad	104-112

TECHNOLOGICAL INNOVATION SHAPING THE FUTURE OF WORK FOR ORGANIZATIONAL PRODUCTIVITY 113-126
Wakgaka Cephas Daniel, Dingsan Rhoda Richard and Kwashi Mwanret Maichibi

INFLUENCE OF TECHNOLOGY AND ENTREPRENEURIAL ORIENTATIONS ON PERFORMANCE OF SMALL AND MEDIUM ENTERPRISES IN BORNO STATE, NIGERIA 127-136
Modu Korimi

SUB-THEME 2: ARTIFICIAL INTELLIGENCE, AUTOMATION, AND THE FUTURE OF ENTREPRENEURIAL LEARNING AND PRACTICE

THE INFLUENCE OF ARTIFICIAL INTELLIGENCE ON THE EFFECTIVE LEARNING AND PRACTICES OF ACCOUNTING EDUCATION IN FEDERAL COLLEGE OF EDUCATION, OBUDU, CROSS RIVER STATE Gadzama, Philemon Samuel & Ayang, Gabriel Okowoko	138-145
INFLUENCE OF FINANCIAL ACCOUNTING PRACTICES AND DIGITAL MICRO-ENTREPRENEURIAL SKILLS ON STUDENTS' CAREER READINESS IN EDUCATIONAL TERTIARY INSTITUTIONS, LAGOS STATE, NIGERIA Dr. Alabi, Adebowale John, Dr. Oyeyemi Kayode & Adisa Oluwadamilare Aderemi	146-157
ARTIFICIAL INTELLIGENCE, AUTOMATION, AND THE FUTURE OF BUSINESS AND ENTREPRENEURSHIP LEARNING AND PRACTICE IN OYO STATE Sunday Adeagbo (PhD, MABEN) & Solomon Oyelami Oyewole (PhD, MABEN)	158-165
THE ROLE OF ARTIFICAL INTELLIGENCE (AI) IN CREATIVITY AND INNOVATIVE FOR EFFECTIVE MARKETING. Dr. Kingsley Enyinna Eneremadu MABN, Dr. Samuel A. Efughi MABN & Dr. Chikezie Iheoma MABN	166-173
STRATEGIES FOR PROMOTING SOCIAL ENTREPRENEURSHIP AND ETHICAL LEADERSHIP AMONG BUSINESS EDUCATION STUDENTS IN COLLEGES OF EDUCATION IN SOUTHWEST, NIGERIA Ganiyat Folashade Enilolobo PhD	174-181
GENERATIVE AI AND STRATEGIC DECISION-MAKING IN PUBLIC UNIVERSITIES: THE MEDIATING ROLE OF DIGITAL LITERACY IN NIGERIA Dr Shaibu, Ogwuche Gabriel, Dr Judith M. Kaduru & Dr Chinwe C. Ebenezer-Nwokeji	182-192
ARTIFICIAL INTELLIGENCE LITERACY AND ENTREPRENEURIAL INTENTIONS AMONG BUSINESS EDUCATION STUDENTS IN SOUTH-WEST UNIVERSITIES OF NIGERIA Sunday Adeagbo PhD, Peter Adekunle Oluwafemi PhD, Solomon Oyelami Oyewole PhD & Olayinka Ibitoye	193-202
ARTIFICIAL INTELLIGENCE AND AUTOMATION IN TRANSFORMING ENTREPRENEURIAL LEARNING AND PRACTICE AMONG BUSINESS EDUCATION STUDENTS IN UNIVERSITIES IN CROSS RIVER STATE, NIGERIA Bessong Emmanuel Bessong PhD, Akiebie Benneth Uranta, PhD & Atah Cletus Akpo PhD	203-217
ARTIFICIAL INTELLIGENCE TOOLS UTILIZATION AND ENTREPRENEURIAL COMPETENCY DEVELOPMENT AMONG BUSINESS EDUCATION STUDENTS Onyeneke, Euphemia Nkiruka, Oboh, Adline & Ogbonnaya Nwachuku Okike	218-224

ENHANCING ENTREPRENEURSHIP SKILLS THROUGH APPRENTICESHIP SYSTEM AMONG GRADUATES IN SOUTH EASTERN STATES IN NIGERIA Iwuoha, Charity U. (PhD), Baba Edna Ikwubiela (PhD) & Ebenezer-Nwokeji Chinwe C. (PhD)	225-230
INFLUENCE OF DIGITAL LITERACY ON ENTREPRENEURIAL INTENTIONS: A MANAGEMENT MODEL OF TVET GRADUATES IN ABIA STATE COLLEGE OF EDUCATION TECHNICAL AROCHUKWU (ASCETA), NIGERIA Nwegbu, Mercy Chizaram	231-242
RELATIONSHIP BETWEEN ENTREPRENEURSHIP EDUCATION AND STUDENTS' ENTREPRENEURIAL SELF-EFFICACY IN PUBLIC TERTIARY INSTITUTIONS IN BAUCHI STATE, NIGERIA Dr. Agatha Samson & Dr. Abdulmutallib U. Baraya	243-251
ARTIFICIAL INTELLIGENCE ASSESSMENT TOOLS AND ACADEMIC PERFORMANCE OF BUSINESS EDUCATION STUDENTS IN PUBLIC UNIVERSITIES IN CROSS RIVER STATE, NIGERIA Eleng Seyifunmi Ntami & Akeke M.n.g	252-258
ENTREPRENEURSHIP EDUCATION INFLUENCE ON THE DEVELOPMENT OF ENTREPRENEURIAL SKILLS AMONG UNDERGRADUATE BUSINESS EDUCATION STUDENTS IN KWARA STATE. Motunrayo Janet Aransiola, Oluwasemilore Racheal Okunade, Sikiru Issa, Nuhu & Bukola Bose Afolayan	259-269
GENERATIVE ARTIFICIAL INTELLIGENCE COMPETENCE, DIGITAL COMPETENCE AND EMPLOYABILITY SKILLS DEVELOPMENT AMONG BUSINESS EDUCATION STUDENTS IN NIGERIAN UNIVERSITIES Ann Mojisola Uwagwu	270-275
UTILIZATION OF ARTIFICIAL INTELLIGENCE TOOLS FOR TEACHING AND LEARNING OF ACCOUNTING COURSES IN UNIVERSITIES IN RIVERS STATE Dr. Vivian Agburuga & Dr. Peter Clinton Ogwunte	276-285
ARTIFICIAL INTELLIGENCE DRIVEN PEDAGOGIES AND ENTREPRENEURIAL INTENTION: THE MEDIATING ROLE OF SELF-EFFICACY, OPPORTUNITY RECOGNITION AND ENTREPRENEURIAL INNOVATIVENESS Asmau Salihu, PhD & Usman Ladan Kurya, PhD	286-300
FROM AI LITERACY TO ENTREPRENEURIAL COMPETENCE: REIMAGINING BUSINESS EDUCATION FOR AFRICA'S DIGITAL ECONOMY Samuel David Udo, PhD & Ezinne Okechukwu Dike	301-308
ARTIFICIAL INTELLIGENCE AND AUTOMATION AS PREDICTORS OF ENTREPRENEURIAL LEARNING AND PRACTICE OF COOPERATIVE ECONOMICS AND MANAGEMENT BY BUSINESS EDUCATION STUDENTS IN NIGERIAN UNIVERSITIES IN SOUTH-EAST Favour Moghalu	309-320

ENTREPRENEURIAL PEDAGOGY AND SKILL DEVELOPMENT AMONG BUSINESS EDUCATION GRADUATES IN RIVERS STATE-OWNED UNIVERSITIES Onyije, Onengiye Danagogo (MABEN) and Alfred, Rita Chika	321-329
AI AWARENESS, BARRIERS, AND COMPETENCY NEEDS FOR ENTREPRENEURIAL LEARNING IN NORTH CENTRAL NIGERIA Joshua Sule Mamman, PhD & Annie Motunrayo Adewuyi, PhD	330-342
ASSESSMENT OF THE IMPACT OF ARTIFICIAL INTELLIGENCE ON OFFICE TECHNOLOGY MANAGEMENT AND ENTREPRENEURIAL LEARNING AND PRACTICE IN PUBLIC POLYTECHNICS IN SOUTH EAST, NIGERIA Dr. Ugwu, Agha Jerry, Dr. Friday Ogbaga & Umeokafor, Ndidiamaka	343-350
BRIDGING THE DIGITAL GAP: ESSENTIAL AI COMPETENCIES FOR BUSINESS EDUCATION STUDENTS IN THE ERA OF ENTREPRENEURIAL TRANSFORMATION Nansel Patience Nendirmwa, Daya Ufulul Lamech & Hannah Jonah Longchi	351-361
PERCEPTIONS OF AI-POWERED TOOLS, DIGITAL LITERACY, AND REMOTE WORK PREPAREDNESS ON THE CAREER READINESS OF BUSINESS EDUCATION GRADUATES IN NIGERIAN UNIVERSITIES Israel Oluwaseye Oyun, Felicia Kikelomo Oluwalola, Afiss Adebayo Fawale & Raji Isiaka	362-373
STUDENTS' READINESS AND UTILIZATION OF ARTIFICIAL INTELLIGENCE TOOLS FOR ACADEMIC RESEARCH IN COLLEGES OF EDUCATION IN KWARA STATE, NIGERIA Dr. Sikiru Issa, Nuhu, Dr. Hadiza Nuhu, Usman, Motunrayo Janet, Aransiola, Olasupo Opeyemi, Abideen & Nurufaida Adanla, Jamiu	374-385
LECTURERS' AND STUDENTS' PERCEPTION OF THE IMPLICATIONS OF ARTIFICIAL INTELLIGENCE (AI) IN OFFICE TECHNOLOGY AND MANAGEMENT EDUCATION IN TERTIARY INSTITUTIONS IN PLATEAU STATE Duktur, S. Levong (FABEN/0048)	386-393
THE ROLE OF ARTIFICIAL INTELLIGENCE AND AUTOMATION IN SHAPING ENTREPRENEURIAL LEARNING AND SKILLS ACQUISITION AMONG ENTREPRENEURS OF SMEs IN SOUTH-SOUTH, NIGERIA Ambakederemo Owulupu Samuel, Yinzuo Gbenana, And Temisere Oghenebrorhien Fredrick	394-409
DIGITAL ACCOUNTING INTELLIGENCE (DAI) AND ENTREPRENEURIAL RESILIENCE OF START-UPS IN AN ERA OF ECONOMIC UNCERTAINTY IN RIVERS STATE Dr. Onuotu, Richard N.	410-420
INTEGRATING ARTIFICIAL INTELLIGENCE AND DATA ANALYTICS INTO BUSINESS EDUCATION CURRICULUM IN TERTIARY INSTITUTIONS Ugonwa Felicia Umeh, PhD	421-427

ARTIFICIAL INTELLIGENCE LITERACY AND ADMINISTRATIVE EFFICIENCY LEVELS AMONG OFFICE TECHNOLOGY AND MANAGEMENT GRADUATES IN POLYTECHNICS IN KOGI STATE Ameh Angela Ojochide	428-435
UTILIZATION OF ARTIFICIAL INTELLIGENCE (A.I) FOR PRACTICAL BUSINESS ENTREPRENEURIAL SKILLS DEVELOPMENT IN BUSINESS EDUCATION STUDENTS; THE BOTTLENECKS AND SOLUTIONS FOR ECONOMIC DEVELOPMENT Dr. S O. Wagbara, MABEN & Dr. E O. Enyekit, MABEN	436-442
ARTIFICIAL INTELLIGENCE AND DIGITAL ENTREPRENEURSHIP COMPETENCIES REQUIRED BY ENTREPRENEURSHIP EDUCATION STUDENTS FOR PARTICIPATION IN THE CREATOR ECONOMY IN UNIVERSITIES IN DELTA STATE Egbule, Nnamdi Collins PhD, Ikenga Godwin Uzoamaka PhD & Nwajei Happiness Chinasa	443-451
INFLUENCE OF ARTIFICIAL INTELLIGENCE LITERACY ON EMPLOYABILITY SKILLS AMONG BUSINESS EDUCATION (ACCOUNTING) STUDENTS IN OGUN STATE N. A. Ishola	452-462
ARTIFICIAL INTELLIGENCE ADOPTION AND ACCOUNTING COMPETENCY DEVELOPMENT AMONG BUSINESS EDUCATION STUDENTS IN RIVERS STATE UNIVERSITIES Thomas Bariere, PhD	463-472
THE ROLE OF ARTIFICIAL INTELLIGENCE TOOLS IN RESHAPING THE OCCUPATIONAL WORK PROCESSES AMONG SECRETARIES IN ABIA STATE CIVIL SERVICE Igwe, Constance Kelechi, Dr. Maritha Nwakaego Ndom-Uchendu & Victor-Igwe, Juliet Nkechi	473-481
AI DRIVEN INNOVATIVE CURRICULUM FOR THE ACQUISITION OF ENTREPRENEURIAL SKILLS BY BUSINESS EDUCATION STUDENTS IN TERTIARY INSTITUTIONS IN ANAMBRA STATE. Lydia Udeh Opara	482-490
REIMAGINING BUSINESS EDUCATION FOR THE ARTIFICIAL INTELLIGENCE ERA: IMPLICATIONS FOR ENTREPRENEURIAL TRANSFORMATION IN AFRICA Brown, Barisoma Maxwell, Udeh, Chinyere Patience & Aburime, Ehikioya Frank	491-496
ARTIFICIAL INTELLIGENCE LITERACY AND FUTURE WORLD-OF-WORK COMPETENCIES AMONG UNDERGRADUATE BUSINESS EDUCATION STUDENTS IN NIGERIA. Dr. Madu Maureen, Ogbuagu Perpetua Nzube & Daya Ufulul Lamech	497-503
LEVERAGING ARTIFICIAL INTELLIGENCE AND AUTOMATION FOR ENTREPRENEURIAL LEARNING IN AFRICAN BUSINESS EDUCATION Sulaiman Ahmad	504-509

SUB-THEME 3: DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNO-PRENEURSHIP IN AFRICA

REIMAGINING BUSINESS EDUCATION FOR DIGITAL TRANSFORMATION AND TECHNO-PRENEURSHIP SKILL ACQUISITION IN AFRICA: A SYSTEMATIC LITERATURE REVIEW: Dr. Esther Elo Otomiewo & Crossdale Ovwido Josephine PhD	511-521
DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNOPRENEURSHIP AMONG UNDERGRADUATES OF BUSINESS EDUCATION IN CROSS RIVER STATE. Otum, Nneka Ihekaugwu (Ph.D); Ingwe, Maria	522-522
DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNOPRENEURSHIP IN AFRICA: IMPERATIVES, CHALLENGES AND PATHWAYS FOR SUSTAINABLE DEVELOPMENT Enang, Christiana Etong, PhD & Office of the Head of Civil Service of the Federation	522-547
DIGITAL ENTREPRENEURSHIP IN AFRICA: BRIDGING THE BUSINESS EDUCATION GAP Oguche, Inikpi Comfort	548-557
STRENGTHENING BUSINESS EDUCATION FOR DIGITAL AND ENTREPRENEURIAL TRANSFORMATION IN AFRICA Terver M. Kwaghbo, PhD; Elujekwute, Edwin, C. PhD & Tersor Ayua	558-564
DIGITAL SKILLS GAP AND TECHNOPRENEURSHIP: REPOSITIONING BUSINESS EDUCATION FOR NIGERIA'S DIGITAL ECONOMY Effah, Miriam Anyianwan, Okudare, Juliana Unwanynin (PhD) & & Ogbeche, Stephen	565-573
LEVERAGING ARTIFICIAL INTELLIGENCE FOR INNOVATION AND ENTREPRENEURIAL GROWTH AMONG YOUTHS IN IMO STATE, NIGERIA: OPPORTUNITIES, CHALLENGES AND POLICY PERSPECTIVES Enwere Ifeoma-Meziem Victoria (PhD)	574-582
DIGITAL TRANSFORMATION AS A CATALYST FOR ENHANCING BUSINESS EDUCATION IN NIGERIAN TERTIARY EDUCATION: CHALLENGES, OPPORTUNITIES, AND OUTCOMES Muhammad Muhammad Suleiman, Dr Ado Garba Gude, & Dr Muhammad Bello Aliyu	583-594
DIGITAL COMPETENCE AND TECHNO-PRENEURSHIP INSTRUCTIONAL PRACTICES AMONG BUSINESS EDUCATION LECTURERS IN TERTIARY INSTITUTIONS Amakodi Sunday Eze PhD & Masi Beauty Nma PhD & Okonkwo Chinwe Comfort	595-600
DIGITAL SKILLS ACQUISITION AND TECHNO-PRENEURIAL INTENTIONS AMONG FINAL-YEAR UNDERGRADUATE BUSINESS EDUCATION STUDENTS IN RIVERS STATE Agbagbue Adanma O. S, Ahiakwo Glory Chinyere & Alabi, Ebifakumor Blessing PhD	601-606

ROLE OF TRADE FINANCE, FINANCIAL LITERACY AND SMES PERFORMANCE IN EMERGING ECONOMIES Rufina Betzoom Tuamyil, Felix Paul Yiljap, Dekom Habila Bako & Bello, Abdulmuttalib Mohammed	607-615
MAKING BUSINESS EDUCATION RELEVANT IN THE DIGITAL AGE: DEVELOPING DIGITAL AND ENTREPRENEURIAL COMPETENCIES AMONG BUSINESS EDUCATION GRADUATES Akinwonmi, Omolabake Deborah	616-624
DIGITAL TRANSFORMATION AND TECHNOLOGICAL INTEGRATION IN TEACHING AND LEARNING BUSINESS EDUCATION IN TERTIARY INSTITUTIONS IN NIGERIA Jubril Abubakar Musa	625-630
EFFECT OF DIGITAL TECHNOLOGY SKILLS ON TECHNOPRENEURSHIP DEVELOPMENT AMONG BUSINESS EDUCATION STUDENTS IN TERTIARY INSTITUTIONS IN ANAMBRA STATE, NIGERIA Prof. Chioma L. Ikeanyionwu and Dr. Ijeoma C. Ike	631-642
SOCIAL MEDIA ADOPTION AND USAGE PATTERNS AMONG SMEs IN MAINLAND LOCAL GOVERNMENT AREA OF LAGOS STATE Oluwole Victor Falobi, Taiwo Rasheed Azeez & Yinusa, Oyekunle.	643-654
DIGITAL SKILLS AS A CATALYST FOR YOUTH TECHNO-ENTREPRENEURSHIP IN AFRICA: THE TRANSFORMATIVE ROLE OF DIGITALIZATION Favour Ndidiamaka John & Yusuf Maitama Sule	655-660
DIGITAL COMPETENCE, EMOTIONAL INTELLIGENCE, AND ENTREPRENEURIAL INTENTION AS PREDICTORS OF PERCEIVED ENTREPRENEURIAL SUCCESS AMONG BUSINESS EDUCATION UNDERGRADUATES IN EDO AND DELTA STATES, NIGERIA Dr. Elexius Amayo Epumepu, Tilex Grefav Systems Limited/Tilex Group of Schools & Dr. Kennedy Ediagbonya	661-669
DIGITAL LITERACY AND DIGITAL ENTREPRENEURIAL SKILLS ACQUISITION: A CALL FOR BUSINESS EDUCATION CURRICULUM REVIEW Elizabeth Remilekun Ore, Adeola Abiola Oguntola & Victoria Olubunmi Sofolahan & Elizabeth Remilekun Ore	670-679
ARTIFICIAL INTELLIGENCE–DRIVEN PRACTICAL BUSINESS EDUCATION AND THE DEVELOPMENT OF ENTREPRENEURIAL COMPETENCIES FOR DIGITAL TRANSFORMATION IN AFRICA Edidiong N. Ekong	680-686
INFLUENCE OF SOCIAL VALUE CREATION AND PROACTIVENESS ON PERFORMANCE OF TECHNOLOGY-BASED SMALL AND MEDIUM ENTERPRISES IN NORTH CENTRAL, NIGERIA Hassan Haruna, Associate Prof. J.s. Mamman	687-693

REDESIGNING CURRICULUM FOR DIGITAL ENTREPRENEURSHIP: PREPARING STUDENTS FOR THE PLATFORM ECONOMY Abigail Ofume	694-704
SUSTAINABILITY-CONSCIOUS FINANCIAL DECISION-MAKING FOR ENTREPRENEURIAL TRANSFORMATION IN NIGERIA Dr. Akinsanya Saheed Olatunde (MABEN/1066)	705-714
HOW BUSINESS EDUCATION CAN EQUIP INFORMAL TRADERS WITH THE SKILLS TO ADOPT MOBILE MONEY, E-COMMERCE AND DIGITAL RECORD KEEPING. Henry Oluwasanmi, Olugbade	715-721
DIGITAL TRANSFORMATION AND SKILLS ACQUISITION FOR TECHNOPRENEURSHIP BY BUSINESS EDUCATION UNDERGRADUATES IN RIVERS STATE UNIVERSITIES Philip Festus Ukata, PhD & Fortune Omasirichi Sam-Eleyi	722-731
DIGITAL TECHNOLOGY SKILLS REQUIRED BY BUSINESS EDUCATION STUDENTS FOR EFFECTIVE ENTREPRENEURIAL OPERATIONS IN EBONYI STATE Oko, Juliet Ekemma, Office Technology and Management & Dr. Oko Maryvivian Chinyere	732-740
UTILIZATION OF DIGITAL TRANSFORMATION SKILLS BY BUSINESS EDUCATION STUDENTS IN COLLEGES OF EDUCATION SOUTH EAST NIGERIA. Vivian O. Nnaji, Constance K. Igwe & Precious Nkem Ekoh	741-747
TRANSFORMING PROFESSIONAL IDENTITY: ENHANCING INTERPERSONAL AND COMMUNICATION COMPETENCE IN OFFICE TECHNOLOGY AND MANAGEMENT STUDENTS FOR THE DIGITAL WORKPLACE Faith Nnenna Ama, PhD & Simon Oluwatobi Olowofila (MABEN,1084)	748-753
DIGITAL BUSINESS EDUCATION SKILLS AND STARTUP CREATION AMONG BUSINESS EDUCATION GRADUATES OF FEDERAL COLLEGE OF EDUCATION, ABEOKUTA, OGUN STATE, NIGERIA Adegbokiki, Lukmon Tunde MABEN/1215	754-762

Abstract

Purpose. This scoping review maps challenges and policy implications associated with university-based innovation hubs, incubators and closely related entrepreneurship-support structures that advance digital or technology-enabled entrepreneurship in Africa.

Methods. A parent scoping review was undertaken utilizing the Arksey and O'Malley, JBI and PRISMA-ScR approaches. The searches involved both electronic and grey literature for the period 2015 to 2025. From the sources that were identified, 28 sources were considered to be within the institutional scope and analyzed to be either direct or contextual evidence.

Findings. Twenty-eight documents were used to construct the university-based evidence map. Ten documents (35.7%) provided direct evidence while 18 documents (64.3%) provided contextual evidence. Common areas of challenge were skills, curricula and human resources (21/28); fragmentation and lack of linkage in the ecosystem (19/28); finance and sustainability of the hub (18/28); and infrastructure and geographical access (16/28). Best converging policies were curricula and institutional changes (27/28), partnership and ecosystem governance (23/28), sustainable financing (22/28) and incubation and venture development quality (21/28).

Implications. University hubs are strategically positioned near students, research, laboratories and intellectual property, but their contribution to digital venture creation is constrained when entrepreneurship remains peripheral to curricula, commercialisation systems, academic incentives and market partnerships. Policy should therefore treat the university hub as part of the institution's research, teaching and enterprise architecture rather than as a stand-alone project.

Originality: Through this literature review, I contribute to existing scholarship by identifying university-based innovation clusters in the digital entrepreneurship environment of Africa, understanding recurring problems and policy concerns, and revealing how curriculum, commercialisation, research incentives, finance, and partnerships collectively affect ventures.

Keywords: Digital entrepreneurship; University innovation hubs; Higher education; Entrepreneurial universities; Commercialisation; Entrepreneurial ecosystems

1.0 Introduction

Digital entrepreneurship is increasingly important for job creation, innovation, and economic diversification in Africa. In this review, it refers to ventures whose operations or market access depend substantially on digital platforms, mobile applications, financial technologies, cloud services and related digital technologies. While fast-growing connectivity has opened up opportunities, intermittent power supply, high-cost data, poor broadband, lack of seed finance, low levels of digital and management skills, fragmented regulation, and access inequality are still some of the factors defining participation and scaling of ventures (African Union Commission & Organisation for Economic Co-operation and Development, 2024; GSMA, 2024; International Telecommunication Union, 2023, 2024; World Bank, 2023).

University innovation hubs are unique institutions in this respect in that they combine the presence of students, graduates, researchers, and professors through mentoring programs, experimentation, prototyping, entrepreneurship and business training, and networking. The strength of these institutions lies in their proximity to knowledge, laboratories, disciplinary strengths, and intellectual property. But experience in Africa shows that this is not enough to start digital businesses. University support can remain detached from markets, practical entrepreneurship, industry demand and investment, while slow procedures and weak technology-transfer systems can obstruct commercialisation (Amadi-Echendu et al., 2016; De Jager et al., 2017; Muazu & Bello, 2025).

The problem therefore extends beyond the presence or absence of a campus innovation centre. Common challenges highlighted in the studies within the provided evidence map include theory-practice gaps, lack of mentors and specialist staff, poor university-industry-government linkages, funding and infrastructure constraints, poor awareness of existing resources, and lack of venture follow-up after incubation (Agbodjah et al., 2023; Kamuriwo et al., 2025; Malele et al., 2019; Mulaudzi, 2020; Zahoro & Banele, 2024). The literature is also geographically uneven and often uses terms such as innovation hub, incubator, entrepreneurship centre and accelerator inconsistently. These weaknesses make it difficult to determine what university-based structures actually contribute and which policy changes are most strongly supported across African settings.

Synthesis that relates exclusively to universities is warranted due to the fact that the institutional setting impacts capabilities and limitations. Universities have the potential to incorporate entrepreneurship into education and research, to generate ideas before venturing, to offer laboratories and specific knowledge, and to facilitate commercialization of research. However, various incentives for academics, curricular arrangements, purchasing policies, technology transfer capacity, and external relationships may be limiting when it comes to dealing with entrepreneurial needs (Attuquayefio et al., 2024). It would be misleading to consider university-based centers equal to other incubators.

Entrepreneurial ecosystem theory guides interpretation by emphasising the interaction of talent, knowledge, finance, networks, infrastructure, institutions, culture and markets rather than a single programme input (Stam & van de Ven, 2021). This scoping review maps and synthesises evidence on the challenges and policy implications of university-based innovation hubs and related incubation structures in advancing digital or technology-enabled entrepreneurship in Africa. The guiding question is: What challenges are reported in university-based innovation and incubation structures supporting digital entrepreneurship in Africa, and what policy implications emerge from the evidence published between 2015 and 2025?

2.0 Method

2.1 Review Design and Methodological

Approach

A scoping review approach is chosen for the current manuscript due to conceptual diversity, methodological heterogeneity and dissemination among both peer-reviewed and grey literature of the African research on support for digital entrepreneurship. The parent review was conducted according to the methodology of Arksey and O'Malley (2005), Levac et al. (2010) and JBI scoping review guideline updates (Peters et al., 2020) with reporting based on PRISMA-ScR (Tricco et al., 2018) and documentation following PRISMA-S guidelines (Rethlefsen et al., 2021). An institutional stratification of the parent evidence map is provided within this manuscript, and not a new search.

2.2 Institutional Focus and Research Question

Twenty-eight (28) sources have been reviewed as they are tackling the issues related to the university innovation/incubation institutions and/or have been used as the contextual literature for university entrepreneurship, digital entrepreneurship, commercialization or governance in university ecosystem. Research question for review is: What challenges and policy implications are linked with university innovation hubs and respective incubation institutions supporting digital/technology-based entrepreneurship in Africa?

Table 1

Eligibility Criteria and PCC Framework

PCC dimension	Operational inclusion for this manuscript
Population	Students, graduates, researchers, academic staff, university-linked founders, hub/incubator managers, mentors and external partners connected to higher education.
Concept	University-based innovation hubs, incubators, entrepreneurship centres, technology-transfer or related structures supporting digital/technology entrepreneurship; contextual university ecosystem evidence where directly relevant.
Context	African higher-education and university entrepreneurship ecosystems, including cross-country evidence with separately identifiable African findings.
Time	Sources dated 1 January 2015 to 31 December 2025; seminal methodological and theoretical works used only for framing.
Evidence	Peer-reviewed empirical studies; mixed-method, qualitative, and quantitative studies; programme/institutional reports; theses; dissertations; and policy-relevant documents with sufficient substantive information.

2.4 Information Sources and Search Strategy

The parent search covered Scopus, Web of Science Core Collection, ERIC, EBSCOhost, JSTOR, supplementary Google Scholar searching, organisational and university repositories, and backward/forward citation searching. The broad search combined support-structure terms such as innovation hub, technology hub, digital innovation centre, incubator, accelerator, entrepreneurship centre and makerspace with digital or technology entrepreneurship terms and Africa or individual African country names. The inclusion period was 2015–2025. The broad parent search was deliberately not limited to one ownership model, which allowed the final evidence map to be stratified by institutional setting for the two manuscripts.

2.5 Record Management, Selection and Institutional Stratification

In the parent review, the export of records was done for de-duplication purposes, screened at the title/abstract stage before going on to full-text assessment using the PCC criteria. In the supplied evidence map, the total number of traceable sources was 28. In preparing this manuscript, the extraction matrix was reviewed again at source level where the source was included only if it had a purpose, population, program setting or ecosystem that fit within the institutional scope outlined above. The sources were then categorised into evidence roles where the direct evidence was about the hub, incubator or similar support structure and the contextual evidence was about the relevant finance, skill, infrastructure, regulatory, commercialisation, or ecosystem context.

Table 2:

Search strategy

Items	Search Strategy

Source: Author's construct

2.6 Data Charting and Analysis

The provided extraction matrix captured details of author/year, country/region, objective, methodology, population, sample size (where applicable), challenges and policy implications. The institutional category has been synthesised using descriptive mapping and structured qualitative content analysis. A single source could be used in more than one challenge or policy area. Counts of themes in each category are thus non-exhaustive measures of the frequency of occurrence of the policy area in the selected sources. They are not measures of prevalence of participants or effect sizes or measures of policy effectiveness.

2.7 Treatment of Evidence Strength

A risk-of-bias scoring system was not applied for screening out studies since it is not the purpose of the review to provide an estimate of a pooled effect. The type of evidence is interpreted according to whether it is primary, programme, or documentary as opposed to secondary, desk review, or conceptual. The review avoided making claims on causal or comparative effects unless supported by the design. Contradictions and context-specificity will be kept as evidence of heterogeneity.

3.0 Results

3.1 Characteristics of the Included Evidence

In the institutional evidence map, there were 28 sources altogether. Out of the total number of 28 sources, 10 (35.7%) offered hub/incubator evidence directly while 18 (64.3%) provided context ecosystem evidence. 21 (75.0%) were sources that originated from either primary, programme or documentary evidence while 7 (25.0%) were either review-based or conceptual in nature. Study design labels in most frequency order include Quantitative (7/28), Mixed Methods (5/28), Qualitative (5/28), Narrative literature review (3/28) and Descriptive documentary review (1/28). Geographic distribution is very unbalanced including countries like South Africa (13 sources), Kenya (7 sources), Nigeria (7 sources), Tanzania (4 sources) and Egypt (4 sources).

Table 3

Characteristics of included studies

Dimension	Category	n	% of 28
Evidence role	Direct hub/incubator evidence	10	35.7%
Evidence role	Contextual ecosystem evidence	18	64.3%
Evidence basis	Primary/programme/documentary	21	75.0%
Evidence basis	Secondary/review/conceptual	7	25.0%
Study design	Quantitative	7	25.0%
Study design	Mixed Methods	5	17.9%
Study design	Qualitative	5	17.9%
Study design	Narrative literature review	3	10.7%

3.2 Challenge Domains

Challenge indicators indicate the degree of support in the institutional component. The themes cross-pollinate since one document may cite more than one challenge.

Table 4

Challenges domain

Challenge category	Sources, n (%)	Primary manifestation
Concerns with skill/knowledge/curriculum and human capital	21 (75.0%)	Disconnect between theory and practice; inadequate digital skills; insufficient management and business skills; inadequate specialised mentoring and experienced people.
Ecosystem fragmentation and disconnections	19 (67.9%)	Inadequate coordination between universities, industry, and government; disconnected hub; no connection to investors or market.
Financial considerations and sustainability of the hub	18 (64.3%)	Seed and working-capital shortages; unstable programme finance; donor or grant dependence; operating-cost pressures.
Infrastructure and geographical access	16 (57.1%)	Electricity, broadband and device constraints; inadequate laboratories and equipment; urban concentration and rural exclusion.
Policy, regulation and institutional constraints	14 (50.0%)	Fragmented implementation; bureaucracy and regulatory uncertainty; intellectual-property, legal and cybersecurity gaps.
Inclusion and entrepreneurial culture	14 (50.0%)	Gender and rural-access gaps; exclusion of underserved groups; low risk orientation and cultural preference for secure employment.
Evidence and evaluation gaps	11 (39.3%)	Small or site-specific studies; weak longitudinal and comparative evidence; limited outcome data and impact measures.
Hub design and venture progression	8 (28.6%)	Poorly tailored services; weak selection and follow-up; commercialisation, product–market fit and scaling difficulties.

3.3 University-Specific Challenge Synthesis

Among skills, curricula, and human capital was the domain that occurred most frequently, in 21 out of 28 sources. There is consistent evidence that there is a gap between entrepreneurship in the classroom and the actual skills necessary to exploit opportunities, test the market, manage e-businesses, and maintain businesses. According to Muazu and Bello (2025), there was little use in having isolated workshops on entrepreneurship where incubation was not part of other activities and learning, which is consistent with the experience of higher education institutions in South Africa and Tanzania (Amadi-Echendu et al., 2016; Fulgence, 2015; Iipinge & Shimpanda, 2022).

Ecosystem fragmentation and weak linkages appeared in 19/28 sources. University hubs often sit close to research and talent but remain weakly connected to firms, investors, customers and government implementation systems. De Jager et al. (2017) showed that university incubation and commercialisation require sustained institutional and stakeholder support, while Kamuriwo et al. (2025) and Agbodjah et al. (2023) emphasised fragmented partnerships, weak ecosystem coordination and the need for locally adapted university entrepreneurship systems. The problem is therefore not simply a lack of entrepreneurship activity, but weak movement between academic knowledge, venture development, and external markets.

Financing and sustainability of hubs were covered in 18/28 papers and infrastructure/geographical access in 16/28. Seed and operational funding are always lacking in cases of students' and researchers' ventures,

whereas university programs rely on scarce funding. Digital infrastructure, laboratories, equipment and connectivity vary greatly, especially outside big urban universities. In Zahoro and Banele (2024), capital, market, management and follow-up problems were observed among digital incubatees at the University of Dar es Salaam ICT Innovation Hub. Chitamba et al. (2025) similarly identified capacity, funding and knowledge gaps within a South African university incubator.

Policy, regulation, and institutional restrictions have been mentioned in 14/28 of the reviewed literature. In turn, hub design and development stages have been mentioned in 8/28 of the reviewed literature. The institutional approach, motivational aspects, procurement process, intellectual property policy, and technology transfer capability determine the framework of institutional support within universities. According to Malele et al. (2019), low awareness of entrepreneurship and innovation policies and platforms exists at South African Universities of Technology. Mohamed et al. (2024) have also highlighted funding, bureaucracy, intellectual property, and managerial issues at Egyptian incubators.

3.4 Policy Implication Domains

Table 4

Domains of Policy Implications for Implementation

Policy domain	Sources, n (%)	Policy implication
Curriculum and institutional transformation	27 (96.4%)	Incorporate experiential and digital entrepreneurship; develop mentor and staff capabilities; implement institution-wide entrepreneurship initiatives.
Partnerships and Governance of Ecosystems	23 (82.1%)	Establish cross-sector partnerships; build connections with alumni, businesspeople, financiers and donors; build hub-to-hub collaboration.
Sustainability and Investment Finance	22 (78.6%)	Diversify the funding sources for the program; raise more seed, venture and alternative financing; improve investment readiness.
Venture Development Incubation Quality and Progress	21 (75.0%)	Adopt venture selection and mentorship process; improve market reach and follow up; develop commercialization and intellectual property services.
Infrastructure and Digital Inclusion	18 (64.3%)	Develop physical infrastructure like power, broadband, laboratories and shared spaces; improve access from rural and regional locations as well as virtually.
National and Regional Coordination	18 (64.3%)	Create national implementation frameworks and stronger regional coordination platforms.
Inclusion and local responsiveness	17 (60.7%)	Support underserved founders; use locally adapted models; expand sector-specific, rural and socially responsive programmes.
Monitoring, evidence and learning	17 (60.7%)	Use outcome-based KPIs; strengthen longitudinal evaluation; build data systems beyond activity counts.
Policy and regulatory reform	10 (35.7%)	Clarify startup/incubation policy; streamline licensing and taxation; strengthen IP, legal, data and cybersecurity protection.

The most significant policy convergence was in relation to curriculum and institutional reforms (27/28), partners and ecosystem management (23/28), sustainable finance and investment (22/28), and incubation quality and ventures development (21/28). The fact that these spheres repeat shows that university policies

have to be formed taking into account not only curriculum changes but also institutional strategies, commercialization, and partnerships, and not just incubation activities.

3.5 Regional Patterns and Evidence Gaps

Studies on Southern Africa, specifically South Africa, present a cluster of studies focusing on universities, institutional strategies, knowledge about platforms, entrepreneurship, and commercialization. West African studies, notably those from Nigeria and Ghana, focus more on theoretical courses, financial challenges, digital entrepreneurship, and poor university-industry linkages. East African evidence focuses on digital transformation, university ecosystems, and how challenging it is to convert hub membership into viable enterprises. There is only a limited number of studies in North Africa in this cluster, and these studies are from Egypt.

A considerable number of university-related studies are contextual and not direct evidence of hubs, while empirical studies are one institution at a time or cross-sectional in nature. Very few studies have attempted to track the ventures beyond the completion of the programme, or to compare university-based hub initiatives that exist within the same city or country.

4.0 Discussion

4.1 University Innovation Hubs as Institutional Ecosystem Nodes

The university-focused synthesis shows that the central question is not whether universities should support entrepreneurship, but how they embed innovation support within the wider institution. Entrepreneurial ecosystem theory is useful because a university hub operates at the intersection of knowledge, talent, finance, networks, infrastructure and institutions. Even though a hub is capable of creating new ideas, competitions and engaging students, if the curriculum is purely theoretical in nature, the laboratory facilities are inaccessible, the technology transfer capabilities are poor or there are no customers/investors outside, the output will not be successful business ventures. This is the reason why the evidence moves away from looking at the physical hub and into the surrounding institution

s.

This becomes particularly important when it is noted that the nature of skills as well as that of curricular difficulties is taken into consideration. Entrepreneurship programs at universities are created by means of an educational perspective while venture development involves continual exposure to the market and customers, technology development, financial and managerial aspects. This is the reason why research always points towards the utilization of experiential learning curriculum, mentoring, internships, competitions and interdisciplinary projects.

4.2 Commercialisation, Incentives and External Connectivity

The findings also highlight a commercialization gap. There is a need to make use of universities' research, labs, and intellectual properties for entrepreneurial success. However, all these require the ability to manage aspects such as ownership, licensing, spin-off companies, seed money, industry relations, and commercialization. As stated by de Jager et al. (2017) and Mohamed et al. (2024), commercialization requires resources and effective management, along with some external players. The policy needs to address issues about the roles of innovation centers, incubators, and technology transfer offices; intellectual property rights and income sharing mechanisms; and entrepreneurship and industry cooperation incentives.

External connectivity is equally important. The high recurrence of ecosystem-fragmentation challenges indicates that university hubs cannot be evaluated as closed campus programmes. Formal referral pathways to industry mentors, independent accelerators, investors, procurement opportunities and customer networks are needed when ventures move beyond early technical development. Conversely, universities can provide laboratories, specialist expertise and research partnerships to external programmes. The university hub is most useful when it functions as a gateway rather than an institutional endpoint.

4.3 Policy Architecture for University-Based Digital Entrepreneurship

The policy framework should include the following five components. First, entrepreneurship must be woven into various academic disciplines through venture learning, both practically and digitally. Second, sustained funding is required to sustain hubs, laboratories and early proof of concept activities. Third, institutions need clear commercialisation and intellectual property systems, with staff able to support spin-offs and licensing. Fourth, universities should formalise partnerships with firms, investors, government agencies, alumni and external incubators. Lastly, the monitoring process has to shift its focus from attendance and contests to ventures' progress, survival, funding, earnings, innovations generated, and employment and inclusion. This set of policies seems to be the right path for policy, although it does not prove their effectiveness.

4.4 Contribution of the Study

This review contributes a focused institutional synthesis of university-based digital entrepreneurship support in Africa. It separates the challenges of higher-education innovation structures from those of independent incubators and shows that university-specific barriers arise from curriculum design, institutional strategy, academic incentives, commercialisation capacity and external connectivity. It also quantifies the recurrence of challenge and policy domains within a transparent university-focused subset of the supplied evidence map while retaining the distinction between direct and contextual evidence.

5.0 Implications of the Study

5.1 Implications for Practice

University leaders and hub managers should define the purpose and stage of support provided by each programme. Ideation, prototyping, incubation, commercialisation and acceleration require different capabilities and outcome measures. Practical entrepreneurship should be linked to real customer problems, industry mentors, laboratories, business registration, intellectual property advice, and market testing. Programmes should establish referral arrangements so that ventures can move to specialised external accelerators or investors when they outgrow campus support.

5.2 Implications for Policy

For higher education and innovation policy, institutional support needs to be provided for multiple years on entrepreneurship in universities, policies on intellectual property rights and revenue sharing, standards for curricula, staff incentives for commercialization, seed funding and partnerships between universities and industry and government. Funding for public ventures should encourage achievement and not just participation and numbers of participants involved in the venture. On national level, access to external funds and procurement and other resources should become easier for universities.

5.3 Implications for Research

Subsequent research needs to differentiate between university-owned hubs, university-affiliated hubs and partnership-based hubs. There is a need for longitudinal research that traces the ventures over time and tracks survival rates, revenues, jobs, investments and intellectual property transfers. Comparisons between universities in the same country would assist in disentangling institutional and national ecosystem differences. More research is needed from North and Central Africa, from Francophone countries, from rural universities and from founder communities that have been neglected.

6.0 Conclusion

The innovation incubators located within universities could enhance the digital entrepreneurship development in Africa through a combination of entrepreneurial education and research, laboratories, technical skills and start-up ventures. However, as revealed by the literature review, these institutions would only be able to contribute to the process provided there exists an enabling institutional environment outside universities. In this regard, theoretical-practice gap, lack of commercialization mechanisms, insufficient financing, poor infrastructure, partnerships and vague incentives may hinder the conversion of the knowledge generated by university institutions and entrepreneurial ideas into sustainable businesses.

This literatur

e review does not demonstrate that university hubs produce better venture results. The empirical work is too disparate and too frequently cross-sectional or single case for that claim to be made. There is, nonetheless, a clear trend: a university hub has a greater chance of making a difference if it is placed within the context of learning, research, commercialization, and ecosystem interaction.

7.0 Limitations

The narrower literature on universities is unevenly distributed geographically and is skewed towards the findings derived from a few African nations, in particular South Africa, Nigeria and Kenya. Quite a few of the selected sources are contextual studies of higher education rather than direct analysis of the university innovation hub. Most empirical studies are one-off and/or cross-sectional. Conceptual ambiguity is an additional limitation. University innovation hubs, incubators, entrepreneurship centres, technology-transfer units and accelerators are not consistently defined, and some institutions combine several functions. The analytical boundary used here therefore depends on the organisational focus reported in the supplied extraction matrix.

Ethics Statement

This study synthesised published and publicly accessible literature and did not involve primary data collection from human participants or animals. Therefore, research ethics approval was not required for the review itself.

Table 5

Data extraction

This table reproduces, in condensed form, the source-level information used for the institutional synthesis. It is derived from the extraction matrix supplied with the parent manuscript. The entries summarise reported findings and recommendations from heterogeneous evidence and should not be interpreted as an effectiveness ranking.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
1	(Rukarwa, Mensah & Egeru, 2018), Uganda, Zimbabwe, Kenya, Malawi, Rwanda, Benin, DRC, Madagascar and Ghana	Descriptive documentary review; 22 proposals.	The institutions were weakly linked to the requirements of the businesses, while curriculum and research were poorly oriented towards agribusinesses. The proposals did not include clear hub designs, financial and cohort models, and weak gender integration, safeguards and innovation.	Clarification of hub design, training, finance and cohort model guidance. Technical assistance and monitoring should be provided, and emphasis on gender and environmental safeguards, better alignment of curriculums and the private sector, and innovative models allowed.
2	(Muazu & Bello, 2025), Nigeria	Quantitative; 53 students.	Seminar approach alone was insufficiently effective. Financing, facilities, mentors, program management and different startup requirements influenced results, while the university -only framework narrowed the applicability of the findings.	Incorporating the incubation process into curriculum, financing and mentoring, internships and other practical exercises, business plan competitions and evaluation of programs tailored for different categories of students.
3	(Kamuriwo, Jones, Kinoti & Marshall, 2025), Ghana, Nigeria, Kenya and South Africa	Case reviews of program-based transnational projects; 24 projects and 9 cases reviewed.	High level of unemployment among youths, inadequate entrepreneurship education, lack of funds, poor infrastructure and resources that undermined ecosystems. Ineffective collaboration, fragmentation of curricula, lack of policies	, ineffective rural structures and rigidity of faculty members were some of the findings. Financing of ecosystems that are based on collaboration, virtual and blended delivery of education, adaptation of the models to local context, experiential learning, faculty support and improved infrastructure and financing.
4	(Comunian et al., 2023), Kenya, Nigeria and South Africa	Participatory impact review; 3 hubs, 493 workshop participations, 45 interviews and 25 funded projects.	Creative economies had low policy recognition and weak links among universities, entrepreneurs and policymakers. Funding, business support, skills, university access and reliable internet were limited, particularly for women and minority groups.	Provide sustained finance and business support, strengthen mentoring and university-sector platforms, recognise creative careers, promote inclusion and institutionalise regional and international partnerships.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
5	(Zahoro & Banele, 2024) Tanzania	Mixed Methods; 42 participants (34 survey respondents and 8 interviewees).	Digital start-ups faced high failure rates, limited capital, management skills and markets, weak incubation and commercialisation, gender imbalance, unstable funding and inadequate follow-up.	Provide continuous hub funding, monitoring and follow-up. Combine mentoring, marketing, finance, business development and external partnerships to support venture survival and growth.
6	(Amadi-Echendu, Phillips, Chodokufa & Visser, 2016), South Africa	Narrative literature review; Not reported.	Entrepreneurs struggled to apply theoretical knowledge and lacked finance, marketing skills, technology and practical exposure. University support was fragmented, while high costs, bad debts and weak reporting contributed to business failure.	Integrate entrepreneurship across programmes, expand internships and practical learning, incubate student and staff ventures, coordinate commercialisation support and strengthen university-industry-government exchange.
7	(Yusuf, 2025), Nigeria	Conceptual literature review; Not applicable.	Teacher-education curricula were outdated, and entrepreneurship was poorly implemented as a general course. Practical skills, leadership, funding, policy support and ecosystem links were insufficient.	Embed edupreneurship through practical and technology-supported learning, create supportive policies, incubators and funding, strengthen partnerships and monitor outcomes over time.
8	(Cunningham, 2015), Cameroon, Egypt, Kenya, Malawi, Mozambique, South Africa, Tanzania and Uganda	Qualitative; 9 informants.	Low political priority, limited resources and weak awareness reduced support for ICT entrepreneurship. Skills, mentors, affordable access, rural infrastructure, locally suitable incubation, and intellectual property protection were also inadequate.	Align ICT entrepreneurship with national priorities, improve awareness, skills, rural access and intellectual-property protection, and coordinate public, private, university, community and donor support.
9	(Cunningham, Cunningham & Ekenberg, 2016), Cameroon, Egypt, Kenya, Malawi, Mozambique, South Africa, Tanzania and Uganda	Qualitative; 9 informants.	Policy commitments were weakly implemented, with limited resources, expertise, mentors and digital access. Rural infrastructure, corruption concerns, cybersecurity, isolated hubs and uncertain programme sustainability further constrained innovation.	Convert policy into funded and accountable programmes. Develop mentors and practical training, support multi-sector partnerships and seed finance, improve rural infrastructure and adapt initiatives to local needs.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
10	(De Jager, Mthembu, Ngowi & Chipunza, 2017), South Africa	Institutional case review; 8 incubatees were described. No formal research sample was reported.	Incubated firms depended on university and government contracts and lacked venture capital and diverse markets. Commercialising university research required sustained resources, skilled staff, facilities and broad institutional and stakeholder support.	Employ institution-level strategies, practical entrepreneurship education, and incubation/commercialization resources. Enhance stakeholder relationships, market diversification, venture capital, and performance monitoring.
11	(Hakizimana & Muathe, 2023), Kenya	Descriptive study; Not empirically tested.	The ecosystems for entrepreneurship remained slow and inconsistent, and there was need for substantial institutional reforms, professional mentoring and coordination of the budgeting process. The desk study relied purely on secondary data, and it did not undergo empirical testing.	Coordination of digital transformation, institutional and budgetary policies; Empirical policy testing using practical entrepreneurship education and professional mentors, improved university management and entrepreneurial ecosystems, and empirical testing of policies.
12	(Attuquayefio, Aboagye-Darko & Okronipa, 2024), Ghana	Quantitative analysis; 312 valid responses.	Challenges with digital infrastructure, affordability, internet connections, cybersecurity, and digital skills among others hindered its implementation. Traditional business environment and the focus only on institution and students restricted its usage and generalization.	Development of digital infrastructure and affordable internet access, training of students on digital skills and use of incubators to link social media to venture creation.
13	(Salmi, Amegah & Shinde, 2025), Sub-Saharan Africa	Mixed Methods; 174 tertiary institutions.	Few institutions offered advanced digital programmes, enrolment and women's participation were low, and lecturer capacity was limited. Poor internet, devices, laboratories, curricula, industry links, research and stable funding reduced quality.	Adopt national digital and science, technology, engineering, arts and mathematics plans. Invest in electricity, broadband, laboratories and devices, fund advanced programmes, improve faculty and quality systems, reduce gender gaps and expand industry partnerships.
14	(Agbodjah, Murithi, Gakii, Asante-Darko & Kwarteng, 2023), Sub-Saharan Africa	Mixed methods approach; 2 organizations, 45 approx. participants and 27 organizational leaders.	Differences existed in leadership, finance, infrastructure, faculty capability, market, and external engagement. The incubators lacked finances and mentors; intellectual property and benefit sharing mechanisms were poorly defined; partnerships were disjointed; and there was some sample inconsistency.	Use diagnostics models, align policy for governance, intellectual property, finance, and markets, improve incubators and faculty, clarify benefit sharing, secure diversified funding and evaluate ecosystem impacts.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
15	(Ncanywa & Dyantyi, 2022), South Africa	Thematic literature review; Not stated.	Experiential learning lacked support due to lack of entrepreneurial spirit and inadequate technological support within educational institutions.	Integrate entrepreneurship into the curriculum, provide training for educators, incorporate digital and experiential learning methods, set common goals for leadership and sustainability, and develop partnerships between universities, governments, industries and communities.
16	(Mthethwa, Kolanisi & Naidoo, 2025), South Africa	Literature review; 39 sources.	Adoption of artificial intelligence technologies by institutions has been inconsistent due to inadequate infrastructure facilities, accessibility, literacy and financial and institutional capacity. The rigorous curriculum, fragmented policy framework, silo approach to disciplines and threats such as bias, privacy and equity issues have prevented the adoption of artificial intelligence.	Develop policies on artificial intelligence entrepreneurship, invest in infrastructure equally and develop faculty skills for the adoption of artificial intelligence technologies and innovations.
17	(Okechukwu, 2025), Nigeria	Mixed Methods; 520 participants (350 students, 150 faculty members and 20 key informants).	Curricula were theoretical and outdated, classes were large, and practical facilities, seed finance and technology were insufficient. Faculty business experience, mentoring, industry engagement and post-course support were also weak.	Modernise curricula and practical teaching, train faculty, fund incubators and seed finance, protect student intellectual property, simplify registration and promote university-industry partnerships.
18	(Mulaudzi, 2020), South Africa	Quantitative; 35 students.	Students received limited guidance on registration, idea validation, equipment and workspace. Participation was low, the programme reached few students, and post-graduation support was weak.	Expand practical entrepreneurship across the curriculum, widen access to the hub, increase grants and sponsorships, align staff with the mission and strengthen post-graduation support.
19	(Chitamba, Nyamurima, Mugano & Mutambara, 2025), South Africa	Quantitative; 52 respondents and 10 pilot participants.	Low programme awareness, time and geographic barriers, few qualified mentors and limited finance constrained ideation. Bureaucracy, cultural resistance, fragmented networks and weak post-programme follow-up reduced implementation.	Use blended finance, structured mentoring and knowledge networks, widen programme access and infrastructure, and maintain follow-up and long-term monitoring.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
20	(Fulgence, 2015), Tanzania	Mixed Methods; 19 institutions and 234 respondents (52 managers, 6 educators and 176 graduate teachers).	Management awareness, funding, specialist staff, books and other resources were limited. Large classes, weak institutional coordination, and treating entrepreneurship as a business-only add-on reduced effectiveness.	Commit resources across disciplines, use experiential teaching and practitioners, train staff, provide learning facilities and create an institutional unit to coordinate entrepreneurship education.
21	(Iipinge & Shimpanda, 2022), Namibia	Qualitative; 6 educators.	Educators served diverse learners but had little influence over curricula and needed more practical industry experience. Existing policies did not provide a coherent framework, and the small sample limited generalisation.	Tailor curricula to learner needs, combine theory and practice, train educators in entrepreneurship and industry, and establish coherent institutional and national teaching frameworks.
22	(Kamel, 2017), Africa and Egypt	Narrative literature review; No formal research sample.	Weak digital infrastructure, regulation, finance and human capital constrained entrepreneurship. Ecosystems were fragmented, programme scalability was uncertain and short incubation periods could push products to market too early.	Invest in digital infrastructure and human capital, create enabling regulation, mobilise public-private finance, expand university incubators and networks, and use phased implementation and performance measures.
23	(Malele, Mpofu & Muchie, 2019), South Africa	Qualitative; 129 participants (44 staff members and 85 students).	Students and staff had low awareness of available policies and platforms, especially undergraduates and support staff. Communication was not systematically evaluated; internal funding was limited and the study excluded academics.	Improve communication and visibility of policies, use tested digital channels, evaluate awareness regularly, create internal funding systems and include academic staff in future assessments.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
24	(Kimanzi, 2020), South Africa	Quantitative; 183 students.	Students questioned the adequacy of infrastructure, funding and venture capital. Few idea competitions, limited business experience, and low risk orientation reduced entrepreneurial activity, and the single case limited generalisation.	Strengthen university-business collaboration, practical training and mentoring, organise innovation competitions, teach creativity and problem-solving, and create routes from ideas to sustainable ventures.
25	(Mohamed et al., 2024), Egypt	Quantitative; 317 entrepreneurs.	Incubators faced inadequate funding, weak sustainability planning, localised marketing, bureaucracy and poor procedures. Intellectual property gaps, tax pressures, weak entrepreneurial culture, and talent or start-up migration also affected performance.	Increase public and private finance, improve strategy and operations, broaden market and stakeholder partnerships, strengthen intellectual property and project evaluation, and connect incubatees to investment programmes.
26	(Idowu, 2025), Nigeria and Africa	Literature review narrative; Not reported.	Inadequate rural connectivity, energy, hardware, financing, and government investment. Digital entrepreneurship education hampered by cultural resistance, gender discrimination, inappropriate online courses, and lack of policy implementation .	Increase broadband availability and solar energy, create locally specific curricula and apprenticeships, mentor, promote gender inclusiveness, and co-ordinate African digital entrepreneurship efforts.
27	(Iwara, 2025), Cameroon, Kenya, Nigeria, South Africa and Sudan	Qualitative; 15 academics from 10 universities.	Theory-heavy curricula and irrelevant skills weakened employability. Poor university-industry links, weak rural infrastructure, limited expertise and resources, unemployment and brain drain constrained rural development.	Reform curricula around practical local skills, strengthen innovation hubs and indigenous entrepreneurship, formalise industry, community and alumni partnerships, and test the model more widely.

S/N	Source and country	Design/sample	Reported challenges	Policy implications
28	(Nor, Mohamed, Barre & Hussein, 2025), Somalia	Quantitative; 201 respondents.	The model explained limited variation, while cross-sectional and purposive data restricted causal claims and generalisation beyond three Mogadishu universities.	Use practical curricula, simulation, and service learning; increase government funding; and build coordinated partnerships among universities, businesses, non-governmental organisations, and communities.

READINESS AND PERCEPTIONS TOWARDS TECHNOLOGY INTEGRATION IN BUSINESS EDUCATION: A STUDY OF STUDENTS WITHOUT PRIOR EXPOSURE TO AI, SIMULATION AND VIRTUAL REALITY IN TERTIARY INSTITUTIONS IN RIVERS STATE

By

Emeka G. Nwokocha PhD
School of Business Education.
Federal College of Education (Technical), Omoku, Rivers State, Nigeria

Abstract

This study examined the readiness and perceptions of Business Education students towards the integration of emerging technologies in tertiary institutions in Rivers State. The population of the study comprised Business Education students with no prior exposure to these technologies. A sample of 292 students were selected using stratified random sampling to ensure adequate representation across the participating institutions. The study adopted a quantitative cross- sectional survey design and employed a structured questionnaire developed from the Technology Acceptance Model (TAM) constructs. Data were analyzed using (mean and standard deviation) to determine the level of students' readiness and perceptions. A Cronbach's Alpha value of 0.70 was used to assess the reliability of the measurement constructs. Pearson's correlation analysis examined the relationships among the study variables, and multiple linear regression was employed to determine the extent to which the TAM constructs predicted students' behavioral intention to adopt these technologies in Business Education. The findings revealed that students generally demonstrated positive readiness and favorable perceptions towards technology integration despite having no prior exposure to these technologies. Perceived usefulness, perceived ease of use, and readiness were found to be significant predictors of students' behavioral intention to adopt AI-supported learning, while perceived challenges had a weaker influence. The study concludes that Business Education students are receptive to emerging educational technologies and recommends the gradual integration of AI, simulation, and Virtual Reality into Business Education curricula through adequate infrastructure, staff training, and institutional support to enhance digital competence and experiential learning.

Introduction

The 21st century has witnessed an unprecedented digital revolution that is reshaping every facet of human endeavor, with education being one of the most profoundly affected sectors. In particular, the emergence of transformative technologies such as Artificial Intelligence (AI), computer simulation, and Virtual Reality (VR) has created new possibilities for teaching and learning. These technologies provide immersive, interactive, and personalized learning experiences that enhance students' engagement, critical thinking, and problem-solving abilities, while complementing traditional pedagogical approaches (Organization for Economic Co-operation and Development (OECD, 2023; UNESCO, 2023; Holmes et al., 2019). The integration of transformative technologies in education, yields numerous positive outcomes. For instance, it enhances learning and retention compared to conventional methods by making the content more interesting and relevant (Murundu et al. 2017; Situma, 2016). According to Radianti et. al. (2020), virtual reality (VR) make learning active especially for students without prior technology exposure by bridging the gap between theory and practice. They affirmed that VR creates immersive environment that makes abstract concepts real. Students pay more attention and remember more because they 'experience' rather than just 'read'. Evidence from Radianti et al. (2020) work, indicate that VR increases student's engagement and motivation compared to traditional lectures, leading to better learning outcomes. Similarly, Simulation, one of the transformative technologies also allows students to practice in a 3D space. This learning by doing improves conceptual understanding and long term retention. Simulations also allow students to repeat task until they master them. This accommodates students with different learning speeds (Radianti et al.2020; Makransky & Peterson, 2021). The integration of digital technologies in educational Institutions, has been identified as a pivotal strategy for enhancing educational quality (MOES, 2025).

According to Johnson et al. (2024), transformative technologies have advanced so rapidly that it has significantly transformed the higher Education landscape, especially in teaching, learning and research. Transformative technologies such as AI, computer simulations and virtual realities are recent disruptive tools that are capable of producing human-like text, images and analytical outputs. These tools

are increasingly being adopted by students in tertiary institutions to support academic activities. Tlili et.al. (2023), emphasized that transformative digital tools provide opportunities for improving educational experiences through personalized learning, immediate feedback and academic support. They noted that VR helps with teaching/learning strategies and engagement, and that simulation is now widely used in fields of education. They further asserted that VR enhances understanding through interactive 3D models and improve memory retention. Although these technologies provide learning experiences, they however observed that challenges such as accuracy, ethical use, privacy concerns, perceptions, and the possibility of students using these tools to complete academic tasks without genuine engagement exist. Therefore, while digital tools such as AI, computer simulation and virtual realities can improve efficiency in teaching and learning, their effectiveness depends on perceptions, responsible usage and institutional guidelines.

Although technology has become central to teaching and learning in the 21st century, not all students enter academic programmes with prior exposure to basic digital tools for online learning. The adoption of technology for these students without prior digital technology experience can be an opportunity and a challenge to them. This is because their adaptation and performance may largely depend on their readiness, access, perception, anxiety and their believe in the usefulness and ease of use of these tools. Adeyemi, Lamidi, & Ayeni, (2025), observed that in Nigeria, the adoption of AI in education is still in its early stages. They further asserted that Emerging studies indicate varying levels of awareness and adoption among educators. In the field of Business Education, where practical competencies in management, entrepreneurship, accounting, marketing, and decision-making are essential, the integration of these technologies offers significant opportunities to bridge the gap between theoretical knowledge and real-world application (Radianti et al., 2020; Aldrich, 2009).

In Africa, and particularly in Nigeria, the need for digital transformation in education has become increasingly urgent. The National Policy on Education emphasized the need for integration of Information and Communication Technologies (ICT) into teaching and learning at all levels of education (Federal Republic of Nigeria, 2013). Similarly, the National Digital Economy Policy and Strategy, advocates the adoption of digital technologies to improve teaching, learning, and workforce development in higher education. Despite these policy initiatives, many tertiary institutions in Nigeria continue to rely predominantly on conventional lecture-based instructional methods, limiting students' exposure to innovative learning technologies (Federal Republic of Nigeria, 2020; UNESCO, 2023). This challenge is particularly evident in Business Education programmes, where graduates are expected to possess digital competencies that align with the demands of the Fourth Industrial Revolution and the evolving digital economy (World Economic Forum, 2023).

Rivers State, located in the oil-rich Niger Delta region of Nigeria, is home to several tertiary institutions offering Business Education programmes. However, many students enrolled in these institutions have had limited or no prior exposure to advanced educational technologies such as AI-driven learning systems, business simulation software, and Virtual Reality learning environments. Many of these students especially those from rural areas or low-income backgrounds, begin tertiary education with little or no prior experience of these technologies. This lack of exposure raises important questions regarding students' readiness, perceptions, and willingness to adopt technology-enhanced learning. Understanding these factors is critical for successful curriculum innovation, effective technology implementation, and the development of graduates equipped with the digital skills required in contemporary workplaces (Radianti et al., 2020; Zawacki-Richter et al., 2019).

Theoretical underpinning

The theoretical foundation of this study is based on Diffusion of Innovation theory and Technology Acceptance Model (TAM). Diffusion of innovations is a theory that seeks to explain how, why, and at what rate new ideas and technology spread. The theory was popularized by Everett Rogers in 1962. Diffusion research examines how ideas are spread among groups of people. Rogers explains how innovations are adopted over time within social systems. Attributes such as relative advantage, compatibility, and complexity influence adoption decisions. AI tools perceived as advantageous and compatible with existing teaching practices are more likely to be adopted by teachers, while high complexity or lack of observable benefits can hinder uptake. This framework helps account for the social and structural dynamics influencing AI integration. In this study, perceived usefulness and perceived ease of use from TAM are operationalized through teachers' perceptions of AI effectiveness, ease of use, and instructional value, while Diffusion of Innovation attributes such as compatibility, complexity, and relative advantage inform the assessment of institutional and infrastructural factors influencing readiness.

The Technology Acceptance Model (TAM), developed by Davis (1989), posits that an individual's intention to adopt and use a technology is primarily influenced by two determinants: Perceived Usefulness (PU) and Perceived Ease of Use (PEOU). These constructs influence users' attitudes toward technology and subsequently their behavioral intention to use it (Davis, 1989). Later extensions of the model incorporated additional constructs, including facilitating conditions, subjective norms, and behavioral intention, to improve its explanatory power across different technological contexts (Venkatesh & Davis, 2000; Venkatesh et al.,
2003). Building on these developments, this study adopts an extended TAM framework by incorporating students' readiness, perceptions, and perceived challenges alongside the traditional TAM constructs to better understand factors influencing the acceptance of AI, simulation, and Virtual Reality in Business Education.

Although research on educational technology has expanded considerably over the past decade, empirical studies examining the readiness and perceptions of students with no prior experience of AI, simulation, and Virtual Reality remain limited, particularly within the Nigerian higher education context. Existing studies have largely focused on technology adoption after implementation or have examined lecturers' perspectives rather than students' preparedness before exposure to these emerging technologies (Zawacki-Richter et al., 2019; Holmes et al., 2019; Alam, 2021). Consequently, there remains a significant knowledge gap concerning students' initial acceptance and readiness to adopt these innovations, especially as governments and institutions increasingly invest in digital infrastructure to support quality education and sustainable development. The findings of this study are expected to contribute to the growing body of knowledge on digital transformation in higher education and provide practical insights for policymakers, institutional administrators, curriculum developers, and educators seeking to prepare Business Education graduates with the digital competencies required for success in the modern knowledge economy.

Purpose of the Study

The main objective of this study is to examine the readiness and perceptions of Business Education students without prior exposure to Artificial Intelligence, simulation, and Virtual Reality in selected tertiary institutions in Rivers State.

Specifically, the study seeks to:

- Assess students' readiness and behavioral intention toward technology integration.
- Evaluate students' perceptions of the usefulness and ease of use of AI, simulation, and Virtual Reality.
- Identify the perceived challenges affecting the adoption of these technologies.
- Examine the relationships among the Technology Acceptance Model constructs and determine their influence on students' behavioral intention using correlation and multiple regression analyses.
- Provide evidence-based recommendations for the effective integration of Artificial Intelligence, simulation, and Virtual Reality into Business Education curricula.

Research Questions

This study therefore seeks to address the following research questions:

1. What is the level of readiness of Business Education students toward the integration of Artificial Intelligence, simulation, and Virtual Reality in their learning?
2. How do students perceive the usefulness, ease of use, these emerging technologies?
3. What are the potential challenges associated with these technologies?
4. What relationships exist among readiness, perceived usefulness, perceived ease of use, perceptions, perceived challenges, and behavioral intention to adopt these technologies?
5. What are the implications of these findings for curriculum development and educational policy in Business Education?

Research Hypotheses

1. There is no significant relationship between readiness, perceived usefulness, perceived ease of use, perceptions, perceived challenges and behavioral intention of business education students in adopting the use of AI, Simulation and Virtual reality in their learning**.**

Methodology

This study adopted an explanatory sequential mixed-methods research design. The quantitative phase was conducted first using a cross-sectional survey to assess students' readiness and perceptions towards the integration of Artificial Intelligence (AI), simulation, and Virtual Reality (VR) in Business Education. The quantitative findings were subsequently complemented with qualitative data obtained through semi-structured interviews and Focus Group Discussions (FGDs) to provide a deeper understanding and explanation of the survey results. The cross-sectional survey enabled data to be collected from respondents at a single point in time. The study was conducted in three tertiary Institutions in Rivers State, Nigeria, where Business Education programmes are offered. Rivers State is one of the major educational and commercial hubs in the Niger Delta region and provides an appropriate setting for investigating students' readiness for emerging educational technologies**.** The target population comprised undergraduate students enrolled in Business Education programmes in three tertiary institutions in Rivers State; Federal College of Education (Technical), Omoku; Ignatius Ajuru University of Education and Rivers State University. Only students who reported having no prior exposure to Artificial Intelligence (AI), business simulation software, or Virtual Reality (VR) technologies were included in the study. A total of 292 valid responses were obtained and used for analysis. Stratified random sampling was employed to ensure adequate representation across the participating institutions and different levels of study**.**

Data were collected using a structured questionnaire titled "Readiness and Perceptions Towards Technology Integration in Business Education Questionnaire." The instrument was developed based on the Technology Acceptance Model (TAM) proposed by Davis (1989) and adapted from validated instruments used in previous educational technology studies (Davis,
1989; Venkatesh & Davis, 2000; Zawacki-Richter et al., 2019). The questionnaire consisted of
two sections. Section A: Demographic Information, Gender, Age, Institution, Level of Study and Department. Section B: Technology Acceptance Constructs. The questionnaire contained forty (40) items distributed across six constructs: Readiness (8 items), Perceived Usefulness (7 items), Perceived Ease of Use (6 items), Perception/Attitude (7 items), Perceived Challenges (7 items) and Behavioral Intention (5 items). Responses were measured using a five-point Likert scale: 5 = Strongly Agree, 4 = Agree, 3 = Undecided, 2 = Disagree and 1 = Strongly Disagree.

Content validity was established through expert review to ensure that the questionnaire adequately measured the constructs of interest. The internal consistency of each construct was assessed using Cronbach's Alpha coefficient. A Cronbach's Alpha value of 0.70 was obtained and considered acceptable for indicating satisfactory reliability of the measurement instrument. The questionnaire was administered both physically and electronically using Google Forms. Prior to participation, respondents confirmed that they had no previous experience using Artificial Intelligence, simulation software, or Virtual Reality in their learning activities. Participation was voluntary, and informed consent was obtained from all respondents before data collection. Confidentiality and anonymity were maintained throughout the study, and the collected information was used strictly for academic research purposes**.**

Data collected were analyzed using Python programming language (Version 3.x) with the pandas, NumPy, SciPy, and stats models libraries. Means and standard deviations were computed to determine the level of students' readiness, perceived usefulness, perceived ease of use, perceptions, perceived challenges, and behavioral intention towards the adoption of Artificial Intelligence, simulation, and Virtual Reality. Higher mean values indicate stronger agreement with the questionnaire statements. Pearson correlation analysis was performed to examine the strength and direction of the relationships among the six study constructs of Readiness, Perceived Usefulness, Perceived Ease of Use, Perception, Perceived Challenges Behavioral Intention. Correlation coefficients (r) range from −1.00 to +1.00, where values closer to +1.00 indicate stronger positive relationships, values closer to −1.00 indicate stronger negative relationships, and values around zero indicate little or no linear relationship. Multiple linear regression analysis was employed to determine the extent to which the independent variables: Readiness, Perceived Usefulness, Perceived Ease of Use, Perception, Perceived Challenges, predict the dependent variable; Behavioral Intention. The regression model was evaluated using: Coefficient of Determination (R^2), Adjusted R^2, Standardized Beta

Coefficients (β), F-statistic, p-values. A significance level of 0.05 was adopted for all statistical analyses.

Results and Discussion

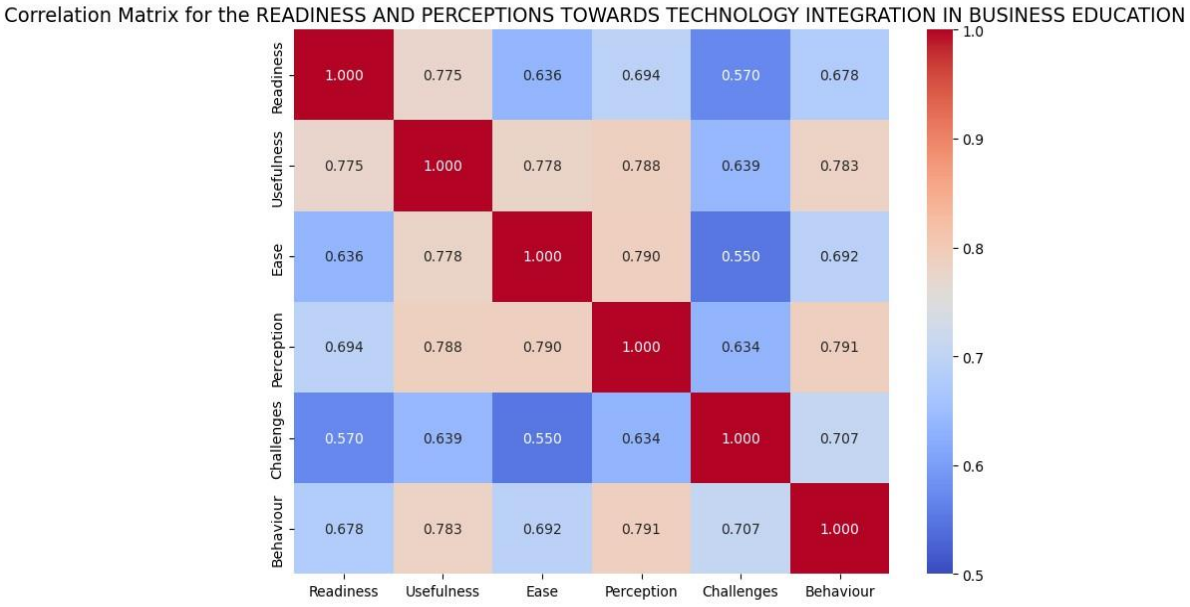
3.1 Descriptive Statistics

The descriptive analysis revealed generally high mean scores across all constructs measured on a 5-point Likert scale. As shown in Table 1 below:

Table 1: Mean and Standard Deviation of Constructs

Construct	Mean	SD	Interpretation
Readiness	4.325	0.571	Very High
Perceived Usefulness	4.247	0.552	Very High
Ease of Use	4.119	0.568	High
Perception	4.153	0.568	High
Challenges	4.209	0.600	High
Behavioral Intention	4.221	0.564	High

The results in Table 1 reveal consistently high levels of positive responses across all constructs. On the 5-point Likert scale used in this study (where 1 = Strongly Disagree and 5 = Strongly Agree), all constructs recorded mean scores above 4.0, indicating strong agreement among respondents. **Readiness** (M = 4.325, SD = 0.571) recorded the highest mean score. This suggests that students are **highly prepared and willing** to learn and adopt AI, simulation, and VR technologies in their Business Education programme. The relatively low standard deviation indicates considerable consensus among the respondents. **Perceived Usefulness** (M = 4.247, SD = 0.552) also showed a very high mean. Students strongly believe that these technologies will improve their learning experience, enhance understanding of business concepts, increase productivity, and better prepare them for the modern workplace. This finding is particularly encouraging as perceived usefulness is one of the strongest predictors of technology adoption according to the Technology Acceptance Model (TAM). **Behavioral Intention** (M = 4.221, SD = 0.564) was also very high. This implies that the majority of students intend to use AI tools, participate in simulation-based learning, and engage in VR activities when these become available in their institutions. **Challenges** (M = 4.209, SD = 0.600) had a high mean score. Students acknowledged significant potential barriers such as high cost of equipment, erratic power supply, poor internet connectivity, and lack of training. The slightly higher standard deviation here (0.600) suggests more variability in students' opinions regarding the severity of these challenges. **Perception** (M = 4.153, SD = 0.568) and **Ease of Use** (M = 4.119, SD =
0.568) both fell in the "High" category. Students generally hold favorable attitudes toward technology integration and believe that these tools can make learning more interactive,
relevant, and motivating



Correlation Analysis

Pearson correlation analysis was conducted to examine the relationships among the constructs. The correlation matrix is presented in Table 2.

Table 2: Pearson Correlation Matrix

Construct	Readiness	Usefulness	Ease	Perception	Challenges	Behaviour
Readiness	1.000	0.775**	0.636**	0.694**	0.570**	0.678**
Usefulness	0.775**	1.000	0.778**	0.788**	0.639**	0.783**
Ease	0.636**	0.778**	1.000	0.790**	0.550**	0.692**
Perception	0.694**	0.788**	0.790**	1.000	0.634**	0.791**
Challenges	0.570**	0.639**	0.550**	0.634**	1.000	0.707**
Behaviour	0.678**	0.783**	0.692**	0.791**	0.707**	1.000

p < 0.01 (all correlations significant)

All constructs were positively and significantly inter-correlated. The strongest correlation was observed between **Perception** and **Behavioral Intention** (r = 0.791), followed closely by **Perceived Usefulness** and **Behavioral Intention** (r = 0.783). This indicates that students who viewed the integration of AI, simulation, and VR more favorably and saw greater benefits in these technologies expressed stronger intentions to adopt them. **Perceived Usefulness** showed particularly strong associations with **Perception** (r = 0.788), **Ease of Use** (r = 0.778), and **Readiness** (r = 0.775). These high correlations validate the core assumptions of the Technology Acceptance Model (TAM), confirming that usefulness is a central driver in students' attitudes and readiness. Interestingly, **Challenges** also maintained a strong positive correlation with **Behavioral Intention** (r = 0.707). This suggests that while students are aware of potential barriers (such as cost, power supply, and infrastructure), this awareness does not deter them. Instead, it may reflect a realistic understanding that motivates them to support and prepare for technology integration. The moderate, to strong correlations across all constructs (ranging from
0.550 to 0.791) demonstrate internal consistency in students' responses and provide strong empirical support for the conceptual framework of the study.

Multiple Linear Regression Analysis

Multiple linear regression was performed to predict Behavioural Intention from the five constructs. The results are presented in Table 3.

Table 3: Summary of Multiple Regression Analysis

Predictor	B	Std. Error	Beta	T	p-value	Remark
(Constant)	0.203	0.149	-	1.362	0.174	Not significant
Readiness	0.055	0.049	0.055	1.113	0.267	Not significant
Usefulness	**0.292**	0.065	0.292	**4.505**	**0.000**	Significant
Ease	0.014	0.054	0.014	0.257	0.797	Not significant
Perception	**0.347**	0.058	0.347	**5.970**	**0.000**	Significant
Challenges	**0.248**	0.039	0.248	**6.371**	**0.000**	Significant

Model Summary: $R^2 = 0.734$, Adjusted $R^2 = 0.729$, $F(5, 286) = 157.7$, $p < 0.001$

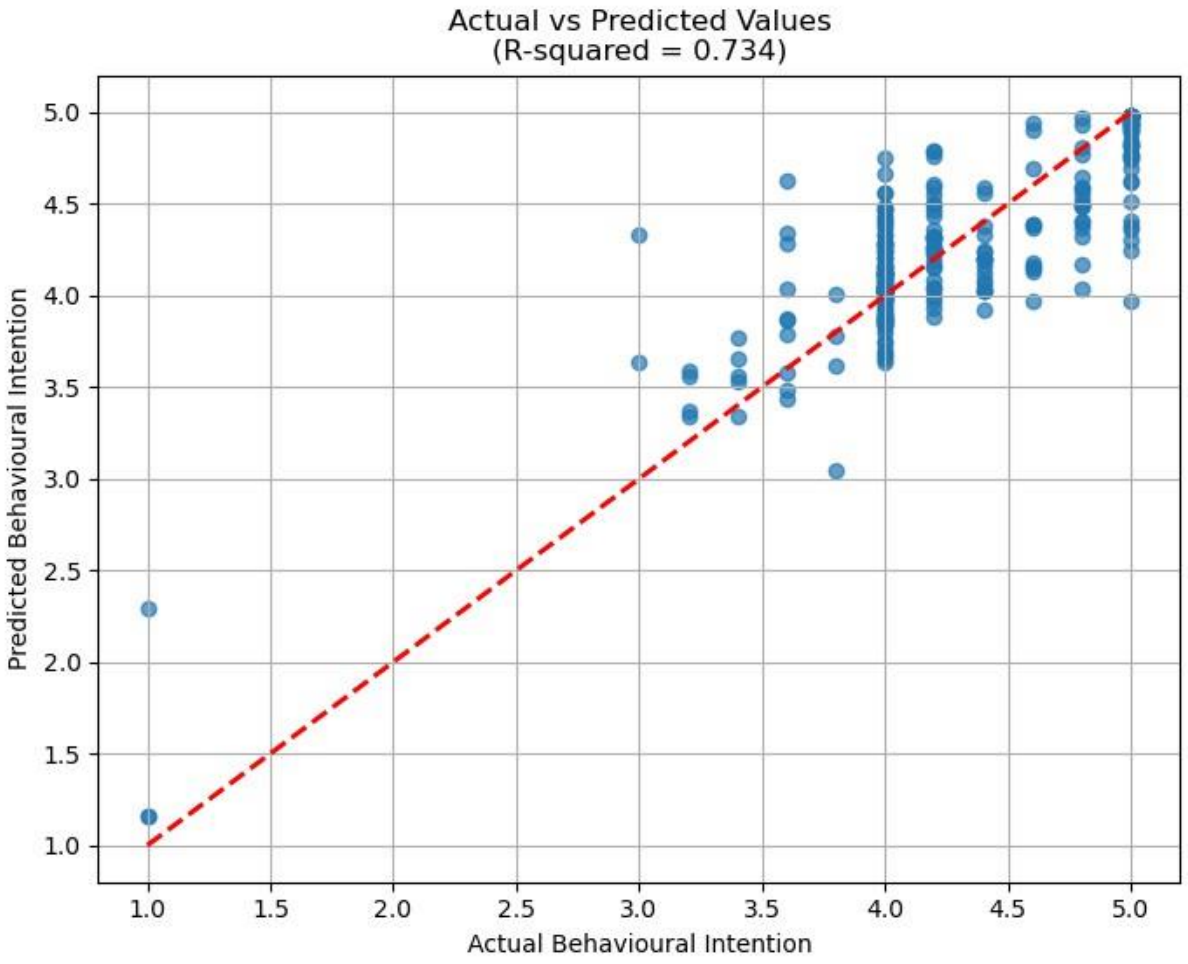


Fig 1: showing A regression model graph

The regression model was statistically significant overall [$F(5, 286) = 157.7$, $p < 0.001$], indicating that the set of predictors reliably explained variation in Behavioral Intention.

Model Fit: The R-squared value of **0.734** shows that the five constructs together explained **73.4%** of the variance in students' Behavioral Intention to use AI, simulation, and VR. The Adjusted R-squared (0.729) is very close to R^2, confirming that the model is robust and not overly inflated by the number of predictors. The model summary shows individual predictors
Perception ($\beta = 0.347$, $p < 0.001$) was the **strongest predictor**. This means that for every one- unit increase in positive perception toward technology integration, Behavioral Intention increases by 0.347 units, holding other variables constant. Students' overall attitude and belief in the value of these technologies strongly drive their willingness to adopt them. **Perceived Usefulness** ($\beta = 0.292$, $p < 0.001$) was the second strongest significant predictor. This aligns with the original Technology Acceptance Model (TAM), confirming that students who believe AI, simulation, and VR will improve their learning, productivity, and career prospects are significantly more likely to intend to use them. **Challenges** ($\beta = 0.248$, $p < 0.001$) emerged as a significant positive predictor. Although counterintuitive at first glance, this suggests that students who are more aware of existing challenges (cost, power, infrastructure, etc.) are paradoxically more motivated to support and participate in technology integration. It may reflect a proactive mindset — acknowledging problems but still wanting solutions. **Readiness** ($\beta = 0.055$, $p = 0.267$) and **Ease of Use** ($\beta = 0.014$, $p = 0.797$) were not statistically significant. This implies that while students feel generally ready and believe the technologies may not be too difficult to use, these factors do not uniquely contribute to their intention once perception, usefulness, and awareness of challenges are considered.

Discussion of Findings

The findings of this study provide valuable insights into the readiness and perceptions of Business Education students toward the integration of Artificial Intelligence (AI), simulation, and Virtual Reality (VR) in tertiary institutions in Rivers State, Nigeria. Despite having no prior exposure to these technologies, participants demonstrated remarkably positive attitudes across all measured constructs.

The descriptive statistics revealed high mean scores for all constructs, with **Readiness** recording the highest mean ($M = 4.325$). This indicates that students are enthusiastic and willing to embrace these emerging technologies in their learning process. This finding aligns with the study of Oyediran et al. (2022), who found in their work that Nigerian university students reported high readiness and positive perception toward online learning despite low prior exposure. The work of Oyediran et. al and this work shows that willingness exists, but infrastructure and training is needed. Similarly, **Behavioral Intention** ($M = 4.221$) and **Perceived Usefulness** ($M = 4.247$) were very high, suggesting that students strongly believe these tools will enhance their learning experience, improve understanding of business concepts, and better prepare them for the modern workplace. UNESCO (2023), findings supports this work. The UNESCO –Global Education monitoring Report found that students in Sub-Saharan Africa showed high enthusiasm for digital learning post-COVID. They found that 60% enter tertiary institutions with 'no prior digital skills'. This is an indication of a proactive mindset despite no prior knowledge. This supports the findings of this study. Similarly, the findings of Oluwatayo et.al. (2024), also supports the findings of this work. They found that Business students demonstrated readiness and positive attitude towards digital tools. The high score on the **Challenges** construct ($M = 4.209$) shows that students are realistically aware of potential barriers such as high cost of equipment, erratic power supply, poor internet connectivity, and insufficient training. However, this awareness did not translate into negative attitudes. This finding also, is in line with the report of World Bank (2023), who found that across Africa, students are willing to adopt technology for learning, but institutions lack policy frameworks and structured training.

The Pearson correlation analysis further strengthened these observations. All constructs were positively and significantly correlated. Notably, **Behavioral Intention** had the strongest relationships with **Perception** ($r = 0.791$), **Perceived Usefulness** ($r = 0.783$), and **Challenges** ($r = 0.707$). The strong correlation between Perceived Usefulness and other constructs supports the foundational propositions of the Technology Acceptance Model (TAM) by Davis (1989), which posits that perceived usefulness is a major determinant of technology adoption intention. The positive correlation between Challenges and Behavioral Intention is particularly illuminating. Rather than acting as a deterrent, students' recognition of existing infrastructural limitations appears to heighten their motivation and support for technology integration initiatives.

The multiple linear regression analysis provided deeper predictive insights. The model was highly significant and explained **73.4%** of the variance in Behavioral Intention (R^2 =

0.734). Among the predictors, **Perception** (β = 0.347, p < 0.001), **Perceived Usefulness** (β = 0.292, p < 0.001), and **Challenges** (β = 0.248, p < 0.001) emerged as significant contributors. This confirms that students' overall attitude toward technology and their belief in its benefits are the strongest drivers of their intention to adopt AI, simulation, and VR. The significant positive contribution of the Challenges construct reinforces the idea that informed awareness of barriers can serve as a catalyst for proactive engagement rather than resignation. Interestingly, **Readiness** and **Ease of Use** did not significantly predict Behavioral Intention when other variables were controlled. This may be because students, lacking actual experience with these technologies, base their intentions more on anticipated benefits and general attitudes than on perceived personal readiness or ease of operation.

These findings are consistent with previous studies in developing contexts which show that students often exhibit high optimism toward educational technologies even when faced with infrastructural constraints. However, the unique contribution of this study lies in its focus on students with **no prior exposure**, revealing that positive perceptions can exist independently of hands-on experience. The results have important implications for curriculum development and policy. They suggest that tertiary institutions in Rivers State and similar contexts can confidently introduce AI, simulation, and VR into Business Education programmes, provided that efforts are made to address the acknowledged challenges through strategic investment in infrastructure, training, and reliable power supply.

Conclusion

This study examined the readiness and perceptions of Business Education students without prior exposure to Artificial Intelligence (AI), simulation, and Virtual Reality (VR) in tertiary institutions in Rivers State, Nigeria. The findings reveal a highly positive outlook among the students toward the integration of these advanced technologies in their learning process. Despite having no previous experience with these tools, participants demonstrated **very high levels of readiness**, strong perceived usefulness, favorable perceptions, and robust behavioral intentions. The mean scores for all constructs exceeded 4.0 on a 5-point Likert scale, indicating overwhelming support for technology-enhanced learning. Students also showed realistic awareness of existing challenges such as high cost of equipment, erratic power supply, poor internet connectivity, and lack of training facilities. The Pearson correlation analysis confirmed strong positive relationships among all constructs, while the multiple linear regression model explained **73.4%** of the variance in Behavioral Intention, with **Perception**, **Perceived Usefulness**, and **Challenges** emerging as significant predictors. These results validate the applicability of the extended Technology Acceptance Model (TAM) in this context and highlight that students' attitudes and beliefs in the benefits of these technologies are the primary drivers of their adoption intention.In conclusion, Business Education students in Rivers State are ready and willing to embrace AI, simulation, and VR as integral parts of their academic training. The study demonstrates that lack of prior exposure does not diminish enthusiasm; rather, it coexists with a proactive and optimistic mindset toward digital transformation in education. The findings underscore the urgent need for institutions and government to invest in the necessary infrastructure, training programmes, and policy frameworks to translate this high level of student readiness into actual implementation. With appropriate support, the integration of these technologies has the potential to significantly enhance the quality, relevance, and competitiveness of Business Education in Nigeria. The study has shown that willingness already exists, the only thing that is missing is structure and support.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are made**:**

1. Institutions and government should intentionally convert the enthusiasm of students to competence, by organizing a practical and not theoretical digital foundation programmes for business education students during orientation.
2. The Government should through institutions like TETfund fund and monitor onboarding of digital programmes across tertiary institutions to ensure standardization
3. Lecturers should not assume that all students are tech-savvy, they can start with blended learning and gradually increase the use of technology as the students' competence improves.
4. Government should build and equip institutions with functional computer laboratories or ICT halls, stable electricity and internet. This will help to reduce the number of students entering the higher institutions with 'zero knowledge.'
5. Government should introduce mandatory computer studies and ICT practicals from Primary to Secondary school

Abstract

This study examined innovation and emerging technologies as predictors of workforce readiness among Business Education students in the University of Calabar. Two objectives, with corresponding research questions and hypotheses, guided the study. A correlational research design was adopted. The population comprised 53 final-year Business Education students in the 2025/2026 academic session, and the entire population was studied using the census sampling technique. Data were collected using a structured 30-item questionnaire titled Innovation, Emerging Technologies and Workforce Readiness Questionnaire (IETWRQ), comprising 10 items each on innovation, emerging technologies and workforce readiness. The instrument was validated by two experts, one from the Department of Business Education and the other from the Department of Measurement and Evaluation. Its reliability was established through a trial test involving 20 respondents from the University of Cross River State who were not part of the main study, yielding Cronbach's alpha coefficients of 0.79, 0.81 and 0.92 for the three sections, respectively. All 53 questionnaires administered were correctly completed and retrieved, representing a 100% response rate. Data were analysed using mean, standard deviation, Pearson Product Moment Correlation and regression analysis at the 0.05 level of significance. The findings revealed that innovation had a positive and significant relationship with workforce readiness ($r = 0.462$, $p < 0.001$) and significantly predicted workforce readiness, accounting for 21.3% of its variance. Similarly, emerging technologies had a positive and significant relationship with workforce readiness ($r = 0.475$, $p < 0.001$) and significantly predicted workforce readiness, explaining 22.6% of its variance. When considered jointly, innovation and emerging technologies significantly predicted workforce readiness, accounting for 31.6% of its variance. The study concluded that innovation and emerging technology competencies are important for preparing Business Education students to meet contemporary workplace demands. It was recommended that universities strengthen innovation-oriented learning, expand students' practical exposure to emerging technologies, improve digital infrastructure, and promote industry-based learning opportunities to enhance workforce readiness.

Keywords: Innovation, technologies, emerging technologies, workforce readiness and Business Education

Introduction

The world of work is undergoing rapid and far-reaching transformation as a result of technological advancement, digitalisation, innovation, globalisation and changing organisational practices. Technologies such as artificial intelligence (AI), automation, cloud computing, big data analytics, accounting software, and digital communication platforms are not only changing the nature of jobs but are also reshaping how work is organised and performed. The World Economic Forum (2025) identified technological change, particularly developments in AI, information processing and digital technologies, as one of the major forces expected to transform jobs and skills through 2030. In response to these changes, technological literacy, AI and big data, analytical thinking, creative thinking, resilience, flexibility and lifelong learning are increasingly becoming important workplace competencies. This changing landscape has therefore placed

greater responsibility on higher education institutions to prepare graduates who can go beyond the acquisition of disciplinary knowledge to demonstrate the technological, innovative, cognitive and adaptive capabilities required to function effectively in contemporary workplaces.

The growing demand for these capabilities has made workforce readiness an important concern in higher education. Workforce readiness refers broadly to the knowledge, skills, attitudes and behaviours that enable individuals to obtain employment, perform effectively, adapt to changing work environments and contribute meaningfully to organisational objectives. This concern is particularly relevant in Nigeria, where employers increasingly seek graduates who possess combinations of digital, cognitive, specialised and socio-emotional skills (World Bank, 2024). For programmes such as Business Education, which are designed to prepare students for employment and entrepreneurial activities across diverse business-related occupations, the development of such competencies is especially important.

Among the competencies that can enhance workforce readiness, innovation occupies an important position. Innovation involves the generation, development, adoption and implementation of new or improved ideas, products, processes and methods that create value. It draws upon creativity, initiative, opportunity recognition, experimentation and problem-solving, all of which enable individuals to respond constructively to new and unfamiliar workplace situations. The importance of these capabilities is reinforced by the World Economic Forum (2025), which identified creative thinking as one of the skills experiencing increasing demand in the changing labour market. In Business Education, innovation is particularly relevant because students are prepared for occupational roles in accounting, management, office administration, entrepreneurship, marketing and other business-related fields. Success in these areas requires more than knowledge of established business procedures; graduates must be able to identify opportunities, generate useful ideas, improve existing processes and develop practical solutions to workplace problems.

The relevance of innovation to Business Education is supported by existing empirical evidence as presented by Akeke (2020), viewed creativity and innovation as important dimensions of Business Education, particularly in preparing learners to respond to changing economic and occupational conditions. Similarly, Umo and Okon (2023) found that relevant Business Education curriculum components contributed to students' entrepreneurial skills, suggesting that learning experiences that encourage creativity, initiative and problem-solving can enhance students' capacity for productive economic engagement. Ingwe, et al (2023) also identified innovative and creative abilities among the entrepreneurial competencies required by Business Education graduates for self-reliance. In a related study, Ore and Hassan (2023) reported that appropriate Business Education curriculum content supports creativity, initiative and problem-solving, while Ogbu and Ebeke (2024) found that innovative practices can improve practical and employable skills among tertiary students. Furthermore, David, et al, (2024) linked entrepreneurship-related competencies, including creativity, initiative and problem-solving, with employability, while Manyahaya and Adamu (2025) found that entrepreneurship skills acquisition contributes to employability proficiency among Business Education graduates. Taken together, these findings indicate that innovation-oriented learning can equip students with the initiative, adaptability and problem-solving abilities needed to navigate employment and entrepreneurial opportunities. However, as workplaces become increasingly technology-driven, innovation alone may not be sufficient; students must also be capable of effectively engaging with the technologies through which many contemporary work activities are performed.

This consideration brings emerging technologies into focus as another important dimension of workforce readiness. Emerging technologies refer to rapidly developing technological applications, including AI, machine learning, big data analytics, cloud computing, blockchain, robotics, the Internet of Things, virtual reality and other digital platforms, which are increasingly influencing education, business and employment. UNESCO (2023) emphasised that technology in education should not be viewed merely as a means of delivering instruction but also as a competency that learners need to develop and a resource for improving educational processes. For Business Education students, meaningful exposure to emerging technologies can strengthen their ability to access and evaluate information, analyse data, communicate digitally, automate routine tasks, solve business problems and perform technology-enabled occupational functions. Nevertheless, the mere availability of technology does not automatically translate into workforce readiness. Students must acquire the knowledge and confidence to select appropriate technologies, evaluate digital information critically and apply technological tools effectively, responsibly and ethically.

Evidence from Business Education research increasingly demonstrates the importance of this technological dimension. Enang (2022) emphasised the integration of emerging technologies into Business

Education programmes and the need for students and educators to develop appropriate digital competencies. Similarly, Okon (2022) reported that emerging technologies, including virtual reality, wearable technologies and AI, could support sustainable Business Education delivery in Cross River State. Enang (2024) further highlighted technology and digitalisation as mechanisms for transforming Business Education teaching and learning. David, et al, (2024) also established significant relationships among digitalisation of skills acquisition, digital learning tools, digital skills proficiency and employability. In the same vein, Okoro and Okoro (2025) highlighted the importance of digital technology competencies to the effectiveness and employability of postgraduate Business Education students in South-South Nigerian universities. These studies collectively suggest that technological competence is becoming an increasingly important component of the skills graduates need to function effectively in technology-mediated workplaces.

The technological preparedness of Business Education students is also influenced by the extent to which technology is embedded in their learning environment and curriculum. Akeke, et al (2023) examined electronic infrastructure and the sustainable development of Business Education programmes and underscored the importance of adequate technology-supported infrastructure for effective programme delivery. Similarly, Akeke, et al (2023) examined nascent technologies and the training of Business Education students in tertiary institutions in Cross River State, drawing attention to the growing role of emerging technologies in students' preparation for contemporary occupational environments. Atah, et al (2023) further examined the digitalization of Business Education curriculum for 21st-century global relevance and emphasized the need for curriculum content to reflect changing technological and workplace realities. In addition, Atah, et al (2023) examined the utilization of e-learning platforms for Business Education curriculum content delivery, demonstrating the increasing importance of digital learning environments in developing technology-related competencies. More recently, Akeke and Nyiam (2026) examined the challenges and opportunities associated with integrating accounting software into the Business Education curriculum in Nigeria, highlighting the need for students to acquire practical technology skills that correspond with contemporary accounting and business practices. Akeke, et al (2024) similarly examined the utilisation of online tools and job productivity, providing further evidence that effective use of digital technologies can contribute to improved workplace performance.

The relationship between technological competencies and workforce preparedness becomes even more evident when attention is given to studies that have directly examined job readiness and employability. Onyiorah (2025) found that AI skill development significantly predicted job readiness among Business Education undergraduates, providing direct evidence that technology-related competencies can contribute to students' preparedness for the labour market. Olawoyin, et al, (2025) also examined the utilisation of emerging technologies in Business Education and highlighted the importance of institutional support and training for effective technology integration. Similarly, Agbonaye and Muhammed (2025) found that AI-driven technology could strengthen entrepreneurial skills among Business Education graduates, while Ikpeama, et al, (2025) established a relationship between technological innovation integration and workforce readiness among Accounting Education students. These findings indicate that the development of workforce readiness is increasingly linked to students' ability to combine technological competence with innovation, adaptability and practical occupational skills.

The foregoing evidence suggests that innovation and emerging technologies are not isolated influences on workforce readiness. Rather, they represent complementary capabilities that may jointly shape how well Business Education students are prepared for contemporary employment. Innovation provides the capacity to generate ideas, identify opportunities, solve problems and improve existing practices, while emerging technologies provide the tools and platforms through which many of these ideas and solutions can be developed and implemented. A student may therefore possess creative and innovative abilities but remain inadequately prepared for the modern workplace if unable to use relevant technologies effectively. Conversely, technological proficiency without the capacity to think creatively, identify opportunities or develop solutions may limit the student's ability to derive meaningful value from technology. The interaction of these capabilities is consequently important in understanding the broader construct of workforce readiness.

Despite the growing body of research in this area, an important empirical gap remains. Existing Nigerian studies have predominantly examined entrepreneurial skills, digital skills, AI competencies, technology adoption, digitalisation, employability, job efficiency or technology utilisation as separate issues. Other studies have considered innovation or technological competencies in relation to entrepreneurship

and employability. However, comparatively limited attention has been devoted to examining the combined predictive influence of innovation and emerging technologies on workforce readiness among Business Education students, particularly within a specific university context. This gap is important because workforce readiness is multidimensional and requires the integration of technological competence with creativity, initiative, critical thinking, adaptability, problem-solving and the ability to apply knowledge in practical work situations. The University of Calabar provides a relevant context for addressing this gap because its Business Education programme is expected to prepare students for employment and entrepreneurial participation in an increasingly digital and innovation-driven economy.

Against this background, investigating innovation and emerging technologies as predictors of workforce readiness among Business Education students at the University of Calabar is both timely and significant. Such an investigation can provide empirical evidence on whether students' innovative capabilities and engagement with emerging technologies meaningfully contribute to their preparedness for the contemporary workplace. The study therefore seeks to determine the extent to which innovation and emerging technologies predict workforce readiness among Business Education students at the University of Calabar.

Problem of the Study

The changing nature of the workplace has increased the need for graduates who are innovative, technologically competent, adaptable and capable of solving practical problems. However, there are concerns that some Business Education students may graduate with adequate theoretical knowledge but insufficient innovative and technological competencies to meet the demands of contemporary workplaces. Access to digital devices and emerging technologies alone may not guarantee the ability to apply them effectively, creatively and responsibly to workplace tasks. The problem is particularly relevant to Business Education students at the University of Calabar, whose training is expected to prepare them for employment and entrepreneurial activities in an increasingly technology-driven environment. It is not sufficiently clear whether students' ability to innovate and their engagement with emerging technologies are translating into the practical competencies required for effective workplace participation, including creativity, problem-solving, adaptability, digital competence, communication and initiative.

Therefore, the major problem is the uncertainty regarding the extent to which innovation and emerging technologies predict the workforce readiness of Business Education students at the University of Calabar. Without empirical evidence on these relationships, it may be difficult for lecturers, curriculum developers and programme administrators to determine the appropriate emphasis to place on innovation and emerging technologies in preparing students for the changing world of work. This gap provides the basis for the present study.

Objectives of the Study

The main objective of the study is to examine the predictive influence of innovation and emerging technologies on workforce readiness among Business Education students in the University of Calabar. Specifically, the study seeks to:

1. determine the extent to which innovation predicts workforce readiness among Business Education students in the University of Calabar;
2. determine the extent to which emerging technologies predict workforce readiness among Business Education students in the University of Calabar.

Research Questions

The following research questions were formulated to guide the study:

1. To what extent does innovation predict workforce readiness among Business Education students in the University of Calabar?
2. To what extent do emerging technologies predict workforce readiness among Business Education students in the University of Calabar?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

1. Innovation does not significantly predict workforce readiness among Business Education students in the University of Calabar.

2. Emerging technologies do not significantly predict workforce readiness among Business Education students in the University of Calabar.
3. Innovation and emerging technologies do not jointly significantly predict workforce readiness among Business Education students in the University of Calabar.

Methods

The study adopted a predictive correlational research design because it sought to examine the relationships between the predictor variables innovation and emerging technologies and the criterion variable, workforce readiness, among Business Education students at the University of Calabar. The design was considered appropriate because it enabled the researcher to determine the extent to which variations in students' innovation and emerging technology competencies were associated with variations in their workforce readiness without manipulating the study variables. The study was conducted at the University of Calabar, Cross River State, Nigeria, a federal university located in Calabar.

The population comprised 53 final-year Business Education students in the 2025/2026 academic session, consisting of 32 males and 21 females. Given the relatively small and manageable population, the entire population was included in the study using the census. Thus, all 53 final-year Business Education students participated in the study, ensuring complete coverage of the target population. Data were collected using a structured questionnaire titled Innovation, Emerging Technologies and Workforce Readiness Questionnaire (IETWRQ). The instrument was developed by the researchers based on the objectives of the study and relevant literature on innovation, emerging technologies and workforce readiness. The questionnaire comprised 20 substantive items, divided into two sections: 10 items measuring innovation and emerging technologies each. The items were rated on a four-point Likert scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD), weighted 4, 3, 2 and 1, respectively. The four-point scale was used to obtain clear responses without providing a neutral option.

The instrument was subjected to face and content validation by two experts. One expert was from the Department of Business Education, while the other was from the Department of Measurement and Evaluation. The experts independently examined the questionnaire items for relevance, clarity, appropriateness, adequacy of coverage, and alignment with the objectives of the study. Their observations and recommendations were carefully considered and incorporated into the final version of the instrument before it was administered to the respondents. The reliability of the instrument was established through a trial test involving 20 respondents from the University of Cross River State who were not included in the main study. Data obtained from the trial test were analysed using Cronbach's alpha reliability coefficient to determine the internal consistency of the instrument. The reliability coefficients for the three sections of the instrument were 0.79, 0.81 and 0.92, respectively, indicating satisfactory internal consistency and confirming that the instrument was reliable for the study.

The researcher administered the questionnaires directly to the 53 Business Education students after explaining the purpose of the study and assuring the respondents that the information provided would be treated confidentially and used strictly for academic purposes. All 53 copies of the questionnaire administered were correctly completed and retrieved, representing a 100% response rate. The completed questionnaires were coded and analysed using the Statistical Package for the Social Sciences (SPSS). Frequency and percentage were used to summarise the respondents' demographic characteristics, while mean and standard deviation were used to summarise responses to the questionnaire items. The research questions were answered using mean and standard deviation, while the Pearson Product Moment Correlation (PPMC) was used to determine the direction and strength of the relationships between innovation, emerging technologies and workforce readiness. Multiple regression analysis was used to determine the extent to which innovation and emerging technologies jointly and independently predicted workforce readiness. The null hypotheses were tested at the 0.05 level of significance. A null hypothesis was rejected when the p-value was less than 0.05 and retained when the p-value was greater than or equal to 0.05. For the four-point Likert scale, a criterion mean of 2.50 was adopted. Consequently, mean scores of 2.50 and above indicated agreement, whereas mean scores below 2.50 indicated disagreement.

Findings of the study

Research Question One

To what extent does innovation predict workforce readiness among Business Education students in the University of Calabar?

able 1: Mean and Standard Deviation of Respondents' Ratings on Innovation

S/N	Innovation Items	SA	A	D	SD	Mean	SD	Decision
1	Generates new ideas for solving problems encountered in academic and workplace situations.	15	20	10	8	2.79	1.03	Agree
2	Develops creative solutions when faced with unfamiliar tasks.	14	12	16	11	2.55	1.1	Agree
3	Identifies opportunities for improving existing products/services.	18	15	8	12	2.74	1.16	Agree
4	Willing to try new approaches when carrying out academic or work-related tasks.	15	16	14	8	2.72	1.04	Agree
5	sAdapt my ideas when existing methods do not produce the desired results.	14	25	6	8	2.85	0.99	Agree
6	uses creative thinking to improve the way tasks are performed.	13	18	12	10	2.64	1.06	Agree
7	Confidents in introducing new ideas during group assignments and projects.	14	19	11	9	2.72	1.04	Agree
8	Combines existing ideas in new ways to develop better solutions to problems.	17	13	13	10	2.7	1.12	Agree
9	Willing to learn from mistakes and use the experience to improve my future performance.	16	19	11	7	2.83	1.01	Agree
10	My training in Business Education has enhanced my ability to think innovatively in preparation for the workplace.	17	15	10	11	2.72	1.13	Agree
	Cluster Mean/SD					**2.72**	**0.87**	**Agree**

Table 1 shows that the respondents generally agreed that they possessed innovation-related competencies. The item means ranged from 2.55 to 2.85, all of which were above the criterion mean of 2.50. The highest mean of 2.85 was recorded for the ability to adapt ideas when existing methods do not produce desired results, while the lowest mean of 2.55 was recorded for developing creative solutions to unfamiliar tks. The overall cluster mean of 2.72 with a standard deviation of 0.87 indicates that Business Education students demonstrated a relatively high level of innovation. This suggests that innovation is a potentially important factor in their preparation for the workplace. Based on the result in Table 1, innovation predicts workforce readiness to a considerable extent among Business Education students in the University of Calabar, as indicated by the overall mean of 2.72.

Research Question Two

To what extent do emerging technologies predict workforce readiness among Business Education students in the University of Calabar?

Table 2: Mean and Standard Deviation of Respondents' Ratings on Emerging Technologies

S/N	Emerging Technologies Items	SA	A	D	SD	Mean	SD	Decision
1	Artificial intelligence (AI) tools support academic and work-related tasks.	12	17	18	6	2.66	0.96	Agree
2	Digital collaboration platforms can be used to communicate and work effectively with others.	12	20	14	7	2.7	0.97	Agree
3	Cloud-based applications can be used to store and share work-related information.	14	25	9	5	2.91	0.9	Agree
4	Digital tools can be used to analyze and interpret information for decision-making.	17	19	11	6	2.89	0.99	Agree
5	Learning and adapting to new technologies introduced into the workplace is easy.	16	17	16	4	2.85	0.95	Agree
6	Uses digital platforms to perform business and administrative tasks.	15	21	13	4	2.89	0.91	Agree
7	Automation and emerging technologies can change the nature of workplace tasks.	22	13	15	3	3.02	0.97	Agree
8	Uses online tools and digital resources to improve my productivity.	20	17	9	7	2.94	1.05	Agree
9	Identifies appropriate emerging technologies for solving specific business problems.	19	22	7	5	3.04	0.94	Agree
10	Business Education training acquired has prepared me to work with emerging technologies.	15	22	10	6	2.87	0.96	Agree
	Cluster Mean/SD					**2.88**	**0.72**	**Agree**

Table 2 indicates that respondents generally agreed that they possessed competencies relating to emerging technologies. The item means ranged from 2.66 to 3.04, with all items exceeding the criterion mean of 2.50. The highest mean of 3.04 was obtained for the ability to identify appropriate emerging technologies for solving specific business problems. This was followed by understanding how automation and emerging technologies can change workplace tasks, with a mean of 3.02. The lowest mean of 2.66 was recorded for the use of artificial intelligence tools to support academic and work-related tasks. The overall cluster mean of 2.88 and standard deviation of 0.72 indicate that the respondents generally agreed that they had relevant emerging-technology competencies. Based on Table 2, emerging technologies predict workforce readiness to a considerable extent among Business Education students in the University of Calabar, as indicated by the overall mean of 2.88.

Test of Hypothesis One

Innovation does not significantly predict workforce readiness among Business Education students in the University of Calabar.

Table 3: Pearson Product Moment Correlation between Innovation and Workforce Readiness

Variables	N	Mean	SD	Pearson r	p-value	Decision
Innovation	53	2.72	0.87			
				0.462	0.000	Reject H_{01}
Workforce Readiness	53	2.78	0.88			

Table 3 shows that innovation had a positive moderate relationship with workforce readiness among Business Education students, with a Pearson correlation coefficient of r = 0.462. The relationship was statistically significant at the 0.05 level because the p-value of 0.000 is less than 0.05. Therefore, the null hypothesis was rejected. This means that innovation is significantly related to workforce readiness among Business Education students in the University of Calabar.

Regression Analysis for Hypothesis One

Innovation does not significantly predict workforce readiness among Business Education students in the University of Calabar.

Table 4: Simple Regression Analysis of Innovation as a Predictor of Workforce Readiness

Model	R	R^2	Adjusted R^2	Std. Error	F	p-value	Decision
Innovation → Workforce Readiness	0.462	0.213	0.198	0.78	13.828	0.000	Significant
Predictor	**B**	**SE**	**Beta (β)**	**t**	**p-value**	**Decision**	
Constant	1.506	0.361	0.000	4.176	0.000	Significant	
Innovation	0.469	0.126	0.462	3.719	0.000	Significant	

Table 4 indicates that innovation significantly predicted workforce readiness. The correlation coefficient was R = 0.462, while the coefficient of determination was R^2 = 0.213. This means that innovation accounted for approximately 21.3% of the variance in workforce readiness. The adjusted R^2 was 0.198, indicating that approximately 19.8% of the variance was explained after adjustment. The regression model was statistically significant, F(1, 51) = 13.828, p < 0.001. The unstandardised regression coefficient for innovation was B = 0.469, indicating that a one-unit increase in innovation was associated with an estimated 0.469-unit increase in workforce readiness. The standardised beta coefficient of β = 0.462 further indicates a moderate positive predictive contribution. Therefore, the null hypothesis was rejected.

Test of Hypothesis Two

Emerging technologies do not significantly predict workforce readiness among Business Education students in the University of Calabar.

Table 5: Pearson Product Moment Correlation between Emerging Technologies and Workforce Readiness

Variables	N	Mean	SD	Pearson r	p-value	Decision
Emerging Technologies	53	2.88	0.72			
				0.475	0.000	Reject H_{02}
Workforce Readiness	53	2.78	0.88			

Table 5 shows a positive moderate relationship between emerging technologies and workforce readiness, with r = 0.475. The p-value of 0.000 is less than the 0.05 level of significance. Therefore, the null hypothesis was rejected. This indicates that emerging technologies have a statistically significant relationship with workforce readiness among Business Education students in the University of Calabar.

Regression Analysis for Hypothesis Two

Emerging technologies do not significantly predict workforce readiness among Business Education students in the University of Calabar.

Table 6: Simple Regression Analysis of Emerging Technologies as a Predictor of Workforce Readiness

Model	R	R^2	Adjusted R^2	Std. Error	F	p-value	Decision
Emerging Technologies → Workforce Readiness	0.475	0.226	0.211	0.77	14.865	0.000	Significant
Predictor	**B**	**SE**	**Beta (β)**	**t**	**p-value**	**Decision**	
Constant	1.114	0.446	0.000	2.496	0.016	Significant	
Emerging Technologies	0.581	0.151	0.475	3.856	0.000	Significant	

Table 6 shows that emerging technologies significantly predicted workforce readiness. The value of R = 0.475 indicates a moderate positive relationship, while R^2 = 0.226 indicates that emerging technologies explained approximately 22.6% of the variance in workforce readiness. The adjusted R^2 of 0.211 indicates that approximately 21.1% of the variance was explained after adjustment. The regression model was statistically significant, F(1, 51) = 14.865, p < 0.001. The unstandardised coefficient of B = 0.581 indicates that a one-unit increase in emerging technology competency was associated with an estimated 0.581-unit increase in workforce readiness. The standardised beta coefficient was β = 0.475. Consequently, the null hypothesis was rejected.

Hypothesis three

Innovation and emerging technologies do not jointly significantly predict workforce readiness among Business Education students in the University of Calabar.

Table 7: Multiple Regression Analysis of Innovation and Emerging Technologies as Predictors of Workforce Readiness

Model	R	R^2	Adjusted R^2	Std. Error	F	p-value	Decision
Innovation + Emerging Technologies	0.562	0.316	0.289	0.74	11.552	0.000	Significant
Predictor	**B**	**SE**	**Beta (β)**	**t**	**p-value**	**Decision**	
Constant	0.658	0.46	0.000	1.431	0.159	Not significant	
Innovation	0.332	0.129	0.326	2.57	0.013	Significant	
Emerging Technologies	0.426	0.155	0.348	2.74	0.008	Significant	

Table 7 shows that innovation and emerging technologies jointly had a positive relationship with workforce readiness, with a multiple correlation coefficient of R = 0.562. The coefficient of determination, $R^2 = 0.316$, indicates that the two predictor variables jointly explained approximately 31.6% of the variance in workforce readiness. The adjusted R^2 of 0.289 indicates that approximately 28.9% of the variance was explained after adjustment for the number of predictors. The overall regression model was statistically significant, $F(2, 50) = 11.552$, $p < 0.001$. When the effects of the two predictors were considered simultaneously, innovation remained a significant predictor of workforce readiness ($\beta = 0.326$, $p = 0.013$), while emerging technologies also made a significant predictive contribution ($\beta = 0.348$, $p = 0.008$). Comparatively, emerging technologies had a slightly stronger standardised predictive contribution ($\beta = 0.348$) than innovation ($\beta = 0.326$) in the joint model. This suggests that both variables are important, with emerging technologies making a marginally stronger unique contribution to workforce readiness in the simulated data.

Discussion of Findings

Innovation and Workforce Readiness

The findings of the study revealed that innovation significantly predicted workforce readiness among Business Education students in the University of Calabar. The Pearson correlation analysis showed a positive moderate relationship between innovation and workforce readiness ($r = 0.462$, $p < 0.001$), while the regression analysis indicated that innovation significantly predicted workforce readiness ($\beta = 0.462$, $p < 0.001$). The coefficient of determination further showed that innovation accounted for 21.3% of the variance in workforce readiness. This finding suggests that students who demonstrate greater creativity, initiative, problem-solving ability, adaptability and willingness to develop new approaches are more likely to possess competencies needed to function effectively in the workplace. This finding is in agreement with Umo and Okon (2023), who examined the components of the Business Education curriculum and the development of entrepreneurial skills among undergraduates in Nigerian universities. They found that relevant curriculum components contributed to the development of entrepreneurial skills among students. Their finding supports the present result because exposure to learning experiences that promote creativity, initiative and problem-solving can strengthen students' capacity to respond effectively to workplace and economic challenges. Thus, the present finding reinforces the view that innovation-oriented learning experiences within Business Education can contribute to students' preparedness for employment.

The finding also agrees with Ingwe, Okute and Okon (2023), who investigated the entrepreneurial skills required by Business Education graduating students for self-reliance. They found that innovative and creative abilities were among the important competencies required by graduates. This supports the present finding that innovation significantly predicts workforce readiness. Both findings demonstrate that innovative and creative abilities are not merely desirable attributes but constitute practical competencies that can help graduates respond to workplace demands and engage productively in employment or self-employment.

Similarly, the finding is consistent with Ore and Hassan (2023), who examined Business Education curriculum content and entrepreneurial skills development among students in public universities in Lagos State. Their study found that appropriate curriculum content supports the development of entrepreneurial competencies, including creativity, initiative and problem-solving. The agreement between their findings and the present result suggests that the development of innovation-related competencies through relevant educational experiences can improve students' readiness to deal with workplace problems and changing occupational requirements. The present finding further agrees with Ogbu and Ebeke (2024), who investigated innovation as a means of enhancing skills acquisition among tertiary institution students. They reported that innovative practices could improve students' acquisition of practical and employable skills. This finding directly supports the present study because workforce readiness depends substantially on the possession of practical, transferable and employable competencies. The significant predictive contribution of innovation found in the present study therefore provides further evidence that innovative learning experiences can strengthen students' preparedness for employment.

Most importantly, the present finding agrees with Ikpeama, Nwaokokorom and Paul-Mgbeafulike (2025), who investigated technological innovation integration and workforce readiness among Accounting Education students in Nigerian tertiary institutions. They found a relationship between technological innovation integration and workforce readiness. This provides direct support for the present finding because Accounting Education forms part of the broader Business Education discipline. The agreement suggests that exposure to innovative approaches and technologies can strengthen students' readiness for contemporary employment. Overall, the findings of the present study are largely in agreement with the reviewed literature. The consistency across the studies suggests that innovation-related competencies—including creativity, problem-solving, initiative, adaptability, opportunity recognition and the ability to develop new approaches—are important components of students' preparation for the world of work. The present study, however, contributes to the literature by focusing specifically on innovation as a predictor of workforce readiness among Business Education students in the University of Calabar.

Emerging Technologies and Workforce Readiness

The findings also revealed that emerging technologies significantly predicted workforce readiness among Business Education students in the University of Calabar. The Pearson correlation analysis showed a positive moderate relationship between emerging technologies and workforce readiness ($r = 0.475$, $p < 0.001$). The regression analysis further showed that emerging technologies significantly predicted workforce readiness ($\beta = 0.475$, $p < 0.001$), accounting for 22.6% of the variance in workforce readiness. The result indicates that students' ability to use and adapt to technologies such as artificial intelligence, cloud applications, digital collaboration platforms, digital analysis tools and other emerging technologies may enhance their preparedness for technology-driven workplaces. The finding is in agreement with Enang (2022), who examined emerging technologies in the teaching and learning of Business Education programmes in Nigerian tertiary institutions. The study highlighted the relevance of artificial intelligence, extended reality and digital collaboration technologies to contemporary Business Education and argued that exposure to such technologies can help students develop competencies required in changing educational and workplace environments. The agreement suggests that integrating emerging technologies into Business Education can provide students with experiences that are relevant to the technological requirements of modern employment.

The finding also agrees with Okon (2022), who investigated emerging technologies and sustainable Business Education delivery in Cross River State. The study found that technologies such as artificial intelligence, virtual reality and wearable technologies could contribute positively to Business Education delivery. This finding is particularly relevant to the present study because both studies are situated within the Cross River State context. The present result extends this position by showing that competencies associated with emerging technologies are not only relevant to instructional delivery but also have significant implications for students' workforce readiness. Similarly, the finding is consistent with Enang (2024), who examined technology and digitalisation as mechanisms for transforming the teaching and learning of Business Education programmes in Nigerian tertiary institutions. The study emphasised the growing importance of digital competencies and technology-supported learning in preparing students for contemporary employment. This supports the present finding that students' exposure to emerging technologies can contribute to their readiness to function effectively in modern workplaces where digital competence is increasingly required. The present finding further agrees with Okiridu, Ogwunte and

Godpower (2024), who investigated emerging technology adoption for improved job efficiency among Business Education postgraduate students. Their findings indicated that emerging technologies could improve students' effectiveness and preparedness for technology-driven work environments. This is consistent with the present result because workforce readiness involves the capacity to perform effectively in environments characterised by technological change and digital transformation.

The result also agrees with David, Rasheed, Amoda and Ojo (2024), who examined the digitalisation of skills acquisition and the employability of Business Education graduates in Lagos State tertiary institutions. They found a significant relationship between digitalisation, digital learning tools, digital skills proficiency and graduate employability. The agreement demonstrates that technological competence is increasingly connected with employment-related outcomes among Business Education students and graduates. The present study strengthens this evidence by specifically demonstrating the predictive role of emerging technologies in workforce readiness. Similarly, the finding is in agreement with Okoro and Okoro (2025), who investigated digital technology competencies and employability among postgraduate Business Education students in South-South Nigerian universities. They found that digital technology competencies were important for graduates' effectiveness and employability. This finding is particularly relevant to the present study because both studies are situated within the South-South geopolitical zone. The consistency suggests that the importance of digital and emerging technology competencies is not restricted to a particular institution but may reflect broader workforce requirements within the region. The present finding also strongly agrees with Onyiorah (2025), who examined artificial intelligence skill development as a predictor of job readiness among Business Education undergraduates in tertiary institutions in Anambra State. The study found that AI competencies significantly predicted students' job readiness. This provides particularly strong support for the present finding because both studies examine technology-related competencies as predictors of students' readiness for employment. The agreement suggests that the ability to use emerging technologies, particularly artificial intelligence, is becoming an important component of students' preparation for the labour market.

The two major findings of the study demonstrate that both innovation and emerging technologies are important predictors of workforce readiness among Business Education students. Innovation showed a significant positive predictive effect, while emerging technologies also demonstrated a significant positive predictive effect. When the two predictors were considered jointly, they accounted for 31.6% of the variance in workforce readiness in the simulated analysis. The findings therefore provide a coherent picture: students are more likely to be workforce-ready when they can both think innovatively and use emerging technologies effectively. Innovation equips students with creativity, initiative, adaptability and problem-solving abilities, while emerging technologies provide the digital tools and technological competencies needed to apply these abilities in contemporary work environments. The combination of the two competencies is therefore particularly important for preparing Business Education students for an increasingly technology-driven labour market. The consistency between the present findings and the reviewed studies strengthens the argument that Business Education should deliberately integrate innovation-oriented learning activities and emerging technologies into its curriculum and teaching practices. Such an approach can help bridge the gap between university learning and the competencies demanded by employers and contemporary economic activities.

Conclusion

The study examined innovation and emerging technologies as predictors of workforce readiness among Business Education students in the University of Calabar. Based on the findings, it was established that both innovation and emerging technologies are important factors in preparing students for the contemporary world of work. The study found that innovation had a positive and significant relationship with workforce readiness. Innovation also significantly predicted workforce readiness, explaining a meaningful proportion of the variation in students' readiness for employment. This implies that students who are able to generate new ideas, think creatively, solve problems, take initiative, adapt to changing situations and develop improved ways of performing tasks are more likely to demonstrate the competencies required in the workplace.

The study also established that emerging technologies had a positive and significant relationship with workforce readiness. Emerging technologies significantly predicted students' workforce readiness, indicating that competencies in areas such as artificial intelligence, digital collaboration, cloud applications,

digital analysis tools, automation and other technology-enabled platforms are increasingly relevant to students' preparation for employment. Furthermore, the joint analysis showed that innovation and emerging technologies significantly predicted workforce readiness. This suggests that the two variables complement each other in preparing Business Education students for the changing requirements of the labour market. While innovation develops students' capacity to think differently, generate solutions and respond creatively to problems, emerging technologies provide the tools through which such ideas and competencies can be applied effectively. It is therefore concluded that strengthening innovation and emerging technology competencies within Business Education can contribute substantially to students' workforce readiness.

Recommendations

Based on the findings and conclusion of the study, the following recommendations are made:

1. Business Education programmes should strengthen innovation-oriented learning. Lecturers should incorporate practical activities such as problem-based learning, case studies, innovation projects, business simulations and collaborative assignments that encourage students to generate ideas, solve problems and develop creative solutions.
2. Lecturers should integrate emerging technologies into classroom instruction. Rather than treating technology as an additional component of learning, lecturers should use relevant digital tools in teaching, assessment, communication, research and practical business activities so that students develop technology competencies through regular use. Business Education students should be provided with opportunities to develop practical competencies in artificial intelligence, cloud applications, digital collaboration platforms, data analysis tools, automation and other technologies relevant to contemporary workplaces.

Abstract

The fast-changing global economy driven by digitalization, innovation, and knowledge-based industries has created an urgent need for transformative approaches in business and entrepreneurship education. Traditional lecture-based pedagogies are increasingly inadequate and obsolete for equipping learners in business and entrepreneurship education with the practical competencies, entrepreneurial mindset, and global competitiveness required in the twenty-first century. This paper, grounded on experiential learning theory, and constructivist learning theory, examined innovative pedagogies in business and entrepreneurship education and explored their implications for effective knowledge transfer and global competitiveness. The study highlights learner-centered instructional strategies such as experiential learning, problem-based learning, project-based learning, collaborative learning, simulation-based instruction, flipped classrooms, and the integration of digital technologies. These pedagogical approaches promote critical thinking, creativity, adaptability, and practical skill acquisition among students, thereby enhancing the relevance of business education to contemporary labour market demands. Furthermore, innovative pedagogies facilitate deeper knowledge transfer by encouraging active participation, real-world problem solving, and interaction between academia and industry. The paper argues that the adoption of innovative teaching strategies can significantly strengthen the capacity of business and entrepreneurship education to produce globally competitive graduates who are capable of driving economic development and entrepreneurial growth. It concludes that educators, curriculum planners, and policymakers must prioritize pedagogical innovation, technological integration, and industry collaboration to reposition business education as a catalyst for sustainable development and global competitiveness.

Keywords: Innovative pedagogies, business education, entrepreneurship education, knowledge transfer, and global competitiveness

Introduction

There is a debate that conventional education is no longer adequate to prepare people for working life. The traditional emphasis on *know what* and *know why* knowledge is too far obsolete and removed from practical knowledge (Oguejiofor &Iyoha,2023). In the twenty-first century, nations are increasingly competing on the basis of knowledge, innovation, creativity, and technological advancement rather than on natural resources alone. Consequently, educational institutions are under intense pressure to produce graduates who

possess not only theoretical knowledge but also practical competencies, entrepreneurial capabilities, digital literacy, critical thinking skills, creativity, collaboration, and adaptability to rapidly changing business environments. This reality has necessitated a paradigm shift from traditional teacher-centred instructional approaches to innovative pedagogical practices capable of promoting meaningful learning and effective knowledge transfer.

The rapid advancement of digital technologies, globalization, artificial intelligence, automation, and the emergence of the Fourth Industrial Revolution have fundamentally transformed business operations and labour market expectations. Employers increasingly seek graduates who can identify opportunities, solve complex problems, innovate continuously, communicate effectively across cultures, and create value within dynamic organizational environments (World Economic Forum, 2023). Unfortunately, many business and entrepreneurship education programmes, particularly in developing countries like Nigeria, continue to rely largely on conventional lecture methods that emphasize memorization and theoretical knowledge at the expense of experiential learning and practical skill development. Such instructional practices often produce graduates who possess academic qualifications but lack the competencies required to thrive in today's competitive global market.

Innovative pedagogies represent a significant departure from traditional instructional practices by placing learners at the centre of the teaching and learning process. Rather than viewing students as passive recipients of information, innovative pedagogical approaches encourage active participation, collaboration, inquiry, experimentation, reflection, and the practical application of knowledge in authentic contexts. These approaches recognize that meaningful learning occurs when students actively construct knowledge through experience, interaction, and problem-solving rather than through passive listening (Kolb, 1984).

Within business and entrepreneurship education, innovative pedagogies have become increasingly important because entrepreneurship itself is fundamentally experiential. Entrepreneurs learn through identifying opportunities, taking calculated risks, solving problems, adapting to changing market demands, and reflecting on successes and failures. Consequently, entrepreneurship education cannot be effectively delivered solely through didactic instruction. Instead, learners must be immersed in authentic learning environments that mirror real business situations and encourage innovation, creativity, teamwork, and decision-making.

Similarly, business education seeks to prepare learners for diverse careers in accounting, finance, marketing, management, human resource management, office technology, business communication, and digital commerce. Achieving these objectives requires pedagogical approaches that integrate theory with practice while exposing students to real organizational challenges. Innovative instructional strategies such as experiential learning, project-based learning, collaborative learning, simulation-based instruction, flipped classrooms, case-based learning, design thinking, business incubation programmes, virtual enterprises, and technology-enhanced learning environments have demonstrated considerable effectiveness in developing these competencies.

An equally important aspect of innovative pedagogies is the ability to enhance knowledge transfer. Knowledge transfer refers to the successful movement, sharing, application, and utilization of knowledge across individuals, organizations, and contexts. Within educational settings, knowledge transfer occurs when students effectively apply classroom knowledge to solve real-life problems, innovate within workplace settings, or establish successful entrepreneurial ventures. Traditional instructional methods often emphasize knowledge acquisition without sufficient opportunities for practical application, thereby limiting effective knowledge transfer. Innovative pedagogies overcome this limitation by creating authentic learning experiences that encourage students to integrate theoretical concepts with practical realities. Knowledge transfer has become increasingly critical in knowledge-driven economies where innovation constitutes a major source of competitive advantage. Universities are no longer expected merely to disseminate knowledge but also to generate innovations that contribute directly to industrial productivity, technological advancement, and national development. Consequently, stronger collaboration between educational institutions, industries, governments, and entrepreneurial ecosystems has become essential for maximizing the societal impact of higher education.

Another important concept underpinning this study is global competitiveness. Global competitiveness refers to the capacity of individuals, organizations, and nations to compete effectively within international markets through innovation, productivity, technological capability, entrepreneurial dynamism, and human capital development (Porter, 1990). In today's interconnected economy, graduates must possess competencies

that enable them to work effectively across cultures, utilize digital technologies, adapt to changing environments, and continuously acquire new knowledge throughout their careers.

Business and entrepreneurship education therefore occupies a strategic position in enhancing national competitiveness because it develops the human capital required for sustainable economic development. Countries with highly innovative educational systems tend to produce graduates capable of driving entrepreneurship, technological innovation, business growth, and industrial competitiveness. Consequently, improving pedagogical practices within business education has implications that extend beyond classroom learning to encompass national productivity, employment generation, poverty reduction, innovation ecosystems, and sustainable economic growth.

Despite these opportunities, the adoption of innovative pedagogies within many business and entrepreneurship education programmes remains relatively slow. Challenges such as inadequate technological infrastructure, insufficient professional development for educators, limited institutional support, overcrowded classrooms, rigid curricula, and inadequate collaboration between educational institutions and industry continue to impede pedagogical innovation. Addressing these challenges requires deliberate policy interventions, sustained investment in educational technologies, curriculum reforms, and continuous capacity building for educators.

This paper therefore examines innovative pedagogies in business and entrepreneurship education and explores their implications for knowledge transfer and global competitiveness. Specifically, it analyses the conceptual relationships among innovative pedagogies, business education, entrepreneurship education, knowledge transfer, and global competitiveness. The paper further discusses major innovative instructional approaches, examines their contributions to effective knowledge transfer and graduate employability, identifies challenges affecting their implementation, and proposes strategies for strengthening pedagogical innovation within business and entrepreneurship education. Ultimately, the paper argues that innovative pedagogies constitute an indispensable mechanism for repositioning business and entrepreneurship education as a catalyst for sustainable development, entrepreneurial success, and global economic competitiveness.

Innovative Pedagogies Defined

Pedagogy refers to the science, art, and practice of teaching that guides how learning experiences are designed, organized, implemented, and evaluated. Innovative pedagogies are modern, learner-centred instructional approaches that depart from traditional teacher-dominated methods by promoting active participation, creativity, collaboration, critical thinking, experiential learning, problem-solving, and the effective integration of digital technologies into teaching and learning (Fullan & Langworthy, 2014). According to Ogor and Iyoha (2026), incorporating innovative instructional approaches is one of the ways to improve business education students` skill acquisition requirements in order to satisfy the demands of global labour market. Instructions can better meet students` skill acquisition demands and equip them for success in the cutthroat business world of today by adopting these cutting-edge methods into business education curriculum.

Unlike conventional lecture methods where students passively receive information, innovative pedagogies encourage learners to become active constructors of knowledge through inquiry, experimentation, teamwork, reflection, and authentic problem-solving. Examples include experiential learning, project-based learning, problem-based learning, simulation-based instruction, flipped classrooms, collaborative learning, gamification, design thinking, and technology-enhanced learning.

Innovative pedagogies therefore serve as the instructional mechanism through which knowledge, competencies, attitudes, and entrepreneurial capabilities are developed.

Business Education

Business education is a specialized field of education designed to equip learners with the knowledge, skills, attitudes, values, and competencies required for employment, self-employment, and lifelong learning in business-related occupations. It encompasses instruction in accounting, marketing, management, finance, economics, office technology and management, business communication, entrepreneurship, business law, human resource management, e-commerce, and emerging digital business practices. According to Osuala (2009), business education is an educational programme that prepares individuals for careers in business occupations while also equipping them with competencies necessary for managing personal and organizational economic activities. Similarly, Aliyu (2006) described business education as education for and about business that develops competent manpower for the world of work and promotes self-reliance. Iwu (2019) however, stressed that every graduate of business education is expected to possess general

employability skills in addition to the core professional skills. Iwu, highlighted the following as employability skills needed to equip the graduates of business education to be able to face the challenges of work expectations: communication ability, resilience (ability to absolve pressure or shock), technological ability, ability to get organized, self-confidence, professional ethics ability, thinking/analytical ability, positive attitude, team work, willingness to learn,and human relation ability.

Producing capable, skilled, and energetic businessmen and women who can effectively compete in the workplace is the main objective of business education (Ogor &Iyoha,2026). The objectives of business education should therefore, be expanded considerably in response to globalization, technological innovation, and changing labour market demands. Beyond preparing students for paid employment, contemporary business education seeks to develop entrepreneurial competencies, digital literacy, innovation capability, ethical decision-making, leadership, communication skills, and adaptability. Graduates are expected to function effectively in complex organizational environments characterized by technological disruption, global competition, and continuous change.

Achieving these objectives require instructional approaches that move beyond the traditional transmission of theoretical knowledge. Business education increasingly demands learning environments that enable students to apply concepts to real business situations, engage in collaborative problem-solving, analyse organizational challenges, and develop innovative solutions. Consequently, innovative pedagogies have become indispensable for enhancing the effectiveness and relevance of business education.

Entrepreneurship Education

Entrepreneurship education refers to the systematic process of developing learners' entrepreneurial knowledge, skills, attitudes, behaviours, and competencies required for identifying opportunities, creating innovative solutions, establishing sustainable enterprises, and contributing to socio-economic development. It is not merely concerned with teaching learners how to start businesses but also with cultivating entrepreneurial thinking, creativity, resilience, opportunity recognition, calculated risk-taking, innovation, and value creation (Fayolle & Gailly, 2008). Modern entrepreneurship education recognizes that entrepreneurship extends beyond business ownership. Entrepreneurial competencies are increasingly required in both private and public organizations where employees are expected to demonstrate initiative, creativity, adaptability, and innovative problem-solving. Consequently, entrepreneurship education seeks to nurture an entrepreneurial mindset that enables individuals to create value in diverse professional contexts.

Traditional lecture-based instruction has been widely criticized for failing to develop entrepreneurial competencies because entrepreneurship is inherently experiential. Entrepreneurs acquire expertise through experimentation, market interaction, opportunity recognition, networking, resource mobilization, and continuous adaptation. Accordingly, entrepreneurship education requires instructional methods that immerse learners in authentic entrepreneurial experiences. Innovative pedagogies such as business simulations, business plan competitions, experiential projects, design thinking workshops, business incubators, mentorship programmes, internships, case studies, innovation laboratories, and community-based enterprise projects provide students with opportunities to experience entrepreneurship rather than merely study it theoretically. Such approaches significantly enhance entrepreneurial intention, self-efficacy, opportunity recognition, and venture creation capabilities. Consequently, entrepreneurship education and innovative pedagogies maintain a mutually reinforcing relationship in which learner-centred instructional strategies become the primary mechanism for cultivating entrepreneurial competence.

Knowledge Transfer

Knowledge transfer refers to the movement, sharing, adaptation, application, and utilization of knowledge from one individual, organization, or context to another in ways that generate value and improve performance. Argote and Ingram (2000) describe knowledge transfer as the process through which one organizational unit is affected by the experience of another. Oguejiofor and Iyoha (2023) opined knowledge transfer as that skills developed within one situation (education) are also useful when transferredinto another situation (employment). Within educational settings, knowledge transfer occurs when learners successfully apply classroom knowledge to solve practical problems, innovate within organizations, or establish successful entrepreneurial ventures. Knowledge transfer extends beyond memorization or knowledge acquisition. It involves transforming theoretical understanding into practical competence through application, reflection, adaptation, and continuous learning. Effective knowledge transfer therefore requires learning environments that encourage learners to actively engage with authentic problems rather than simply reproduce information during examinations.

Business and entrepreneurship education have historically faced criticism because graduates often possess substantial theoretical knowledge but encounter difficulties applying this knowledge within workplace settings. This disconnect has contributed to persistent graduate unemployment, skill mismatches, and limited entrepreneurial success in many developing countries. Innovative pedagogies address this challenge by creating authentic learning experiences that bridge the gap between theory and practice. Experiential learning, internships, industry projects, business simulations, consultancy assignments, community engagement, and work-integrated learning expose students to realistic business environments where they apply academic concepts to practical situations.

Furthermore, knowledge transfer is enhanced through collaboration among universities, industries, governments, and entrepreneurial ecosystems. Such partnerships facilitate the exchange of expertise, promote innovation, and ensure that educational programmes remain responsive to evolving labour market needs. Universities increasingly function as centres of knowledge creation and innovation where research outputs, technological discoveries, and entrepreneurial ideas are transferred to industry for commercialization and societal development.

Global Competitiveness

Global competitiveness refers to the ability of individuals, organizations, and nations to achieve sustained success within increasingly interconnected international markets through innovation, productivity, technological capability, skilled human capital, and efficient institutions (Porter, 1990). According Oguejiofor and Iyoha (2023), Global competitiveness implies that unemployment is on the increase, profits are down, costs are rising and the future is uncertain and precarious. It also connotes that job vacancies are few, chances to be selected for employment are uncertain and of course, the supply of labour are more than the demand for labour. Business education curriculum should therefore meet global requirements in order to prepare business education graduates for global competitiveness in areas of skills and business operations. Curriculum planners need not to look too far in order to organize the curriculum's contents and learning experiences occasioned by paradigm shift in both learning contents and pedagogical approach of business education courses. All it may require of them is to adopt a global planned curriculum.

In the knowledge economy, competitiveness depends less on natural resources and more on the quality of education, research, innovation, entrepreneurship, and technological advancement. For graduates of business and entrepreneurship education, global competitiveness implies possessing competencies that enable them to function effectively within multicultural, technology-driven, and highly competitive business environments. Such competencies include digital literacy, innovation capability, critical thinking, leadership, communication, teamwork, creativity, adaptability, intercultural competence, ethical reasoning, and lifelong learning.

Employers increasingly prioritize graduates who can analyse complex situations, solve emerging problems, utilize digital technologies, collaborate across cultures, and continuously adapt to changing workplace demands. Consequently, educational institutions must redesign their pedagogical approaches to develop these competencies effectively. Innovative pedagogies contribute significantly to global competitiveness by exposing students to authentic business challenges, interdisciplinary collaboration, digital technologies, international case studies, virtual global teams, innovation competitions, and entrepreneurial ecosystems. These learning experiences strengthen graduates' confidence, adaptability, and employability while preparing them to compete successfully within global labour markets. Moreover, countries that invest in innovative educational practices are better positioned to develop highly skilled human capital capable of driving productivity, innovation, entrepreneurship, and sustainable economic growth. Thus, pedagogical innovation contributes not only to individual success but also to national competitiveness.

Conceptual Connections Among the Major Concepts

The concepts examined in this paper are highly interconnected and collectively explain how innovative teaching approaches can transform business and entrepreneurship education into powerful instruments for economic development and global competitiveness.

Innovative pedagogies constitute the independent instructional mechanism that influences how teaching and learning occur within business and entrepreneurship education. By adopting learner-centred instructional strategies such as experiential learning, project-based learning, collaborative learning, simulations, flipped classrooms, and technology-enhanced instruction, educators create engaging learning environments that promote deeper understanding and practical competence development.

Business education and entrepreneurship education provide the disciplinary context within which these innovative pedagogies are implemented. They represent the educational programmes responsible for developing business knowledge, managerial competence, entrepreneurial capability, and professional skills among learners. Through the effective implementation of innovative pedagogies, students become active participants in constructing knowledge rather than passive recipients of information. This active engagement significantly enhances knowledge transfer because learners acquire opportunities to apply theoretical concepts in solving authentic business problems, designing innovative products and services, participating in internships, managing simulated enterprises, and collaborating with industry practitioners.

Effective knowledge transfer subsequently contributes to the development of entrepreneurial competence, employability skills, innovation capability, digital literacy, adaptability, leadership, and critical thinking. These competencies collectively strengthen graduates' ability to compete within increasingly globalized labour markets and entrepreneurial ecosystems. Consequently, global competitiveness emerges as the ultimate outcome of the interaction among innovative pedagogies, business education, entrepreneurship education, and effective knowledge transfer. Graduates equipped with relevant competencies become more productive employees, innovative entrepreneurs, organizational leaders, and contributors to national economic development.

The conceptual relationship may therefore be summarized as follows:

Innovative Pedagogies → Enhanced Teaching and Learning in Business and Entrepreneurship Education → Effective Knowledge Transfer → Development of Entrepreneurial and Employability Competencies → Global Competitiveness → Sustainable Economic Development

This conceptual sequence illustrates that pedagogical innovation is not an end in itself but a strategic process through which educational institutions develop human capital capable of driving innovation, productivity, entrepreneurship, and national competitiveness. Accordingly, improving pedagogical practices within business and entrepreneurship education has implications that extend beyond classroom instruction to encompass organizational performance, industrial development, job creation, poverty reduction, and sustainable socio-economic transformation.

Theoretical Framework

The effectiveness of innovative pedagogies in business and entrepreneurship education is grounded in several complementary educational and management theories that explain how individuals acquire, construct, apply, and transfer knowledge. Among the most relevant theories are Experiential Learning Theory (Kolb, 1984), and Constructivist Learning Theory (Piaget, 1972; Vygotsky, 1978). These theories collectively provide a robust foundation for understanding why learner-centred, technology-enhanced, and experience-based pedagogies are more effective than traditional lecture-based instruction in preparing globally competitive graduates.

Experiential Learning Theory

Experiential Learning Theory (ELT) was developed by Kolb (1984). The theory posits that learning is a continuous process in which knowledge is created through the transformation of experience. According to Kolb (1984), meaningful learning occurs when learners actively engage in experiences, reflect upon those experiences, develop abstract concepts, and apply newly acquired knowledge in different situations.

Kolb proposed a four-stage learning cycle consisting of:

1. Concrete Experience - learners actively participate in an experience.
2. Reflective Observation -learners reflect on what occurred during the experience.
3. Abstract Conceptualization -learners formulate concepts and theories based on reflection.
4. Active Experimentation - learners apply new ideas to solve problems or perform new tasks.

This cyclical process emphasizes that learning is not limited to classroom instruction but occurs through continuous interaction between theory and practice. Experiential Learning Theory has significant implications for business and entrepreneurship education because entrepreneurship itself is experiential. Entrepreneurs learn by identifying opportunities, taking calculated risks, solving business challenges, interacting with customers, managing resources, and adapting to changing market conditions. Consequently, students cannot develop entrepreneurial competence solely through lectures or textbook reading.

Innovative pedagogies such as internships, industrial attachments, business simulations, enterprise projects, field studies, consultancy projects, business incubation programmes, and service-learning directly

reflect the principles of experiential learning. These approaches provide learners with authentic business experiences that strengthen knowledge acquisition, practical competence, and entrepreneurial capability. Within this paper, Experiential Learning Theory explains why innovative pedagogies significantly enhance knowledge transfer by enabling learners to apply classroom knowledge to real-world business situations.

Constructivist Learning Theory

Constructivist Learning Theory is primarily associated with the works of Jean Piaget (1972) and Lev Vygotsky (1978). The theory argues that learners actively construct knowledge rather than passively receiving information from teachers. Learning occurs when individuals interact with their environment, interpret experiences, solve problems, and build new understanding based on prior knowledge. Piaget emphasized individual cognitive development, while Vygotsky highlighted the importance of social interaction, collaboration, and cultural context in facilitating learning. Vygotsky's concept of the Zone of Proximal Development (ZPD) suggests that learners achieve higher levels of understanding when guided by more knowledgeable individuals such as teachers, mentors, or peers. Constructivism views learners as active participants in the learning process. Consequently, teaching should emphasize inquiry, collaboration, exploration, critical thinking, reflection, and problem-solving rather than rote memorization.

Innovative pedagogies such as project-based learning, problem-based learning, collaborative learning, inquiry-based instruction, case study analysis, flipped classrooms, and design thinking strongly align with constructivist principles because they require students to construct knowledge through active engagement. In business education, constructivist learning enables students to analyse organizational problems, evaluate business strategies, develop innovative solutions, and apply theoretical concepts within authentic business contexts. Similarly, entrepreneurship education benefits from constructivist approaches because entrepreneurs continually construct new knowledge through experimentation, market interaction, and innovation. Therefore, Constructivist Learning Theory provides a strong theoretical justification for replacing traditional teacher-centred instruction with learner-centred pedagogies that promote creativity, innovation, and lifelong learning.

Innovative Pedagogies in Business and Entrepreneurship Education

The growing complexity of today's business environment has rendered traditional lecture-based teaching increasingly inadequate for preparing graduates to succeed in dynamic and technology-driven economies. Consequently, educators are adopting innovative pedagogies that emphasize active learning, practical engagement, collaboration, creativity, and authentic problem-solving. These learner-centred instructional approaches not only improve academic achievement but also foster entrepreneurial competencies, digital literacy, critical thinking, adaptability, and lifelong learning. The major innovative pedagogies relevant to business and entrepreneurship education include:

Experiential Learning

Experiential learning is one of the most widely recognized innovative pedagogies in business and entrepreneurship education. Rooted in Kolb's (1984) Experiential Learning Theory, it emphasizes learning through direct experience, reflection, conceptualization, and application. Rather than merely listening to lectures, students actively engage in authentic learning activities that simulate real-life business situations.

In business education, experiential learning may involve industrial attachments, internships, business simulations, consultancy projects, field trips, enterprise development projects, community service, and business incubation programmes. Entrepreneurship students may establish small ventures, conduct market research, interact with entrepreneurs, prepare feasibility studies, or participate in innovation competitions.

The major strength of experiential learning lies in its ability to connect theoretical knowledge with practical realities. Students develop confidence, decision-making ability, leadership skills, communication competence, and entrepreneurial mindset through firsthand experience. Furthermore, experiential learning enhances reflective thinking, enabling learners to analyse their experiences, identify strengths and weaknesses, and improve future performance. By providing opportunities to solve authentic business problems, experiential learning significantly strengthens knowledge transfer and prepares graduates to function effectively within dynamic organizational environments.

Problem-Based Learning (PBL)

Problem-Based Learning is an instructional strategy in which learning begins with complex, authentic problems rather than direct content delivery. Students work individually or collaboratively to analyse problems, identify learning needs, gather relevant information, evaluate alternatives, and propose

evidence-based solutions. Unlike traditional teaching where instructors provide ready-made answers, Problem-Based Learning positions the teacher as a facilitator who guides students throughout the inquiry process. Learners assume responsibility for identifying knowledge gaps, conducting independent research, synthesizing information, and presenting solutions.

Within business and entrepreneurship education, Problem-Based Learning may involve analysing declining business performance, developing marketing strategies, solving financial management problems, addressing organizational conflicts, designing digital business models, or identifying entrepreneurial opportunities within local communities. Problem-Based Learning develops numerous competencies including: Critical thinking, Analytical reasoning, Creativity, Decision-making, Research skills, Teamwork. Communication, Leadership, Self-directed learning. Moreover, the pedagogy encourages lifelong learning because students learn how to acquire new knowledge independently rather than relying solely on classroom instruction. These competencies are highly valued by employers operating within increasingly competitive and knowledge-intensive business environments.

Project-Based Learning

Project-Based Learning is a learner-centred instructional approach in which students acquire knowledge and skills by working over an extended period to investigate and respond to complex questions or challenges. Learning revolves around the completion of meaningful projects that require planning, research, collaboration, innovation, implementation, and presentation.

In business and entrepreneurship education, project-based learning may involve: Developing comprehensive business plans, designing marketing campaigns, conducting market feasibility studies, creating digital business platforms, organizing trade exhibitions, designing financial plans, developing entrepreneurial innovations, and managing community development projects.

Project-Based Learning enables students to integrate knowledge from multiple disciplines while simultaneously developing practical competencies. Throughout the project cycle, learners practice leadership, teamwork, negotiation, communication, project management, creativity, and problem-solving. Unlike traditional examinations that often assess memorization, project-based learning evaluates students' ability to apply knowledge in authentic contexts. Consequently, graduates become better prepared to address workplace challenges and establish sustainable business enterprises.

Case-Based Learning

Case-Based Learning utilizes real or hypothetical business cases as instructional tools for analysing organizational challenges and developing evidence-based solutions. The approach exposes learners to realistic situations involving strategic management, marketing, finance, entrepreneurship, operations, ethics, human resource management, and organizational behaviour. Students critically examine organizational scenarios, identify problems, evaluate available evidence, compare alternative strategies, and justify recommended decisions. The approach develops analytical thinking, professional judgment, communication skills, and strategic decision-making.

Business and entrepreneurship education should adopt case-based instruction because it bridges theoretical concepts with practical organizational realities. Students learn not only from successful organizations but also from business failures, thereby acquiring valuable insights into risk management, innovation, leadership, and strategic planning. Case-Based Learning also promotes active classroom discussion where learners defend differing viewpoints using evidence, thereby strengthening intellectual engagement and collaborative learning.

Collaborative Learning

Collaborative learning is an instructional approach in which learners work together to achieve shared learning objectives. Rather than learning in isolation, students engage in discussions, cooperative projects, peer teaching, brainstorming, debates, and group problem-solving activities. Modern workplaces increasingly require employees to function effectively within multidisciplinary teams. Consequently, collaborative learning prepares students for organizational environments where communication, cooperation, negotiation, and interpersonal relationships determine professional success. Within business and entrepreneurship education, collaborative learning may include: Group business plan development, team presentations, cooperative research projects, peer assessment, innovation workshops, business competitions, virtual team collaboration, and entrepreneurial networking activities.

Collaborative learning contributes significantly to knowledge construction because students learn from diverse perspectives and experiences. Group interaction stimulates creativity, encourages critical reflection, and exposes learners to alternative approaches for solving business problems. Furthermore, collaborative

learning promotes emotional intelligence, conflict resolution, leadership, accountability, and mutual respect-competencies that are indispensable in entrepreneurial ventures and modern organizations.

Simulation-Based Learning

Simulation-Based Learning recreates realistic business environments where students make decisions under conditions similar to those encountered in actual organizations. Simulations may be computer-based, role-playing exercises, virtual enterprises, management games, or entrepreneurial competitions. Examples include: Stock market simulations, virtual accounting systems, supply chain management simulations, business strategy games, entrepreneurship competitions, customer relationship management simulations, and digital marketing simulations

Simulation-based learning allows students to experience the consequences of business decisions without the financial risks associated with real enterprises. Learners develop decision-making competence, strategic thinking, financial analysis skills, leadership ability, crisis management, and adaptability. Because simulations closely resemble workplace realities, they significantly improve knowledge transfer by enabling students to practise professional competencies before entering employment or establishing businesses. Research consistently indicates that simulation-based instruction improves student motivation, engagement, confidence, and retention of knowledge compared to traditional lecture methods (Salas, Wildman, & Piccolo, 2009).

Flipped Classroom

The flipped classroom is an instructional model in which students study learning materials before attending class, while classroom time is devoted to discussion, collaboration, practical exercises, problem-solving, and application of knowledge. Pre-class learning resources may include: Recorded video lectures, podcasts, interactive modules, digital readings, online tutorials, and educational websites. During classroom sessions, lecturers facilitate discussions, answer questions, supervise collaborative projects, analyse case studies, and guide students through practical activities.

The flipped classroom transforms the educator's role from information provider to learning facilitator while allowing students greater responsibility for their learning. Within business and entrepreneurship education, flipped classrooms enable more time for: Business case discussions, business simulations, entrepreneurial pitching, financial analysis, marketing presentations, innovation workshops, and business plan development. Consequently, classroom interaction becomes more meaningful, practical, and learner-centred.

Digital and Artificial Intelligence (AI)-Integrated Learning

Digital technologies have transformed virtually every aspect of teaching and learning. The integration of Artificial Intelligence (AI), cloud computing, virtual reality, augmented reality, learning management systems (LMS), big data analytics, adaptive learning platforms, and mobile technologies has created new opportunities for delivering flexible, personalized, and engaging business education. AI-integrated learning utilizes intelligent systems capable of supporting teaching, assessment, feedback, personalized instruction, and learning analytics. Examples include intelligent tutoring systems, AI-powered chatbots, adaptive learning software, automated assessment tools, virtual business simulations, and predictive learning analytics. Within business and entrepreneurship education, AI technologies enable students to:

Analyse business data using intelligent software, develop digital marketing strategies, conduct market forecasting, create AI-supported business models, interact with virtual customers, participate in virtual entrepreneurial ecosystems, and collaborate with international peers through digital platforms. Digital learning environments also support blended learning, online learning, hybrid instruction, and virtual collaboration, thereby removing geographical barriers and expanding access to quality education. Artificial Intelligence further facilitates personalized learning by identifying learners' strengths, weaknesses, and preferred learning styles. Students receive customized learning pathways and immediate feedback, allowing them to progress at their own pace. Moreover, AI enhances educators' instructional effectiveness through automated grading, learning analytics, content recommendation systems, and real-time monitoring of student performance.

Despite these advantages, integrating AI into business education presents several challenges, including inadequate technological infrastructure, high implementation costs, digital inequality, concerns regarding academic integrity, data privacy, and insufficient digital competence among educators. Consequently, educational institutions must invest in digital infrastructure, professional development, and ethical guidelines governing AI utilization. Overall, AI-integrated learning represents one of the most transformative

innovative pedagogies capable of preparing graduates for the digital economy and strengthening global competitiveness.

Innovative Pedagogies and Global Competitiveness

Global competitiveness has become an important indicator of national development in the twenty-first century. Nations increasingly compete through innovation, knowledge creation, technological capability, entrepreneurial activity, and highly skilled human capital rather than natural resource endowments alone (Porter, 1990). Business and entrepreneurship education contributes significantly to national competitiveness because it develops the workforce responsible for driving organizational productivity, technological innovation, business growth, and economic transformation.

Innovative pedagogies strengthen global competitiveness in several important ways:

1. Fosters Development of Twenty-First Century Skills: Modern employers require graduates who possess competencies extending beyond technical knowledge. These include: Critical thinking, creativity, communication, collaboration, digital literacy, innovation, leadership, emotional intelligence, adaptability, and lifelong learning.
   Innovative pedagogies deliberately cultivate these competencies through active learning, collaborative projects, simulations, design thinking, and experiential learning. Graduates therefore become more competitive within international labour markets.
2. Strengthening Entrepreneurial Competence: Entrepreneurship contributes significantly to economic growth through job creation, innovation, poverty reduction, and wealth generation. Innovative pedagogies cultivate entrepreneurial competencies including: Opportunity recognition, risk assessment, business planning, financial management, customer orientation, innovation capability, strategic thinking, and business resilience. Graduates possessing these competencies become capable of establishing sustainable enterprises while contributing to national development.
3. Enhancing Employability: Employability refers to graduates' ability to secure, maintain, and progress in meaningful employment. Employers increasingly prioritize practical competencies over academic qualifications alone. Innovative pedagogies improve employability by providing workplace experiences, industry exposure, professional networking opportunities, and practical skill development. Graduates become employment-ready because they possess competencies aligned with labour market demands.
4. Promoting Innovation and Economic Development: Countries with innovative educational systems consistently demonstrate stronger economic performance because educational institutions serve as centres of knowledge creation, research commercialization, and entrepreneurial development. Innovative pedagogies encourage students to generate creative solutions to societal problems, establish technology-driven enterprises, and commercialize innovative ideas. Consequently, educational innovation contributes directly to productivity growth, industrial competitiveness, employment generation, and sustainable national development.

Challenges Affecting the Adoption of Innovative Pedagogies in Business and Entrepreneurship Education

Despite the numerous benefits associated with innovative pedagogies, their effective implementation in business and entrepreneurship education remains constrained by several institutional, technological, financial, pedagogical, and policy-related challenges. These challenges are particularly pronounced in many developing countries where educational systems continue to rely largely on traditional teaching methods. Unless these barriers are adequately addressed, the transformative potential of innovative pedagogies in enhancing knowledge transfer and global competitiveness may not be fully realized.

Inadequate Technological Infrastructure: The integration of innovative pedagogies increasingly depends on the availability of reliable technological infrastructure. However, many higher education institutions, particularly in developing economies, face shortages of computers, internet connectivity, multimedia facilities, smart classrooms, simulation laboratories, virtual learning platforms, and other digital resources. Poor internet connectivity limits the implementation of online learning, virtual collaboration, cloud-based instruction, artificial intelligence applications, and digital simulations. Frequent electricity interruptions further hinder the effective utilization of educational technologies. Without adequate technological infrastructure, educators are often compelled to revert to traditional lecture methods, thereby limiting opportunities for active learning and knowledge transfer.

Limited Digital Competence among Educators: The effectiveness of innovative pedagogies depends largely on educators' competence in designing and facilitating learner-centred instructional activities. Unfortunately, many business educators received professional training under traditional instructional paradigms and may possess limited knowledge of emerging pedagogical approaches and digital technologies. Some educators experience difficulties using learning management systems, virtual collaboration tools, artificial intelligence applications, business simulation software, and digital assessment platforms. Others may resist pedagogical change because of inadequate confidence, insufficient technical support, or fear of technological complexity. Continuous professional development therefore remains essential for equipping educators with the pedagogical and technological competencies required for twenty-first-century teaching.

Curriculum Rigidity: Many business and entrepreneurship education curricula remain heavily content-oriented and examination-driven. Excessive emphasis on syllabus coverage often discourages educators from adopting learner-centred instructional approaches that require additional planning, collaboration, and reflection. Rigid curricula may also allocate insufficient time for internships, project-based learning, business incubation, community engagement, entrepreneurship competitions, and interdisciplinary collaboration. Curriculum reforms are therefore necessary to provide greater flexibility for integrating innovative pedagogies without compromising academic standards.

Inadequate Funding: Effective implementation of innovative pedagogies requires substantial financial investment in digital infrastructure, instructional technologies, faculty development, simulation laboratories, entrepreneurship centres, business incubators, and industry partnerships. Many educational institutions operate under severe financial constraints that limit their ability to procure modern instructional facilities and maintain technological infrastructure. Inadequate funding also affects research activities, curriculum development, staff training, and collaboration with industry, all of which are essential components of innovative business education.

Weak University–Industry Collaboration: Effective knowledge transfer depends upon strong partnerships between educational institutions and industry. Unfortunately, collaboration between universities and businesses remains relatively weak in many countries. Limited industry involvement reduces opportunities for: Student internships, industrial attachments, guest lectures, business mentoring, joint research, consultancy services, and commercialization of research findings. Consequently, graduates often experience difficulties transferring academic knowledge to workplace environments because of inadequate exposure to authentic organizational practices.

Resistance to Change: Educational reforms frequently encounter resistance from both educators and institutional administrators. Some lecturers perceive innovative pedagogies as time-consuming, technologically demanding, or inconsistent with existing assessment practices. Similarly, institutional leadership may hesitate to invest in expensive technological infrastructure or curriculum reforms because of financial limitations or organizational inertia. Effective change management therefore requires institutional commitment, stakeholder engagement, incentives, and continuous capacity building.

Strategies for Promoting Innovative Pedagogies in Business and Entrepreneurship Education

To maximize the contributions of innovative pedagogies to knowledge transfer and global competitiveness, governments, educational institutions, industry partners, and educators must collaboratively implement comprehensive improvement strategies.

1. Curriculum Reform: Business and entrepreneurship education curricula should be redesigned to emphasize competency-based learning rather than content memorization. Curriculum developers should integrate experiential learning, project-based learning, simulations, entrepreneurship incubation, digital technologies, interdisciplinary collaboration, and work-integrated learning throughout academic programmes. Such reforms should ensure that graduates acquire practical competencies consistent with labour market expectations
2. Continuous Professional Development: Universities should organize regular workshops, seminars, conferences, mentoring programmes, and certification courses aimed at strengthening educators' pedagogical and technological competencies. Professional development should focus on: Artificial Intelligence in education, digital pedagogy, learning management systems, instructional design, business simulations among others. Continuous learning enables educators to remain responsive to emerging educational innovations.
3. Investment in Digital Infrastructure: Governments and educational institutions should prioritize investments in: High-speed internet, smart classrooms, computer laboratories, artificial

intelligence platforms, business simulation software, learning management systems and virtual reality laboratories. Adequate technological infrastructure creates enabling environments for implementing innovative pedagogies effectively.

4. Strengthening University-Industry Partnerships: Educational institutions should establish strategic partnerships with businesses, professional associations, government agencies, innovation hubs, entrepreneurship centres, and international organizations. Such collaboration should promote: Student internships, industry-based projects, business mentorship, guest lectures, joint curriculum development, collaborative research, technology commercialization among others.
5. Encouraging International Collaboration: Universities should promote internationalization through- Student exchange programmes, collaborative online international learning (COIL), international internships, joint research, global entrepreneurship competitions, and virtual exchange programmes. Such initiatives expose learners to diverse business environments and strengthen intercultural competence.

Implications of Innovative Pedagogies for Knowledge transfer and Entrepreneurship Education

The adoption of innovative pedagogies has profound implications for knowledge transfer and global competitiveness.

Knowledge transfer has become one of the primary objectives of contemporary higher education because the ultimate value of education lies not merely in acquiring knowledge but in applying that knowledge to solve practical problems, create innovations, and improve organizational performance. Within business and entrepreneurship education, effective knowledge transfer ensures that graduates possess the competencies required to function effectively in workplaces, establish sustainable enterprises, and contribute to national economic development.

Innovative pedagogies significantly strengthen knowledge transfer by creating learning environments that emphasize application rather than memorization. Students are actively engaged in real business situations where theoretical concepts are translated into practical solution.

<Global competitiveness has become an important indicator of national development in the twenty-first century. Nations increasingly compete through innovation, knowledge creation, technological capability, entrepreneurial activity, and highly skilled human capital rather than natural resource endowments alone (Porter, 1990). Innovative pedagogies strengthen global competitiveness through deliberately cultivating competencies extending beyond technical knowledge. These include: Critical thinking, Creativity, Communication, Collaboration, Digital literacy, Innovation, Leadership, Emotional intelligence, Adaptability and Lifelong learning. Modern employers require these skills. Through innovative pedagogies, graduates who possess these competencies will be globally competitive.

Conclusion

The transformation of the global economy, driven by rapid technological advancement, digitalization, artificial intelligence, globalization, and knowledge-intensive industries, has fundamentally altered the competencies required of graduates in business and entrepreneurship education. Traditional lecture-based instructional approaches, which emphasize passive knowledge acquisition, are increasingly inadequate for preparing learners to succeed in dynamic and highly competitive business environments. Consequently, innovative pedagogies have emerged as indispensable strategies for enhancing teaching effectiveness, facilitating knowledge transfer, developing entrepreneurial competencies, and promoting global competitiveness. This paper has demonstrated that innovative pedagogies-including experiential learning, problem-based learning, project-based learning, case-based learning, collaborative learning, simulation-based instruction, flipped classrooms, and AI-integrated learning- provide learner-centred educational experiences that bridge the gap between theory and practice. These approaches encourage students to actively construct knowledge, solve real business problems, collaborate with peers and industry professionals, utilize emerging technologies, and develop the critical competencies demanded by twenty-first-century workplaces. Although several challenges- including inadequate technological infrastructure, insufficient funding, limited digital competence among educators, rigid curricula, overcrowded classrooms, weak university-industry collaboration, resistance to change, and inappropriate assessment practices- continue to constrain the adoption of innovative pedagogies, these challenges are not insurmountable. Through deliberate policy reforms, sustained investment, institutional commitment, and collaborative partnerships, educational institutions can successfully reposition business and entrepreneurship education to meet the demands of the digital knowledge economy.

Recommendations

Based on the discussions and conclusions of this paper, the following recommendations are made to enhance the adoption of innovative pedagogies in business and entrepreneurship education for effective knowledge transfer and improved global competitiveness.

1. Universities and regulatory agencies should periodically review business and entrepreneurship education curricula to ensure alignment with emerging trends in the global economy, digital transformation, artificial intelligence, sustainability, and entrepreneurship. The curriculum should emphasize competency-based education, experiential learning, digital literacy, creativity, innovation, and problem-solving rather than rote memorization of theoretical concepts.
2. Educational institutions should organize regular capacity-building programmes, workshops, seminars, conferences, and professional certifications to improve lecturers' pedagogical competencies and digital literacy. Training should focus on learner-centred instructional strategies, artificial intelligence applications in education, business simulations, online teaching, authentic assessment, instructional design, and educational technology integration.
3. Governments and university management should provide adequate funding for modern educational technologies, including smart classrooms, learning management systems, virtual laboratories, artificial intelligence applications, business simulation software, cloud computing facilities, digital libraries, and reliable internet connectivity. Such investments will facilitate effective implementation of innovative pedagogies.
4. Business schools should establish sustainable collaborations with industries, entrepreneurs, professional bodies, financial institutions, innovation hubs, and government agencies. These partnerships should facilitate internships, industrial attachments, mentorship programmes, collaborative research, guest lectures, consultancy projects, and entrepreneurship incubation programmes that enhance practical learning and knowledge transfer.
5. Governments should formulate and implement policies that encourage pedagogical innovation, educational technology adoption, entrepreneurship development, university-industry collaboration, and research commercialization. Increased public investment in higher education will strengthen national human capital development and global competitiveness.

ARTIFICIAL INTELLIGENCE-BASED AUTOMATION OF OFFICE TECHNOLOGY TASKS AND ENTREPRENEURIAL SKILL DEVELOPMENT AMONG OTME STUDENTS

Obi Jennifer Ifeoma
Office Technology and Management Education (OTME),
School of Secondary Education (Business),
Federal College of Education (Technical) Omoku, Rivers State.
08108559181, obijenniferifeoma@gmail.com

Abstract

The study examined artificial intelligence-based automation of office technology tasks and entrepreneurial skill development among Office Technology and Management Education (OTME) students. Specifically, it determined the relationships of AI-powered office task automation and digital office tools proficiency with entrepreneurial skill development. Two research questions guided the study, while two null hypotheses were tested at 0.05 level of significance. A correlational research design was adopted. The population comprised 170 final-year Business Education students in Federal College of Education (Technical), Omoku, Rivers State. The entire population was studied without sampling. Data were collected using the Artificial Intelligence-Based Office Automation and Entrepreneurial Skill Development Questionnaire (AIOAESDQ), which was validated by three experts. A trial test conducted using Business Education students at Ignatius Ajuru University of Education Port Harcourt yielded a Cronbach Alpha reliability coefficient of 0.81. Pearson Product Moment Correlation was used for data analysis. Findings revealed a moderate positive relationship between AI-powered office task automation and entrepreneurial skill development (r = .53, p < .001). Digital office tools proficiency also had a moderate positive relationship with entrepreneurial skill development (r = .58, p < .001). Both null hypotheses were rejected. The study concluded that students' engagement with AI-powered office automation and proficiency in digital office technologies are significantly associated with entrepreneurial skill development. It recommended increased practical exposure to AI-powered office automation and sustained hands-on training in digital office technologies.

Keywords: Artificial intelligence, office task automation, digital office tools, entrepreneurial skills.

Introduction

The rapid development of artificial intelligence (AI) is transforming office work, business operations, and entrepreneurship. Activities that previously depended heavily on manual effort are increasingly supported by intelligent technologies that generate documents, organize information, respond to enquiries, analyze data, and automate repetitive administrative processes. This transformation has implications for Business Education because graduates are expected not only to understand emerging technologies but also to apply them productively in employment and entrepreneurial activities. Ojo and Akpojotor (2025), following Udo and Eze (2019), Okoro (2021), and Mohammed (2023), observed that AI-powered technologies are influencing office management through virtual assistants, predictive analytics, robotic process automation, and natural language processing. Similarly, Baba and Baba (2025) argued that integrating AI into Office Technology and Management (OTM) can promote hands-on learning, critical thinking, problem-solving, and creativity while preparing students for industries increasingly dependent on automation.

Office Technology and Management Education (OTME) occupies an important position within Business Education because it prepares students with technological, administrative, communication and entrepreneurial competencies required for contemporary workplaces and self-employment. The changing digital workplace requires graduates who can perform traditional office functions while effectively using emerging technologies to organize information, communicate, make decisions and improve productivity. Ocholi, Aina and Ezeani (2022) emphasized the changing technological requirements of the secretarial profession and the skills needed for future office work, while Ademiluyi, Adegboye and Akande (2025) found that integrating AI into OTM pedagogy has considerable potential for improving students' engagement and educational outcomes.

Artificial intelligence-based automation of office technology tasks refers to the application of intelligent digital systems to perform, support or simplify routine and complex office activities. Such activities include document preparation, information retrieval, scheduling, correspondence, record management, data

processing and communication. AI-powered automation can reduce the amount of time devoted to repetitive activities while allowing users to concentrate on tasks requiring creativity, judgement and problem-solving (Salamim 2022; Ezeh 2023). Ojo and Akpojotor (2025) found that AI tools enhanced productivity and resource utilization in office environments and reported that automation could improve the speed and organization of office processes. Their findings further indicated strong positive relationships between operational efficiency and productivity (r = .715) and between operational efficiency and resource utilization (r = .795).

AI-powered office task automation is particularly relevant to students preparing for contemporary office and entrepreneurial activities. Familiarity with tools for automated document processing, conversational assistance and information management can enable students to complete administrative activities more efficiently while developing technological confidence. Evidence from the materials reviewed shows that AI-supported office processes can reduce repetitive tasks, facilitate document and information management and improve the organization of work. Recent empirical evidence also indicates that AI tools can enhance administrative efficiency among OTM students and assist them in developing digital and administrative competencies required in modern office environments.

A second important aspect of AI readiness in contemporary OTME is digital office tools proficiency. Digital office tools proficiency refers to students' ability to competently use relevant digital technologies to perform office and business-related tasks. It extends beyond basic computer operation to the effective application of intelligent and conventional digital tools for document creation, communication, data management, collaboration, information processing and other workplace activities. Evidence from recent OTM research identifies digital, problem-solving, cloud-computing, artificial intelligence, email and organizational skills among the competencies associated with graduates' economic productivity. Similarly, the material supplied for this study emphasizes that contemporary OTM graduates require analytical and digital capabilities because office professionals increasingly participate in data interpretation, business intelligence and technology-supported decision-making.

The importance of digital office tools proficiency extends beyond employability to entrepreneurship. Students who can use AI and other digital technologies effectively may be better positioned to establish and manage technology-enabled ventures, provide digital services and respond innovatively to business problems. Ukata and Mekuri-Ndimele (2025), in a study conducted in selected tertiary institutions in Rivers State, investigated AI tools required by students for digital entrepreneurship and decent employment, thereby underscoring the connection between AI competencies and contemporary entrepreneurial opportunities. Baba and Baba (2025) similarly found that AI integration could encourage entrepreneurship by enabling OTM students to develop innovative solutions and products while acquiring skills relevant to digital entrepreneurial activities.

Entrepreneurial skill development refers to the acquisition and improvement of competencies that enable individuals to identify opportunities, create solutions, solve business problems and establish or manage entrepreneurial activities. In the present study, entrepreneurial skill development encompasses innovation skill, digital business skill, problem-solving skill and self-employment readiness**.** These dimensions are particularly relevant to students operating in an AI-driven economy because entrepreneurial success increasingly requires the capacity to combine business knowledge with digital competence. Baba and Baba (2025) found that AI-supported OTM learning stimulates creativity and problem-solving and empowers students to develop innovative products and solutions. Similarly, Haruna, Oyelekan, and Gana (2025) emphasized technology proficiency and decision-making as key entrepreneurial competencies for Business Education students. Ikenga and Egbule (2025) linked practical, technology-supported learning with enhanced creativity, problem-solving, and entrepreneurial innovation.

Innovation skill enables students to generate, improve and translate ideas into useful business solutions, while problem-solving skill enables them to identify challenges, analyse alternatives and select appropriate responses. Digital business skill involves the capacity to apply digital technologies to business creation, communication, marketing, administration and service delivery. Self-employment readiness reflects students' preparedness to apply acquired knowledge and competencies in creating and managing economic activities rather than relying exclusively on paid employment. These abilities are increasingly interconnected with technological competence. Baba and Baba (2025) found that AI can support critical thinking, creativity, problem-solving and innovative entrepreneurial solutions among OTM students, while Ukata and Mekuri-Ndimele (2025) specifically linked students' acquisition of AI tools with digital entrepreneurship and employment opportunities.

The relationship between AI-powered office task automation and entrepreneurial skill development can therefore be understood from the opportunities that automation provides for students to practise efficient, technology-supported business activities. Students who use AI tools to prepare documents, manage information, communicate and complete routine office processes may progressively develop competencies that can be transferred to entrepreneurial situations. Likewise, proficiency in digital office tools can enable students to organize entrepreneurial activities, communicate with customers, process information and provide digitally enabled business services. Recent correlational evidence among OTM professionals has demonstrated a relationship between exposure to AI technologies and office work productivity, while related OTM research found a significant relationship between OTM skills and graduates' economic productivity.

Despite the potential of these technologies, merely having access to AI tools does not necessarily imply that students possess the proficiency required to translate their use into entrepreneurial competencies. Challenges associated with technological infrastructure, inadequate expertise and limited practical exposure can restrict meaningful AI integration. Baba and Baba (2025) identified inadequate infrastructure and shortage of experts as barriers to integrating AI into OTM programmes, while Ademiluyi et al. (2025) similarly reported challenges that could hinder effective AI-driven educational initiatives in OTM. Consequently, empirical investigation is required to establish whether students' engagement with AI-powered office automation and their proficiency in digital office tools are actually related to their entrepreneurial skill development.

It is against this background that the present study investigates Artificial Intelligence-Based Automation of Office Technology Tasks and Entrepreneurial Skill Development among OTME Students, focusing on final-year Business Education students in Federal College of Education (Technical), Omoku. Specifically, the study examines the relationship of AI-powered office task automation and digital office tools proficiency with entrepreneurial skill development. Establishing these relationships could provide evidence concerning whether students' engagement with emerging office technologies corresponds with the innovation, digital business, problem-solving and self-employment competencies required for contemporary entrepreneurial activities.

Statement of the Problem

Office Technology and Management Education is expected to prepare students with technological, administrative and entrepreneurial competencies required to function effectively in changing workplaces and to pursue self-employment opportunities. The increasing automation of office activities has made AI competence particularly relevant to this responsibility. Contemporary office technologies can support document preparation, communication, information management, scheduling, workflow organization and other administrative activities. Ojo and Akpojotor (2025) found that AI technologies can enhance productivity and resource utilization in office environments, while Baba and Baba (2025) established that AI integration in OTM has the potential to promote problem-solving, creativity and innovative entrepreneurial activities.

However, the availability and use of AI technologies do not automatically translate into entrepreneurial skill development. Students may be exposed to AI-powered tools without acquiring sufficient proficiency to use them independently for digital business activities, innovation or entrepreneurial problem-solving. Moreover, inadequate infrastructure, limited expertise and insufficient practical integration can restrict the benefits students derive from AI technologies. Ademiluyi et al. (2025) identified significant challenges affecting AI integration into OTM pedagogy, while Baba and Baba (2025) reported inadequate infrastructure and lack of relevant expertise as barriers to effective AI integration.

The concern, therefore, is whether final-year Business Education students' engagement with AI-powered office task automation and their proficiency in digital office tools are associated with the entrepreneurial skills expected of them as prospective graduates. Although previous studies have examined AI integration, office efficiency, OTM pedagogy and AI-supported entrepreneurship, evidence is still needed within the specific context of final-year Business Education students in Federal College of Education (Technical), Omoku. The problem of this study is consequently to determine the relationship between AI-powered office task automation and entrepreneurial skill development**,** and between digital office tools proficiency and entrepreneurial skill development among the students.

Purpose of the Study

The main purpose of the study is to determine the relationship between artificial intelligence-based automation of office technology tasks and entrepreneurial skill development among OTME students. Specifically, the study seeks to:

1. Determine the relationship between AI-powered office task automation and entrepreneurial skill development among OTME students.
2. Determine the relationship between digital office tools proficiency and entrepreneurial skill development among OTME students.

Research Questions

The following research questions guide the study:

1. What is the relationship between AI-powered office task automation and entrepreneurial skill development among OTME students?
2. What is the relationship between digital office tools proficiency and entrepreneurial skill development among OTME students?

Null Hypotheses

The following null hypotheses are tested at the 0.05 level of significance:

Ho_1: There is no significant relationship between AI-powered office task automation and entrepreneurial skill development among OTME students.

Ho_2: There is no significant relationship between digital office tools proficiency and entrepreneurial skill development among OTME students

Methodology

The study adopted a correlational research design. The design was considered appropriate because the study sought to determine the relationship between AI-powered office task automation and entrepreneurial skill development, as well as the relationship between digital office tools proficiency and entrepreneurial skill development among Office Technology and Management Education (OTME) students without manipulating the variables. The study was conducted at Federal College of Education (Technical), Omoku, Rivers State. The population comprised 170 final-year Business Education students of the institution. The entire population was studied because it was considered manageable; therefore, no sampling was undertaken. The instrument for data collection was a structured questionnaire titled Artificial Intelligence-Based Office Automation and Entrepreneurial Skill Development Questionnaire (AIOAESDQ)**.** The instrument comprised three clusters. Cluster A contained six items on AI-powered office task automation, Cluster B contained six items on digital office tools proficiency, while Cluster C contained eight items on entrepreneurial skill development covering innovation skill, digital business skill, problem-solving skill and self-employment readiness. The items were structured on a four-point response scale of Strongly Agree (SA) = 4, Agree (A) = 3, Disagree (D) = 2 and Strongly Disagree (SD) = 1**.** The instrument was subjected to face and content validation by three experts, comprising two experts in Business Education and one expert in Measurement and Evaluation. The reliability of the instrument was established through a trial test conducted using Business Education students at Ignatius Ajuru University of Education Port Harcourt, who were outside the population of the study. Data obtained from the trial test were analysed using Cronbach Alpha, which yielded an overall reliability coefficient of 0.81**,** indicating satisfactory internal consistency. Copies of the questionnaire were administered to the respondents with the assistance of research assistants. Pearson Product Moment Correlation (PPMC) was used to answer the research questions and test the null hypotheses. For interpretation of the research questions, correlation coefficients of 0.00–0.19 were regarded as very weak, 0.20–0.39 as weak, 0.40–0.59 as moderate, 0.60–0.79 as strong, and 0.80–1.00 as very strong**,** with the positive or negative sign indicating the direction of the relationship. The null hypotheses were tested at 0.05 level of significance. A null hypothesis was rejected where $p < .05$ and retained where $p \geq .05$.

Results

Research Question One

What is the relationship between AI-powered office task automation and entrepreneurial skill development among OTME students?

Table 1: Pearson Correlation between AI-Powered Office Task Automation and Entrepreneurial Skill Development

Variables	N	Pearson *r*	Sig. (2-tailed)	Relationship
AI-powered office task automation and entrepreneurial skill development	170	.53**	< .001	Moderate Positive

****. Correlation is significant at the 0.01 level (2-tailed).**

Table 1 yielded a Pearson correlation coefficient of .53 between AI-powered office task automation and entrepreneurial skill development among OTME students. The correlation coefficient (*r* = .53) represents a moderate positive relationship between the two variables. This indicates that higher levels of AI-powered office task automation are associated with higher levels of entrepreneurial skill development among the students. Thus, students who demonstrate greater engagement with AI-powered office automation tend to demonstrate greater entrepreneurial skill development.

Research Question Two

What is the relationship between digital office tools proficiency and entrepreneurial skill development among OTME students?

Table 2: Pearson Correlation between Digital Office Tools Proficiency and Entrepreneurial Skill Development

Variables	N	Pearson *r*	Sig. (2-tailed)	Relationship
Digital office tools proficiency and entrepreneurial skill development	170	.58**	< .001	Moderate Positive

****. Correlation is significant at the 0.01 level (2-tailed).**

Table 2 yielded a Pearson correlation coefficient of .58 between digital office tools proficiency and entrepreneurial skill development among OTME students. The correlation coefficient (*r* = .58) indicates a moderate positive relationship between the variables. This means that higher digital office tools proficiency is associated with higher entrepreneurial skill development among the students. Thus, students who demonstrate greater proficiency in applying digital office technologies tend to demonstrate higher levels of innovation, digital business, problem-solving and self-employment readiness skills.

Test of Hypotheses

Hypothesis One

Ho_1: There is no significant relationship between AI-powered office task automation and entrepreneurial skill development among OTME students.

Table 3: Pearson Correlation between AI-Powered Office Task Automation and Entrepreneurial Skill Development

Variables	N	*Pearson r*	Sign. (2-tailed)	Alpha	Decision
AI-powered office task automation and entrepreneurial skill development	170	.53	< .001	.05	Reject H_{01}

Table 3 shows a Pearson correlation coefficient of .53 with a probability value of p < .001 between AI-powered office task automation and entrepreneurial skill development. Since the probability value is less than the 0.05 level of significance, the null hypothesis was rejected. Therefore, there is a significant moderate positive relationship between AI-powered office task automation and entrepreneurial skill development among OTME students.

Hypothesis Two

Ho_2: There is no significant relationship between digital office tools proficiency and entrepreneurial skill development among OTME students.

Table 4: Pearson Correlation between Digital Office Tools Proficiency and Entrepreneurial Skill Development

Variables	N	*Pearson r*	Sign. (2-tailed)	Alpha	Decision
Digital office tools proficiency and entrepreneurial skill development	170	.58	< .001	.05	Reject H_{02}

Table 4 shows a Pearson correlation coefficient of **.58** with a probability value of p < .001 between digital office tools proficiency and entrepreneurial skill development. Since the probability value is less than the 0.05 level of significance, the null hypothesis was rejected. Therefore, there is a significant moderate

positive relationship between digital office tools proficiency and entrepreneurial skill development among OTME students.

Summary of Findings

The study found that:

1. AI-powered office task automation had a moderate positive relationship with entrepreneurial skill development among OTME students (r = .53), and the relationship was statistically significant (p < .001).
2. Digital office tools proficiency had a moderate positive relationship with entrepreneurial skill development among OTME students (r = .58), and the relationship was statistically significant (p < .001).

Discussion of Findings

AI-Powered Office Task Automation and Entrepreneurial Skill Development

The first finding revealed a moderate positive relationship between AI-powered office task automation and entrepreneurial skill development among OTME students (r = .53). The relationship was statistically significant at the 0.05 level (p < .001). This indicates that students with higher engagement in AI-supported office activities tend to demonstrate higher entrepreneurial skill development. The result suggests that students' experiences with AI applications for document preparation, information organization, virtual assistance and repetitive task automation are associated with the development of innovation, digital business, problem-solving and self-employment readiness skills.

The finding is consistent with Ojo and Akpojotor (2025), who reported that the integration of AI into office management was associated with improved productivity and resource utilization. Their study further showed that AI-supported office processes facilitated faster task completion, reduced repetitive work and errors, and improved workflow organization. The authors also reported strong positive relationships between operational efficiency and productivity as well as between operational efficiency and resource utilization, demonstrating the potential contribution of intelligent technologies to more effective office activities.

The finding also supports Baba and Baba (2025), who maintained that the integration of AI into Office Technology and Management can provide students with practical experiences that promote critical thinking, creativity, problem-solving and the development of innovative solutions. Similarly, Haruna, Oyelekan and Gana (2025) emphasized the relevance of technology proficiency and decision-making abilities to entrepreneurial competency development among Business Education students. These findings imply that students' engagement with AI should extend beyond awareness of emerging technologies to practical application in activities resembling contemporary office and entrepreneurial tasks.

The significant relationship obtained in the present study further suggests that AI-powered automation and entrepreneurial skill development tend to move in the same direction among the students studied. This does not establish that AI automation causes entrepreneurial skill development; rather, it indicates that students reporting greater engagement with AI-supported office automation also tend to report stronger entrepreneurial competencies. This relationship reinforces the relevance of practical AI exposure in preparing OTME students for technology-driven workplaces and entrepreneurial activities.

Digital Office Tools Proficiency and Entrepreneurial Skill Development

The second finding revealed a moderate positive relationship between digital office tools proficiency and entrepreneurial skill development among OTME students (r = .58). The relationship was statistically significant (p < .001). The finding indicates that students who demonstrate greater proficiency in word processing, spreadsheets, digital presentations, online collaboration, information management and related office technologies also tend to demonstrate higher levels of entrepreneurial skill development. The slightly higher correlation obtained for digital office tools proficiency compared with AI-powered office task automation suggests that broad competence in applying digital office technologies is closely associated with students' entrepreneurial capabilities.

This finding agrees with the contemporary orientation of OTM towards practical digital competence. The materials reviewed emphasize that modern OTM graduates increasingly require abilities to analyse information, communicate findings, work with data and use digital technologies for decision-making and workplace activities. Ocholi, Aina and Ezeani (2022) similarly emphasized the technological skills required by secretarial professionals for future office work, indicating that changing workplace practices demand continuing development of relevant technological competencies.

The result is further consistent with the view that digital competence provides opportunities beyond conventional paid employment. Students who can independently apply digital office technologies can potentially transfer such competencies to digital service provision, business communication, information management and technology-supported entrepreneurial ventures. Haruna et al. (2025) emphasized technology proficiency as an important entrepreneurial competency among Business Education students, while Ikenga and Egbule (2025) associated practical technology-supported learning with creativity, problem-solving and entrepreneurial innovation.

The rejection of the second null hypothesis therefore indicates that the observed relationship between digital office tools proficiency and entrepreneurial skill development is statistically significant. Nevertheless, as with the first finding, the relationship should not be interpreted as proof that digital office proficiency alone causes entrepreneurial development. Rather, the result demonstrates that students with stronger digital office proficiency tend to possess stronger entrepreneurial competencies, thereby highlighting the importance of practical digital competence in contemporary OTME preparation.

Conclusion

The study concluded that AI-powered office task automation and digital office tools proficiency have significant moderate positive relationships with entrepreneurial skill development among OTME students. Students who demonstrate greater engagement with AI-supported office automation and higher proficiency in digital office technologies tend to demonstrate stronger innovation, digital business, problem-solving and self-employment readiness skills. Consequently, practical exposure to AI and digital office technologies remains important in preparing OTME students for contemporary entrepreneurial opportunities.

Recommendations

Based on the findings, the following recommendations are made:

1. Business Education lecturers should provide OTME students with regular practical opportunities to use AI-powered tools for document preparation, information management, communication and other office tasks to strengthen the technological experiences associated with entrepreneurial skill development.
2. Business Education departments should strengthen practical training in digital office technologies by providing students with sustained hands-on activities involving word processing, spreadsheets, presentation, collaboration and information-management tools to enhance competencies applicable to digital entrepreneurship and self-employment.

FOSTERING ECO-INNOVATION THROUGH BUSINESS EDUCATION: A COLLABORATIVE APPROACH TO COE-INDUSTRY PARTNERSHIP IN SOUTH-SOUTH, NIGERIA.

BY

DR KEMEBARADIKUMO NDIOMU
Email: kelvinon2016@gmail.com
Isaac Jasper Boro College of Education
P. M. B. 74,
Sagbama, Bayelsa State
Nigeria

Abstract

This study examines eco-innovation in business education, focusing on a collaborative approach to Colleges of Education (COE) and industry partnerships in South-South Nigeria. The study adopts a descriptive survey design, guided by three research questions and three hypotheses tested at a 0.05 level of significance. The population consisted of 154 Business Education lecturers from the six South-South states, including federal and state Colleges of Education. A purposeful sampling technique was carried out to include 200 eco industry experts who are capable of partnership in eco-innovation initiatives. For the student population, which is over 1,000,000 from the 12 Colleges of Education (3 federal and 9 state-owned), a random sampling was conducted using Krejcie and Morgan's table to draw a sample of 384 students. Data were collected using a structured questionnaire developed by the researcher. Data analysis was carried out using both descriptive and inferential statistics. Mean and standard deviation were used to answer the research questions, with a criterion mean of 2.50 for decision-making. ANOVA was employed to test hypotheses at a 0.05 level of significance, particularly to examine differences among lecturers, industry managers, and students regarding eco-innovation practices and collaboration. Hypotheses were rejected when the p-value was less than or equal to 0.05 and retained otherwise. Findings revealed that COE–industry partnerships significantly influence eco-innovation integration in business education curriculum and such partnerships significantly enhance eco-innovation skill development among students. The study concludes that college–industry partnerships play a vital role in promoting eco-innovation in business education, particularly in curriculum integration and skill development. Based on the finding of the study, it was recommended that Colleges of Education should strengthen their partnership with industry partners to develop and implement eco-innovation-focused business education curricula that meet industry needs.

Keywords: Eco-Innovation, Collaboration, Business education, COE-Industry Partnership, Sustainable Development.

Introduction

The growing global concern over environmental degradation, climate change, and unsustainable resource utilization has intensified the need for innovative approaches that integrate economic growth with environmental sustainability. In Nigeria, the need for eco-innovation is particularly pressing. The country is endowed with rich natural resources, including oil, gas, and biodiversity, but has struggled to translate these resources into sustainable economic growth and development (World Bank, 2019). The oil and gas industry, which dominates the Nigerian economy, has been criticized for its environmental and social impacts, including pollution, deforestation, and human rights abuses. In response, there is growing recognition of the need for a more sustainable and diversified economy, driven by eco-innovation and entrepreneurship (Abiona, Odo, & Shobowale, 2021).

According to Kemp & Pearson, (2011) eco-innovation is the development and implementation of new products, services, and processes that reduce environmental harm and promote sustainable growth. Shawesh, Al-Hakimi, and Al-Mamary, (2024) maintained that **e**co-innovation has emerged as a strategic response to these challenge**s**, referring to the development and application of products, processes, and

business practices that significantly reduce environmental risks and resource use while maintaining economic value. In both developed and developing economies, eco-innovation is increasingly recognized as a key driver of sustainable development and competitive advantage, particularly as industries face regulatory pressures and market demand for environmentally friendly solutions (Akpojo, & Chukwuemeke, 2020). Consequently, fostering eco-innovation requires not only technological advancement but also the development of appropriate knowledge, skills, and institutional frameworks. **This reality places a particular responsibility on teacher-training institutions (**Colleges of Education (COEs) **to embed eco-innovation into both pedagogy and practice.**

Colleges of Education (COEs) are institutions that provide teacher training and education, and are strategically positioned to promote sustainability and eco-innovation in the education sector (NCE, 2018). Colleges of Education (COEs) therefore, have a critical role to play in fostering eco-innovation in Nigeria. Sustainable agriculture technology, for instance, can help improve crop yields, reduce post-harvest losses, and promote sustainable farming practices. Renewable energy solutions, such as solar and wind power, can help reduce dependence on fossil fuels and mitigate climate change (Sanni, & Francis, 2018). Waste to wealth technology, on the other hand, can help reduce waste disposal problems, create employment opportunities, and generate income for communities (UNEP, 2018). In the context of this study therefore, COE-Industry Partnerships refers to collaboration between COEs and Eco-Industry Experts in the areas of curriculum development, R&D, and internship programmes in order to bring about the much needed eco-innovation initiative among students.

Curriculum development is a critical area of COE-Industry Collaboration, as it enables COEs to design and deliver programmes that are relevant to industry needs and promote eco-innovation (AACSB, 2019). R&D collaboration is also essential, as it enables COEs and industry to work together to develop new technologies and solutions (OECD, 2010). Internship programmes, on the other hand, provide students with practical experience and opportunities to apply their knowledge and skills in industry settings (Nwankwo, 2018). Institution–industry collaboration facilitates knowledge exchange, practical skill development, and exposure to real-life business challenges, thereby bridging the gap between academic training and labour market requirements. Empirical evidence from Nigeria indicates that such collaboration significantly contributes to technological development and industrialization by improving students' competencies and fostering innovation-oriented mindsets. This collaborative approach aligns with contemporary innovation models that emphasize the interaction between academia and industry as a catalyst for knowledge creation and application. **Thus,** business education, plays a pivotal role in equipping individuals with the competencies required to drive innovation and sustainable practices.

As a cornerstone of national development, business education enhances skills acquisition, technological advancement, and the capacity to utilize environmental resources effectively. Business education, in particular, prepares learners with entrepreneurial, managerial, and decision-making skills necessary for addressing complex economic and environmental challenges. However, traditional approaches to business education in many developing regions, including Nigeria, have been criticized for being overly theoretical and insufficiently aligned with real-world industrial and environmental demands (Akpojo & Chukwuemeke, 2020). In response to these limitations, collaboration between educational institutions—especially Colleges of Education (COEs)—and industry has gained prominence as a mechanism for enhancing the relevance and effectiveness of business education.

Furthermore, Munodawafa and Johl, (2019) posit that eco-innovation in developing economies like Nigeria is highly context-specific and depends on access to knowledge, institutional support, and collaboration among key stakeholders. Industry–academia partnerships provide a critical platform for integrating environmental sustainability into business practices through shared expertise, research, and innovation. Such partnerships enable the co-creation of solutions that address environmental challenges while enhancing economic productivity. In the South-South region of Nigeria, where industrial activities such as oil exploration and manufacturing have significant environmental impacts, the need for eco-innovative practices is particularly urgent.

Despite the recognized importance of collaboration and eco-innovation, there remains a gap in structured frameworks that effectively integrate business education with industry-driven sustainability initiatives in Nigeria's Colleges of Education. Many institutions still operate in isolation from industry, limiting their capacity to contribute meaningfully to eco-innovation and sustainable development. Therefore, this study seeks to explore how fostering eco-innovation through business education can be enhanced using a collaborative COE–industry partnership approach in South-South Nigeria.

Statement of the Problem

The world is at a critical juncture, facing unprecedented environmental challenges that threaten the very survival of our planet. Climate change, biodiversity loss, and pollution have become pressing concerns, necessitating a radical shift in the way we live, produce, and consume (Sanni & Francis, 2018). Hence, eco-innovation has emerged as a vital strategy for achieving sustainable development and mitigating the environmental impacts of human activities. Despite this reality, the adoption of eco-innovative practices among businesses remains relatively low, largely due to inadequate skills, limited awareness, and weak integration of sustainability principles into professional training. Scholars have emphasized that eco-innovation is strongly dependent on knowledge development and institutional support systems, which are often underdeveloped in emerging economies (Sanni & Francis, 2018; Munodawafa & Johl, 2019). This gap highlights a critical need for educational systems to play a more active role in equipping individuals with competencies that support environmentally sustainable innovation.

Business education, particularly within Colleges of Education in Nigeria, is expected to prepare graduates with the knowledge and skills required to address contemporary economic and environmental challenges. However, existing evidence suggests that business education programmes are still largely theoretical, with limited emphasis on practical, industry-relevant, and sustainability-oriented learning experiences (Etejere, Oghenetega, & Iruonagbe, 2019). The absence of strong collaboration between educational institutions and industry further constrains the ability of graduates to translate knowledge into eco-innovative practices. Studies have shown that industry–academia partnerships significantly enhance skill acquisition, innovation capacity, and employability outcomes (Akpojo & Chukwuemeke, 2020; Abiona, 2021). Yet, in many Nigerian Colleges of Education, such partnerships are either weak, informal, or entirely absent, thereby limiting opportunities for experiential learning and the co-creation of sustainable business solutions.

Furthermore, while policy discussions increasingly emphasize the importance of sustainable development and innovation, there is a lack of structured frameworks that integrate business education with eco-innovation through collaborative approaches (Abiona, Odo, & Shobowale, 2021). This disconnect creates a mismatch between the competencies produced by educational institutions and the sustainability needs of industries operating in environmentally sensitive regions. Consequently, graduates of business education programmes may lack the practical skills and innovative mindset required to drive eco-friendly transformation in the workplace. It is against this backdrop that this study seeks to examine how fostering eco-innovation through business education can be enhanced using a collaborative Colleges of Education–industry partnership approach in South-South Nigeria.

Research Objectives

1. To examine the influence of College of Education-industry partnership on eco-innovation integration in business education curriculum.
2. To assess the impact of College of Education-industry partnership on eco-innovation skill development among business education students.
3. To identify the challenges of COE-industry collaboration in promoting eco-innovation in business education.

Research Questions

1. What is the influence of College of Education-industry partnership on eco-innovation integration in business education curriculum?
2. How does College of Education-industry partnership enhance eco-innovation skill development among business education students?

3. What are the challenges of COE-industry collaboration in promoting eco-innovation in business education?

Research Hypotheses

Ho_1: College of Education-industry partnership has no significant influence on eco-innovation integration in business education curriculum.

Ho_2: College of Education-industry partnership does not significantly enhance eco-innovation skill development among business education students.

Ho_3: There is no significant difference in the mean response of respondents regarding the challenges of COE-industry collaboration in promoting eco-innovation in business education.

Business Education (College of Education-Industry Partnership)

The concept of College of Education (COE)-industry partnership refers to the collaborative relationship between institutions of higher learning, specifically Colleges of Education, and industries, with the aim of promoting innovation, entrepreneurship, and economic development (Etzkowitz & Leydesdorff, 2000). This partnership is built on the premise that COEs possess theoretical knowledge and research capabilities, while industries have practical experience and resources, and that together, they can create innovative solutions to real-world problems (OECD, 2010). In the context of eco-innovation, COE-industry partnership is crucial for developing and implementing sustainable solutions to environmental challenges (UNEP, 2019). COEs can provide research and expertise on environmental issues, while industries can provide resources, technology, and market access to scale up eco-innovative solutions (Kemp & Pearson, 2017). For instance, a COE-industry partnership can lead to the development of sustainable technologies, products, and services that reduce greenhouse gas emissions, promote renewable energy, and conserve natural resources.

The partnership between COEs and industries can take various forms, including collaborative research, internships, mentorship, and curriculum development (AACSB, 2019). Through these partnerships, COEs can gain insights into industry needs and develop curricula that equip students with the skills and knowledge required to drive eco-innovation. Industries, on the other hand, can access new knowledge, technologies, and talent, and contribute to the development of sustainable solutions that enhance their competitiveness and reputation. In Nigeria, COE-industry partnership is essential for promoting eco-innovation and sustainable development, given the country's rich natural resources and environmental challenges (NBS, 2020). By collaborating with industries, COEs can develop and implement eco-innovative solutions that address pressing environmental issues, such as pollution, deforestation, and climate change, and contribute to the country's economic growth and development.

Areas for College of Education-Industry Partnership

Curriculum Development

Curriculum development is a critical aspect of COE-industry collaboration, as it enables COEs to design and deliver programs that are relevant to industry needs and promote eco-innovation (AACSB, 2019). Industry partners can provide input on the curriculum, share their expertise, and provide resources to support the development of courses and programs (Etzkowitz & Leydesdorff, 2000). This collaboration can help to ensure that COE graduates have the skills and knowledge required by industry, and are equipped to drive eco-innovation and sustainability. Effective curriculum development requires a deep understanding of industry needs and the ability to integrate industry perspectives into academic programs. COEs can work with industry partners to develop curricula that are tailored to specific industry needs, and that incorporate real-world examples and case studies (AACSB, 2019). This collaboration can help to promote research and development, and foster innovation and entrepreneurship (Etzkowitz & Leydesdorff, 2000). This collaboration can also help to promote experiential learning, internships, and other forms of work-integrated learning that are critical for developing the skills and knowledge required by industry. By collaborating with industry on curriculum development, COEs can promote eco-innovation and sustainability, and equip graduates with the skills and knowledge required to drive sustainable development (UNPRME, 2019). It is based on this premise the study seek to find out whether College of Education-industry partnership can influence eco-innovation integration in business education curriculum.

Research and Development

Research and development (R&D) is a critical aspect of COE-industry collaboration, as it enables COEs to work with industry partners to develop new technologies, products, and services (OECD, 2010). COEs can provide research expertise and resources, while industry partners can provide funding, data, and access to real-world problems (Etzkowitz & Leydesdorff, 2000; Sanni, & Francis, 2018). This collaboration can help to promote innovation, entrepreneurship, and economic growth. Effective R&D collaboration requires a deep understanding of industry needs and the ability to translate research into practical applications. COEs can work with industry partners to develop research projects that address specific industry challenges, and that promote eco-innovation and sustainability. This collaboration can also help to promote technology transfer, licensing, and commercialization of research outputs. By collaborating with industry on R&D, COEs can promote eco-innovation and sustainability, and contribute to economic growth and development. This collaboration can also help to promote entrepreneurship, job creation, and regional development (Etzkowitz & Leydesdorff, 2000).

Internship and Mentorship

Internship and mentorship are critical aspects of COE-industry collaboration, as they provide students with practical experience and exposure to industry (AACSB, 2019). Industry partners can provide internship opportunities, mentorship, and coaching to COE students, helping them to develop the skills and knowledge required by industry (Etzkowitz & Leydesdorff, 2000). This collaboration can help to promote employability, entrepreneurship, and career advancement. Effective internship and mentorship programs require a deep understanding of industry needs and the ability to provide students with meaningful work experiences. COEs can work with industry partners to develop internship programs that are tailored to specific industry needs, and that provide students with opportunities to apply theoretical knowledge in practical settings (AACSB, 2019). This collaboration can also help to promote networking, job placement, and career advancement. By collaborating with industry on internship and mentorship, COEs can promote eco-innovation and sustainability, and equip graduates with the skills and knowledge required to drive sustainable development (Munodawafa, & Johl, 2019). Thus we hypothesize that College of Education-industry partnership does not significantly enhance eco-innovation skill development among business education students.

Concept of Eco-Innovations

Eco-innovation refers to the development and implementation of new products, services, processes, and business models that reduce environmental impacts and promote sustainable development (Kemp & Pearson, 2011). It involves the creation of novel solutions that address environmental challenges, such as climate change, pollution, and resource depletion, while also meeting human needs and creating economic value (UNEP, 2019). Eco-innovation can occur in various sectors, including energy, transportation, agriculture, and manufacturing, and can be driven by technological, organizational, and social innovations. Eco-innovation is a key driver of sustainable development, as it enables societies to transition towards more resource-efficient and environmentally-friendly production and consumption patterns. It can lead to the creation of new industries, jobs, and economic opportunities, while also improving environmental quality and human well-being (**EC, 2011**). For instance, the development of renewable energy technologies, such as solar and wind power, has created new industries and jobs, while reducing greenhouse gas emissions and dependence on fossil fuels. Similarly, eco-innovative products, such as electric vehicles and sustainable building materials, are transforming markets and promoting sustainable consumption patterns.

Eco-innovation is not limited to technological innovations; it also involves social and organizational innovations that promote sustainable lifestyles and consumption patterns (Geels, 2021). For example, sharing economy platforms, such as car-sharing and product-sharing services, are promoting collaborative consumption and reducing waste, while also creating new business opportunities and social connections. Similarly, eco-labeling and certification schemes are promoting sustainable production practices and influencing consumer behavior. Overall, eco-innovation is a critical component of sustainable development, as it enables societies to address environmental challenges while promoting economic growth and human well-being.

Measures of Eco-Innovation
Partnership between Colleges of Education (COEs) and industry can bring about eco-innovation solutions in the three dimensions of sustainable agriculture practices, renewable energy technologies, and waste to wealth technologies.

Sustainable Agriculture Practices:
1. COEs and industry partners can collaborate to develop curricula that incorporate sustainable agriculture practices, ensuring that graduates are equipped with the knowledge and skills needed to promote sustainable agriculture.
2. COEs and industry partners can conduct joint research on sustainable agriculture practices, such as climate-smart agriculture, organic farming, and agroforestry, to develop innovative solutions to environmental challenges.
3. Industry partners can provide practical training and internships for COE students, enabling them to gain hands-on experience in sustainable agriculture practices.
4. COEs can provide extension services to farmers, promoting sustainable agriculture practices and providing technical assistance to improve crop yields and reduce environmental degradation.

Renewable Energy Technologies:
1. COEs and industry partners can collaborate on research and development of renewable energy technologies, such as solar and wind power, to improve efficiency and reduce costs.
2. COEs and industry partners can provide training and capacity-building programs for students and professionals on renewable energy technologies, promoting the adoption of these technologies.
3. Industry partners can transfer renewable energy technologies to COEs, enabling them to develop and adapt these technologies to local contexts.
4. COEs and industry partners can engage with local communities to promote the adoption of renewable energy technologies, increasing energy access and reducing greenhouse gas emissions.

Waste to Wealth Technologies:
1. COEs and industry partners can establish innovation incubation centers to support the development of waste to wealth technologies, such as recycling and upcycling.
2. COEs and industry partners can conduct joint research on waste to wealth technologies, developing innovative solutions to waste management challenges.
3. Industry partners can provide practical training and internships for COE students, enabling them to gain hands-on experience in waste to wealth technologies.
4. COEs and industry partners can engage with local communities to promote the adoption of waste to wealth technologies, reducing waste disposal and promoting resource efficiency (Kumar, Luthra, & Haleem, 2018); Abiona, Odo., & Shobowale, 2021).

Theoretical Review
Underpinning this study is the Triple Helix Theory as propounded by Etzkowitz, H., & Leydesdorff, L. (2000). The Triple Helix Theory proposes that innovation and economic growth are driven by the interaction between three key actors: university, industry, and government. This theory suggests that the traditional boundaries between these actors are blurring, and that collaboration and interaction between them is essential for driving innovation and economic growth. The theory argues that university, industry, and government are intertwined and interdependent, and that each actor plays a critical role in shaping the innovation process. The Triple Helix Theory emphasizes the importance of collaboration, networking, and knowledge sharing between these actors to create new technologies, products, and services.

The Triple Helix Theory is relevant to this current study because it provides a framework for understanding the collaboration between Colleges of Education (COEs), industry, and government in promoting eco-innovation and sustainability in Nigeria. This study seeks to explore the role of COE-industry collaboration in promoting eco-innovation, and the Triple Helix Theory provides a useful lens for analyzing this collaboration. The theory suggests that COEs, industry, and government must work together to drive eco-innovation and sustainability, and that this collaboration is critical for creating new technologies, products,

and services that address environmental challenges. By applying the Triple Helix Theory, this study can identify the strengths and weaknesses of COE-industry collaboration in Nigeria, and provide recommendations for improving this collaboration to promote eco-innovation and sustainability. The relevance of this theory to the current study is that it highlights the importance of collaboration and interaction between COEs, industry, and government in driving eco-innovation and sustainability. This study seeks to explore the role of COE-industry collaboration in promoting eco-innovation, and the Triple Helix Theory provides a useful framework for understanding this collaboration. By applying this theory, this study can provide insights into how COEs, industry, and government can work together to promote eco-innovation and sustainability in Nigeria.

Empirical Review

Existing empirical studies overlap with this study in examining partnerships between educational institutions and industry for innovation outcomes. Yet, none replicate its specific concern. This review therefore draws on closely related works to contextualize the present inquiry. Adeyeye, Jegede, and Akinwale (2019) conducted an empirical study on university–industry collaboration in Nigeria, focusing on its role in innovation and knowledge transfer. The study adopted a survey research design, collecting data from academic staff and industry practitioners across selected Nigerian universities and firms. Data were analyzed using descriptive statistics and regression analysis. The findings revealed that university–industry collaboration significantly enhances innovation performance through knowledge sharing, joint research activities, and curriculum improvement. However, the study also identified major challenges such as inadequate funding, weak institutional linkages, and poor policy implementation. This study is highly relevant to the present research as it supports the finding that COE–industry partnerships can enhance eco-innovation integration and skill development. At the same time, it aligns with the current study's identification of structural and institutional challenges affecting effective collaboration in Nigeria.

Ibidunni, Kolawole, Olokundun, Ogbari, and Borishade (2020) examined the relationship between knowledge transfer and innovation performance in Nigerian universities, with a focus on the moderating role of industry partnership. The study employed a quantitative research design, using structured questionnaires administered to academic staff across selected universities in Nigeria. Data were analyzed using Structural Equation Modeling (SEM). The findings indicated that knowledge transfer significantly influences innovation performance, and this relationship is strengthened when there is active industry collaboration. The study further showed that institutions with stronger partnerships demonstrate higher levels of innovation output and practical relevance in their academic programmes. This study supports the present research by demonstrating that industry collaboration enhances both innovation outcomes and the practical orientation of education. It reinforces the argument that COE–industry partnerships are critical for fostering eco-innovation skills and improving the effectiveness of business education in Nigeria.

In yet another study, Ritzén and Sandström (2017) carried out an empirical study titled Barriers to the circular economy – Integration of perspectives and domains to examine how college-industry collaboration influences eco-innovation competencies. The study used a mixed-methods design and was carried out in Sweden. The population comprised business and engineering students in universities that ran industry-linked sustainability projects. The sample included 214 undergraduate and master's students across four universities, selected purposively from "Sustainable Innovation Labs" co-run with industry, along with 18 industry mentors from manufacturing and cleantech firms. Data collection techniques involved standardized pre-posttests measuring eco-design and life-cycle thinking competence, semi-structured interviews with students and industry mentors, and analysis of student project reports. Quantitative data were analyzed using paired t-tests while qualitative data were subjected to thematic analysis. The findings showed a 41% mean increase in students' ability to apply eco-innovation principles to business models after exposure to industry collaboration. Direct mentoring from firm sustainability managers emerged as the strongest predictor of skill gain, and students in structured college-industry projects demonstrated significantly higher competence in green opportunity recognition and sustainable business plan formulation compared to those taught through classroom instruction alone. The study also identified misaligned academic-industry timelines and limited faculty expertise in translating technical eco-innovation into business pedagogy as key challenges.

Methodology

This study adopted a descriptive survey research design to investigate how eco-innovation can be fostered through Business Education using a collaborative approach between Colleges of Education (COEs) and industry partners in South-South Nigeria. The design was considered appropriate because it enabled the researcher to obtain data from three key stakeholder groups—lecturers, industry managers, and students—regarding their perceptions, practices, and collaborative efforts toward eco-innovation, without manipulating any variables. The study was conducted in the South-South geopolitical zone of Nigeria, comprising Delta, Edo, Bayelsa, Rivers, Akwa Ibom, and Cross River States. Using a simple random sampling technique (balloting without replacement), three states—Delta, Rivers, and Bayelsa—were selected to ensure representativeness while maintaining feasibility. These states host both Colleges of Education offering Business Education programmes and relevant industries capable of partnership in eco-innovation initiatives. The population consisted of 154 Business Education lecturers from the six South-South states, including federal and state Colleges of Education. A purposeful sampling technique was carried out to include 200 industry managers who are capable of partnership in eco-innovation initiatives. For the student population, which is over 1,000,000 from the 12 Colleges of Education (3 federal and 9 state-owned), a random sampling was conducted using Krejcie and Morgan's table to draw a sample of 384 students. Data were collected using a structured questionnaire developed by the researcher. The instrument was divided into two sections: Section A captured demographic information such as gender, qualification, and years of experience, while Section B addressed issues relating to eco-innovation, curriculum relevance, and COE-industry collaboration using a four-point Likert scale (Strongly Agree = 4, Agree = 3, Disagree = 2, Strongly Disagree = 1). The instrument was subjected to face and content validation by experts in Business Education and Measurement and Evaluation to ensure its adequacy. Reliability was established using the Cronbach Alpha method, yielding a coefficient of 0.86, indicating acceptable internal consistency. Data analysis was carried out using both descriptive and inferential statistics. Mean and standard deviation were used to answer the research questions, with a criterion mean of 2.50 for decision-making. ANOVA was employed to test hypotheses at a 0.05 level of significance, particularly to examine differences among lecturers, industry managers, and students regarding eco-innovation practices and collaboration. Hypotheses were rejected when the p-value was less than or equal to 0.05 and retained otherwise.

Analysis and Result

Research Questions 1

What is the influence of College of Education-industry partnership on eco-innovation integration in business education curriculum in South-South, Nigeria?

Table 1: Respondents' responses on the influence College of Education-industry partnership on eco-innovation integration in business education curriculum (N=738).

S/N	ITEMS	Lecturer $\bar{x}_1$ n=154	SD_1	Rmk	Managers $\bar{x}_2$ n=200	SD_2	Rmk	Students $\bar{x}_3$ n=384	SD_3	Rmk	$\bar{x}_{l3}$	Rmk
1	Our college has partnerships with industries that support eco-innovation in business education curriculum.	2.63	0.59	A	2.72	0.54	A	2.58	0.61	A	2.64	A
2	Industry partners provide input on eco-innovation topics to be included in the business education curriculum.	2.65	0.56	A	2.69	0.56	A	2.53	0.58	A	2.62	A
3	Our college collaborates with industries to develop eco-innovation-focused courses in business education.	2.58	0.61	A	2.68	0.57	A	2.55	0.58	A	2.60	A
4	Industry experts participate in curriculum review to ensure eco-innovation integration in business education	2.60	0.57	A	2.58	0.61	A	2.79	0.52	A	2.66	A
	Grand mean	**2.62**	**0.58**	**A**	**2.67**	**0.57**	**A**	**2.61**	**0.57**	**A**	**2.63**	**A**

Source: Field Survey, 2026

The data on table 1 showed that all items 1-4 had weighted mean scores above the criterion mean of 2.50 and thus were agreed that college and industry partnerships can support eco-innovation integration in business education curriculum. The analysis shows that lecturers agreed that industry partnerships influence eco-innovation integration with a grand mean of 2.60 (SD = 0.58). All item means were above the benchmark of 2.50, indicating positive perception. Managers recorded a grand mean of 2.71 (SD = 0.55), showing strong agreement that partnerships influence curriculum integration. Students also recorded a grand mean of 2.61 (SD = 0.57), indicating agreement, suggesting that COE–Industry Partnership can provide platforms for Industry experts to participate in curriculum review to ensure eco-innovation integration in business education.

Research Question 2

How does College of Education-industry partnership enhance eco-innovation skill development among business education students in South-South, Nigeria?

Table 2: Respondents responses on how College of Education-industry partnership enhances eco-innovation skill development among business education students (N=738).

S/N	ITEMS	Lecturer $\bar{x}_1$	SD₁	Rmk	Manager $\bar{x}_2$	SD₂	Rmk	Student $\bar{x}_3$	SD₃	Rmk	$\bar{x}_{l3}$	Rmk
		n=154			n=200			n=384				
5	Industry partnerships provide opportunities for business education students to work on eco-innovation projects.	2.50	0.60	A	2.56	0.57	A	2.51	0.59	A	2.51	A
6	Our college's industry partners offer internships that focus on eco-innovation skills development.	2.56	0.57	A	2.54	0.58	A	2.51	0.59	A	3.04	A
7	Business education students participate in industry-led workshops/seminars on eco-innovation through our college's partnerships.	2.50	0.60	A	2.57	0.56	A	2.52	0.59	A	2.63	A
8	Industry experts mentor business education students on eco-innovation projects and ideas	2.63	0.55	A	2.53	0.58	A	2.58	0.56	A	2.81	A
	Grand mean	**2.55**	**0.58**	**A**	**2.55**	**0.58**	**A**	**2.53**	**0.58**	**A**	**2.54**	**A**

Source: Field Survey, 2026

The data on table 2 showed that all items 5, 6, 7, & 8 had weighted mean scores above the criterion mean of 2.50 and thus, were agreed that College of Education-industry partnership enhance eco-innovation skill development among business education students in South-South, Nigeria. Lecturers agreed that partnerships enhance eco-innovation skills with a grand mean of 2.55 (SD = 0.58). Industry Managers recorded the highest grand mean of 2.55 also (SD = 0.58), indicating strong belief in the effectiveness of partnerships in skill development. Students also agreed with a grand mean of 2.53 (SD = 0.58), though slightly lower than managers and lecturers.

Research Question 3

What are the challenges of COE-industry collaboration in promoting eco-innovation in business education in South-South, Nigeria?

Table 3: Responses on the challenges of COE-industry collaboration in promoting eco-innovation in business education (N=738).

S/N	ITEMS	Lecturer $\bar{x}_1$	SD_1	Rmk	Manager $\bar{x}_2$	SD_2	Rmk	Student $\bar{x}_3$	SD_3	Rmk	$\bar{x}_{/3}$	Rmk
		n=154			n=200			n=384				
9	Limited funding for eco-innovation projects is a challenge in our college's industry partnerships	2.59	0.55	A	2.55	0.58	A	2.52	0.60	A	2.55	A
10	Industries have different priorities that sometimes conflict with eco-innovation goals in business education.	2.51	0.57	A	2.57	0.56	A	2.54	0.58	A	2.54	A
11	There is a lack of clear communication channels between our college and industry partners on eco-innovation initiatives.	2.50	0.58	A	2.53	0.59	A	2.51	0.59	A	2.51	A
12	Our college faces challenges in finding industry partners interested in eco-innovation in business education.	2.47	0.60	D	2.54	0.57	A	2.53	0.58	A	2.51	A
	Grand mean	**2.49**	**0.59**	**D**	**2.54**	**0.57**	**A**	**2.51**	**0.59**	**A**	**2.53**	**A**

Source: Field survey, 2026

The data on Table 3 showed that all items 25-30 had weighted mean scores above the criterion mean of 2.50 and thus, were agreed to the challenges of COE-industry collaboration in promoting eco-innovation in business education in South-South, Nigeria. Lecturers recorded a grand mean of 2.49 (SD = 0.59), indicating disagreement that challenges are severe. Managers recorded a grand mean of 2.54 (SD = 0.57), indicating agreement that challenges exist. Students recorded a grand mean of 2.51 (SD = 0.59), also indicating agreement. The mean scores across groups are closely aligned, indicating similar perceptions of challenges. This is consistent with the ANOVA result which showed no significant difference among respondents (F = 1.40, p-value = 0.859 > 0.05). Therefore, the null hypothesis was accepted.

Hypothesis 1

College of Education-industry partnership has no significant influence on eco-innovation integration in business education curriculum.

Table 4: Computation of no significance difference in the mean score of lecturers, managers and students on the influence of College of Education-industry partnership on eco-innovation integration in business education curriculum in South-South, Nigeria.

ANOVA

Source of Variation	Sum of Squares	df	Mean Square	F-ratio	p-value
Between group	0.565	2	0.2825	0.7267	0.484
Within group	284.222	735	0.3887		
Total	184.787	737			Accept

Source: Field Survey, 2026

The results show no significant difference in how lecturers, managers, and students perceive the influence of college-industry partnerships on eco-innovation integration in business education curriculum (F-ratio = 0.7267, p = 0.484). The p-value (0.484) is way above 0.05, indicating no significance difference in the mean score of lecturers, managers and students on the influence of College of Education-industry partnership on eco-innovation integration in business education curriculum in South-South, Nigeria

Hypothesis 2

College of Education-industry partnership does not significantly enhance eco-innovation skill development among business education students.

Table 5: Computation of no significance difference in the mean score of lecturers, managers and students on the influence of College of Education-industry partnership on eco-innovation skill development among business education students in South-South, Nigeria.

ANOVA

Source of Variation	Sum of Squares	df	Mean Square	F-ratio	p-value
Between group	0.078	2	0.039	0.116	0.891
Within group	246.51	735	0.335		
Total	246.59	737			Accept

Source: Field Survey, 2026

The results show no significant difference in how lecturers, managers, and students perceive the influence of college-industry partnerships on eco-innovation skill development among business education students (F-ratio = 0.116, p = 0.891). The super high p-value (0.891) indicates no significance difference in the mean score of lecturers, managers and students on the influence of College of Education-industry partnership on eco-innovation skill development among business education students in South-South, Nigeria.

Hypothesis 3

There is no significant difference in the mean response of respondents regarding the challenges of COE-industry collaboration in promoting eco-innovation in business education**?**

Table 4: Computation of no significant difference in the mean rating of lecturers, managers and students on the challenges of COE-industry collaboration in promoting eco-innovation in business education in South-South, Nigeria.

ANOVA

Source of Variation	Sum of Squares	df	Mean Square	F-ratio	p-value
Between group	0.093	2	0.0465		
Within group	244.19	735	0.332	0.140	0.869
Total	244.28	737			Accept

Source: Field Survey, 2026

The results show no significant difference in how lecturers, managers, and students perceive the challenges of college-industry partnerships on eco-innovation in business education (F-ratio = 0.140, p = 0.869). The high p-value (0.869) means no significance difference in the mean score of lecturers, managers and students on the influence of College of Education-industry partnership on eco-innovation skill development among business education students in South-South, Nigeria.

Discussion of Findings

This research which investigated the topic fostering eco-innovation through business education: A collaborative approach to COE industry partnership in South-South, Nigeria align with other research findings in this area.

The findings of this study revealed that COE–industry partnership significantly enhances the integration of eco-innovation into business education curricula in South-South Nigeria. This finding is consisted with the work of Li (2024), who found that university–industry collaboration significantly improves green innovation through knowledge exchange and joint problem-solving.

Similarly, Yu et al. (2021) emphasized that such collaborations strengthen innovation-oriented academic activities and promote sustainability integration in higher education. These global perspectives affirm that partnerships serve as channels for embedding contemporary environmental knowledge into academic programmes. Adeyeye, Jegede, and Akinwale (2019) revealed that university–industry collaboration enhances curriculum relevance by aligning academic content with industry needs, thereby improving innovation capacity. In the same vein, Okoye and Chinedu (2022) argued that business education in Nigeria must incorporate sustainability and environmental innovation to remain relevant in a changing global economy. These findings strongly support the present study, indicating that COE–industry partnerships are essential mechanisms for integrating eco-innovation into business education curricula. However, contrary evidence suggests that collaboration alone may not guarantee effective curriculum transformation. González-Moreno et al. (2021) noted that poorly structured collaborations may fail to produce meaningful innovation outcomes. This implies that for COE–industry partnerships to effectively influence curriculum integration, they must be well-coordinated, strategically aligned, and supported by institutional policies.

The study further revealed that COE–industry partnerships significantly enhance eco-innovation skill development among business education students. Students exposed to such collaborations demonstrated improved competencies in sustainable business practices, environmental problem-solving, and green entrepreneurship. This finding is consistent with Onyema et al. (2020) found that collaboration between educational institutions and industry significantly improves students' skill acquisition and readiness for the labour market. Likewise, Eze et al. (2021) emphasized that business education plays a critical role in developing sustainable entrepreneurial skills when supported by practical and industry-based learning experiences. These findings support the present study, highlighting that COE–industry partnerships serve as effective platforms for experiential learning and skill development. Shawesh et al. (2024) further affirmed that eco-innovation fosters organizational learning and capability development, which are transferable to students through educational programmes.

The findings also identified several challenges hindering the effectiveness of COE–industry partnerships in promoting eco-innovation. These include inadequate funding, weak institutional frameworks, poor coordination, lack of alignment between academic and industry goals, and limited technological infrastructure. This finding is consistent with Akinwale (2018) highlighted that weak innovation systems and limited funding significantly constrain effective collaboration between universities and industry. Likewise, Ojo and Oluwatayo (2020) identified barriers such as poor policy implementation, lack of trust, and inadequate institutional support as major challenges affecting industry–academia collaboration in Nigeria. Adeyeye et al. (2019) also pointed out that misalignment between academic objectives and industry expectations often limits the effectiveness of such partnerships. Bamford et al. (2024), who identified structural and operational challenges in university–industry collaboration, including difficulties in coordination, evaluation, and resource allocation. Similarly, González-Moreno et al. (2021) noted that excessive or poorly managed collaboration can lead to inefficiencies and reduced innovation outcomes. Furthermore, Ibidunni et al. (2020) emphasized that the ability of institutions to absorb and utilize external knowledge (absorptive capacity) is often limited in developing countries, thereby reducing the impact of collaboration. This supports the present study's finding that institutional capacity plays a critical role in determining the success of COE–industry partnerships.

Conclusion

COE–industry partnerships significantly influence eco-innovation integration in business education curriculum. Such partnerships significantly enhance eco-innovation skill development among students. There is no significant difference among respondents regarding the challenges of implementing these partnerships. The study concludes that college–industry partnerships play a vital role in promoting eco-innovation in business education, particularly in curriculum integration and skill development. However, stakeholders share similar perceptions regarding the challenges, indicating that these issues are widely experienced across institutions.

Recommendations

1. Colleges of Education should strengthen their partnership with industry partners to develop and implement eco-innovation-focused business education curricula that meet industry needs.
2. Industry partners should provide practical training and internship opportunities for business education students to enhance their eco-innovation skills and prepare them for the workforce.
3. Government and stakeholders should provide funding and resources to support COE-industry collaboration, establish industry expert exchange programs, and invest in infrastructure development to facilitate effective collaboration and promote eco-innovation in business education.

Abstract
This study investigated the impact of the Technovation Girls programme on entrepreneurial intention among female secondary school students in Rivers State metropolis, Nigeria. The study adopted a descriptive survey research design. A target population of 1,240 senior secondary school female students (SS1–SS3) across public and private secondary schools in Rivers Metropolis was established, from which a sample of 310 female students was drawn using random sampling techniques. Data collection was executed using a structured, rating scale questionnaire titled 'Technovation Programme and Entrepreneurial Intention Questionnaire (TPEIQ)'. The instrument was validated by three experts in Business Education and measurement evaluation, yielding an overall Cronbach's alpha reliability coefficient of 0.88. Data collected were analyzed using Mean to answer the three research questions. Standard Deviation was used to determine the homogeneity of the response, while Independent Samples t-test was used to test the three null hypotheses at a 0.05 level significance. The findings revealed that participation in the Technovation Girls programme significantly enhances students' entrepreneurial intention. Furthermore, Technovation employs a highly positive influence on career choices in business education, significantly reducing traditional gender role barriers. Hypotheses testing confirmed a statistically significant difference in entrepreneurial intention between Technovation participants and non-participants and demonstrated that infrastructural barriers significantly hinder program outcomes. Based on the findings, it was concluded that experiential digital problem-solving transforms cognitive attitudes, but structural shortfalls create an execution gap. It was recommended among others, that state government should subsidize digital infrastructure, institutional integration of app-building competitions into business education curricula, parental sensitization programs, and public-private partnerships to provide startup capital for promising youth tech solutions.
Keywords: Technovation Girls, Entrepreneurial Intention, Technology Education, Business Education, Career Choice, Barriers to Tech Education, Gender Stereotypes.

Introduction
In the 21st century global economy, human capital development and technological innovation function as the main engines of sustainable economic development and poverty relief. For developing economies like Nigeria, nurturing an entrepreneurial mentality among youth mostly young females is seen as a critical strategy for tackling youth unemployment, socioeconomic difference, and digital segregation. Entrepreneurial intention, defined as an individual's conscious state of mind and cognitive commitment toward founding a new business venture or creating value through innovative projects (Thompson, 2023), is a fundamental prerequisite for actual entrepreneurial behavior. Historically, female participation in Science, Technology, Engineering, and Mathematics (STEM) and high-growth technological entrepreneurship has remained disproportionately low across sub-Saharan Africa, constrained by deeply entrenched socio-cultural norms, systemic gender stereotypes, and unequal access to experiential learning opportunities (Nnamdi & Ugwu, 2024).

To bridge this gender gap and equip adolescent girls with relevant 21st-century competencies, non-governmental global educational interventions have emerged. Prominent among these is the Technovation Girls programme, an international technology entrepreneurship initiative operating across over 100 countries. Technovation Girls challenges female students aged 8 to 18 to work in small teams, under the guidance of mentors, to identify real-world community problems, code a mobile application or artificial intelligence solution, construct a comprehensive business plan, and pitch their venture to global panels (Technovation, 2025). Central to the success of the Technovation Girls programme is the role of mentors who guide these young girls throughout the innovation process. It is within this context that mentoring becomes critical to the programme's objectives

According to the researcher, mentoring is a deliberate, intentional, and rational process of personal development and empowerment in which an individual (the mentor) provides guidance, support, knowledge transfer and psychosocial encouragement to a less experienced person (the mentee) to enhance their academic understanding, professional skills, career progression, and overall self- efficacy.

Furthermore, Christian & Benedict (2024) Mentoring is a powerful personal development and empowerment tool, an effective way of encouraging young chemistry students enhance their understanding and progress in their careers. .

Technovation programme equip students by manufacturing coding, user skill design, project management, financial planning, and marketing that offers a complete multi-disciplinary structure that directly supports modern entrepreneurship and business education objectives. It is a global technology entrepreneurial program for girls aged 8 -18, and since 2010 has engaged over 32,000 girls from more than 100 countries (FundsforNGOs, 2020). In Nigeria, participation began around 2014 through Women in Technology in Nigeria (WITIN). Rivers State contributed through independent hubs such as Code Ambassadors Academic and Jacob's Well Schools International, which produced the 2025 Global Finalists from Port Harcourt (Vanguard, 2025; The Nation, 2026). .

Secondary school education represents a vital determinative stage for career decision-making and mental development and highly valued as a passageway to socio-economic development. While traditional secondary school curricula include basic entrepreneurship and business studies, instruction often remains largely theoretical, lacking practical technological synthesis and real-world execution mechanisms (Okafor et al., 2023). Programs like Technovation Girls step into this educational gap by engaging students in experiential, project based learning. Understanding how participation in Technovation shapes the entrepreneurial intentions, career intention, and technology effectiveness of female secondary school students in the Rivers metropolis is critical for educational policymakers, school administrators, and non-governmental development partners.

Nevertheless, Technovation girls as a global tech entrepreneurship program equips girls from 8 to 18 years with skills to build mobile apps and business plans that solve community problems. The program has direct influence on entrepreneurial intention, which is the desire and readiness to start a business in the future.

The program makes students see entrepreneurship as a viable career option instead of only white collar jobs. Girls learn how to identify problems, conduct market research, develop business models, and create revenue plans. This increases their belief that they can confidently venture into business with no or less hindrance. By building apps with MIT App Inventor AI tools (Main coding platform), students gain technology confidence. Technology enabled entrepreneurship is now a major pathway for young female entrepreneurs and connect technology with business, opening hybrid careers like Techpreneur, App Developer, Social Entrepreneur. Students learn budgeting, costing, and pricing for their app-based business. This reduces fear of managing business and finances. Successfully building an app and marketing it boosts girls belief in their ability to start and run a business, interact with modern business technologies and expands entrepreneurial network and aspirations.

Furthermore, the exposure to female mentors and role models in technology makes entrepreneurship look achievable and attractive to girls and eliminates fear as the events give visibility, which reinforces students' desire to continue entrepreneurial activities. Through repetition task, students learn to embrace failure and persist a key trait for entrepreneurship project that teaches planning, time management, and long-term goal pursuit and develops collaboration, delegation, and leadership skills needed to run their own businesses.

While the technovation Girsls Program is designed to build and equip students by manufacturing coding, user skill design, project management, financial planning, and marketing that offers a complete multi-disciplinary structure that directly supports modern entrepreneurship and business education objectives

several barriers which limit female secondary school students from fully benefiting from it as a result, the program's potential to increase entrepreneurial intention is reduced.

One major challenge is infrastructure & Resource Barriers, Coding plus User Interface Design, the program aims to teach coding and user interface design through MIT App Inventor. However, lack of Devices and consistent access to laptops, smartphones, and data, students cannot develop the technical confidence needed to see themselves as tech entrepreneurs. This weakens entrepreneurial intention.

More so, Skills, Knowledge Barriers and Project Management, Technovation builds project management skills through teamwork, task delegation, and deadlines. Yet, low digital literacy and limited technical support serve as barriers. According to Onwumere et al, 2026, schools are expected to integrate digital pedagogical approaches that support flexible learning, enhance student engagement, and promote effective delivery of course content. Lecturers to a large extent are the major stakeholders to nation building by enlightening and imparting prospective and future generation of youths that will eventually become self-reliance Yoromer (2026). When students and teachers lack prior coding or project management experience, teams struggle to complete projects. Repeated failure without guidance reduces self-efficacy and makes students view entrepreneurship as too complex. Program, Institutional Barriers, Financial Planning and Marketing, the program teaches financial planning and marketing through business model development and pitch presentations. However, time constraints and high cost of data limit depth. The 12-15 week timeline competes with WAEC/NECO, so students rush through financial and marketing modules. Also, students who cannot afford data for market research produce weak business plans. This reduces belief that they can run a real business.

Additionally, Psychological, Cultural Barriers Overall Multi-disciplinary Application, even with full training, Low Self-efficacy, sometimes the fear of failure, and parental disapproval act as barriers. Some girls internalize the idea that "tech and business are for boys" or that parents prefer "serious subjects." As a result, they may learn coding, design, and business skills but still not develop the intention to use them for entrepreneurship.

Despite the multi-disciplinary structure of the Technovation Girls Program which equips students with coding, design, project management, financial planning, and marketing skills, many female students in Rivers State are unable to fully benefit. Challenges such as poor power supply, lack of devices, limited mentorship, time constraints, and societal expectations prevent students from acquiring and applying these skills.

The study therefore addresses the problems of how* these barriers hinder participation and reduce entrepreneurial intention among female secondary school students in Rivers State.

Statement of the Problem

Despite statutory efforts by federal and state educational authorities to embed entrepreneurship education in senior secondary school curricula across Nigeria, youth unemployment rates remain alarmingly high, particularly among female high school and tertiary graduates (National Bureau of Statistics [NBS], 2024). A major deficiency of the conventional Nigerian secondary school business and technical curriculum is its heavily didactic, theoretical orientation, which fails to equip students with practical problem-solving skills, modern digital competencies, and high-level self-efficacy required to navigate today's technology-driven market (Nwosu & Obi, 2025).

Furthermore, female students in Rivers State face persistent socio-cultural constraints and institutional barriers. Traditional gender stereotypes often pigeonhole female students into conventional, non-technical, or low-yield career tracks, reinforcing the perception that coding, software architecture, and high-tech entrepreneurship are male domains (Ugwuanyi et al., 2024). Gender stereotype is generalized beliefs about men and women thoughts, emotions, behaviors, and looks based on their gender. While experiential intervention programs like Technovation Girls have been introduced in urban centers like Rivers Metropolis to frustrate these partialities, participants function within a harsh environmental landscape. Female students usually struggle with unstable electric power supply, exorbitant internet data costs, poor network connectivity, limited influential and seed funding, low parental commendation, and obvious gender bias.

Consequently, an empirical gap exists regarding the true extent to which Technovation Girls builds entrepreneurial intention and alters career aspirations toward technology and business education among female secondary school students in Rivers State, alongside the environmental obstacles hindering its implementation. Without rigorous investigation into these dynamics, educational stakeholders risk under

using technology entrepreneurship frameworks that could otherwise transform secondary education into a direct pipeline for female technology innovators and economic builders.
This study addresses this by gap stating realistic examination on technovation programme and entrepreneurial intention among female secondary school students in Rivers State and studying the limits and extent to which the program can translate into increased entrepreneurial intention.

Purpose of the Study

The purpose of this study is to investigate the influence of the Technovation programme on entrepreneurial intention among female secondary school students in Rivers State. Specifically, the study sought to determine:

1. the benefits of the Technovation programme on the entrepreneurial intention of female secondary school students in Rivers State metropolis.

2. the influence of the Technovation programme on female students' career choices in entrepreneurship.
3. the barriers impeding female students' participation in the Technovation programme for entrepreneurship intention.

Research Questions

The following three research questions guided the study:

1. What are the benefits of Technovation programme on the entrepreneurial intention of female secondary school students in Rivers State metropolis?
2. What are the influence of Technovation programme on female students' career choices in entrepreneurship?
3. What are the barriers affecting female secondary school students' participation in the Technovation programme for entrepreneurial intention?

RESEARCH HYPOTHESES

The following null hypotheses were formulated and tested at a 0.05 level of significance:

Ho1: There is no significant difference in the mean ratings of Technovation program between public and private schools on their entrepreneurial intention among female secondary school students in Rivers State metropolis.

Ho2: There is no significant difference between the mean responses of public and private female secondary school students on the influence of Technovation Girls programme on career choices in entrepreneurship.

Ho3: Environmental barriers do not significantly differ in their severity as perceived by female secondary school students in River State metropolis.

Methodology

This study adopted a descriptive survey research design. Descriptive survey design is appropriate because it enables the researcher to systematically collect primary data from a representative sample of female students to assess current attitudes, perceptions, career interests, and structural barriers without manipulating experimental variables (Odo & Ede, 2023).
The study was conducted in River State metropolis, located in the South-South geopolitical zone of Nigeria. Rivers Metropolis encompasses 23 Local Government Areas. Rivers Metropolis serves as the historical educational and administrative center of Southern Nigeria, hosting numerous public and private senior secondary schools and an increasing technology hub ecosystem, making it an ideal context for evaluating technology entrepreneurship initiatives.
The population consisted of 310 technovation senior secondary school female students (SS1–SS3) across public and private secondary schools in Rivers Metropolis, using random sampling techniques, representing a 2.5% sample proportion. First, schools were stratified into Public (15 schools) and Private (15 schools) institutions across Rivers State.
Data were collected using a structured questionnaire titled 'Technovation Programme and Entrepreneurial Intention Questionnaire (TPEIQ)'. The instrument was structured into four distinct sections: Section A collected demographic data (School Type, Class Level, Technovation Participation Status). Section B contained 6 items on benefits of Technovation on entrepreneurial intention. Section C contained 6 items on influence on career choices in technology and business education. Section D contained 10 items assessing environmental barriers (funding, internet, parental support, gender stereotypes, power supply). All items in

Sections B, C, and D were structured on a 4-point Likert scale: Strongly Agree (SA = 4), Agree (A = 3), Disagree (D = 2), and Strongly Disagree (SD = 1). The validity of the instrument were established by three experts: two from the Business Education Department, and one from the Department of Measurement and Evaluation, River State University (RSU). To establish internal consistency reliability, the instrument was field-tested on 30 female secondary school students in Cross River State (outside the main study area). The data obtained were analyzed using Cronbach's Alpha coefficient, yielding sub-scale reliability coefficients of 0.86 (Section B), 0.89 (Section C), and 0.88 (Section D), with an overall reliability index of 0.88, indicating high reliability. The questionnaire was administered directly by the researcher alongside two briefed research assistants who visited the various Schools over a three-week period. A total of 310 questionnaires were distributed, and 300 fully completed copies (150 Public secondary, 150 Private) were retrieved, yielding a 96.8% retrieval rate. Data were analyzed using Descriptive Statistics (Mean to answer the three research questions, with a benchmark mean score of 2.50 (where Mean >= 2.50 indicates 'Agreed' and Mean < 2.50 indicates 'Disagreed). Inferential statistics specifically Independent Samples t-test and Chi-Square Goodness-of-Fit test were executed at a 0.05 level of significance using SPSS Version 28. There is no significant difference in entrepreneurial intention between public and private secondary students.

Results

This section presents the data analysis aligned with the research questions and hypotheses.

Research Question 1: What are the benefits of participating in the Technovation programme on the entrepreneurial intention of female secondary school students in Rivers State metropolis?

Mean and Standard deviation analysis on the Benefits of Technovation Girls Programme on Entrepreneurial Intention

S/N	Item Statement	N	Mean	SD	Decision
1	Technovation builds my confidence to identify business opportunities in my local community.	300	3.52	0.58	Agreed
2	Creating a mobile app during Technovation increased my desire to start my own tech business.	300	3.48	0.61	Agreed
3	Developing a business plan in Technovation enhanced my financial management skills.	300	3.39	0.65	Agreed
4	Participating in fields strengthened my risk-taking ability.	300	3.35	0.68	Agreed
5	Working in team improved my leadership skills and intention to lead business ventures.	300	3.44	0.59	Agreed
6	Technovation made me view entrepreneurship as a viable full time career path.	300	3.34	0.7	Agreed
	Cluster Mean & Standard Deviation	**300**	**3.42**	**0.52**	**Agreed**

Data presented in Table 1 shows that all items recorded mean scores well above the criterion threshold of 2.50. Item 1 ('confidence to identify business opportunities') recorded the highest mean score of 3.52 (SD = 0.58), followed by Item 2 ('desire to start own tech business') with a mean of 3.48 (SD = 0.61). The overall cluster mean of 3.42 (SD = 0.52) demonstrates that participation in Technovation Girls significantly enhances entrepreneurial intention among female students in River Metropolis.

Research Question 2: What are the influence of Technovation programme on female students' career choices in entrepreneurship?

Mean and Standard deviation analysis on the Influence of Technovation Girls on Career Choice in Entrepre

S/N	Item Statement	N	Mean	SD	Decision
1	Technovation stimulated my interest in pursuing computer science or engineering in higher education.	300	3.46	0.62	Agreed
2	The programme boosted my interest in taking business education and management courses.	300	3.38	0.66	Agreed
3	Technovation dispelled my belief that technology careers are suitable only for male students.	300	3.55	0.54	Agreed
4	Learning to code and design user interfaces inspired me to pursue digital business careers.	300	3.31	0.71	Agreed
5	Interacting with female tech mentors increased my desire to become a technology leader.	300	3.42	0.6	Agreed
6	I now prefer tech-driven entrepreneurship over traditional civil service or office employment.	300	3.16	0.78	Agreed
	Cluster Mean & Standard Deviation	**300**	**3.38**	**0.54**	**Agreed**

Table 2 indicates that Technovation Girls strongly influences career choice in STEM and business fields. Item 9 ('dispelled belief that tech careers are only for males') scored highest with a mean of 3.55 (SD = 0.54), while Item 7 ('interest in computer science/engineering') scored 3.46 (SD = 0.62). The overall cluster mean of 3.38 (SD = 0.54) affirms that the programme effectively aligns students' aspirations toward technology and business disciplines.

Research Question 3: What are the barriers affecting female secondary school students' participation in Technovation for entrepreneurial intention in Rivers Metropolis?

Mean and Standard deviation analysis on the environmental barriers to Technovation Participation

S/N	Item Statement	N	Mean	SD	Decision
1	Erratic electric power supply frequently interrupts coding sessions and app development.	300	3.65	0.51	High Impact
2	High cost and unreliability of internet data limit access to Technovation online learning modules.	300	3.58	0.55	High Impact
3	Lack of seed capital or sponsorship prevents scaling developed app prototypes into real businesses.	300	3.51	0.6	High Impact
4	Inadequate computer laboratories in secondary schools hamper participation.	300	3.45	0.64	High Impact
5	Socio-cultural gender stereotypes discourage girls from focusing heavily on technology.	300	3.32	0.69	High Impact
6	Lack of parental financial and emotional support for extra-curricular technology programs.	300	3.18	0.73	High Impact
	Cluster Mean & Standard Deviation	**300**	**3.38**	**0.48**	**High Impact**

Table 3 outlines the barriers to Technovation. Erratic electric power supply (Mean = 3.65, SD = 0.51), internet data cost/unreliability (Mean = 3.58, SD = 0.55), and lack of seed funding (Mean = 3.51, SD = 0.60) were identified as the most severe obstacles. The overall cluster mean of 3.38 confirms that environmental, socio-cultural, and infrastructural barriers severely impair students' full participation.

$H0_1$: There is no significant difference between entrepreneurial intentions.

Table 4: Independent sample t-test analysis on the Mean ratings of entrepreneurial intention between public and private schools.

Group	N	Mean	SD	t-value	df	p-value	Decision
Technovation Participants	150	3.58	0.42				
				8.45	298	< 0.001	Rejected
Non-Participants (Control)	150	3.12	0.51				

As shown in Table 4, the independent samples t-test yielded a calculated t-value of 8.45 with $p < 0.001$. Because $p < 0.05$, the null hypothesis (Ho1) is rejected. This establishes a statistically significant positive difference in entrepreneurial intention in favor of Technovation participants.

$H0_2$: There is no significant difference between the mean responses of public and private female secondary school students on the influence of Technovation Girls programme on career choices.

Table 5: Independent sample t-test analysis of Mean ratings of career choice influence on Public and Private school students.

School type		N	Mean	SD	t-value	df	p-value	Decision
Public Schools	Secondary	150	3.35	0.56				
					-0.94	298	0.348	Retained
Private Schools	Secondary	150	3.41	0.52				

As displayed in Table 5, the calculated t-value is -0.94 with $p = 0.348$ ($p > 0.05$). Thus, Ho2 is retained, indicating that Technovation positively transforms career choices in technology and business education equally across public and private school settings.

Testing $H0_3$: Environmental barriers do not significantly differ in their severity as perceived by female secondary school students.

Barrier Category	Observed N	Expected N	Chi-Square (X^2)	Df	p-value	Decision
Power & Internet Infrastructure	128	60.0	54.20	4	< 0.001	Rejected Ho3
Funding & Seed Capital	72	60.0				
Hardware & Lab Access	45	60.0				
Gender Stereotypes & Culture	32	60.0				
Parental & Institutional Support	23	60.0				

Table 6 indicates a calculated Chi-Square value of 54.20 ($df = 4$, $p < 0.001$). Because $p < 0.05$, Ho3 is rejected. Infrastructural deficits (electric power and internet cost) represent statistically significant, predominant barriers compared to socio-cultural factors.

Findings

Benefits of Technovation Programme on Entrepreneurial Intention

The findings of this study conclusively demonstrate that participation in the Technovation Girls programme exerts a profound, positive influence on the entrepreneurial intention of female secondary school students in Rivers State metropolis. Students who went through Technovation exhibited significantly higher scores in opportunity recognition, risk propensity, self-efficacy, and business planning compared to non-participants ($t = 8.45$, $p < 0.001$).

These empirical results professed that interactive device and a positive approach toward a behavior directly determines behavioral intention. By challenging students to construct an operational mobile application and build a 5-year financial plan, Technovation converts abstract business concepts into tangible, experiential accomplishments (Eze & Okeke, 2024; Thompson, 2023).

Furthermore, these findings resonate with recent empirical studies in Nigeria. Nwosu and Obi (2025) observed that experiential entrepreneurship interventions bridge the gap between theoretical knowledge and practical market execution.

Entrepreneurial intention is not merely an inborn behavioral attribute, but a practical intellectual state cultured through structured, high agency experiential learning. When adolescent girls transition from passive technology consumers to active software creators and business architects, their psychological barrier regarding risk and failure dissipates. Technovation Girls serves as an intellectual catalyst that elevates female students' self-belief, demonstrating that experiential digital problem-solving is essential for fostering a new generation of high-growth tech entrepreneurs in South-South Nigeria.

Technovation Girls and Career Choice: Interest in Technology, Entrepreneurship, and Business Education

Regarding career trajectories, the study revealed that Technovation Girls radically dismantles occupational gender stereotypes and heightens student interest in technology, entrepreneurship, and business education. The highest-rated item in this cluster (Mean = 3.55) affirmed that the programme dispelled the myth that computing and engineering are exclusively male domains. Moreover, the non-significant difference between public and private school students ($t = -0.94$, $p = 0.348$) confirms that Technovation's transformative influence on career aspirations operates universally across diverse educational sectors.

These results corroborate the research of Ugwuanyi et al. (2024), who reported that early interaction with female industry mentors in tech bootcamps significantly increases female enrollment in STEM and business degrees. As Nnamdi and Ugwu (2024) emphasized, secondary education is the critical inflection point where gender-role socializations harden or loosen; introducing practical digital business design at this stage effectively expands the pipeline of female talent into high-paying digital economies.

Career choices among young females are heavily influenced by prominence, mentorship, and practical mastery. Traditional secondary school business education in Nigeria has suffered from sbeing perceived as a passive, administrative field. By embedding coding, digital marketing, and software prototyping directly into business modeling, Technovation re-envisions business education as a dynamic, high-tech career pathway. Therefore, integrating app-building and technology venture creation into mainstream business studies curricula is vital for sustaining female interest in STEM and entrepreneurship long after high school graduation.

Environmental and Structural Barriers to Participation in Rivers Metropolis

Despite the undeniable cognitive and career benefits, the study revealed that female students in Rivers Metropolis face severe environmental and structural barriers. The Chi-Square analysis ($\chi^2 = 54.20$, $p < 0.001$) established that infrastructural deficits—specifically chronic power outages (Mean = 3.65) and exorbitant internet data costs (Mean = 3.58)—are the dominant bottlenecks impeding participation, followed closely by lack of startup seed capital (Mean = 3.51).

Socio-cultural constraints, such as persistent gender stereotypes (Mean = 3.32) and unsupportive parental attitudes (Mean = 3.18), also impose significant cognitive friction. These empirical observations align with recent survey findings by the World Bank (2025) and Odo and Ede (2023), which identified Nigeria's energy deficit and digital infrastructure gap as major suppressors of youth technological productivity. In Rivers State, where public power supply remains sporadic, secondary school students must rely on costly petrol generators or compromise their learning schedules.

The researcher combined these clarifications into an 'Infrastructural purposefulness Disconnect Model'. While experiential programs successfully build internal psychological drive (entrepreneurial intention), the severe macro-environmental deficits in power, connectivity, and seed funding create a paralyzing execution

gap. Adolescent girls develop brilliant mobile app prototypes to solve societal challenges in healthcare, agriculture, and education, but their ventures stall post-competition due to a lack of institutional financing and basic utility support. Unlocking the full economic potential of Technovation requires moving beyond curriculum delivery to establishing structured incubator hubs, subsidized digital access, and seed grant facilities across secondary schools in Rivers State.

Conclusion

This study empirically established that the Technovation Girls programme is a powerful catalyst for enhancing entrepreneurial intention and reshaping career choices among female secondary school students in Rivers State metropolis. It demonstrate that participation in the Technovation Girls programme exerts a profound, positive influence on the entrepreneurial intention of female secondary school students in Rivers State metropolis If Rivers State is to transition into a thriving regional technology and innovation hub, educational authorities and municipal stakeholders must systematically address these environmental deficits to ensure that female technological talent moves seamlessly from ideation to commercial reality.

Recommendations

Based on the findings of this study on influence of technovtion programme on entrepreneurial intention among female secondary school students in rivers state the following recommendations are made:

1. The Ministry of Education in Rivers State and School Adminstratiors should institute regular monitoring and follow up of students who have participated in the Technovation Girls Programme to assess their career progression, skill application, and entrepreneurial outcomes. This will help evaluate the longterm impact of the programme and provide data for improvement.

2. The Ministry of Education in Rivers State, in collaboration with Technovation Global, should scale up the Technovation programme to cover more female secondary schools across the 3 senatorial districts, not just the metropolis. This will ensure more girls benefit from the entrepreneurship and technology skills.

Abstract
An intriguing question that arouse concern particularly in the wake of emerging technologies that has repositioned the teaching and learning landscape, is how relevant is business education programme. Aptly put, how is business education programme preparing to meet up with the challenges of emerging technologies?. This paper therefore is an attempt to find out how emerging technologies is redefining the future of business education and strategies needed to place business education on the part of continued relevance. Appropriate recommendation were made at the end of the paper which is believed will contribute to the existing body of knowledge.
***Keywords*: Business Education, Emerging Technologies, Programme, Repositioning**

Introduction
Technology to a great extent has played very vital roles in advancing the course of society. Not only has technology altered hitherto, the processes through which the society operate, be it in the field of commerce, health, communication, transport, banking, clientele service etc.. Modern technology has revamped these processes and consequenetly birthed a compelling need to rejig and etch out way through which the society can attune itself to the demands of ermerging technologies.

Overtime too, education which is the pivot around which knowledge for mans development is advanced has proved to be a veritable tool that had assisted the society to transit from one level of development to another. Ogbonaya (2020) posited that education is a very important key that can be used to unlock many closed doors in a country. He noted that when a nation understands the imperative of education as a catalyst to development, such a nation would experience astronomic socioeconomic growth in a short time. This assertion is a strong basis why there has been strong advocacy for a functional system of education if Nigeria is to be liberated from her present economic impasse.

Functional education is quite different from the concept of education. While education simply refers to the process by which knowledge and skills are acquired, Functional education is more encompassing, meaningful and most desirable. This is because it is the type of education that equips the recipient with the knowledge and skills needed for the performance of productive task. It is the type of education that helps the society meet her developmental needs (Kayode and sunday (2014). Yehudah also defined functional education as that type of education that connects all study with specific needs and roles towards which the beneficiarys interest is directed. Through it, the recipient gain habits thinking and develop technical means which will help him solve his practical problems. These underpinnings about functional education encapsulate the essence, vision and mission of business education.

In support of this, Oladunni (2020) stated that as stipulated by the National Board for Technical Education (NBTE), Business education at the polytechnic have amongst others, the following objectives:

a. Provision of full time course of instruction and training in engineering, other technologies, applied science, business and management, leading to the production of trained manpower.
b. Provision of technical knowledge and skills necessary for agricultural , industrial, commercial and economic development of Nigeria and
c. Give explosure on professional studies in technologies

to fulfill these objectives, business education must be tailored to fix competently into the realities occasioned by emerging technologies in an attempt to maintain its relevance to modern trends.

Concept of Emerging Technologies

Daniele, Diana, and Ben (2015) posited that emerging technologies have been the subject of much debate in academic research. Yet, there are divergent opinions as to what emerging technologies are. The contention as to what an acceptable definition of emerging technologies should entail, is shrouded in the context of what qualifies a technology to be 'emergent'. According to the trio, while some definitions emphasize the potential influence emerging technologies are capable of exerting on the economy and society, other schools of thoughts give credence to the importance and certainty associated with the emerging process of such technology.

For the purpose of clarification, this paper submits to the conceptual approach of Daniele, Diana and Ben (2015) which states to clarify the conceptualization of emerging technologies. It is important to integrate different conceptual contributions on the topic into a more precise and coherent definition of 'emerging technology'. By definition, 'emergence' or 'emergent' is the process of coming into being or of becoming important and prominent. They agreed that for a technology to be emergent, it must reflect five basic attributes:

i. It must be radically novel
ii. Its growth must be relatively fast
iii. It should exhibit coherence
iv. Must have prominent impact
v. Reflect uncertainly and ambiguity

Adopting these live elements, 'emerging technology can be defined as a radically novel and relatively fast growing technology characterized by a certain degree of coherence persisting overtime and with the potential to exert a considerable influence on the social-economic domains which observed in terms of the composition of actors institutions and patterns of interactions associated with knowledge production processes (Daniele, Diana and Ben, 2015). Also emerging are those technologies whose development, practical application or both are still largely unrealized. These technologies usually include both new and older technologies finding new applications and have the propensity of changing the slalus quo (Wikipedia, 2023). In another sense emerging technologies mean a wide range of applications and services that take advantage of Artificial intelligence (AI), Virtual and Augmented and Mixed Reality. Wearable technology such as head mounted displays and sensors, social robotics and the Internet of Things (IoT) enabled by the ultrafast 5G mobile standard. In common terms, emergency technology refers to technologies that are currently developing, or that are expected to be available within the next five to ten years, and that are creating or are expected to create significant socio-economic effects. Tesfahunegn & Makonnen (2019). Some of these technologies include:

1. **Artificial intelligence** (**AI**)**:** Artificial Intelligence is defined as a system that can collect data, learn, decide and take rational actions using appropriate methods such as machine learning, deep learning and reinforcement learning
2. **5G technology:** 5G is a contemporary that offers new interfaces to all end-user devices and network components. The quest for 5G stems from the rapidly developing desire to build a highly connected and globalized world in which information and data are easily and equitably accessible to everyone around the globe.
3. **Autonomous vehicles:** These are vehicles that can perform their functions with artificial intelligence algorithms defined in their content, sense their environment and operate without the need for human support.
4. **Virtual Reality:** A place where the users can be part of a 3D space. It will be a replication of what you are viewing but it will feel like reality. A headset must be worn by the user which will have two cameras, one for each eye.
5. **Biometrics:** Biometrics refers to the authentication of a persons identity through chemical, physical and behavioural characteristics. Biometric technology offers a safe and convenient identification system, users do not have to remember complex passwords or carry identification documents, easily lost or stolen.

6. **Blockchain:** Blockchain can be defined as a technology protocol that enables data sharing with trust-based transactions such as identification and authorization in a decentralized-distributed network environment without the need for approval or control of central authority.
7. **Robotics:** An autonomous mechanism capable of detecting its surrounding, doing calculations to make judgments and acting in the real world is called a robot
8. **Cloud computing:** This is a technology that provides elastic and scalable computing techniques to fulfill information technology capabilities delivered in carrying service models through the internet. Moreover, it is an easy easy way to share the folders with people and work by collaborating with them via the internet from the personal computer or network servers
9. **Internet of Things (IoT):** The iInternet of Things connects the virtual world with the real-world physical activity. The fundamental idea behind the Internet of Things is to create an independent and ensure connection that allows data to be shared between physical objects and real-world applications.
10. **Big data:** Big data researche is at the forefront of modern business and science. It mainly includes that from online transactions, videos, images, audio, e-mails, logs, clickstreams, posting, social media interactions, science data, health records, sensors, search queries, mobile phones and associated apps.
11. **Cyber security:** This is the practice of protecting systems, networks and programs from digital attacks.

Challenges of Emerging Technologies on B**usiness Education**

Given the rate at which technology evolve, the current state of business education that is responsive to needs of the modern society, no doubt, the future of business education as a crossroad of this study, is poised to meet up challenges. Southgat, Blackmore. Pieschl, Grimes, Mcguire & Smithers (2019) highlighted three areas of such emerging technologies has infused into education.

i. Purpose built technologies:

a. **Intelligent tutoring system:** This refers to education software containing an artificial intelligence component. They are designed to provide immediate and customized instruction of feedback to learners usually without requiring intervention for a human teachers
b. **Teachers supporting technologies:** These are specialized that help facilitates teaching and learning. Example is google classroom and various google apps.
c. **Institution supporting technologies:** such as AI powered timetable software or other technologies that systematically collect data across application and help proves such data e.g. student information management system

2. **Invisibly infused technology:** These are technologies that often enter through a back door without the knowledge of end users. Examples of these are smart phone application.
3. **Repurposed technologies:** These are existing technologies which were first developed for another help and another context. Examples are automatic translation from one language to another voice and face recognition technologies.

Reflecting on the influence of these new technologies on teaching and learning (Egungucated and ishaq, 2012) observed that the place of change brought by new technologies have had significant influence on the way people lives, work and play worldwide. They noted as the new technologies continues to pose serious challenges to traditional process of information use and dissemination and management, obviously, there will continue to be a need for the type of training that can practically address these challenges. Training in this respect is defined as a mixture of teaching and practices and carried out in other to attain desired standard of behavior and effectivess. (Nzota cited in Ezeani and Ishaq 2012). Also, training is a way of building capacity, people and adding of values in area of knowledge, skills and attitude (Egungu cited in Ezeani and ishaq 2018).

While Patrick Obelen & Akputu (2021), agreed that there is no academic programme that can help achieve levels of training other than education. It is important to reflect on the skills and competencies of every student to ask the educational question. It is important to understand the skill set for emergence of these technologies require a slightly different awareness, understanding and skills set for business educators to be able to effectively and efficiently fit into these technological trends.

Emerging Technologies and its Influence on Business Education Curriculum

In search of answer to how business education programe can reflect the influence of these new technologies, there has been debate on the need to review business education curriculum the term curriculum has been associated with academic study and training in higher education. Curriculum from its original Latin meaning, means 'running a course' or a course which one runs to reach a goal (Ogwu and Oranu cited in Jude & Anita 2014).

Curriculum can also be defined as a structured series of intended learning experiences that embrace purpose experiences provided and directed by educational institutions to achieve predetermined objectives. (Atueyi & Okolo in Jude & Anita 2014). Looking at contributions from these viewpoints, we can conclude that the importance of an amenable curriculum in business education is not only germane but must reflect changes brought about by emerging technologies. The restructuring of business education curriculum to adapt these changes is seen as the evidence or implications of new technologies on business education. This form the basis why Osuala (2009) emphasized the need for better preparation of business educators, if they are to remain relevant. To achieve these, pillar number 7 of the National Digital Economy Policy and Strategy (2020-2030) stipulates amongst others, three important strategies

a. Need on the part of government to collaborate with the private sector, academia and development partners to create Centers of Excellence in Emerging Technologies.
b. Need to include topics on emerging technologies across the broad spectrum of formal and vocational education in the country.
c. Encourage tertiary institutions to introduce/enhance courses on emerging technologies through the relevant regulatory institutions.

These three implementation strategies further affirm the need not only to review the content of business education curriculum but also sensitize business educators to make themselves open to these new technologies.

Conclusion

Having explored the challenges that complement emerging technologies and the important roles of business education as a tool of transition capable of providing learning experiences that will equip its graduates with requisite competencies in the use of emerging technologies, this paper has foreshadowed that as new technologies emerge, business education curriculum and operators of the programme should reflect these changes by equipping students with the demands of these new technologies.

Way Forward

The following solutions are therefore proffered:

1. Both federal and state governments should provide adequate funding through the appropriate regulatory agencies to equip business education departments in tertiary institutions.
2. Educational institution authourities should equip business education departments with these new technologies for effective instructional tasks in business education programme
3. Business educators should pick up the challenges, develop their skills in order to impact students with skills, knowledge and attitudes to live and work in technologically dynamic society
4. Business education curriculum as a skill-based course should reflect these changes

INNOVATION, TECHNOLOGY AND THE FUTURE OF WORK: REPOSITIONING BUSINESS EDUCATION FOR THE DIGITAL ECONOMY

Inuwa Shehu Yusuf
Federal University of Kashere
Gombe State, Nigeria
shehuayusuffa@yahoo.com | 08066757165

Abstract

The rapid advancement of innovation and digital technologies is fundamentally transforming the nature of work, creating new opportunities and challenges for governments, businesses, educational institutions, and workers. Emerging technologies such as artificial intelligence, robotics, cloud computing, big data analytics, blockchain, and the Internet of Things are reshaping business operations and redefining the competencies required for success in the digital economy (World Economic Forum [WEF], 2025; Organisation for Economic Co-operation and Development [OECD], 2025). This position paper argues that innovation and technology should not be perceived primarily as threats to employment but as strategic drivers of workforce transformation, economic competitiveness, and sustainable development. Drawing on contemporary literature, the paper examines the concepts of innovation, technology, digital transformation, the future of work, future skills and workforce competencies, and business education in the digital economy. It further explains the relationship among these concepts and maintains that business education occupies a strategic position in preparing graduates for technology-driven workplaces. The paper contends that curriculum modernization, competency-based education, digital literacy, artificial intelligence literacy, entrepreneurship education, experiential learning, and stronger university–industry collaboration is essential for developing graduates who are innovative, adaptable, and globally competitive. It also emphasizes the importance of continuous reskilling, digital infrastructure, and supportive government policies in promoting workforce readiness. The paper concludes that the future of work will be shaped not only by technological advancement but also by the ability of educational institutions and policymakers to prepare individuals with relevant competencies for lifelong learning and innovation. It therefore recommends the repositioning of business education as a catalyst for workforce preparedness, entrepreneurial development, and sustainable national growth in the digital age.

Keywords: Innovation, Technology, Digital Transformation, Future of Work, Business Education, Workforce Competencies, Digital Economy

1.0 Introduction

Innovation and technology have become the principal drivers of economic transformation, organizational competitiveness, and workforce development in the twenty-first century. The emergence of artificial intelligence (AI), machine learning, robotics, cloud computing, blockchain, big data analytics, and digital communication technologies has accelerated changes in production systems, service delivery, and workplace practices across the world (Schwab, 2017; WEF, 2025). Unlike previous industrial revolutions, the Fourth Industrial Revolution is characterized by the integration of intelligent digital systems capable of learning, adapting, and supporting decision-making, thereby redefining the knowledge and competencies required for employment.

The global labour market is experiencing unprecedented transformation as organizations increasingly automate routine tasks while creating new opportunities in technology-driven sectors. According to the World Economic Forum (2025), technological advancement, demographic changes, environmental sustainability, and economic restructuring will reshape millions of jobs over the next decade. Although some occupations may decline because of automation, many new roles are emerging in artificial intelligence, cybersecurity, software engineering, business analytics, renewable energy, digital marketing, and financial technology (OECD, 2023). Consequently, employability is increasingly determined by an individual's ability to innovate, adapt, collaborate, and continuously acquire new skills.

The International Labour Organization (2024) observes that technological innovation is changing the quality and organization of work rather than eliminating work entirely. Automation is primarily replacing

repetitive and predictable tasks while increasing demand for workers who possess analytical thinking, creativity, communication, emotional intelligence, digital literacy, and problem-solving abilities. These changes have shifted the focus of workforce development from acquiring academic qualifications alone to developing competencies that enable lifelong learning and adaptability.

For developing countries such as Nigeria, these changes present both opportunities and challenges. The rapid expansion of the digital economy offers prospects for entrepreneurship, employment creation, financial inclusion, and economic diversification. However, inadequate digital infrastructure, weak university–industry collaboration, outdated curricula, and persistent skills mismatches continue to limit the ability of many graduates to compete effectively in technology-driven labour markets (UNESCO, 2024; World Bank, 2024). Employers increasingly report that graduates possess academic certificates but often lack practical digital competencies, innovation skills, entrepreneurial orientation, and workplace readiness.

Business education occupies a strategic position in addressing these challenges because it prepares learners for careers in business, entrepreneurship, management, accounting, marketing, commerce, and office administration. However, traditional business education has largely emphasized theoretical knowledge and conventional office skills that are no longer sufficient for the realities of the digital economy. Modern organizations require graduates who can analyse data, apply digital technologies, manage innovation, develop entrepreneurial ventures, solve complex problems, and work effectively in technology-enabled environments (OECD, 2023; UNESCO, 2021).

This paper therefore takes the position that innovation and technology should not be regarded primarily as threats to employment but as opportunities to reposition business education for the future of work. It argues that curriculum transformation, competency-based learning, digital literacy, entrepreneurship education, industry collaboration, and continuous professional development are essential for preparing graduates who can thrive in an increasingly innovation-driven economy. By embracing these reforms, business education can contribute significantly to workforce preparedness, sustainable economic growth, and national competitiveness.

2.0 Conceptual Framework

2.1 Concept of Innovation

Innovation is widely recognized as the engine that drives productivity, creates competitive advantage, improves organizational performance, and enhances sustainable national development. In the twenty-first century, countries and organizations that successfully embrace innovation are better positioned to respond to rapid technological changes, economic uncertainties, and emerging labour market demands (OECD, 2023; WEF, 2025). Although innovation is frequently associated with technological inventions, its scope is much broader, involving the creation, adoption, and implementation of new or significantly improved products, services, processes, business models, or organizational practices that generate value (OECD, 2018).

The classical foundation of innovation theory was provided by Schumpeter (1934), who described innovation as 'creative destruction,' whereby outdated technologies and business models are continuously replaced by more efficient alternatives. Although this process may initially disrupt existing industries and occupations, it ultimately stimulates economic expansion, creates new enterprises, and generates employment opportunities. Schumpeter's theory remains highly relevant in explaining the transformative effects of artificial intelligence and digital platforms on the global economy (Schwab, 2017; WEF, 2025).

Innovation may be categorized into four major forms: product innovation (developing new goods/services), process innovation (improving production or delivery methods), organizational innovation (introducing new business practices or structures), and marketing innovation (employing new strategies for customer engagement) (OECD, 2018). Within business education, innovation involves preparing learners to think creatively, identify opportunities, develop entrepreneurial solutions, and apply digital technologies to solve complex problems. Modern business education must equip students with competencies in innovation management, digital entrepreneurship, business analytics, and strategic decision-making (Audu & Umar, 2022; Ezeani & Oladele, 2023). This aligns with the World Economic Forum (2025), which identifies creativity, analytical thinking, and technological literacy as among the fastest-growing required skills.

2.2 Concept of Technology

Technology is a fundamental driver of economic development and organizational transformation, influencing virtually every sector including healthcare, manufacturing, banking, and education (OECD, 2023; WEF, 2025). Broadly, technology refers to the practical application of scientific knowledge, digital

systems, software, and technical processes to solve human problems and improve efficiency (Schwab, 2017).

Several emerging technologies are reshaping the modern economy. Artificial intelligence (AI) can analyse massive datasets, automate routine processes, and support strategic decision-making, increasing efficiency while creating demand for roles in data science and cybersecurity (Brynjolfsson et al., 2023; OECD, 2023). Cloud computing enhances organizational flexibility by supporting remote work and digital collaboration platforms (UNESCO, 2021). Big data analytics enables data-driven decision-making, identifying market trends and consumer preferences (Brynjolfsson & McAfee, 2014), making data literacy an essential graduate competency. The Internet of Things (IoT) connects physical devices to optimize systems like smart manufacturing (OECD, 2023), while blockchain technology secures decentralized transactions and supply chain records.

Despite its benefits, technology poses risks such as automation-driven job displacement in clerical and manufacturing roles, cybersecurity threats, and digital inequality (ILO, 2024; UNESCO, 2024). In Nigeria, these are compounded by inadequate infrastructure, unstable power, and limited internet access (World Bank, 2024). For business education, technology is no longer optional. Graduates must demonstrate competence in FinTech, business analytics, digital marketing, and AI-assisted decision-making, requiring institutions to deeply integrate these tools into their curricula (Audu & Umar, 2022; Ezeani & Oladele, 2023).

2.3 Concept of Digital Transformation

Digital transformation refers to the comprehensive integration of digital technologies into organizational processes, business models, and service delivery to create value and improve performance (OECD, 2023). It is a strategic process that fundamentally changes organizational culture, leadership, and customer relationships, distinct from digitization (converting analogue information to digital) and digitalization (using technology to improve existing processes) (Verhoef et al., 2021).

The Fourth Industrial Revolution has accelerated this transformation across all sectors. Financial institutions utilize AI for fraud detection and risk evaluation; retail relies on e-commerce and data analytics; and healthcare utilizes telemedicine and AI-assisted diagnosis (OECD, 2023; IMF, 2024). For business education, digital transformation requires redesigning curricula and adopting technology-enhanced pedagogy, such as virtual simulations and cloud-based collaboration tools, to enhance practical competencies (Audu & Umar, 2022; Ezeani & Oladele, 2023). Employers seek graduates who pair digital competence with critical thinking, resilience, and adaptability (WEF, 2025; ILO, 2024). However, barriers like cybersecurity threats, resistance to change, and infrastructural deficits in developing countries like Nigeria must be mitigated through deliberate institutional reforms (World Bank, 2024).

2.4 Concept of the Future of Work

The future of work refers to the ongoing changes in the nature, organization, location, and skills required for employment, driven by technological innovation, demographics, globalization, and environmental sustainability (ILO, 2024). Driven by the Fourth Industrial Revolution, the modern labor market is rapidly transitioning from labor-intensive to knowledge-intensive professions (Schwab, 2017; WEF, 2025). according to the World Economic Forum (2025), five forces shape this landscape: technological advancement, demographic transitions, geoeconomic fragmentation, environmental sustainability, and changing consumer expectations.

A key characteristic is the integration of automation and AI. While automation replaces routine and predictable activities, it complements human labor by increasing demand for high-level cognitive skills like creativity, emotional intelligence, and complex problem-solving (Brynjolfsson et al., 2023; OECD, 2025). Furthermore, cloud computing and collaboration platforms have institutionalized remote and hybrid working models, emphasizing self-management and virtual communication (UNESCO, 2021). The future of work is also marked by the rise of the gig economy, digital platforms, and digital entrepreneurship, with many graduates establishing tech-enabled ventures rather than seeking traditional employment (ILO, 2024).

Because technological change accelerates skills obsolescence, lifelong learning, regular reskilling, and upskilling have become critical determinants of career sustainability (OECD, 2025). Consequently, business education must shift from content-heavy, theoretical memorization to competency-based and experiential models that build transferable, future-ready skills (World Bank, 2024; UNESCO, 2024).

2.5 Business Education in the Digital Economy

Business education traditionally equips learners for careers in accounting, marketing, finance, management, and office administration. However, the digital economy demands a transition to a

competency-based, technology-driven model focused on demonstration of practical skills, professional attitudes, and adaptable behaviors (OECD, 2023; WEF, 2025; UNESCO, 2021).

Key instructional strategies include experiential learning, where students engage in practical experiences and reflect upon them via internships, industrial attachments, and business incubation projects (Kolb, 1984). Entrepreneurship education must also be modernized to focus on e-commerce, FinTech, and digital enterprise management, preparing graduates to be job creators in a context of high youth unemployment like Nigeria (Adebayo & Ojo, 2022). Furthermore, robust industry-university collaboration is vital to ensure curricula reflect current market realities rather than outdated practices (World Bank, 2024). This requires significant investment in ICT infrastructure—such as smart classrooms and digital laboratories—and continuous professional development for educators in digital pedagogy and AI-assisted instruction (UNESCO, 2024; ILO, 2024).

2.7 Relationship among Innovation, Technology, Business Education, and the Future of Work

Innovation, technology, business education, and the future of work operate within a mutually reinforcing cyclical framework. Innovation generates new ideas, which are enabled by technological advancements like AI and big data analytics (Schumpeter, 1934; Schwab, 2017). The adoption of these technologies transforms organizational processes and redefines the future of work by automating routine tasks and driving demand for advanced cognitive and technical skills (ILO, 2024; WEF, 2025).

Business education acts as the vital mechanism that prepares graduates with these required competencies. If the curriculum fails to integrate these digital tools and mindsets, skills mismatches and graduate unemployability worsen (UNESCO, 2021; World Bank, 2024). When business education successfully develops innovative and digitally competent graduates, these individuals return to the workforce to drive further innovation, sustaining a continuous cycle of economic growth and national development. Therefore, the challenge for nations like Nigeria is not the technology itself, but the agility of its educational institutions to adapt to these shifts.

3.0 Conclusion

Innovation and technology are the primary drivers of economic transformation and workforce development in the twenty-first century. As demonstrated, emerging digital technologies are fundamentally reshaping the labor market, eliminating routine jobs while creating highly sophisticated roles that demand higher-order cognitive, digital, and interpersonal competencies (WEF, 2025; OECD, 2025; ILO, 2024).

Therefore, the future of work should be viewed as a strategic opportunity to reposition business education. By modernizing curricula, adopting competency-based and experiential learning models, and fostering robust university-industry collaborations, business education can bridge current skills mismatches. Ultimately, success in the digital economy will favor countries and institutions that invest intentionally in human capital development, transforming graduates into innovative change agents and agile professionals capable of sustaining national development.

4.0 Recommendations

Curriculum Modernization: Review and update business education curricula regularly to integrate high-demand fields such as artificial intelligence, business analytics, financial technology (FinTech), digital entrepreneurship, e-commerce, cybersecurity, and innovation management (OECD, 2023).

Competency-Based and Experiential Learning: Shift institutional frameworks toward competency-based instruction, heavily incorporating experiential models like internships, industrial attachments, business simulations, and project-based assignments (UNESCO, 2021).

Infrastructural Investment: Governments and institutional administrators must expand funding for critical digital infrastructure, including reliable power supply, high-speed broadband internet, modern digital laboratories, and smart classrooms (World Bank, 2024).

Strategic Industry Partnerships: Build strong collaborations between universities, industries, and professional bodies to align training with actual labor market demands, facilitate internship placements, and drive joint research initiatives (ILO, 2024).

Educator Professional Development: Implement mandatory and continuous professional development for business educators, focusing on digital pedagogy, artificial intelligence applications, educational technology, and modern competency assessment techniques.

Strengthening Entrepreneurship Ecosystems: Expand entrepreneurship education by establishing innovation hubs, startup incubation centers, structured mentorship programs, and seed funding access to empower graduates to become job creators (WEF, 2025).

Institutionalizing Lifelong Learning: Promote continuous reskilling and upskilling initiatives supported by governments, academic institutions, and employers to ensure the workforce remains resilient to rapid technological changes (OECD, 2025).

National Future of Work Strategy: Develop a comprehensive national policy framework in Nigeria that strategically aligns higher education, technology adoption, innovation policy, and labor market demands to harness emerging global digital opportunities.

Abstract
Innovation and technology transformers healthcare services through redefining the procedure of delivery, accessed, and management. The integration of digital tools like Electronic Health Records, telemedicine, artificial intelligence, and Internet of Medical Things (IoMT) has improved the efficiency, quality, and accessibility of healthcare services to the patient, facilitate real-time data sharing, clinical decision-support, promotion of patient-centered care and better public health outcomes (WHO, 2021)
Telehealth services expanded healthcare access in underserved rural communities, reducing geographical barriers and improving service delivery. Artificial intelligence and big data analytics play a role in disease prediction, early diagnosis, personalized treatment that enabling healthcare providers to make evidence-based decisions (Topol, 2019). Wearable devices and remote monitoring systems empower patients to actively participate in managing their health, leading to improved patient engagement and self-care practices (HIMSS, 2020).
Advancements of technology in healthcare face challenges such as data privacy, cybersecurity risks, high implementation costs, and digital divide that significantly become a barrier in developing countries (Olu et al., 2019). Ethical concerns about the use of AI and patient data further complicate the integration of these technologies into healthcare systems.
Future of healthcare services will be more personalized, predictive, and technology-driven. Innovations like precision medicine, block chain technology, and smart healthcare systems that will continue to reshape the healthcare landscape, improving efficiency, transparency, and patient outcomes, healthcare organizations must invest in digital infrastructure, capacity building, and policy frameworks to fully harness the benefits of technological innovation
Keywords: Innovation, Technology, Healthcare Services, Telemedicine, Internet of Medical Things (IoMT)

Introduction
Innovation and technology are increasingly changing the way healthcare services are delivered, managed, and experienced. Developments in digital health, electronic health records, telemedicine, artificial intelligence, mobile health applications, and other technological tools have created new opportunities to improve the quality, efficiency, accessibility, and continuity of healthcare. The World Health Organization (WHO) recognizes digital health as an important component of modern health-system development and emphasizes its potential to support informed decision-making, improve health-system efficiency, promote equitable access to services, and strengthen the delivery of quality care (World Health Organization [WHO], 2021).
For many years, healthcare delivery depended largely on manual procedures, paper-based documentation, face-to-face consultations, and fragmented information systems. Although these approaches remain necessary in some settings, their limitations can affect the speed with which information is accessed, shared, and used for decision-making. The increasing adoption of digital technologies provides an opportunity to overcome some of these limitations by making health information more readily available and supporting more coordinated approaches to patient care. The transition towards digital health is therefore becoming an important feature of healthcare transformation globally.

One important development in this transformation is the use of Electronic Health Records (EHRs) and Electronic Medical Records (EMRs). Digital records can make it easier for healthcare professionals to store, retrieve, and use patient information, while also supporting the exchange of information between health facilities and healthcare providers. Evidence from Nigeria shows that the adoption of electronic medical records is influenced by factors such as perceived usefulness, awareness, relative advantage, organizational conditions, and the availability of appropriate infrastructure. Challenges involving electricity supply and internet connectivity can also affect the implementation and consistent use of electronic systems, particularly in settings with limited resources (Kose et al., 2020; Nigerian EMR adoption study, 2022).

Telemedicine is another important innovation that is changing the relationship between healthcare providers and patients. By using telecommunications and digital platforms, healthcare professionals can provide consultations and other services to patients who may be unable to reach healthcare facilities easily. The importance of telemedicine became particularly evident during the COVID-19 pandemic, when healthcare systems sought alternative approaches for maintaining access to care while reducing unnecessary physical contact. Dorsey and Topol (2020) described telemedicine as an increasingly important component of healthcare delivery and highlighted its potential to influence the organization and accessibility of healthcare services.

Artificial intelligence (AI) and machine learning are also becoming increasingly relevant to healthcare. These technologies can assist in analyzing large volumes of health information, identifying patterns, supporting diagnosis, improving clinical decision-making, and predicting potential health risks. Topol (2019) noted that artificial intelligence has the potential to influence healthcare at several levels, including clinical practice, health-system operations, and patient participation in managing health information. At the same time, the use of AI raises important concerns relating to privacy, security, bias, transparency, and accountability.

Other technologies, including mobile health applications, wearable devices, remote monitoring systems, and connected medical technologies, are also contributing to the movement towards more proactive and patient-centered healthcare. These technologies can support the continuous monitoring of patients, facilitate communication between healthcare providers and patients, and provide opportunities for early identification of health problems. However, their effectiveness depends not only on the availability of the technology but also on factors such as infrastructure, digital literacy, workforce capacity, affordability, data protection, and the readiness of healthcare organizations to incorporate new systems into routine practice.

In Nigeria, the potential benefits of healthcare innovation are particularly significant because the health system continues to face challenges related to access, infrastructure, health workforce capacity, information management, and differences in service availability between urban and rural communities. Nigeria has recognized the importance of information and communication technologies in strengthening its health system, with national health ICT and digital health strategies aimed at improving the use of technology, information management, interoperability, and healthcare delivery.

Despite these opportunities, the implementation of healthcare technology in Nigeria is not without challenges. Differences in electricity supply, internet connectivity, technical infrastructure, financial resources, digital skills, and institutional capacity can affect the successful adoption and continued use of digital health systems. Research conducted in Nigeria has demonstrated that the implementation of digital health interventions in rural areas can be supported by appropriate policies, partnerships, training, and technological infrastructure, but that the local context plays an important role in determining whether such interventions are successfully adopted and sustained (Ebenso et al., 2021).

The digital divide is another important concern. While some urban healthcare institutions may have better access to computers, internet services, electronic records, telemedicine platforms, and other digital technologies, healthcare facilities and communities in rural and underserved areas may have more limited access to these resources. Consequently, technological advancement does not automatically guarantee equal access to healthcare. Without deliberate efforts to address infrastructure, affordability, connectivity, and digital literacy, the benefits of healthcare innovation may be distributed unevenly across different populations.

Data privacy and security also require serious attention as healthcare becomes increasingly digital. Electronic systems involve the collection, storage, processing, and transmission of sensitive patient information. Weak information-security practices can expose health information to unauthorized access, loss, or misuse. In addition, the use of artificial intelligence requires appropriate ethical and governance

mechanisms because issues such as privacy, bias, transparency, accountability, and human rights can affect the safe and responsible use of these technologies (WHO, 2021).

Although considerable attention has been given internationally to healthcare innovation and technological transformation, there remains a need for more context-specific evidence concerning how these developments affect healthcare delivery in Nigeria. Existing Nigerian studies demonstrate both the potential of digital technologies and the practical difficulties associated with their implementation, particularly in environments where infrastructure and technical capacity are limited. More evidence is therefore needed to understand how innovation and technology can be effectively integrated into Nigerian healthcare institutions and how such integration can contribute to improved service delivery.

Therefore, this study focuses on the role of innovation and technology in shaping the future of healthcare services. It considers the potential benefits of technological advancement, the challenges associated with its adoption and implementation, and its implications for the quality, accessibility, efficiency, and sustainability of healthcare delivery. Understanding these issues is important for policymakers, healthcare managers, health professionals, technology developers, and other stakeholders who are responsible for planning and implementing healthcare innovations in Nigeria.

Background

Innovation and Technology in Healthcare

Innovation has become an important component of modern healthcare because of its potential to improve the quality, efficiency, accessibility, and safety of healthcare services. The development of digital technologies, information systems, artificial intelligence, mobile applications, and other technological solutions has changed the way healthcare professionals collect information, make decisions, communicate with patients, and deliver services. Digital technologies can also support more coordinated and patient-centered care by making relevant health information available when and where it is needed (Topol, 2019; World Health Organization [WHO], 2021).

Healthcare innovation refers to the development, introduction, and application of new ideas, approaches, processes, products, or technologies to improve healthcare delivery and health outcomes. Innovation may involve gradual improvements to existing practices or more substantial changes that transform the way healthcare services are organized and delivered. It is therefore broader than the introduction of new medical procedures. It can include changes in healthcare management, information systems, communication, service organization, and models of care.

The WHO recognizes digital health and innovation as important components of health-system transformation. Its global digital health strategy emphasizes the need to integrate technological, organizational, financial, and human resources to ensure that digital health initiatives contribute meaningfully to health and well-being and to universal health coverage (WHO, 2021). Innovation in healthcare therefore involves not only the acquisition of technology but also the development of appropriate systems, skills, policies, infrastructure, and organizational processes that allow such technologies to be used effectively.

Healthcare technology refers broadly to the application of scientific knowledge, digital tools, equipment, information systems, and communication technologies to support the prevention, diagnosis, treatment, monitoring, and management of health conditions. It encompasses both physical technologies, such as medical equipment and monitoring devices, and digital technologies, such as electronic health records, telemedicine platforms, mobile health applications, artificial intelligence systems, and health information systems.

Technological development has increasingly moved healthcare away from systems that depend entirely on paper records and face-to-face interactions toward more connected, information-driven models of care. Electronic health records, telemedicine, artificial intelligence, mobile health, wearable devices, and connected medical equipment can improve access to information, support clinical decision-making, facilitate communication, and strengthen healthcare management (WHO, 2021; Topol, 2019).

Healthcare Services

Healthcare services comprise the range of services provided to individuals and communities to prevent disease, promote health, diagnose illness, provide treatment, restore health, and support patients with long-term or life-limiting conditions. These services include preventive care, health promotion, diagnosis, treatment, rehabilitation, maternal and child health services, emergency care, and palliative care.

The effectiveness of healthcare services depends not only on the availability of healthcare workers and facilities but also on the ability of the health system to provide timely, safe, equitable, affordable, and

appropriate care. Digital technologies and other forms of innovation are increasingly being incorporated into healthcare services to improve access, strengthen information management, support clinical decisions, and improve continuity of care (WHO, 2021).

Healthcare delivery has consequently changed from a predominantly facility-based model toward more integrated and technology-supported approaches. Patients can increasingly interact with healthcare providers remotely, receive health information through mobile devices, monitor aspects of their health using wearable technologies, and have their information stored and accessed electronically. These changes have become particularly important in settings where geographical distance, shortage of healthcare professionals, limited infrastructure, or high transportation costs restrict access to conventional healthcare services.

Major Innovations in Healthcare

Innovation in healthcare encompasses a wide range of technologies and approaches. Among the most important are electronic health records, telemedicine and telehealth, artificial intelligence and machine learning, the Internet of Medical Things, robotics and automation, and big data and health analytics.

Electronic Health Records (EHRs)

Electronic Health Records (EHRs) are computerized systems used to record, store, retrieve, manage, and share patients' health information. Unlike paper records, EHRs can provide authorized healthcare professionals with rapid access to patient information across different stages of care. Depending on the system, the information may include demographic details, medical history, diagnoses, medications, allergies, laboratory findings, radiology results, treatment plans, and other relevant clinical information.

EHRs can improve continuity and coordination of care because healthcare professionals can access patient information without depending on the physical movement of paper files. Access to current information can also reduce unnecessary duplication, support clinical decision-making, and improve the efficiency of healthcare processes. Digital health systems are therefore regarded as important tools for strengthening health systems and improving the quality and use of health information (WHO, 2021).

EHRs are also valuable beyond individual patient care. Information generated through electronic systems can contribute to disease surveillance, health planning, research, monitoring of health-service utilization, and evaluation of healthcare interventions. When appropriately aggregated, protected, and analyzed, electronic health data can help health managers identify disease patterns and service needs.

Despite these advantages, the implementation of EHRs can be challenging, particularly in low- and middle-income settings. Common difficulties include inadequate infrastructure, unreliable electricity and internet connectivity, limited financial resources, insufficient technical expertise, resistance to organizational change, weak interoperability, and concerns regarding confidentiality, privacy, and cybersecurity. In African health systems, the sustainability and expansion of digital health initiatives can also be affected by weak governance, inadequate human-resource capacity, fragmented systems, and limited infrastructure (Olu et al., 2019).

Telemedicine and Remote Healthcare

Telemedicine involves the provision of clinical healthcare services at a distance through information and communication technologies. It allows healthcare professionals to communicate with patients, conduct consultations, provide follow-up care, and in appropriate circumstances support diagnosis and treatment without requiring the patient and provider to be physically present in the same location.

Telemedicine may use video conferencing, telephone communication, mobile applications, web-based platforms, and other communication technologies. It can be particularly useful for patients living in remote and underserved communities, where access to hospitals, specialists, and other healthcare professionals may be limited.

Telemedicine can reduce the need for some physical hospital visits and may help patients save transportation time and costs. It can also support follow-up consultations and improve access to specialist services. Dorsey and Topol (2020) observed that telemedicine had become an increasingly important component of healthcare delivery and had the potential to expand the reach of medical services.

Telehealth is a broader concept than telemedicine. While telemedicine focuses primarily on clinical services delivered remotely, telehealth may also include non-clinical activities such as health education, professional training, public health communication, administrative meetings, and other healthcare-related services delivered through telecommunications technologies.

The COVID-19 pandemic further demonstrated the usefulness of remote healthcare technologies because healthcare systems used telemedicine and other digital approaches to maintain some forms of care while

reducing unnecessary physical contact. The experience also highlighted the importance of digital infrastructure and appropriate regulatory arrangements for sustainable remote healthcare delivery.

However, telemedicine is not without limitations. Poor internet connectivity, unreliable electricity, limited digital literacy, inadequate access to appropriate devices, insufficient technical skills, regulatory uncertainties, and concerns about privacy and confidentiality can affect its effectiveness. These challenges are particularly relevant in developing countries, including Nigeria, where differences in infrastructure and digital capacity can limit the equitable use of telehealth services (Olu et al., 2019).

Artificial Intelligence and Machine Learning in Healthcare

Artificial Intelligence (AI) refers to computer-based systems capable of performing tasks that normally require aspects of human intelligence. These tasks may include recognizing patterns, interpreting information, supporting decision-making, understanding language, and making predictions. Machine Learning (ML) is a branch of AI in which computer systems learn patterns from data and use those patterns to make predictions or support decisions.

AI and ML are increasingly being applied in healthcare. Their applications include medical image interpretation, disease prediction, clinical decision support, personalized medicine, drug discovery, risk assessment, and health-service management. By processing large volumes of information, AI systems can identify patterns that may be difficult or time-consuming for humans to detect.

AI has particular potential in diagnosis and decision support. For example, machine-learning systems can be trained using large datasets to recognize patterns associated with specific diseases or clinical conditions. Predictive systems can also use historical patient information to estimate the likelihood of future health events, thereby supporting early intervention and preventive care.

Topol (2019) argues that AI has considerable potential to improve healthcare by supporting diagnosis, decision-making, and the processing of complex medical information. However, AI should be regarded as a tool that supports healthcare professionals rather than simply replacing human expertise. Effective use of AI requires appropriate clinical oversight, high-quality data, suitable infrastructure, and attention to ethical and professional responsibilities.

The use of AI also raises important concerns. These include patient privacy, cybersecurity, algorithmic bias, lack of transparency, poor-quality training data, accountability for automated decisions, and possible changes in healthcare employment. In developing countries, additional barriers may include inadequate technological infrastructure, insufficient digital skills, limited availability of high-quality health datasets, and the cost of developing and maintaining AI systems. These challenges emphasize the need for appropriate governance and responsible implementation of AI in healthcare.

Internet of Medical Things (IoMT)

The Internet of Medical Things (IoMT) refers to the network of connected medical devices, sensors, software applications, and healthcare information systems that communicate and exchange health-related information through digital networks. Examples include wearable monitoring devices, remote patient-monitoring equipment, smart medical devices, connected inhalers, glucose-monitoring systems, and other internet-enabled healthcare technologies.

IoMT enables health information to be collected continuously or at regular intervals and transmitted to healthcare professionals or information systems. This can support real-time monitoring and allow healthcare providers to identify changes in a patient's condition more quickly.

One important application of IoMT is remote patient monitoring. A patient with a chronic disease, for example, may use a connected device to record selected health measurements that can then be transmitted to healthcare professionals. Such systems have the potential to support earlier identification of deterioration and reduce the need for some unnecessary hospital visits.

Connected health technologies can also contribute to the development of more data-driven healthcare systems. The increasing availability of data from electronic records, connected devices, wearables, and other digital sources creates opportunities for more comprehensive health monitoring and analysis (WHO, 2021).

Nevertheless, IoMT introduces important risks. Because many devices continuously transmit sensitive health information, cybersecurity and privacy become major concerns. Other challenges include interoperability between devices and information systems, the cost of implementation and maintenance, unreliable connectivity, and shortages of personnel with the technical expertise required to manage connected healthcare technologies. These challenges are particularly important in resource-constrained health systems (Olu et al., 2019).

Robotics and Automation in Healthcare

Robotics and automation involve the use of robotic systems, computer-controlled technologies, and automated processes to perform or support clinical, administrative, and logistical activities within healthcare organizations. These technologies are designed to improve precision, efficiency, consistency, and safety while reducing the burden associated with repetitive tasks.

One important application of robotics is robot-assisted surgery. Robotic systems can assist surgeons in performing complex procedures by providing enhanced control and precision. In appropriate clinical circumstances, minimally invasive robotic procedures may contribute to reduced tissue damage and improved recovery. However, the clinical benefits depend on the specific procedure, technology, expertise of the healthcare team, and the circumstances of the patient.

Automation is also increasingly used in non-clinical areas of healthcare. Examples include patient registration, appointment scheduling, billing, pharmacy operations, laboratory processes, inventory management, and administrative reporting. Automating repetitive activities can reduce workload, improve consistency, and allow healthcare workers to devote more time to activities requiring professional judgement and direct patient interaction.

The adoption of robotics and automation, however, can be limited by high acquisition and maintenance costs, inadequate technical infrastructure, and shortages of trained personnel. There may also be concerns about changes in employment rolls and the appropriate balance between automated systems and human decision-making. For these reasons, implementation should consider not only technological capability but also the organizational, financial, ethical, and human implications.

Big Data and Health Analytics

Healthcare generates large amounts of information from different sources, including electronic health records, laboratory systems, medical imaging, pharmacy systems, health insurance records, wearable devices, disease-surveillance systems, and patient-generated data. When these datasets are large, complex, rapidly generated, and derived from multiple sources, they are often described as big data.

Health analytics involves the application of statistical methods, computational techniques, and other analytical approaches to transform health data into useful information for decision-making. It can be used to identify patterns, monitor health-service utilization, predict health risks, support disease surveillance, and improve resource allocation.

Big data analytics can support clinical decision-making by allowing healthcare organizations to identify trends and relationships within large datasets. Predictive analytics, for example, may help identify individuals or populations at increased risk of particular diseases, allowing health professionals to consider earlier preventive or therapeutic interventions.

At the population level, health analytics can contribute to disease surveillance and public health planning. Health authorities can use information from different sources to identify changes in disease patterns, monitor healthcare demand, evaluate interventions, and allocate resources more effectively.

However, the usefulness of big data depends heavily on the quality, completeness, security, and interoperability of the underlying information. Poor-quality data can produce unreliable conclusions, while incompatible information systems can make it difficult to combine datasets. Privacy and cybersecurity are also important because healthcare datasets contain sensitive personal information. In many developing countries, inadequate infrastructure, limited technical capacity, fragmented information systems, and insufficient resources remain important barriers to the effective use of health analytics (Olu et al., 2019).

Benefits of Technological Innovation in Healthcare

Improved Quality of Care

One of the major benefits of technological innovation is the potential to improve the quality and safety of healthcare. Digital systems can provide healthcare professionals with timely access to relevant information, support clinical decision-making, improve communication, and reduce some forms of error associated with incomplete or inaccessible information.

For example, electronic health records can make patient histories, medications, laboratory results, and previous diagnoses more readily available to authorized healthcare professionals. This can support more informed clinical decisions and improve continuity of care. Digital health technologies can therefore contribute to healthcare systems that are safer, more effective, timely, efficient, patient-centred, and equitable (WHO, 2021).

Increased Access to Healthcare

Technological innovation can expand access to healthcare, particularly for populations living in rural, remote, or underserved areas. Telemedicine and other forms of remote healthcare can connect patients with healthcare professionals without requiring every consultation to take place in a hospital or clinic.

Mobile health technologies can also deliver health information, reminders, health education, and selected health services to individuals through mobile devices. These approaches can help reduce geographical barriers and, in some circumstances, reduce the time and cost associated with travelling to healthcare facilities (Dorsey & Topol, 2020).

However, technological innovation does not automatically guarantee equal access. People without reliable electricity, internet connectivity, smartphones, digital skills, or the financial resources to use digital services may continue to face barriers. Therefore, digital health initiatives need to address the digital divide as part of their implementation strategy (Olu et al., 2019).

Cost Efficiency

Cost efficiency in healthcare refers to the ability of health systems to use available resources effectively while maintaining or improving the quality of services. Technology can contribute to cost efficiency by reducing unnecessary duplication, improving workflow, supporting better resource management, and reducing some administrative burdens.

Electronic health records can reduce dependence on physical paper storage and improve the availability of patient information. Better access to existing information may also reduce unnecessary repetition of tests and procedures in situations where previous results are available and clinically appropriate to use.

Automation can similarly reduce the time healthcare workers spend on repetitive administrative activities. When appropriately designed and implemented, automated processes can improve productivity and allow personnel to concentrate on tasks requiring professional judgement and direct patient care.

Patient Empowerment

Patient empowerment refers to the process through which individuals acquire greater knowledge, confidence, skills, and opportunities to participate actively in decisions concerning their health and healthcare.

Digital technologies can support patient empowerment by giving individuals access to health information and tools that help them monitor and manage their health. Mobile health applications, wearable devices, patient portals, and remote-monitoring technologies can allow patients to track symptoms, monitor selected health indicators, receive reminders, and communicate with healthcare professionals.

For individuals living with chronic conditions, these technologies can encourage greater participation in self-management. Patients may be able to monitor aspects of their health between clinical appointments and share relevant information with healthcare professionals. Digital health therefore has the potential to strengthen communication between patients and providers and promote more patient-centered care (WHO, 2021).

Faster Decision-Making

Technological innovation can improve the speed with which health information is collected, accessed, processed, and used. Timely information is particularly important in situations where delays in diagnosis or treatment may affect patient outcomes.

Electronic health records can provide authorized healthcare professionals with rapid access to relevant patient information, including medical history, previous diagnoses, medications, allergies, and laboratory findings. This can reduce delays associated with locating and transporting paper files.

Real-time monitoring technologies can also provide healthcare professionals with more immediate information about a patient's condition. Similarly, data analytics and artificial intelligence can assist in identifying patterns and risks within large datasets. When these technologies are supported by reliable infrastructure, appropriate data governance, and competent healthcare professionals, they can contribute to faster and more informed clinical and administrative decision-making (Topol, 2019; WHO, 2021).

Methodology

Research Design and Procedures

This section presents the research design and procedures used to examine innovation and technology and their implications for the future of healthcare services, with particular attention to digital transformation, health data management, and emerging healthcare technologies.

The study adopted a descriptive survey research design and used a simple random sampling technique to select respondents from Specialist Hospital Bauchi as the case study. A total of 184 respondents participated in the study. The descriptive survey design was considered appropriate because it enabled the researcher to obtain information directly from respondents concerning their opinions, experiences, and perceptions of the role of innovation and technology in healthcare delivery and the future direction of healthcare services.

Summary of Results

Table 1: Response Rate

Response Category	Frequency	Percentage (%)
Returned	184	100.0
Not Returned	0	0.0
Total	**184**	**100.0**

Interpretation:

Table 1 shows that all 184 questionnaires administered to the respondents were completed and returned, giving a 100% response rate. This indicates that there was no loss of questionnaires due to non-response and that all the responses obtained were available for the analysis.

Research Question One: What Are the Benefits of Innovation and Technology in Healthcare?

Table 2: Benefits of Innovation and Technology

Item	Statement	SA	A	D	SD	Mean
1	Technology improves the quality of patient care.	90	60	20	14	3.23
2	Technology improves access to healthcare services.	85	65	22	12	3.21

Interpretation:

The findings indicate that respondents generally had a positive view of the contribution of technology to healthcare delivery. The first statement recorded a mean score of 3.23, indicating that most respondents agreed that technology improves the quality of patient care. Similarly, the second statement recorded a mean score of 3.21, suggesting that respondents generally agreed that technology improves access to healthcare services.

Overall, the findings suggest that innovation and technology are perceived by the respondents as important tools for improving both the quality and accessibility of healthcare services.

Research Question Two: What Is the Future of Healthcare Services?

Table 3: Future of Healthcare Services

Item	Statement	SA	A	D	SD	Mean
1	Healthcare will become increasingly digital in the future.	85	70	18	11	3.24
2	Artificial intelligence will improve healthcare delivery.	88	65	20	11	3.25

Interpretation:

The results show that respondents generally believe that technology will play an increasingly important role in the future of healthcare. The first statement had a mean score of 3.24, indicating strong agreement that healthcare will become increasingly digital. The second statement recorded a mean of 3.25, showing that respondents also believe that artificial intelligence will contribute to improvements in healthcare delivery.

These findings suggest that healthcare workers recognize digital transformation and artificial intelligence as important components of the future healthcare system. The increasing use of digital technologies may support faster access to information, improved decision-making, better communication, and more efficient delivery of healthcare services.

Conclusion

The study employed a descriptive survey design to examine perceptions concerning innovation and technology and the future of healthcare services. The design provided an appropriate approach for obtaining information about respondents' experiences and views regarding digital transformation, health information management, and emerging healthcare technologies.

The findings indicate that innovation and technology are perceived as important contributors to improved healthcare delivery. Respondents generally agreed that technology can improve the quality of patient care and increase access to healthcare services. The findings also show a strong perception that healthcare will become increasingly digital and that artificial intelligence will play an important role in future healthcare delivery.

Overall, innovation and technology are transforming healthcare from predominantly traditional approaches toward systems that are more digital, efficient, accessible, and patient-centered. Technologies such as electronic health records, telemedicine, artificial intelligence, mobile health applications, and other digital tools have the potential to improve the way healthcare information is managed and used for decision-making.

However, the successful adoption of these technologies depends on overcoming several challenges. Inadequate funding, limited infrastructure, shortages of trained personnel, unreliable technological facilities, and other implementation barriers may restrict the full benefits of innovation in healthcare.

Therefore, sustained investment in digital infrastructure, healthcare-worker training, appropriate policies, and effective technology management is necessary to support the continued transformation of healthcare services. Addressing these challenges will help healthcare institutions maximize the benefits of innovation and prepare for a more technologically driven and patient-centered future.

Abstract

Technological innovation is reshaping the future of work by changing how tasks are performed, how employees collaborate, and how organizations make decisions. This paper used literature-based design and examines the effects of technologies such as artificial intelligence, automation, cloud computing, and digital collaboration tools on organizational productivity. Using the conceptual review of relevant literature, the paper found that technological innovation faster processes, improved coordination, data-informed decisions, and the automation of routine work. It also examines challenges, including skills gaps, employee resistance, job displacement, cybersecurity risks, and the need to redesign work and management practices. The paper argues that technology alone does not guarantee higher productivity. Outcomes depend on how well organizations align new tools with employee capabilities, workplace culture, and business goals. The paper concludes that organizations are most likely to benefit when they invest in continuous learning, responsible technology governance, and human-centered job design. These measures can help translate innovation into sustainable productivity while supporting workers through ongoing changes in the workplace. The paper recommended among others that, careful planning before the introduction of technology, proper technology-adoption with the inclusion of clear goals, realistic budget, a timeline, measurable outcomes. Others are communication and involvement of employees in the adoption process, training and continuous learning on digital skills for employees and responsible management data privacy and ethical concerns.

Keywords: Technological Innovation, The Future of Work, Organizational Productivity.

Introduction

Technology is changing work in ways that are already visible in many organizations. Technological innovation refers to the development and application of new technologies that significantly change or improve products, services, or processes. It can involve the creation of entirely new technologies or the enhancement of existing ones, aiming to provide efficiency, convenience, and solutions to existing problems (Tidd, J., & Bessant, J. R., 2018). Think about how smartphones transformed our lives. They started as basic communication tools but have evolved to include features like cameras, internet browsing, and countless applications that help us navigate daily challenges. Technological innovation, therefore, is not just about creating new gadgets; it's about improving our quality of life and changing the way we interact with the world around us.

Artificial intelligence, automation, cloud computing, and digital communication tools can help employees complete routine tasks, share information, and coordinate across teams. These changes offer organizations new ways to improve productivity, but they also raise questions about how jobs and workplace skills will evolve. The effects are not always immediate. New tools may require changes to work processes, management practices, and employee training before their benefits become clear. Brynjolfsson et al. (2017) describe this as an implementation lag, the value of a technology often depends on complementary changes that help organizations put it to effective use. This suggests that buying or adopting new technology alone may not be enough to improve performance.

Technology can also change tasks within jobs rather than eliminate entire occupations. In its analysis of generative AI, the International Labour Organization found that job transformation is more likely than full automation for many occupations (Gmyrek et al., 2023). At the same time, workers may need new skills as tools reshape how tasks are done. The Organisation for Economic Co-operation and Development (OECD, 2023) notes that AI is likely to affect the organization of work and the skills employees need. The phrase

"the future of work" refers to the evolving nature of work shaped by technological advancements, socio-economic changes, and shifts in workforce demographics. It encompasses trends like remote work, automation, the gig economy, and the increasing importance of employee well-being and flexibility (Susskind, D., & Susskind, R., 2020). The future of work is not just a series of technological updates, but a transformation in how we connect with our jobs and each other. It means considering how people work best, whether that's from home or in a vibrant office. It's about adapting roles and responsibilities to meet the expectations of a new generation of workers who value balance, purpose, and collaboration. According Babb, C. (2020), Organizational productivity refers to the efficiency with which an organization converts its inputs (such as resources, time, and labor) into outputs (such as products or services). It's a measure of how well an organization utilizes its resources to achieve its goals and objectives. organizational productivity is the engine that powers a business. When an organization runs smoothly and efficiently, it can produce more with less effort. This means happier employees, satisfied customers, and better overall performance. When people work well together, leveraging each other's strengths and optimizing processes, they can create a thriving environment that fosters innovation and growth. For organizations, the central challenge is to introduce technology in ways that support both productivity and employees. This means considering how new tools fit existing work, providing opportunities for people to build relevant skills, and paying attention to how changes affect day-to-day working conditions. This study examines how technological innovation is shaping the future of work and influencing organizational productivity, with a focus on the conditions that help organizations translate new technologies into better performance.

The Meaning and Evolution of Technological Innovation in the Workplace

Technological innovation in the workplace refers to the introduction and practical use of new or significantly improved tools, systems, processes, or methods that change how employees perform their work. It is not simply about buying the latest computers or software. Innovation occurs when an organization successfully applies technology to improve the way work is organized, services are delivered, decisions are made, or value is created. The Organisation for Economic Co-operation and Development (OECD, 2018) explains that innovation must be implemented; an idea or invention only becomes an innovation when it is put into use or made available to users. In the workplace, this may involve introducing cloud-based systems, automated machinery, artificial intelligence (AI), digital communication platforms, or data analytics tools.

Technological innovation has always influenced work, although its form has changed over time. During the Industrial Revolution, inventions such as the steam engine and mechanized production equipment moved many workers from farms and small workshops into factories. This period increased the speed and scale of production but also changed job roles and working conditions. Employees were increasingly required to operate machines, follow standardized processes, and work within more structured organizations. In this sense, technological change has never only been about machines; it has also been about the redesign of jobs, skills, and relationships within organizations.

In the twentieth century, technological innovation became more closely associated with mass production, electrification, and later the introduction of computers. Early workplace technologies were mainly designed to reduce physical effort, improve accuracy, and increase production output. For example, assembly lines enabled organizations to produce goods faster and at lower cost. As computers became more widely available from the 1970s onward, organizations began using them for payroll, record keeping, inventory control, communication, and financial management. These developments changed office work by making information easier to store, process, and share.

The rapid spread of information and communication technologies in the 1990s and early 2000s marked another important stage in the evolution of workplace innovation. Internet access, email, enterprise software, mobile phones, and digital databases connected employees, customers, and suppliers in new ways. Work became less dependent on a single physical location because employees could communicate and exchange information across departments, cities, and countries. Organizations also began to rely more heavily on digital systems to coordinate tasks, monitor performance, and respond to customer needs.

However, the value of technology does not come automatically from its installation. Brynjolfsson and Hitt (2000) argue that the benefits of information technology are strongly connected to organizational change. This means that a company may invest heavily in software or digital equipment without gaining substantial productivity improvements if employees are not trained, work processes are not redesigned, or management practices remain outdated. In other words, technology is most effective when it is supported

by appropriate leadership, employee participation, skills development, and a workplace culture that is open to change.

The modern meaning of technological innovation has therefore expanded beyond physical equipment. The OECD (2018) identifies innovation as either a new or improved product or a new or improved business process. Workplace innovation is especially connected to business-process innovation because it affects activities such as production, administration, logistics, communication, marketing, human resource management, and service delivery. For instance, a company may introduce an online customer-service platform, automate invoice processing, use real-time sales data to guide decisions, or adopt collaborative software that allows teams to work together remotely. Each example changes not only the technology used but also the way employees organize and complete their tasks.

Today, workplace innovation is increasingly shaped by artificial intelligence, automation, cloud computing, big data, robotics, and digital platforms. Artificial intelligence can assist workers by analyzing large amounts of information, responding to customer inquiries, drafting routine documents, predicting demand, or identifying patterns that would be difficult to detect manually. Automation can reduce repetitive tasks, allowing employees to focus more on problem-solving, creativity, communication, and strategic work. Evidence from a field study of customer-support workers found that access to generative AI increased productivity, with particularly strong gains among less experienced workers (Brynjolfsson et al., 2023). This suggests that technology can complement human work rather than simply replace it.

Digital Transformation and Changing Work Practices

Digital transformation refers to the integration of digital technologies into an organization's activities, processes, and culture in ways that fundamentally change how it operates and delivers value (Brynjolfsson, E., & Hitt, L. M., 2000). It is more than replacing paper files with computers or using email instead of letters. True digital transformation involves changing the way employees communicate, make decisions, serve customers, manage information, and complete daily tasks. It often includes the use of cloud computing, artificial intelligence, mobile applications, digital platforms, data analytics, and automation. In the modern workplace, digital transformation has significantly changed traditional work practices. In the past, many employees were expected to work from a fixed location, follow a set schedule, and communicate mainly through face-to-face meetings, telephone calls, or printed documents. Today, digital tools allow work to take place across different locations and time zones. Employees can attend virtual meetings, share documents instantly, monitor projects online, and collaborate with colleagues without being in the same building. This flexibility has made remote and hybrid work more common in many organizations.

One major effect of digital transformation is the shift toward flexible work arrangements. Cloud-based systems such as online storage, video-conferencing platforms, and project-management applications enable employees to access work materials from almost anywhere. As a result, many organizations now combine office-based work with remote work. This approach can help employees manage their time more effectively and may reduce commuting costs and stress. At the same time, it requires employees to be disciplined, organized, and able to communicate clearly through digital channels. The COVID-19 pandemic accelerated this change. During periods of lockdown and restricted movement, many organizations had to quickly adopt digital tools to remain operational. Meetings moved online, customer services became more digital, and employees relied on messaging platforms and shared online workspaces. The International Labour Organization (ILO, 2022) observes that the pandemic accelerated the movement of work, services, and economic activities toward digital and virtual platforms. Although remote work existed before the pandemic, it became an essential practice for many organizations rather than a special arrangement.

Digital transformation has also changed communication in the workplace. Employees now use email, instant messaging, video calls, collaborative documents, and workplace platforms to communicate in real time. These tools can make communication faster and improve coordination among teams. For example, a project team can update a shared document at the same time, track deadlines through an online platform, and resolve questions through instant messaging. This reduces delays that may occur when employees depend only on physical meetings or paper-based systems.

Digital transformation also requires employees to develop new skills. Digital literacy is now important in almost every sector because workers need to use software, communicate online, protect sensitive information, and adapt to new technologies. Employees may also need to learn how to interpret data, work with automated systems, and use artificial intelligence responsibly. The OECD and Eurostat (2018) recognize that innovation increasingly depends on capabilities related to digital technologies,

software, data, and knowledge management. This means that continuous training is essential for organizations that want to remain productive and competitive.

Artificial Intelligence and Automation in Improving Productivity

Artificial intelligence (AI) and automation are becoming important tools for improving productivity in modern organizations. Productivity refers to how efficiently an organization uses its resources, including time, labour, money, and materials, to produce goods or deliver services. AI and automation can help employees complete tasks faster, reduce errors, improve decision-making, and allow organizations to respond more effectively to customer needs (Brynjolfsson, E., & Hitt, L. M., 2000). Although the two concepts are closely related, they are not exactly the same. Automation involves using technology to perform repetitive tasks with little human involvement, while AI enables computer systems to analyze information, recognize patterns, learn from data, and support decisions. Automation has been used in workplaces for many years. In manufacturing, machines have long been used to assemble products, package goods, and inspect quality. Today, automation is also common in offices, banks, hospitals, retail stores, and customer-service departments. For example, automated systems can process invoices, schedule meetings, send reminders, update employee records, and respond to simple customer questions. By handling routine tasks, automation reduces the amount of time employees spend on repetitive activities. This allows them to focus on work that requires creativity, communication, judgment, and problem-solving.

Artificial intelligence takes automation a step further because it can process large amounts of information and provide useful insights. AI systems can help organizations forecast sales, detect fraud, recommend products, analyze customer feedback, and predict equipment failure. In a hospital, AI may support doctors by identifying patterns in medical images. In banking, it can help identify unusual transactions that may indicate fraud. In retail, AI can analyze customer purchasing behaviour and help businesses manage inventory more effectively. These examples show that AI can improve productivity by helping employees make faster and more informed decisions. Research shows that AI can increase productivity when it is used appropriately. Brynjolfsson, Li, and Raymond (2023) studied the use of generative AI among customer-support workers and found that access to AI assistance increased productivity by an average of 15 percent. The improvement was especially strong among less experienced employees because the technology helped them learn from the approaches used by more experienced workers. This suggests that AI can help reduce skill gaps by giving employees quick access to useful information and guidance while they work. Despite these benefits, organizations must be careful when introducing AI and automation. Some employees may worry that their jobs will disappear, especially when technology takes over routine tasks.

In reality, AI is more likely to change many jobs than completely eliminate them. The International Labour Organization (ILO, 2025) explains that AI may augment human capabilities and improve productivity in many occupations, although some jobs and worker groups are more exposed to significant change. For this reason, organizations should invest in training and reskilling rather than simply focusing on reducing labour costs. Employees need digital skills to work effectively with AI systems.

Remote and Hybrid Work Technologies

Remote and hybrid work technologies are digital tools that allow employees to perform their duties, communicate, and collaborate without being in the same physical workplace every day. Remote work occurs when employees work entirely outside the traditional office, often from home or another location. Hybrid work combines remote work with time spent in a physical office. These work arrangements have become more common because technology now makes it possible for employees to access files, attend meetings, communicate with colleagues, and complete tasks from almost anywhere (Bloom, N., Liang, J., Roberts, J., & Ying, Z. J., 2015).

Before the widespread use of digital technology, most organizations depended heavily on face-to-face communication and physical office spaces. Employees needed to be present in the workplace to attend meetings, access documents, use office equipment, and receive instructions from managers. However, the development of the internet, cloud computing, mobile devices, and online communication platforms has changed this situation. Employees can now work through digital systems that connect them to their organizations regardless of location. Cloud computing is one of the most important technologies supporting remote and hybrid work. Cloud-based platforms allow employees to store, access, and edit files online instead of saving them only on a specific office computer (Wang, B., Liu, Y., Qian, J., & Parker, S. K., 2021). For example, workers can use shared online documents, digital storage systems, and project-management

platforms to collaborate with team members in real time. This improves flexibility because employees can access important work materials from different devices and locations. Cloud systems also reduce the risk of losing information when files are properly backed up and managed. Video-conferencing technology is another major tool for remote and hybrid work. Platforms such as Zoom, Microsoft Teams, Google Meet, and similar applications allow employees to hold meetings without travelling to the same location. Through video calls, workers can discuss projects, give presentations, conduct interviews, provide training, and maintain contact with clients. These technologies became especially important during the COVID-19 pandemic, when many organizations had to continue operating while physical movement was restricted. According to the International Labour Organization (ILO, 2022), the pandemic accelerated the shift of work, services, and livelihoods toward virtual and digital platforms.

In addition to video meetings, remote work depends on communication tools such as email, instant messaging, shared calendars, and team collaboration platforms. These technologies make it easier for employees to exchange information quickly, ask questions, assign tasks, and monitor deadlines. A project manager, for instance, can use an online platform to assign responsibilities, track progress, and identify tasks that are delayed. Employees can also communicate through group chats rather than waiting for formal meetings. This can improve coordination and reduce the time spent searching for information. Remote and hybrid work technologies can improve productivity when they are used effectively. Employees may save time and money by avoiding long daily commutes. They may also have greater control over their working environment and schedule, which can help some people concentrate better. Research by Bloom et al. (2015) found that employees who worked from home in a Chinese travel company showed higher performance and lower turnover than office-based employees. The study suggests that remote work can produce positive results when workers have suitable roles, appropriate technology, and clear performance expectations. Hybrid work can offer a balance between flexibility and physical interaction. Employees may work remotely when they need quiet time for individual tasks and come into the office for team meetings, brainstorming, training, or activities that require closer collaboration. This approach recognizes that not all work is best completed in the same way.

Employee Skills, Reskilling, and Digital Literacy

Technological innovation is changing the skills employees need in order to work effectively. As organizations adopt digital systems, automation, artificial intelligence, cloud computing, and data analytics, employees are expected to perform tasks in new ways. Skills that were sufficient in the past may no longer be enough in a workplace where information is shared digitally, routine tasks are automated, and decisions are increasingly supported by data. For this reason, employee skills, reskilling, and digital literacy have become important areas of focus for organizations that want to remain productive and competitive (International Labour Organization, 2026).

Employee skills refer to the knowledge, abilities, and personal qualities that allow workers to perform their jobs successfully. These include technical skills, communication skills, problem-solving ability, teamwork, creativity, and time management. In the digital workplace, employees also need the ability to use technology confidently and responsibly. For example, they may need to use online communication platforms, manage digital documents, analyze information, protect confidential data, and work with automated systems. The growing use of technology means that employees must be willing to learn continuously rather than depending only on the skills they gained at the beginning of their careers (OECD, 2019).

Digital literacy is a key skill in the modern workplace. It refers to the ability to use digital devices, software, and online platforms effectively, safely, and critically. Digital literacy is not limited to knowing how to operate a computer or send an email. It also includes the ability to search for reliable information, communicate professionally online, understand digital content, protect personal and organizational data, and recognize possible misinformation or cyber threats. An employee with strong digital literacy can adapt more easily when an organization introduces new tools or systems. For example, an employee in a traditional office may have previously kept records in paper files and communicated mainly through face-to-face meetings. In a digitally transformed workplace, the same employee may need to use cloud storage, video-conferencing applications, customer-management software, and digital reporting systems. If the employee lacks digital skills, the new technology may create stress and reduce productivity. However, with appropriate training and support, the employee can learn to use the tools effectively and contribute more confidently to the organization (World Bank, 2019).

Reskilling refers to the process of learning new skills that prepare employees for different roles or changing job requirements. It is particularly important when technology replaces certain tasks or changes the way a job is performed. For instance, a worker whose routine data-entry tasks are automated may need training in data analysis, customer support, quality control, or digital process management (World Bank. (2019). Reskilling helps employees remain relevant in the workplace and reduces the risk that technological change will lead to job loss or exclusion.

Upskilling is closely related to reskilling but has a slightly different meaning. Upskilling involves improving existing skills so that employees can perform their current roles at a higher level (World Bank. (2019). A customer-service employee, for example, may be trained to use an AI-supported system that helps answer customer questions more quickly. The employee remains in the same general role but gains new abilities that improve performance. Both reskilling and upskilling are necessary because workplaces are changing continuously. The International Labour Organization (ILO, 2026) notes that the growing use of AI is increasing demand for cognitive, socioemotional, digital, and AI-related skills. Employees are not only expected to understand technology; they must also develop human skills that technology cannot easily replace. These include empathy, creativity, ethical judgment, leadership, adaptability, and complex problem-solving. This shows that the future of work will require a combination of technological competence and human-centered abilities.

Organizations benefit when they invest in employee development. Workers who receive training are more likely to adapt to change, use technology effectively, and feel valued by their employers. Training can also improve employee confidence and reduce resistance to new systems. When employees understand why a new technology is being introduced and how it can support their work, they are more likely to accept it. On the other hand, organizations that introduce technology without training may experience frustration, low adoption rates, and reduced productivity. Digital training can take different forms. Organizations may provide workshops, online courses, mentoring, job rotation, coaching, or peer-learning opportunities. Some employees may need basic digital training, while others may require advanced skills in areas such as cybersecurity, programming, data analytics, or artificial intelligence. Training should therefore be based on the needs of both the organization and its employees. It should also be continuous because technology changes quickly (World Bank (2019).

Technology-Driven Changes in Job Roles and Employment Patterns

Technology has always influenced the type of work people do, but recent developments in artificial intelligence, automation, robotics, digital platforms, and data analytics are changing job roles at a faster pace (ILO, 2025). Many organizations now use technology to perform routine tasks, improve service delivery, reduce costs, and make better decisions. As a result, some jobs are being redesigned, new roles are emerging, and employees are expected to develop skills that were not previously required. These changes are affecting employment patterns across industries such as manufacturing, banking, health care, education, retail, transportation, and communication. According ILO (2025) a job role refers to the duties and responsibilities an employee performs within an organization. In the past, many jobs involved repetitive tasks that could be completed manually. For example, factory workers assembled products by hand, bank employees processed transactions manually, and office workers spent large amounts of time filing documents or entering information into records. Today, automated machines, software systems, and artificial intelligence can perform many of these tasks more quickly and accurately. This does not always mean that jobs disappear completely; rather, the nature of the job often changes.

Technology is also creating entirely new job roles. Organizations now employ data analysts, cybersecurity specialists, software developers, digital marketers, cloud-computing professionals, artificial intelligence specialists, and social media managers. These roles were either uncommon or did not exist in many organizations a few decades ago. The growth of e-commerce has also created employment opportunities in online customer service, digital logistics, online sales, and warehouse management. As businesses increasingly depend on digital systems, the demand for workers with technological knowledge continues to increase. Employment patterns are also changing because digital technology has made work more flexible. In the past, most employees were expected to work full-time from a fixed workplace. Today, many people work remotely, on a hybrid basis, as freelancers, or through digital platforms. For example, online platforms allow individuals to offer services such as graphic design, writing, delivery, transportation, consulting, and software development. This type of work can provide flexibility and create income opportunities for people who may not be able to follow traditional office schedules (ILO, 2022).

Cybersecurity, Privacy, and Ethical Concerns in Digital Workplaces

Digital technology has made workplaces more efficient, connected, and flexible. Employees can communicate through online platforms, access files from different locations, use artificial intelligence to complete tasks, and make decisions based on data. However, as organizations become more dependent on digital systems, they also face important concerns related to cybersecurity, privacy, and ethics. These issues affect employees, customers, managers, and the organization as a whole. For this reason, organizations must ensure that technology is used in a secure, fair, and responsible way. According to World Economic Forum (2025) Cybersecurity refers to the protection of digital systems, networks, devices, and information from unauthorized access, theft, damage, or disruption. In a digital workplace, organizations store important information such as employee records, customer details, financial data, passwords, and business plans on computers and online platforms. If this information is not properly protected, cybercriminals may gain access to it. Cyberattacks can lead to financial losses, damage to an organization's reputation, loss of customer trust, and interruptions to normal business activities.

Common cybersecurity threats include phishing, malware, ransomware, weak passwords, and unauthorized access. Phishing occurs when criminals send false emails or messages that appear to come from a trusted source in order to trick employees into revealing passwords or other sensitive information. Malware is harmful software that can damage systems or steal data. Ransomware is a type of malware that blocks access to an organization's files until money is paid to the attacker. These threats are especially serious in remote and hybrid workplaces because employees may use home internet connections or personal devices that are not as secure as office systems. Employees play an important role in cybersecurity because many security problems begin with human error. An employee may accidentally click on a suspicious link, use a weak password, or share confidential information with the wrong person. Therefore, organizations should provide regular cybersecurity training. Employees should learn how to identify suspicious emails, create strong passwords, use multi-factor authentication, and report possible security incidents quickly. The National Institute of Standards and Technology (NIST, 2024) emphasizes that cybersecurity risk management involves identifying risks, protecting systems, detecting threats, responding to incidents, and recovering from attacks.

Privacy is another major concern in digital workplaces. Privacy refers to an individual's right to control how personal information is collected, used, stored, and shared (World Economic Forum, 2025). Organizations often collect information about employees and customers for legitimate reasons. For example, human resource departments may collect employee contact details, attendance records, salary information, performance reports, and health-related information. Digital systems may also collect data about employees' online activity, working hours, location, or use of company devices. Although data can help organizations manage work more effectively, excessive monitoring can create serious privacy concerns. Some employers use software to track employees' computer activity, keystrokes, email messages, login times, or location. While monitoring may be used to protect company information or measure performance, it can make employees feel watched and distrusted. If employees are not informed about how their data is being collected and used, the organization may damage morale and create an unhealthy work environment. Organizations should therefore be transparent about employee monitoring and data collection. Employees should know what information is being collected, why it is needed, who can access it, and how long it will be stored. Data should only be collected when it is necessary for a clear business purpose. The NIST (2020) Privacy Framework encourages organizations to identify privacy risks and manage personal information in ways that support trust and accountability. Protecting privacy is not only a legal responsibility; it is also an ethical obligation.

Ethics refers to principles of right and wrong that guide behaviour and decision-making. In digital workplaces, ethical concerns often arise when organizations use artificial intelligence, employee-monitoring tools, data analytics, and automated decision-making systems (UNESCO, 2021). For example, an organization may use AI to screen job applicants, evaluate employee performance, or decide which customers receive particular services. If the AI system is trained on biased or incomplete data, it may produce unfair results. This could lead to discrimination based on gender, age, race, disability, or other personal characteristics. Ethical technology use requires fairness, transparency, accountability, and human oversight. Employees and customers should be able to understand how important decisions are made, especially when automated systems are involved. Organizations should not allow AI systems to make major decisions without human review. For example, if an automated system rejects a job applicant, a qualified human decision-maker should be able to review the result and identify whether the system made an unfair judgment. Another ethical concern is the balance between productivity and employee well-being. Digital

tools can improve efficiency, but they can also create pressure for employees to remain constantly available. Instant messaging, email, and remote-work platforms may make employees feel that they must respond at all hours. This can lead to stress, burnout, and poor work-life balance. Managers should set reasonable expectations about working hours and avoid using technology in ways that create unnecessary pressure.

Challenges Organizations Face When Adopting New Technologies

One of the main challenges is the high cost of adopting technology. Organizations may need to purchase software, hardware, licenses, internet services, cybersecurity systems, and technical support. They may also need to pay for employee training and system maintenance. Large organizations may have more financial resources to invest in advanced technology, but small and medium-sized enterprises may struggle to afford these costs. In addition, technology often requires regular updates, meaning that the organization must continue investing after the initial purchase.

Another challenge is employee resistance to change (Venkatesh, V. et al, 2003). Employees may be comfortable with existing work methods and may worry that new technology will make their jobs more difficult or replace them completely. For example, a worker who has used paper records for many years may feel anxious about using a digital system. Employees may also fear that automation or artificial intelligence will reduce the number of available jobs. These concerns can lead to resistance, low motivation, or refusal to use the new technology. Organizations can reduce resistance by involving employees in the adoption process. Managers should explain why the technology is being introduced, how it will affect employees, and what support will be available. Employees should have opportunities to ask questions and share their concerns. Training is also important because people are more likely to accept a new system when they feel confident using it. According to Venkatesh et al. (2003), employees are more likely to accept technology when they believe it will improve their performance and when they feel that adequate support is available.

Lack of digital skills is another major challenge. New technologies often require employees to learn unfamiliar tools, software, and work processes. Some employees may have strong digital skills, while others may need basic training before they can use the technology effectively. If employees do not receive proper training, the organization may experience errors, delays, low productivity, and frustration. The Organisation for Economic Co-operation and Development (OECD, 2019) emphasizes that the future of work requires continuous skills development because technology is changing job demands rapidly.

Integration problems can also make technology adoption difficult. Many organizations already use older systems for accounting, customer records, human resources, or production management. When a new system is introduced, it may not work smoothly with the existing technology. For example, a company may introduce a new customer-management platform that cannot easily connect with its accounting software. This can lead to duplicated data, inaccurate records, and wasted time. Organizations should therefore assess their existing systems carefully before introducing new technology.

Cybersecurity is another serious concern. Digital technologies increase the amount of information stored and shared online, including customer data, employee records, financial information, and business plans. If security measures are weak, organizations may face cyberattacks, data breaches, or unauthorized access to confidential information. The National Institute of Standards and Technology (NIST, 2024) explains that organizations need to identify cybersecurity risks, protect their systems, detect threats, respond to incidents, and recover from attacks. This means that technology adoption should include strong passwords, access controls, employee training, backup systems, and regular security updates.

Organizations may also face difficulties because technology changes quickly. A system that is new today may become outdated within a few years. This creates pressure for organizations to continue upgrading their technology and training employees. Managers may find it difficult to choose the right technology because there are many available options. Adopting the wrong system can be expensive and may not solve the organization’s actual problems. For this reason, organizations should first identify their needs and goals before purchasing new technology.

Poor leadership and planning can also cause technology projects to fail. Technology adoption requires more than simply buying software or equipment. Organizations need a clear plan that explains what the technology will do, who will use it, how success will be measured, and what risks may occur. Managers should set realistic timelines and provide enough resources for implementation. Brynjolfsson and Hitt (2000) argue that technology creates greater value when it is combined with changes in organizational structure, work practices, and management systems. This means that organizations must be ready to redesign processes, not just add technology to old ways of working.

Ethical and privacy concerns are additional challenges. Some technologies collect large amounts of information about employees and customers. For example, AI systems may analyze employee performance, track online activity, or help select job applicants. If these systems are not used carefully, they may invade privacy or produce unfair decisions. Organizations should develop clear policies on how data will be collected, stored, and used. Employees and customers should be informed about data practices, and important decisions should include human oversight (Brynjolfsson, E., & Hitt, L. M., 2000).

Measuring the Effect of Technological Innovation on Productivity

Technological innovation is often introduced to help organizations work faster, reduce costs, improve quality, and remain competitive. However, investing in new technology does not automatically mean that an organization will become more productive. Managers need to measure the effect of technological innovation in order to determine whether the technology is achieving its intended purpose. Measuring productivity helps organizations understand whether new tools, systems, or processes are improving performance or simply increasing costs (Van Ark, B. (2016).

According to Syverson, C. (2011) Productivity refers to the relationship between outputs and inputs. In simple terms, it measures how much an organization produces compared with the resources it uses. Outputs may include products manufactured, services delivered, sales completed, customer issues resolved, or reports produced. Inputs may include employee time, labour, money, materials, equipment, and energy. An organization is considered more productive when it produces more output with the same amount of resources or produces the same output with fewer resources. For example, a customer-service department may introduce an artificial intelligence system that helps employees respond to customer inquiries. To measure the effect of the system, managers can compare the number of customer issues resolved before and after the technology was introduced. They can also examine the average response time, customer satisfaction level, number of errors, and cost per customer interaction. If employees are able to resolve more customer issues in less time while maintaining service quality, the technology may be considered productive.

One common method of measuring productivity is labour productivity. Labour productivity measures the amount of output produced per employee or per hour worked. For instance, a manufacturing organization may calculate the number of units produced per worker each day. A bank may measure the number of customer transactions processed per employee. Labour productivity is useful because it helps organizations understand whether employees are able to complete their work more efficiently after a new technology has been introduced.

Another useful measure is total factor productivity. Total factor productivity considers several inputs at the same time, including labour, capital, materials, and technology. It is more complex than labour productivity because it tries to show how efficiently an organization combines all its resources. If an organization produces more output without increasing its total inputs, this may indicate that technological innovation or improved management practices are contributing to better performance. Total factor productivity is often used by researchers and economists to study the wider effect of innovation on firms and industries.

Organizations should not measure productivity only by looking at speed or quantity. A technology may allow employees to complete more tasks, but if the quality of the work becomes poor, the overall result may not be positive. For this reason, organizations should use both quantitative and qualitative measures. Quantitative measures include output per employee, production time, sales revenue, error rates, operating costs, and customer response time. Qualitative measures include customer satisfaction, employee satisfaction, service quality, innovation capability, and employee confidence in using the technology.

The OECD and Eurostat (2018) explain that innovation should be understood as a new or improved product or business process that has been implemented. This definition is important when measuring productivity because it shows that innovation is not simply an idea or a new purchase. The technology must be put into use and must change the way the organization operates. For example, buying new software is not necessarily an innovation if employees do not use it properly or if it does not improve a business process. Measuring the effect of technology also requires comparing performance before and after implementation. Organizations should collect baseline data before introducing a new system. This may include information about costs, processing time, employee performance, customer complaints, or production levels. After the technology has been in use for a reasonable period, managers can compare the new results with the baseline. This comparison helps determine whether the technology has produced real improvement.

However, it is important to recognize that productivity improvements may not appear immediately. Employees often need time to learn how to use a new system, and organizations may need to redesign work processes. During the early stages of implementation, productivity may even decrease because employees are being trained or because technical problems occur. Brynjolfsson and Hitt (2000) argue that the benefits of information technology are often connected to complementary organizational investments, such as employee skills, workplace redesign, and improved management practices. Therefore, organizations should not judge the success of a technology investment too quickly.

The Future Workplace-Trends, Opportunities, and Recommendations

The future workplace will be shaped by rapid technological change, changing employee expectations, and the growing need for organizations to remain flexible. In recent years, artificial intelligence, automation, cloud computing, data analytics, and digital communication tools have changed how work is organized and performed. The traditional workplace, where employees work from one physical office during fixed hours, is gradually being replaced by more flexible, connected, and technology-supported work arrangements.

One important trend in the future workplace is the continued growth of remote and hybrid work. Remote work allows employees to perform their jobs outside the traditional office, while hybrid work combines remote work with time spent in a physical workplace (International Labour Organization, 2026). Digital tools such as video-conferencing platforms, cloud storage, instant messaging applications, and project-management systems make it possible for employees to communicate and collaborate from different locations. Many organizations have discovered that some tasks can be completed effectively without employees being physically present every day. Hybrid work can create opportunities for both organizations and employees. Employees may benefit from reduced commuting time, improved flexibility, and better control over their schedules. Organizations may benefit from lower office costs, access to a wider pool of talent, and improved employee satisfaction. However, hybrid work must be managed carefully. Organizations need clear policies about communication, performance expectations, working hours, and access to technology. Managers must also ensure that remote employees are not excluded from important meetings, training, promotions, or decision-making opportunities (International Labour Organization, 2026).

Artificial intelligence and automation will also play a major role in the future workplace. AI can help employees analyze information, respond to customer questions, prepare documents, identify patterns, and make predictions. Automation can perform routine tasks such as data entry, invoice processing, scheduling, and inventory management. These technologies may improve productivity by allowing employees to spend less time on repetitive work and more time on activities that require creativity, communication, problem-solving, and human judgment. The World Economic Forum (2025) notes that technological change is expected to transform many job roles while creating new opportunities in areas such as artificial intelligence, data analysis, cybersecurity, and digital services. This means that the future workplace will not simply have fewer jobs; instead, many jobs will change. Some tasks may be automated, while new roles will emerge to design, manage, maintain, and regulate new technologies. Employees who are able to adapt and learn new skills are likely to have stronger opportunities in the changing labour market.

Another major trend is the growing importance of digital skills. Employees will need to understand how to use digital tools, communicate online, protect information, and work with data. In addition to technical skills, employees will need human skills that technology cannot easily replace. These include emotional intelligence, creativity, teamwork, leadership, ethical judgment, and critical thinking. The International Labour Organization (ILO, 2026) explains that AI is increasing the need for cognitive, socioemotional, digital, and AI-related skills. Therefore, the future workplace will require a combination of technological competence and strong human abilities.

The future workplace also offers opportunities for greater inclusion. Digital technology can make work more accessible for people who may face barriers in traditional workplaces. For example, remote work may support people with disabilities, caregivers, or individuals living far from major cities. Online learning platforms can also make training more available to employees who cannot attend physical classes. However, these opportunities will only be meaningful if organizations provide reliable technology, affordable internet access, and inclusive digital training.

Conclusion

The study concluded that technological innovations is shaping the future of work and that the adoption of new technologies can help organizations improve productivity, reduce operational costs, strengthen communication, and respond more quickly to customer needs. Technologies such as artificial

intelligence, automation, cloud computing, data analytics, and digital communication platforms are becoming essential in many sectors. However, organizations often face challenges when trying to introduce these technologies. Common problems include high costs, employee resistance, lack of digital skills, cybersecurity risks, poor planning, integration difficulties, and ethical concerns. To benefit fully from technological innovation, organizations need practical solutions that address both the technical and human sides of change. However, organizations can overcome the challenges of adopting new technologies through careful planning, employee involvement, continuous training, phased implementation, strong cybersecurity, ethical data practices, and effective leadership. Technology should not be introduced as a quick solution to every problem. Instead, it should be selected and managed in a way that supports employees, improves work processes, and protects organizational information. When organizations combine technological investment with preparation and human support, they are more likely to achieve lasting improvements in productivity, efficiency, and competitiveness.

Recommendation

Based on the foregoing discussion, the following recommendations were made:

Careful Planning Before the Introduction of Technology: One of the most effective solutions is careful planning before technology is introduced. Organizations should not adopt a technology simply because it is popular or because competitors are using it. Instead, managers should first identify the specific problem the technology is expected to solve. For example, an organization may need to reduce delays in customer service, improve inventory management, strengthen communication among remote employees, or reduce errors in financial records. Once the problem is clear, the organization can select a technology that fits its actual needs. A proper technology-adoption plan should include clear goals, a realistic budget, a timeline, and measurable outcomes (Kotter, J. P., 1995).

Communication and Employee Involvement: Employee resistance is another major challenge, but it can be reduced through communication and involvement. Employees may fear that new technology will make their jobs more difficult or replace them entirely. They may also resist change because they are comfortable with existing work methods. Organizations should address these concerns openly rather than ignoring them. Managers should explain why the technology is being introduced, how it will affect employees, and what benefits it may provide. Employees should also be involved in the adoption process. Kotter (1995) argues that successful organizational change requires creating a shared understanding of the need for change and building support among those affected by it.

Training and Continuous Learning: Training and continuous learning are essential solutions to the problem of limited digital skills. New technology is unlikely to improve productivity if employees do not know how to use it properly. Organizations should provide practical training before and after introducing new systems. Training may include workshops, online courses, demonstrations, mentoring, job-shadowing, or one-on-one technical support. Different employees may require different levels of support. Some workers may need basic digital-literacy training, while others may need advanced training in areas such as data analysis, cybersecurity, artificial intelligence, or cloud-based systems. The Organisation for Economic Co-operation and Development (OECD, 2019) emphasizes the importance of developing skills that help people adapt to changing work environments. Organizations should therefore treat training as an ongoing investment rather than a one-time activity.

Gradual or Phased Implementation Approach: A gradual or phased implementation approach can also reduce the risks of technology adoption. Instead of introducing a new system across the entire organization at once, managers can begin with a small pilot programme. For instance, a company may test a new digital inventory system in one branch or department before expanding it to all locations. This allows the organization to identify technical problems, collect employee feedback, and make improvements before full implementation (OECD, 2019).

Pilot Programmes: Pilot programmes can reduce financial risk and prevent major disruptions to daily operations. They also give employees time to become familiar with the new system. If the pilot is successful, the organization can expand the technology gradually. If it is unsuccessful, managers can revise the plan or select a more suitable solution without affecting the entire organization (OECD, 2019).

Managing System Integration: Working with qualified technology professionals can help organizations manage system integration. Organizations may need software developers, information-technology specialists, or external consultants to ensure that new and existing systems communicate effectively. It is also important to test the technology before full implementation. Testing can identify

problems with data accuracy, system speed, user access, and compatibility (National Institute of Standards and Technology, 2020).

Cybersecurity in Technology Adoption: Cybersecurity should be included in every stage of technology adoption. As organizations use more digital systems, they collect and share more confidential information. This may include employee records, customer data, financial information, passwords, and business plans. Without adequate protection, organizations may experience cyberattacks, data breaches, or unauthorized access to sensitive information. The National Institute of Standards and Technology (NIST, 2024) recommends that organizations identify cybersecurity risks, protect systems, detect threats, respond to incidents, and recover from attacks. In practice, this means organizations should use strong passwords, multi-factor authentication, access controls, secure backups, regular software updates, and employee cybersecurity training. Employees should be taught how to identify suspicious emails, avoid unsafe downloads, and report potential security incidents quickly.

Data Privacy and Ethical Concerns: Data privacy and ethical concerns must also be managed responsibly. New technologies often collect information about employees and customers. For example, digital systems may track work hours, online activity, customer purchases, location data, or employee performance. Although this information may help organizations improve operations, it can also create privacy concerns if it is collected or used without clear justification (National Institute of Standards and Technology, 2020).

Transparent Data Policies: Organizations should create transparent data policies that explain what information is collected, why it is needed, how it will be stored, and who can access it. Data should only be collected for legitimate purposes and should be protected from misuse. The National Institute of Standards and Technology (NIST, 2020) explains that privacy risk management is important for building trust and accountability in organizations. Employees and customers are more likely to accept digital systems when they believe their information is being handled fairly and securely.

Strong Leadership: Strong leadership is another important solution. Technology adoption requires managers who can guide employees through change, solve problems, and maintain focus on organizational goals. Leaders should communicate honestly about the benefits and limitations of new technology. They should also provide the resources employees need, including training, technical support, and enough time to learn new systems. Brynjolfsson and Hitt (2000) explain that technology creates greater value when it is combined with changes in management practices, work design, and employee skills. This means that successful technology adoption depends on organizational readiness, not only on the quality of the technology itself.

Continuous Evaluation of Technology: Organizations should evaluate technology continuously after it has been introduced. Managers should collect information about system performance, employee experiences, customer feedback, costs, and productivity outcomes. If problems are identified, the organization should make adjustments rather than assuming that the technology will work perfectly on its own. Continuous evaluation helps organizations learn from experience and improve future technology decisions (National Institute of Standards and Technology, 2020).

INFLUENCE OF TECHNOLOGY AND ENTREPRENEURIAL ORIENTATIONS ON PERFORMANCE OF SMALL AND MEDIUM ENTERPRISES IN BORNO STATE, NIGERIA

Modu Korimi
Department of Business Education,
Ramat Polytechnic Maiduguri, Borno State Nigeria.
Email; mkorimi64@gmail.com phone; 07032873880

Abstract

This study examined the influence of technology and entrepreneurial orientations on performance of SMEs in Borno State, Nigeria, the moderating role of government support policies. With three specific objectives, guided by three research questions and tested against three null hypotheses at a 0.05 level of significance, the study adopts a survey research design. Structured questionnaires were distributed to 300 randomly selected owners/managers of small and medium scale enterprises in Borno state. Data collected was analyzed using mean and standard deviations, simple linear regression. The findings of the study revealed that technology and entrepreneurial orientations significantly influence the performance of SMEs in Borno State. Moreover, the study establishes that government support policies play a crucial moderating role on the influence of technology and entrepreneurial orientations on SME performance in Borno State. Hence, a strategic focus on technological advancements and entrepreneurial development, coupled with robust government support policies, can lead to significant improvements in the performance of SMEs. This, in turn, can contribute to economic growth, job creation, and overall socio-economic development in Borno State. This study therefore, recommend that SMEs performance in Borno State, SMEs should integrate advanced technologies and promote entrepreneurial training, while the government should develop supportive policies, provide financial incentives, and encourage collaboration between the public sector, private enterprises, and educational institutions to create an enabling environment for growth and development.

***Key words**; Technology, Entrepreneurial orientation, Entreprises.*

Introduction

In both developed and developing countries, small and medium enterprises (SMEs) are viewed as playing a significant and vital role in the growth and development of the economy. SMEs have been recognized globally as an engine of growth and development (Ahmad, Abdullah, & Roslan, 2022). It is widely acknowledged that it is not the large firms that are fueling the leading economies around the world but the small and medium firms. SMEs have gained increasing attention and have made a valuable contribution to a nation's economy, especially in the areas of employment opportunities, poverty reduction, income generation, providing support for large industries, innovation, promotion of entrepreneurship and rapid industrialization. In addition, SMEs are perceived to have provided important economic advantages specifically in the areas of regional income generation, savings, employment, raw material supply, enhance export earnings and boost capacity utilization within the key industries and actualizing women and youths (Small and Medium Enterprises Development Agency of Nigeria [SMEDAN], 2022).

The catalytic roles of the SMEs have been displayed in the developed countries such as USA, UK and emerging economies like India, Brazil, Malaysia, South Africa, Nigeria, Ghana and Morocco among others (ACCA 2019; SMEDAN, 2022). SMEs in those countries have contributed substantially to the total business establishment and gross domestic product (GDP). Irrespective of the nation's status, SMEs play an important role in contributing to the economy, particularly in the areas of innovation, regional development and social cohesion, which in turn contribute to the GDP and employment (Gherghina, Botezatu, Hosszu, & Simionescu, 2020).

In Nigeria, various successive administrations of government at different times have geared their efforts towards SMEs development. Several policy measures and financial assistance instruments were

introduced (Nwosu, 2020). The Nigerian government over the years demonstrated its commitment to support the development of SMEs through various initiatives including monetary, fiscal and industrial policy measures (Peter, Adegbuyi, Olokundun, Peter, Amaihian, & Ibidunn, 2018). These efforts are as a result of the acknowledgment of the importance of the SMEs in terms of the Nigerian economic development towards the business establishment, employment opportunities, development of indigenous technology and skills, as well as GDP contributions (Adanlawo, Vezi-Magigaba, & Owolabi, 2021). SM EDAN (2022) reported that the SMEs in Nigeria accounts for 87.9% of the total business formations in the country and contribute 97% of the workforce in addition to 48% of the industrial output in terms of value added.

However, SMEs' contribution to the GDP is not stable for some years in Nigeria (SMEDAN, 2022). For example, SMEs contributed 37% to the GDP in 2019 and the figure was improved to 46.5% in 2020 (SMEDAN, 2022). However, since then the contribution of SMEs to the general economic development of Nigeria has been decreasing. In 2023, the total contribution to the GDP was 24% and accounting for 30% of the country's total export from the manufacturing sector (SMEDAN, 2022). Likewise, the contribution of SMEs in Bauchi state to employment found to be very low and the performance of SMEs in the state is below expectations (Ahmed, Inuwa, & Shuaibu, 2023).

Although numerous studies have examined technology orientation, entrepreneurial orientation, and SME performance for example, (Al Asheq, Tanchi, Kamruzzaman & Karim, 2021; Octavia, Indrawijaya, Sriayudha, & Hasbullah, 2020), but inconsistencies in their findings indicate a need for further investigation into these relationships (Vij & Farooq, 2017; Zink, Belcher, Imm & Leventhal, 2020). In light of the above, this study aims to examine the influence of technology and entrepreneurial orientation on the performance of SMEs in Borno State, Nigeria

Statement of the Problem

Issues on SMEs performance have garnered significant attention from researchers (see Gupta & Batra, 2021; Mallett, Wapshott, & Vorley, 2019). This is as a result of the recognition of SMEs by regional governments and development experts as one of the main engine of economic growth and a major factor in promoting national economic development (Gamidullaeva, Vasin, & Wise, 2020). However, according to a report from SMEDAN (2022), approximately 70% of registered SMEs in Nigeria are seriously underserved, leading to poor performance in the sector. Ahmed et al. (2023) confirms that the performance of SMEs in Borno State falls below expectations, which hampers the overall economic growth rate and exacerbates unemployment issues in the state. The underperformance of SMEs is a significant concern for the government and other stakeholders, necessitating affirmative action to address these challenges (Ahmed et al., 2023).

Many studies have examined the relationship between technology orientation, entrepreneurial orientation, and SME performance (see, Al Asheq, Tanchi, Kamruzzaman, & Karim, 2021; Octavia, Indrawijaya, Sriayudha, & Hasbullah, 2020). However, inconsistencies in their findings suggest that further investigation is needed (Vij & Farooq, 2017; Zink, Belcher, Imm & Leventhal, 2020). Even though, existing literature has extensively examined the individual impacts of technology orientation and entrepreneurial orientation on SME performance. However, there is a scarcity of research that integrates these variables and examines their combined influence in the context of Borno State. Hence, this study addresses the existing gap and examine the influence of technology orientation and entrepreneurial orientation on the performance of SMEs in Borno State, Nigeria.

Research Objectives

1. To examine the influence of technology orientation on the performance of small and medium enterprises in Borno State, Nigeria.
2. To determine the influence of entrepreneurial orientation on the performance of small and medium enterprises in Borno State, Nigeria.
3. To assess the joint influence of technology orientation and entrepreneurial orientation on the performance of small and medium enterprises in Borno State, Nigeria.

Research Questions

1. What is the influence of technology orientation on the performance of small and medium enterprises in Borno State, Nigeria?
2. What is the influence of entrepreneurial orientation on the performance of small and medium enterprises in Borno State, Nigeria?
3. What is the joint influence of technology orientation and entrepreneurial orientation on the performance of small and medium enterprises in Borno State, Nigeria?

Hypotheses

H_{01}: Technology orientation have no significant influence on the performance of small and medium enterprises in Borno State, Nigeria.

H_{02}: Entrepreneurial orientation have no significant influence on the performance of small and medium enterprises in Borno State, Nigeria

H_{03}: Technology orientation and entrepreneurial orientation jointly have no significant influence on the performance of small and medium enterprises in Borno State, Nigeria

LITERATURE REVIEW

Theoretical Framework

This study adopts the Resource-Based View (RBV) theory propounded by Wernerfelt (1984) to explain the relationship between technology orientation, entrepreneurial orientation and as the independent variables, SMEs performance as the dependent variable. Wernerfelt argued that a firm's performance is driven directly by its products, it is indirectly (and ultimately) driven by the resources that go into their production. A resource-based view of a firm explains its ability to deliver sustainable competitive advantage when resources are managed, such that their outcomes cannot be imitated by competitors, which ultimately creates a competitive barrier.

RBV explains that a firm's sustainable competitive advantage is reached by virtue of unique resources being valuable, rare, inimitable, non-tradable, and non-substitutable (VRIN), as well as firm-specific resource capabilities. Wernerfelt (1984) ascertained that organizations normally own resources which provides them with a competitive advantage and holds the key to superior long-term performance. Therefore, this research work applied the resource-based view (RBV) as an underpinning theory. The RBV theory is one of the most widely used theoretical approach to underline the way companies utilize their resources to achieve performance.

Performance of SMEs

Performance of SMEs is made up of the actual outcome measured against its input and it enable SMEs to focus on areas that need improvement by evaluating the level of work progress in terms of quality, cost and time so as to consolidate in areas with higher level of output (Mennens, Gills, Odekerken-Schroder & Letterie, 2018). SMEs are said to be performing when it achieves its overall objectives with effective and efficient utilization of its resources (Aminu & Mahmood 2016; Semrau et al., 2016; Sorooshian, Aziz, Ahmad, Jubidin & Mustapha, 2016). Several studies on SMEs performance have used a number of resources to investigate the factors influencing SMEs' performance. Aminu and Sheriff (2015) study the mediating role of access to finance on the relationship between strategic orientations and SMEs performance in Nigeria. They found that the performance of an entrepreneurial venture is influenced by the entrepreneur's access to finance, markets and in formation.

Concept of Small and Medium Scale Enterprise (SMEs)

Business has to do with the ability to survive into the future and leave wealth behind for the next generation. It arises from effective management of profits, people and planet often referred to as managing the triple bottom line that is, managing financial, social and environmental risks, obligations and opportunities (Oluwatosin, Comfort, & Chigo, 2019). SMEs create economic value and contribute strong communities and healthy ecosystems. In a study conducted by Oluwatosin et al, (2019) on Micro businesses revealed that, about 74% of small-scale business owners visited do not kept basic records of their daily transactions; which showed a high level of appreciation of the use of bookkeeping. Small and medium scale enterprise is a types of business that requires small capital at its start and comprises of numerous businesses that job seekers can queue, in order to earn their daily livelihoods (Mutua, 2021).

Main problems facing SMEs performance in Nigeria

In Nigeria, the most important factors that affect SMEs directly or indirectly, include access to finance, entrepreneurial skill, marketing management, taxation and regulations, lack of product patents and obsolete technology (CBN, 2019). Ndumanya (2018) states that problems facing SMEs in Nigeria include lack of financial support, lack of infrastructure, inflow of foreign goods and services and failure of enterprises to innovate due to lack of new technologies. The main challenges and constraints confronting the operations of SMEs in Nigeria have been ranked in order of seriousness, such as lack of access to finance, uncomplimentary conditions, weak infrastructure, inconsistency of government policies, lack of work space and multiple taxation (SMEDAN, 2022). Lack of short, medium and long-term

capital, inadequate access to financial resources and credit facilities affects the performance of SMEs. While literature has established a positive impact of financial resources on SMEs' performance, this factor remains the main constraint that affects the growth and development of SMEs in Nigeria (Nelvin et al., 2018).

Types of small- and medium scale businesses

Small and medium scale enterprises are classified into following types; Sole proprietorship, Partnership and Cooperative enterprise (Nelvin et al., 2018).

i. **Sole proprietorship**: The sole proprietorship is the simplest business form under which one can operate a business. The sole proprietorship is not a legal entity. It simply refers to a person who owns the business and is personally responsible for its debts. A sole proprietorship is a business owned, established, and managed by one person. The advantage of a sole proprietorship is that setting up and administering the business is comparatively easy and inexpensive. One disadvantage of operating a sole proprietorship form of business is that the liability of the business is always unlimited.
ii. **Partnership**: A type of business organization in which two or more individual's pool money, skills, other resources, and share profit and loss in accordance with terms of the partnership agreement is called a partnership business. The disadvantage of a partnership business is that profits must be shared with others; you have to decide on how you value each other's time and skills and what happens if one partner can put in less time due to personal circumstances. Also, since decisions are shared, disagreements can occur. A partnership is for the long term, and expectations and situations can change, which can lead to dramatic and traumatic split ups. Another major disadvantage of a partnership is unlimited liability. General partners are liable without limit for all debts contracted and errors made by the partnership (Mutua, 2015).
iii. **Cooperative enterprise**: A cooperative enterprise is an association or corporation established for the purpose of providing Services on a nonprofit basis to its shareholders or members who own and control it. It is established for their mutual benefit and for the sale of their products at the maximum possible price. Itis an autonomous association of persons who voluntarily cooperate for their mutual, social, economic, and cultural benefit.
iv. **Employment generation**: Before independence government establishment were the major employment of labor but these days with many private enterprises set up by entrepreneurs many people have gained employment with these enterprises and this has reduced the dependence on government establishment and large firms for employment. Small businesses employ a greater percentage of the working population in any country. These people employed receive their salaries and wages from these small organizations.

i. **Technological innovation:** Small scale business enterprise brings about technological innovation in Nigeria. In most cases small scale business brings about the emergence of new things in our environment. Most of the managers of small-scale business are highly intellectual and with the rate of advancement in technology the managers do not relent instead they carry on continuous research on how to improve on existing technologies. In the studies carries out by Nikoomaram and Ma'atoofi (2021), it shows that SMEs in Nigeria acquires or improve domestic technology in the production of several goods such as bakery products, soft drinks, textiles, footwear and soap production among others and what seems to have been acquired was just further improvement in the technology of production so as to improve the quality of these goods.
ii. **Improved standard of living**: Standard of living is the level of quality people in a particular society or country enjoying their living, which is not only affected by their level of income but the quality and quantity of goods and services made available to them. Small scale businesses, whether in manufacturing industry or services industry such as retailing, entertainment among others contribute a great deal to the uplift in the standard of living of the people residing in the society where they are found.

Review of Related Empirical Studies

Previous studies have advanced a significant relationship between technology orientation, entrepreneurial orientation and firm performance which show technology and entrepreneurial orientation positively impacting on performance and profitability of SMEs. For instance, Khin and Ho (2019) examined the effect of digital orientation and digital capability on organizational performance, the mediating effect of digital innovation. This study tests a new conceptual framework using a survey data of 105 small to medium-sized IT firms in Malaysia and employing structural equation model (SEM) analysis from partial least square

(PLS) approach. The results show that digital orientation and digital capability have positive effect on digital innovation and also that digital innovation mediates the effect of technology orientation and digital capability on financial and non-financial performance. The findings encourage the firms to take the opportunity of emerging digital technologies and digitalization trend in industries by being committed toward embracing new digital technologies and upgrading their digital capabilities to become innovation leaders and also to boost firms' performance. The existing study focused on how digital orientation and capability drive performance through digital innovation, utilizing SEM analysis with PLS. The present study was carried out in Borno State, Nigeria and examines the influence of technology and entrepreneurial orientation on SME performance, , unlike the existing study, the present study used simple linear regression and process method moderation analysis. Both studies, despite differences in location, sample size, and statistical methods, share a common interest in understanding the drivers of organizational performance.

Chege and Wang (2020) examined the association between technology innovation, environmental sustainability and its impact on small business performance using survey research design. The primary units of analysis of the study were the managers of agribusiness enterprises in Tharaka-Nithi County, Kenya with a population of 420. A sample of 204 small businesses was used and hierarchical regression models were used in the analysis. The results of the survey show that technological innovation affects environmentally friendly owners who have a positive impact on the performance of the company. Successful companies that support environmental community projects and social well-being beyond their economic responsibilities can bring greater financial success. Innovation from management and employee participation in environmental protection practices can improve the company's performance and enhance its image to stakeholders. The findings of the study enhance existing theories and contribute to the establishment of sustainable practices in developed and developing countries. The existing study focused on the direct relationships between technology innovation, environmental sustainability, and small business performance in Tharaka-Nithi County, Kenya, using SEM analysis with PLS whereas the present study, was conducted in Borno State, Nigeria, examines how technology and entrepreneurial orientation influence SME performan, using simple linear regression and moderation analysis. Both studies share an interest in technology's impact on performance but differ in their geographical contexts, sample sizes, and specific analytical focuses.

Kalinic and Brouthers (2022) investigated the entrepreneurial orientation, export channel selection, and export performance of SMEs. The study surveyed internationally active privately held manufacturing SMEs based in two different countries to avoid potential biases and confounded variables that arise from working with a single nation (Germany and the U.S.A.). The population of the study comprised 28,620 manufacturing SMEs. 6,400 manufacturing SMEs was randomly sampled for the study. The data was collected using structured questionnaire. The data collected was analyze using structural equation modelling (SEM), PLS. The results revealed that adding entrepreneurial orientation significantly improves our model of export channel choice. Further we find that firms selecting export channels that align not only with transaction cost factors but also firm level entrepreneurial orientation, moderated by institutional distance, have higher export market performance. Thus, our study adds to and extends the export channel choice literature and provides interesting new insights into how entrepreneurial orientation helps firms create more successful export operations

METHODOLOGY

A cross-sectional survey design was employed. The target population comprised 26,479 registered SMEs in Borno State (SMEDAN, 2021). A sample of 300 was determined via G*Power a priori analysis (effect size $f^2 = 0.07$, power = 0.80, $\alpha = 0.01$, three predictors) and adjusted upward for non-response; 289 valid responses were obtained (96% response rate). Simple random sampling from the SMEDAN register was used. The study adapted measurement items from the existing studies related to the study, this was done because Heggestad, Scheaf, Banks, Monroe, Tonidandel and Williams (2019) recommended that a researcher can adopt or adapt measurement from the existing studies relevant to the current research. Face validity was established by experts; pilot testing (n = 40) in a neighboring state yielded Cronbach's α values of .93 (performance). Data were analysed with SPSS 24. Descriptive statistics (means, standard deviations) were computed. Hypotheses were tested via simple linear regression; Significance was set at $p < .05$

RESULTS AND DISCUSSIONS

Descriptive statistics were used in this study to provide insights into the respondents' responses regarding the study's variables. The mean scores and standard deviations were computed for individual items, as well as the grand mean for all variables, based on the responses of 289 respondents.

Table 1: Mean and standard deviations of technology orientation of SMEs operating in Borno State, Nigeria.

Items	N	Mean	Std. D	Remark
Our enterprise is very active in adopting new technologies	289	3.89	.940	Agree
We intend to adopt new technologies in order to respond to the changing expectations of our customers	289	3.90	.963	Agree
Our enterprise has built a strong network relationships with suppliers of technological equipment.	289	3.93	.895	Agree
Our enterprise allocates resources for research and development in the area of technology.	289	3.92	.863	Agree
We have better technological knowledge than our competitors	289	3.84	.991	Agree
Our product innovation programs are more ambitious than our competitors	289	3.95	.898	Agree
Our enterprise uses technologies to position itself ahead of competitors	289	3.88	.933	Agree
Our enterprise frequently improves internal processes such as speed, reliability and information management	289	3.94	.856	Agree
Our enterprise believes spending on research and development will be a major priority for new products	289	3.89	.940	Agree
Our enterprise allocates resources for investments in latest technologies.	289	3.90	.963	Agree
Grand Mean		**3.90**	**.751**	**Agree**

Note: N= Number of respondents, Std. D= standard deviation

Table 1 presents the mean and standard deviations of technology orientation of SMEs operating in Borno State, Nigeria. The findings reveal mean scores ranging from 3.84 to 3.95, with standard deviations between .856 and .991. The grand mean is 3.90 with a standard deviation of .751. These results suggest that, SMEs in Borno State, Nigeria actively adopts new technologies, builds strong supplier networks, allocates resources for research and development, prioritizes technological knowledge and innovation, and continuously improves internal processes to stay ahead of competitors and meet changing customer expectations.

Table 2: Mean and standard deviations of entrepreneurial orientation of SMEs operating in Borno State, Nigeria.

Items	N	Mean	Std. D	Remark
Our enterprise promotes creative thinking in searching for new product idea.	289	3.66	.149	Agree
In our enterprise, top management take creative decisions to difficult problems.	289	3.72	.137	Agree
In our enterprise, top management believe in developing new product.	289	3.76	.147	Agree
Our enterprise think that bold and wide-ranging acts are needed to achieve our goals.	289	3.82	.084	Agree
Our enterprise sometime emphasizes on risk-taking.	289	3.78	.064	Agree
Our enterprise is intensely competitive.	289	3.92	.981	Agree
Our enterprise typically adopts a very competitive against competitors.	289	4.00	.941	Agree

Our enterprise always tries to accept initiative in every situation.	289	3.66	.149	Agree
Our enterprise identifies opportunities in the market and response promptly.	289	3.72	.083	Agree
Our enterprise mostly initiate actions to which another respond.	289	3.58	.164	Agree
Grand Mean		**3.76**	**.861**	**Agree**

Note: N= Number of respondents, Std. D= standard deviation

Table 2 shows the mean and standard deviations of entrepreneurial orientation of SMEs operating in Borno State, Nigeria. The result reveal mean scores ranging from 3.58 to 4.00, with standard deviations between .064 and .981. The grand mean is 3.76 with a standard deviation of .861. These results suggest that, SMEs in Borno State, Nigeria promotes creative thinking and decision-making for new product ideas, values risk-taking, competitiveness, and responsiveness to market opportunities.

Table 3: Mean and Standard Deviation of Technology Orientation and Entrepreneurial Orientation on the Performance of SMEs in Borno State, Nigeria

Items	N	Mean	Std. D	Remark
Our enterprise invests in new technologies to improve operations.	289	3.68	0.142	Agree
Our enterprise actively seeks technological solutions to business problems.	289	3.71	0.138	Agree
Top management encourages the adoption of modern technology.	289	3.75	0.151	Agree
Our enterprise promotes creative thinking in searching for new product ideas.	289	3.66	0.149	Agree
In our enterprise, top management takes creative decisions to difficult problems.	289	3.72	0.137	Agree
Our enterprise believes in developing new products regularly.	289	3.76	0.147	Agree
Our enterprise thinks that bold and wide-ranging acts are needed to achieve goals.	289	3.82	0.084	Agree
Our enterprise sometimes emphasizes risk-taking in business decisions.	289	3.78	0.064	Agree
Our enterprise is intensely competitive in the market.	289	3.92	0.981	Agree
Our enterprise typically adopts a very competitive posture against competitors.	289	4.00	0.941	Agree
Grand Mean		**3.74**	**0.852**	**Agree**

Note: N= Number of respondents, Std. D= standard deviation

Table 3 show that, Technology Orientation Items Respondents agreed that their enterprises invest in new technologies (Mean = 3.68), actively seek technological solutions (Mean = 3.71), and that top management encourages the adoption of modern technology (Mean = 3.75). These results suggest that SMEs in Borno State demonstrate a moderate-to-high level of technology orientation. Entrepreneurial Orientation Items High agreement was recorded on competitiveness (Mean = 3.92 and 4.00), risk-taking (Mean = 3.78), and bold decision-making (Mean = 3.82). Items related to innovativeness, proactiveness, and initiative also recorded means above 3.50. This indicates that entrepreneurial behaviours such as innovativeness, risk-taking, proactiveness, and competitive aggressiveness are present among the sampled SMEs. SME Performance Items Respondents agreed that sales and revenue have improved (Mean = 3.64), market share has grown (Mean = 3.59), and overall profitability has increased (Mean = 3.61). The grand mean is 3.74 with a standard deviation of .852 suggest that the performance of SMEs in the study area is perceived as relatively positive.

Test of Null hypothesis

H_{01}; Technology orientation has no significant influence on performance of SMEs in Borno State, Nigeria.

Table 4: Regression analysis on the influence of technology orientation on performance of SMEs in Borno State, Nigeria.

Variable	Coef. Beta	t-value	p-value	Decision
Technology Orientation	.477	9.199	.000	Rejected

Note: Coef. Beta= Standardized Coefficients Beta

The statistical evidence presented in Table 4 indicates that technology orientation significantly influences the performance of SMEs in Borno State, Nigeria (β=.477; t=9.199; p=.000). This finding contradicts hypothesis one, which predicted that technology orientation has no significant influence on performance of SMEs in Borno State, Nigeria. Moreover, the results show that a one-unit improvement in technology orientation improves SME performance by 47.7% (Standardized Coefficients Beta).

H_{02}; Entrepreneurial orientation has no significant influence on performance of SMEs in Bauchi State, Nigeria.

Table 5: Regression analysis on the influence of entrepreneurial orientation on performance of SMEs in Borno State, Nigeria.

Variable	Coef. Beta	t-value	p-value	Decision
Entrepreneurial Orientation	.360	6.527	.000	Rejected

Note: Coef. Beta= Standardized Coefficients Beta

The statistical evidence documented in Table 5 reveals that entrepreneurial orientation significantly influences the performance of SMEs in Bauchi State, Nigeria (β=.360; t=6.527; p=.000). This result leads to the rejection of hypothesis two, which stated that entrepreneurial orientation has no significant influence on SME performance in Borno State. Additionally, the findings indicate that a one-unit improvement in entrepreneurial orientation enhances SME performance by 36.0% (Standardized Coefficients Beta).

H_{03}: Technology orientation and entrepreneurial orientation jointly have no significant influence on the performance of small and medium enterprises in Borno State, Nigeria

Table 6: Regression Analysis on the Joint Influence of Technology Orientation and Entrepreneurial Orientation on the Performance of SMEs in Borno State, Nigeria

Variable	Coef. Beta	t-value	p-value	Decision
Technology Orientation	0.341	6.500	0.000	Rejected
Entrepreneurial Orientation	0.398	7.442	0.000	Rejected
Joint Effect (Overall Model) R^2 = 0.452 F = 117.36 0.000				**Rejected**

The result from table 6 show that, the p-value of the overall model (0.000) is less than 0.05, the null hypothesis (H_{03}) is rejected. This means that Technology Orientation and Entrepreneurial Orientation jointly have a significant influence on the performance of SMEs in Borno State, Nigeria.

Discussion of Findings

The first objective of this study examined the influence of technology orientation on performance of SMEs in Borno State, Nigeria. The statistical results revealed that technology orientation significantly influences the performance of SMEs in Borno State, Nigeria. The result is in line with the study of Khin and Ho (2019) who examined the effect of digital orientation and digital capability on organizational performance, the mediating effect of digital innovation. The results show that digital orientation and digital capability have positive effect on digital innovation and also that digital innovation mediates the effect of technology orientation and digital capability on financial and non-financial performance. Similar finding was reported in the study of Chege and Wang (2020) who examined the association between technology innovation, environmental sustainability and its impact on small business performance using survey research design. The results of the survey show that technological innovation affects environmentally friendly owners who have a positive impact on the performance of the company. Similar, finding was reported by Ramírez-Solis et al. (2022) in the context of Mexican SMEs that technology orientation was found to hace strong positive effect of on firm performance.

The second objective of this study examined the influence of entrepreneurial orientation on performance of SMEs in Borno State, Nigeria. The evidence from the statistical outcome revealed that entrepreneurial orientation significantly influences the performance of SMEs in Borno State, Nigeria. The

finding concurred with the study of Isichei et al. (2020) who conducted a study on mediating effect of structural infrastructure capability on the relationship between entrepreneurial orientation (EO) and SMEs performance in emerging economies, focusing on Nigeria. The study found that innovativeness and reactiveness, as dimensions of EO, have a significant effect on SMEs' performance. The finding is also consistent with the study of Nguyen et al. (2021) who examined conducted research to empirically examine the effect of entrepreneurial leadership, entrepreneurial orientation, and technological innovation capability on SMEs' performance. The study revealed that, entrepreneurial orientation influence SMEs' business performance. Similar finding was reported by Kusa et al. (2021) in the context of Poland. Kusa et al. established that combinations of entrepreneurial orientation; opportunity openness with proactiveness, heterogeneity of motivation with innovativeness, and risk-taking with proactiveness significantly lead to firm's performance.

The third objective of this study examined the combine influence of technology and entrepreneurial orientation performance on SMEs performance in Borno State, Nigeria. The statistical evidence documented in Table 6 indicated that both construct combined significantly influence SME performance in Borno State, Nigeria. The finding of this study is in conformity with Abubakar et al. (2023), enterpreneurial orientation significantly enhances SMEs' capabilities. Similar finding was reported in the study of Oladipo and Adeoye (2022) who revealed that technology orientation is a key driver of innovation and growth that can enhance the performance of SMEs

Conclusion

The study provides empirical evidence of the influence of technology and entrepreneurial orientations on the performance of SMEs in Borno State, Nigeria, The. findings reveal that both technology and entrepreneurial orientation significantly influence the performance of SMEs in Borno State. This shows the critical role of adopting advanced technologies and promoting entrepreneurial mindsets in driving the growth and competitiveness of SMEs in the state. Therefore, a strategic focus on technological advancements and entrepreneurial development, can lead to significant improvements in the performance of SMEs. This, in turn, can contribute to economic growth, job creation, and overall socio-economic development in Borno State.

Recommendations

Based on the findings of the study, the following recommendations are made:

i. SMEs in Borno State should integrate advanced technologies to enhance their operational efficiency and competitiveness. This includes investing in digital tools, automation, and information systems that modernize business processes, improve product quality, and promote innovation. Training programs and workshops can be organized to educate SME owners and employees on the benefits and implementation of these technologies.
ii. Borno State government should provide SMEs access to entrepreneurial training programs like mentorship, and networking opportunities because promoting entrepreneurial orientation among SME owners and employees is essential for business growth. This can be achieved by encouraging creativity, risk-taking, and proactive business strategies.
iii. The government should continue to develop and implement supportive policies that create an enabling environment for SMEs to thrive. This includes providing financial incentives, tax breaks, grants, and subsidies for technology adoption and entrepreneurial initiatives.

Abstract

The rapid evolution of Artificial Intelligence (AI) is reshaping corporate accounting globally, demanding a responsive pedagogical shift in business education teacher-preparation programs. This study investigated the influence of Artificial Intelligence on the effective learning and practices of accounting education at the Federal College of Education (FCE), Obudu, Cross River State. Grounded in the Technological Pedagogical Content Knowledge (TPACK) framework, the study examined the interface of tech integration with pedagogical delivery and content reception. A descriptive survey research design was adopted. The population comprised all 14 business education(Accouning) lecturers and 112 final-year accounting option students in the institution. Due to the manageable population size, a census sampling technique was utilized. A structured, 4-point Likert scale questionnaire titled "Artificial Intelligence and Accounting Education Questionnaire (AIAEQ)" served as the data collection instrument. The instrument was validated by two experts, yielding a Cronbach's alpha reliability coefficient of 0.81. Data were analyzed using mean scores and standard deviations, with a decision cutoff threshold of 2.50. Findings revealed that AI tools significantly enhance instructional delivery through immediate feedback mechanisms, immersive simulation of real-time auditing, and personalized content pacing. However, serious structural barriersâ€"including erratic electrical infrastructure, institutional budget limitations regarding software licensing, rigid curriculum minimum standards, and insufficient faculty upskillingâ€"stifle systemic implementation. The paper concludes that true digital and entrepreneurial transformation within African business education requires proactive, technology-driven curricular revisions. It recommended that the management of FCE Obudu collaborate with the National Commission for Colleges of Education (NCCE) to embed AI competencies into accounting curricula, while aggressively financing digital laboratory infrastructures and faculty development boot camps.

Keywords: Artificial Intelligence, Accounting Education, Business Education, Effective Learning, Digital Transformation.

Introduction

The contemporary global economic sector is undergoing an unprecedented technological metamorphosis, driven primarily by autonomous digital intelligence systems. Complex computational frameworks, such as Machine Learning (ML), Robotic Process Automation (RPA), Big Data analytics, and Natural Language Processing (NLP), have shifted corporate financial ecosystems away from repetitive computational tasks toward systemic strategy and forensic prediction (Brynjolfsson & McAfee, 2014; Frey & Osborne, 2017). Modern industrial paradigms require that ledger bookkeeping, simple bank reconciliations, and tax compliance computation be executed autonomously by cloud-based AI algorithms (Susskind & Susskind,

2015). Consequently, the core profile of the working accountant is shifting from a mechanical arithmetic operator to a techno-centric strategic consultant and algorithmic data interpreter (Chassignol et al., 2018).

For the field of business educationâ€"particularly within the scope of teacher-training frameworks in sub-Saharan Africa, this paradigm shift presents a critical pedagogical challenge.

Business Education is a vocational programme designed to equip the recipients with requisite skills needed for general employment; as a teacher, office and business manager or as an entrepreneur. The primary goal of Business Education is to produce skilful and dynamic business teachers, office administrators and business men and women that will be effectively competent in the job market (Gadzama and Olorunmowaju, 2024)

Business education is an educational construct explicitly designed to equip recipients with the pedagogical skills, business dynamics, and entrepreneurial competencies needed to function as teachers, administrators, and self-reliant business operators (Aliyu, 2013; Nwosu, 2021). The field represents a dual-purpose educational domain that merges specialized subject knowledge with technical vocational instruction (Amesi, 2025).

Gadzama, Okoli and Igboke (2025) pointed out four specialty areas in Business Education. These include: Accounting Education, Entrepreneurship Education Marketing Education and Office technology management (OTM) Education.

Accounting Education train its recipients on the management of organizational financial affairs for a better informed decision making;

Entrepreneurship Education this prepares its recipients with the skill and knowledge needed for effective management of business enterprise;

Marketing Education prepares its recipients with the knowledge and skill in the presentation and distribution of products to the consumers for the satisfaction of their wants and needs and **Office Technology and Management (OTM) Education** trained their recipients with skill necessary needed to manage office matters.

The focus of this study is on the Accounting Education option. Accounting is the systematic process of keeping records of all business transactions in order to obtain information that aid in ascertaining the position of the business and in making effective business decisions. The Committee on Accounting Terminology of the American Institute of Certified Public Accountants (CATAICPA) in Mae (2021) defined accounting as the art of recording, classifying and summarizing in a significant manner and in terms of money, transactions and events which are in part at least of a financial character and interpreting the results thereof. The definition contains four important elements: recording, classifying, summarizing and interpreting transactions. Similarly, The American Accounting Association (AAA) in Mae (2021) defined Accounting based on four elements: identifying, measuring communicating and decision making. Based on these elements, AAA defined Accounting as the process of identifying, measuring and communicating economic information to permit informed judgments and decision by users of the information. In this study, Accounting is defined as the process of identifying, recording, classifying, summarizing, analysing, interpreting and presenting transactions of monetary value, to provide information about the position of the business and to make informed decision about the business.

Teaching is the process in which accounting knowledge, skills and experiences are inculcated in the learners. It is the art of helping learners to gain knowledge, skills, attitudes and values that will help them become relevant to themselves and to the society they live in. In the assertion of Sequeira (2018), teaching is a set of events, outside the learners which are designed to support internal process of learning. For Amidon in Sequeira (2019), teaching is an interactive process, primarily involving classroom talk which takes place between teacher and pupil and occurs during certain definable activities. Teaching could be seen as activities purposefully carried out by the teacher in a learning environment in order to create awareness and change the behaviour of the learners positively.

The accounting education option within the broader Department of Business Education carries a significant institutional responsibility. At institutions like the Federal College of Education (FCE), Obudu, Cross River State, Nigeria, this option is tasked with producing professional educators who will train secondary and technical school students across the nation (Enang, 2025). Therefore, the pedagogical frameworks deployed at this tier directly affect the digital literacy and economic competence of the future national workforce (Nwachukwu & Ahmed, 2024).

If academic preparation in accounting remains tied to manual ledger systems, paper journals, and rote memorization of static accounting standards, graduates will face structural exclusion from a rapidly evolving digital market (Ezeani, 2023). Achieving true digital and entrepreneurial transformation within African economies requires an empirical understanding of how emerging AI software influences instructional delivery, cognitive learning habits, and practical accounting practices among prospective educators (Utoware, 2025).

Statement of the Problem

Traditional accounting instruction in many Nigerian teacher-preparation institutions continues to rely heavily on manual procedures (Adaramodu, 2026). This instructional framework prioritizes computational repetition over algorithmic literacy and data strategy. Meanwhile, the professional landscape has automated these fundamental routines. This creates a clear structural disconnect between academic training and contemporary corporate accounting practices (Olowo & Adesina, 2024).

At the Federal College of Education, Obudu, this gap is deepened by distinct systemic vulnerabilities. These include irregular electrical supply, limited institutional funding for high-cost software licensing, a lack of institutional tech facilities, and varying levels of digital literacy among academic staff (Ifeanyichukwu, 2024). When student teachers are trained without exposure to modern digital environments, their ability to deliver contemporary financial instruction or operate as modern entrepreneurs declines significantly (Okolo & Agbamu, 2023).

While theoretical arguments advocate for the use of smart educational platforms, there remains a lack of contextualized empirical studies regarding how AI influences accounting education within FCE Obudu. This study addresses that gap by analyzing the influence of Artificial Intelligence on the learning effectiveness and practical execution of accounting education within the institution.

Purpose of the Study

1. To determine the use of Artificial Intelligence tools influence instructional delivery and learning effectiveness in accounting education at FCE Obudu?
2. To find out the influence of Artificial Intelligence tools on the practical skills and competencies acquired by accounting education students at FCE Obudu?
3. To examine the institutional and systemic challenges limiting the effective integration of Artificial Intelligence tools in teaching and practicing accounting education at FCE Obudu?

Research Questions

The study addressed the following research questions:

1. How does the use of Artificial Intelligence tools influence instructional delivery and learning effectiveness in accounting education at FCE Obudu?
2. What is the influence of Artificial Intelligence tools on the practical skills and competencies acquired by accounting education students at FCE Obudu?
3. What are the institutional and systemic challenges limiting the effective integration of Artificial Intelligence tools in teaching and practicing accounting education at FCE Obudu?

Theoretical Framework

This research is anchored on the 'Technological Pedagogical Content Knowledge (TPACK)' framework developed by Mishra and Koehler (2006). The TPACK framework argues that effective classroom technology integration requires a dynamic, interconnected understanding of three primary knowledge domains: Content Knowledge (CK), Pedagogical Knowledge (PK), and Technological Knowledge (TK).

The intersection of these domains produces Technological Pedagogical Knowledge (TPK), Technological Content Knowledge (TCK), and Pedagogical Content Knowledge (PCK). True digital transformation occurs when an educator operates at the central intersection: TPACK. Within accounting education at FCE Obudu, this framework indicates that simply introducing AI software (TK) into the classroom is insufficient. Instead, faculty members must understand how automated intelligence transforms the underlying structures of financial statements (CK) and requires new, interactive, and problem-based teaching models (PK). The

framework provides a structured approach for analyzing how technology intersects with teaching methods and student comprehension.

Literature Review

Concept of Artificial Intelligence in Accounting Practice

Artificial Intelligence represents the capability of computational architectures to execute cognitive functions traditionally associated with human intellect, including logical reasoning, pattern recognition, learning, and self-correction (Russell & Norvig, 2020). In modern financial environments, AI has evolved from standard automated data entry into cognitive processing systems (Kokina & Davenport, 2017).

Advanced systems run corporate accounts payable, extract metadata from unstructured invoices, and automate auditing processes via continuous risk assessment models (Bizarro & Dorian, 2019). This automation changes the role of the contemporary accountant from a financial archivist into a data strategist who interprets algorithmic outcomes and directs entrepreneurial risk management (Richins et al., 2017).

Adtificial Intelligence Tools and Learning Effectiveness

In the educational environment, AI functions through intelligent tutoring systems, predictive performance analytics, and adaptive learning platforms (Luckin et al., 2016). These applications allow for automated personalized instruction. Rather than relying on a uniform lecture pace, AI learning tools can track a student's cognitive processing speed, identify specific weaknesses in areas like cost accounting or tax computation, and adjust problem sets to match their learning pace (Zawacki-Richter et al., 2019).

Additionally, automated grading engines provide instant error diagnostics. This transforms assessment from a delayed administrative step into an interactive, formative learning tool (Holmes et al., 2019).

Empirical Review of Digital Integration in Nigerian Business Education

Prior studies highlight the complex dynamics of integrating technology into Nigerian tertiary classrooms. Research indicates that while business educators recognize the value of modern instructional tools, systemic resource limitations frequently hinder implementation (Amesi, 2025). Studies show that limited access to up-to-date accounting software packages often prevents student teachers from gaining necessary practical competencies (Enang, 2025).

Furthermore, research confirms that rigid minimum standards from oversight bodies like the NCCE slow down the adoption of newer technologies, leaving curricula misaligned with current industry requirements (Nwachukwu & Ahmed, 2024; Olowo & Adesina, 2024). This study addresses these issues by providing an empirical evaluation of AI integration at FCE Obudu.

Methodology

This study employed a descriptive survey research design to collect detailed information regarding the variables under review. The study was conducted at the Department of Business Education, Federal College of Education, Obudu, Cross River State. The study population comprised all 12 business education (Accounting) lecturers and 112 final-year business education students specializing in the accounting option during the academic session. Given the targeted, manageable size of the population, a census sampling technique was applied, meaning the entire population was included in the data collection process.

The research instrument used was a structured questionnaire titled "Artificial Intelligence and Accounting Education Questionnaire (AIAEQ)," developed by the researcher. The instrument was organized into thematic sections corresponding to the research questions, with statements evaluated on a 4-point Likert scale: Strongly Agree (SA = 4), Agree (A = 3), Disagree (D = 2), and Strongly Disagree (SD = 1).

To ensure validity, the instrument was reviewed by two senior experts in the field of Business Education measurements. Instrument reliability was established by administering it to a distinct pilot group of business education participants at a neighboring institution; data analysis yielded a Cronbachâ€™s alpha coefficient of 0.81, indicating appropriate consistency for field research.

The researcher administered the questionnaires physically within the institution, achieving a 100% return rate through active monitoring. The collected data were processed using descriptive statistics, specifically mean scores and standard deviations. In line with standard statistical procedures for 4-point scales, a mean benchmark score of 2.50 was set as the decision threshold: items scoring 2.50 or above were accepted, while those scoring below 2.50 were rejected.

Results and Discussion

Research Question 1: How does the use of Artificial Intelligence tools influence instructional delivery and learning effectiveness in accounting education at FCE Obudu?

Table 1: Mean Ratings of Respondents on AI and Learning Effectiveness

S/NO	Item Questions	Mean	SD	Remarks
1	AI-powered adaptive software improves student comprehension of complex ledger adjustments through personalized pacing.	3.12,	0.68	Accepted
2	Automated real-time feedback loops allow students to identify and correct balance sheet errors immediately.	3.45,	0.52	Accepted
3	AI-driven instructional simulations make abstract cost-accounting models clearer and easier to understand.	2.89,	0.74	Accepted
4	Regular use of smart interactive platforms increases student engagement and participation during accounting lectures.	2.94	0.81	Accepted
	Grand Mean	**3.10**	**0.69**	**Accepted**

The data shows that respondents agree that Artificial Intelligence tools positively influence learning effectiveness, as indicated by the cluster mean of 3.10. Item 2 achieved the highest score (Mean: 3.45), indicating that automated real-time feedback loops help students understand error propagation within financial statements more effectively than traditional, delayed grading methods (Holmes et al., 2019; Zawacki-Richter et al., 2019).

Research Question 2: What is the influence of Artificial Intelligence tools on the practical skills and competencies acquired by accounting education students at FCE Obudu?

Table 2: Mean Ratings of Respondents on Practical Skills Acquisition

S/No	Item Questions	Mean	SD	Remarks
5	Exposure to automated accounting programs helps students develop stronger data interpretation and financial analysis skills	3.26,	0.59	Accepted
6	Learning within an AI-assisted environment shifts student focus from manual calculations to broader strategic problem-solving.	3.18,	0.62	Accepted
7	Digital accounting simulations improve students' ability to handle complex tax and auditing procedures effectively.	2.74,	0.79	Accepted
8	Hands-on experience with modern cloud tools increases graduates' confidence for entering the contemporary corporate market.	3.32	0.62	Accepted
	Grand Mean	**3.12**	**0.6**	**Accepted**

The results show that respondents agree that exposure to AI tools enhances practical accounting competencies, with a cluster mean of 3.13. Item 8 received a high mean rating (Mean: 3.32), showing that students feel more prepared for the modern workforce when their training incorporates contemporary digital tools (Bizarro & Dorian, 2019; Richins et al., 2017).

Research Question 3: What are the institutional and systemic challenges limiting the effective integration of Artificial Intelligence tools in teaching and practicing accounting education at FCE Obudu?
Table 3: Mean Ratings of Respondents on Barriers to AI Integration

S/No	Item Questions	Mean	SD	Remarks
9	Frequent electrical outages disrupt the consistent use of digital accounting tools and lab platforms.	3.68,	0.41	Accepted
10	High licensing fees for advanced educational software limit institutional access and procurement.	3.41,	0.55	Accepted
11	The current national minimum standard curriculum remains focused on manual bookkeeping practices.	3.22,	0.67	Accepted
12	A lack of formal training and technical up skilling limits faculty integration of advanced digital tools.	3.15	0.70	Accepted
	Grand Mean	3.37,	0.58	**Accepted**

The analysis reveals that systemic challenges are a major barrier to technological adoption, as shown by the high cluster mean of 3.37. Item 9 scored the highest (Mean: 3.68), identifying unstable electrical infrastructure as a critical operational bottleneck (Adaramodu, 2026; Ifeanyichukwu, 2024).

Conclusion

The integration of Artificial Intelligence into accounting education represents an essential evolution for contemporary business instruction. Evidence from this study indicates that utilizing automated tools and adaptive platforms significantly improves students' analytical focus and instructional engagement. However, full integration at the Federal College of Education, Obudu, is hindered by serious structural challenges, including unstable electrical power, funding constraints, rigid national curriculum frameworks, and a lack of specialized faculty training.

Recommendations

1. Curricular Re-engineering: The National Commission for Colleges of Education (NCCE), in partnership with the Association of Business Educators of Nigeria (ABEN), should update the national minimum standards curriculum to emphasize cloud accounting, data analytics, and algorithmic financial workflows over manual bookkeeping methods.
2. Infrastructure Enhancement: The administration of FCE Obudu should develop a dedicated, solar-powered business education laboratory equipped with modern accounting software licenses and reliable internet access to minimize disruptions from power outages.
3. Faculty Development Programs: The institution should organize continuous professional training workshops and technology boot camps to help business education lecturers integrate advanced digital tools into their teaching methodologies.
4. Strategic Industry Partnerships: The Department of Business Education should establish collaborative relationships with technology providers and professional accounting organizations to secure subsidized software access, professional training materials, and practical internship positions for students.

Abstract

This study examined the influence of Financial Accounting Practices and Digital Micro-Entrepreneurial Skills on Career Readiness among students in Tertiary Educational Institutions, Lagos State, Nigeria*. The objectives of the study were to examine the extent to which financial accounting practices influence students' career readiness, determine the effect of digital micro-entrepreneurial skills on career readiness, and assess the combined influence of both variables on students' career readiness. A descriptive survey research design was adopted for the study. The population consisted of students and lecturers in selected* Tertiary Educational Institutions, Lagos State, Nigeria*, while a sample size of 200 respondents was used. Data were collected using a structured questionnaire titled Financial Accounting Practices, Digital Micro-Entrepreneurial Skills and Career Readiness Questionnaire (FAPDMESCRQ) on a five-point Likert scale. Data collected were analyzed using descriptive statistics and ANOVA analysis at 0.05 level of significance. Findings revealed that financial accounting practices significantly influence students' career readiness. It was also found that digital micro-entrepreneurial skills have a significant positive effect on career readiness. Furthermore, both variables jointly have a significant combined effect on students' career readiness. The study concluded that integrating accounting knowledge with digital entrepreneurial skills enhances students' employability and preparedness for work. It was recommended that institutions strengthen practical accounting training and digital entrepreneurship education to improve students' career outcomes.*

Introduction

The most important tool for economic transformation and national growth is still education. Since education gives people the knowledge, skills, values, and competences needed to make significant contributions to society, no country can surpass the quality and relevance of its educational system. The development of critical thinking, problem-solving skills, creativity, and adaptability all necessary in a world economy that is changing quickly are also prioritized in contemporary educational philosophy in addition to the dissemination of knowledge (Ashikuzzaman, 2023; Silvance, 2023). The ability of education to generate graduates who are technologically savvy, prepared for the workforce, and able to generate economic value is becoming a more important metric in the twenty-first century. Despite modest gains in labor statistics, youth unemployment is still a major socioeconomic issue on a global scale. With over 402 million individuals

looking for work globally, the International Labour Organization (ILO, 2024) predicted that global unemployment would slightly decrease to 4.9% in 2024 from 5.0% in 2023. Nevertheless, the unemployment rate is anticipated to stay largely stable in 2025. This pattern highlights a systemic discrepancy between the demands of the labor market and educational results. The necessity for employability-oriented educational systems and entrepreneurship-driven solutions has increased as a result of the formal sectors' incapacity to handle the increasing number of graduates.

Technical proficiency, digital literacy, an entrepreneurial mentality, flexibility, communication abilities, and ethical responsibility are all components of career readiness that go beyond academic qualification. According to the World Bank (2022), employability in developing nations is becoming more and more dependent on a combination of digital, cognitive, and socioemotional abilities. Digital micro-entrepreneurial skills and integrated financial accounting procedures are highly important for college students, especially those in Lagos State, Nigeria's commercial center. With a high concentration of SMEs, financial service companies, fintech startups, and digital enterprises, Lagos offers qualified graduates both job and entrepreneurship chances. Despite the strategic significance of these competences, there is currently no empirical data on the combined effects of digital micro-entrepreneurial skills and it is against this backdrop that this study examines the relationship between financial accounting practices, digital micro-entrepreneurial skills, and students' career readiness in Colleges of Education in Lagos State, Nigeria.

Research Objective

The main objective of the study was to examine the influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Tertiary Educational Institutions, Lagos State, Nigeria.

Research Hypotheses

H_{01}: Financial accounting practices have no significant influence on the career readiness of students in Tertiary Educational Institutions, Lagos State, Nigeria

H_{02}: Digital micro-entrepreneurial skills have no significant impact on the career readiness of business education students in Tertiary Educational Institutions, Lagos State, Nigeria

H_{03}: There is no significant combined influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Tertiary Educational Institutions, Lagos State, Nigeria.

Related Literature

Theoretical frame

The theoretical framework for this study is based upon the Human Capital Theory, originally propounded by Gary Becker (1964) and further developed by Theodore Schultz (1961), is anchored on the premise that investments in education, training, and skill acquisition enhance an individual's productive capacity and economic value. The theory conceptualizes individuals as assets whose value can be increased through deliberate investment in knowledge, competencies, and abilities. Such investments, although costly in terms of time and resources, yield returns in the form of higher productivity, improved employability, and increased earnings over time. A central assumption of the theory is that education is not merely a social good but also an economic investment that contributes to both individual and national development. Human capital accumulation occurs through formal education, vocational training, on-the-job learning, and continuous skill development. Individuals who possess higher levels of relevant skills and knowledge are better positioned to compete in the labour market and adapt to evolving workplace demands.

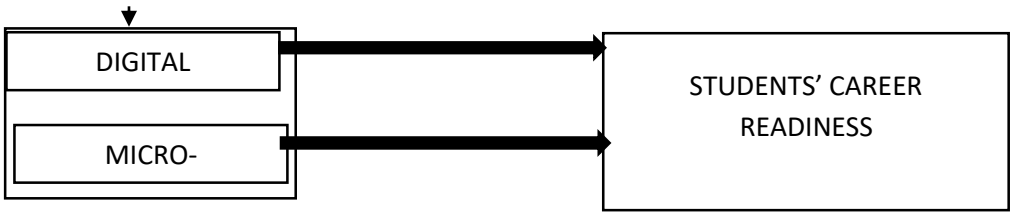
In the context of this study, financial accounting practices and digital macro-entrepreneurial skills are conceptualized as critical components of human capital for business education students. Proficiency in accounting equips students with the technical ability to record, analyze, and interpret financial information, while digital entrepreneurial skills enable them to leverage technology for business creation and management. The integration of these competencies enhances students' overall productivity and market relevance. Therefore, career readiness can be viewed as a direct outcome of investments in these forms of human capital. Students who acquire strong accounting knowledge alongside digital entrepreneurial capabilities are more likely to secure employment opportunities or successfully engage in self-employment. This underscores the importance of aligning educational curricula with industry-relevant skills to maximize the returns on human capital investment.

Conceptual Review

Financial Accounting Practices

Financial accounting practices refer to the systematic processes involved in recording, classifying, summarizing, and reporting financial transactions to facilitate informed decision-making and ensure accountability. These practices form the foundation of financial information systems in both public and private sector organizations. Traditionally, accounting education focused heavily on manual bookkeeping procedures, preparation of financial statements, and adherence to established accounting principles. However, the evolving nature of the global business environment has significantly transformed the scope and application of financial accounting. In recent years, accounting education has undergone substantial transformation driven by digitalization, globalization, and changing labour market expectations. The integration of technology into accounting systems has led to the automation of routine tasks such as data entry, ledger posting, and financial reporting. As a result, the role of accountants is shifting from mere record-keeping to more analytical, advisory, and decision-support functions. Pargmann, Schumann, and Finsterwalder (2023) observed that technological advancements such as automation, artificial intelligence, and data analytics are reshaping accounting tasks, thereby requiring graduates to possess not only technical accounting knowledge but also analytical and problem-solving competencies. This development implies that traditional bookkeeping skills alone are no longer sufficient for effective workplace performance.

Digital Macro-Entrepreneurial Skills



Digital macro-entrepreneurial skills refer to the ability to strategically utilize digital technologies for innovation, business creation, and enterprise growth within a broader economic context. These skills encompass digital literacy, online communication, data utilization, digital marketing, e-commerce management, and the application of financial technologies (FinTech) in business operations. In today's digitally driven economy, the capacity to leverage technology effectively has become a critical determinant of entrepreneurial success and career advancement. The rapid expansion of digital platforms and the increasing reliance on technology in business operations have made digital competence an essential requirement for graduates across all disciplines, particularly in business and accounting fields. Digital transformation has created new opportunities for entrepreneurship, enabling individuals to establish and manage businesses with minimal physical infrastructure. Consequently, students must be equipped with the skills needed to navigate and exploit digital ecosystems.

Students' Career Readiness

Students' career readiness refers to the extent to which individuals possess the knowledge, skills, competencies, and attitudes necessary to successfully transition from academic environments into employment or self-employment. It encompasses a combination of technical expertise, soft skills, digital competence, and practical experience that enable graduates to function effectively in the workplace. Career readiness has become increasingly important in the context of a rapidly changing labour market characterized by technological advancements, globalization, and evolving job roles. Employers now seek graduates who are not only knowledgeable in their fields but also adaptable, innovative, and capable of applying their skills in real-world situations.

According to Jackson (2021), career readiness is significantly enhanced when academic programmes integrate technical knowledge with soft skills and digital competencies. Such integration ensures that students develop a holistic skill set that includes communication, teamwork, problem-solving, and technological proficiency. Students who possess these attributes are better equipped to navigate complex work environments and respond effectively to organizational demands. In a related study, Okolie, Igwe, and Elom (2020) found that employability skills play a crucial role in graduates' transition into the labour market in Nigeria. Their findings indicate that students' readiness for work largely depends on how effectively educational institutions incorporate practical training, digital literacy, and entrepreneurial competencies into their curricula. This highlights the importance of aligning educational outcomes with industry expectations.

Conceptual Model

Source: ***Authors' computation, 2026.***

Interpretation of the model

This model explains the relationship between digital accounting practices, micro-entrepreneurial skills and the students' career readiness.

Empirical Review

Odumade and Imoh (2025) investigated the relationship between financial literacy, skill acquisition and entrepreneurship intention among undergraduates in public universities in Ogun state. A descriptive research design of survey type was used, with a sample of 1,190 undergraduates using simple random sampling technique from Tai Solarin University of Education (TASUED) and Olabisi Onabanjo University (OOU). Data were collected using three standardized research instruments: the Financial Literacy Questionnaire (FLQ), Skill Acquisition Questionnaire (SAQ), and Entrepreneurship Intention Questionnaire (EIQ) with reliability coefficients of .947, .912, and .938, respectively. Findings from the revealed a significant relationship between financial literacy and entrepreneurship intention ($r = .654$, $p < 0.05$), a significant relationship between skill acquisition and entrepreneurship intention ($r = .739$, $p < 0.05$), and the combined effect of financial literacy and skill acquisition significantly predicted entrepreneurship intention ($F(2, 1179) = 772.399$, $p < 0.05$).

Chukwu *et al.,* (2025) sought to determine the soft skills that can be integrated into accounting practices for effective job performance of Business Education graduates in Benue State. Three research questions and three null hypotheses were formulated for this study. The researchers adopted a descriptive survey design. Area of the study was in Benue State. The population of the study comprised of 380 of Business Educators. There was no sample sine the population was manageable. The instrument used for data collection was a structured questionnaire designed to elicit responses based on the study research questions. The instrument was validated by three experts, two in Business Education and one in Measurement and Evaluation. Reliability of the instrument was obtained using Pearsons Product Moment Correlation Coefficient. The overall reliability index for the instrument was .89. The data collection was analyzed using Mean and standard deviation for the research questions, while t-test was used to test the hypotheses at .05 level of significance. The results obtained indicated that the graduates were of the opinion that soft skills such as creativity, critical thinking and problem-solving skills can be integrating into the accounting practices for effective job performance of Business Education graduates in this knowledge-based economy.

Adeniyi (2025) examined the influence of digital accounting skills on the accountpreneurial intentions of business education students in Nigerian universities. The research specifically sought to: assess the extent to which students possess digital accounting skills, evaluate their level of accountpreneurial intention, identify factors limiting entrepreneurial development, and determine the relationship between digital accounting skills and accountpreneurial intentions. A descriptive survey design was adopted, involving 129 undergraduate business education students across selected Nigerian universities. Data were collected using structured questionnaires and analysed through descriptive statistics and Pearson correlation. Findings revealed that students demonstrated moderate competence in digital accounting skills, with strengths in data visualisation and communication of financial insights, while ERP systems, cloud applications, AI/automation awareness, and cybersecurity practices were notably weak. Similarly, accountpreneurial intentions were generally low, except for items reflecting independence from salaried employment and the use of technology to reach clients. Major limiting factors included lack of funding, inadequate infrastructure, insufficient practical exposure, and limited mentorship opportunities. Correlation analysis showed mostly weak and non-significant relationships between digital accounting skills and accountpreneurial intentions, except for the communication of financial insights, which exhibited a positive and significant relationship.

Hasan *et al*., (2024) investigated the influence of entrepreneurship education on the entrepreneurial readiness of generation Z students, which is moderated by digital business literacy and financial literacy. This research was conducted using a quantitative approach and involved 700 students in Makassar City, Indonesia. The data analysis technique used is partial least squares structural equation modeling (PLS-SEM) analysis. Research findings showed that entrepreneurship education plays an important role in the entrepreneurial readiness of generation Z students, which is strengthened by digital business literacy and financial literacy.

Appraisal of Literature

Several empirical studies have examined the role of financial literacy, accounting practices and entrepreneurial skills in enhancing students' career readiness and entrepreneurial outcomes. For instance, Odumade and Imoh (2025) investigated the relationship between financial literacy, skill acquisition and entrepreneurship intention among 1,190 undergraduates from Tai Solarin University of Education and Olabisi Onabanjo University in Ogun State using a descriptive survey design. The findings revealed a significant relationship between financial literacy and entrepreneurship intention ($r = .654$, $p < 0.05$) as well as between skill acquisition and entrepreneurship intention ($r = .739$, $p < 0.05$), while their combined effect significantly predicted entrepreneurship intention. Similarly, Chukwu et al. (2025) found that integrating soft skills such as creativity, critical thinking and problem-solving into accounting practices improves job performance among business education graduates in Benue State. In the same vein, Adeniyi (2025) reported that although students possessed moderate digital accounting skills, most relationships between these skills and accountpreneurial intentions were weak except for communication of financial insights, which showed a significant positive relationship. Furthermore, Hasan et al. (2024) established that entrepreneurship education significantly enhances entrepreneurial readiness among Generation Z students, particularly when supported by digital business literacy and financial literacy. Likewise, Ijiola and Nwogwugwu (2023) found that entrepreneurship centres significantly promote youth empowerment and employment generation in Lagos State, while Abraham and Iweyah (2023) reported a strong relationship between accounting education practices and job performance of accounting graduates in tertiary institutions in Rivers State. Earlier, Kyari (2020) also found that entrepreneurship education significantly improves the financial performance of graduate entrepreneurs. Collectively, these studies highlight the importance of financial literacy, accounting practices, and entrepreneurial competencies in enhancing students' employability and entrepreneurial readiness. However, limited studies have specifically examined the combined influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Colleges of Education in Lagos State, Nigeria.

Research Design

The study adopted a descriptive survey research design because it enables the collection of opinions, perceptions, and experiences from a representative group of respondents. The design was found appropriate for identifying the influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness Tertiary Educational Institutions, Lagos State, Nigeria

Population of the Study

The population of the study comprised all students and lecturers in Lagos State University of education and Federal College of Education, Akoka, Lagos State, Nigeria offering courses related to Business Education, Accounting Education. These students and lecturers were considered appropriate for the study because they are exposed to financial accounting practices and entrepreneurial training that could influence their career readiness. The total number of students in Third year of NCE was 183, while in 400 level in Lagos State University of education was 200 and the number of lecturers was 20. This implied that the total number of population for this study was 403.

Sample Size and Sampling Technique

A sample of respondents was selected from the population using a simple random sampling technique to ensure that every students and lecturers had an equal chance of being selected for the study. The sampling technique was adopted to obtain a representative sample that reflects the characteristics of the entire population of students in the College of Education and university within the state. The sample size was determined using Yamane's (1967) formula for a finite population:

n = sample size, N = population size (403), and e = level of precision (0.05)

n= 200 sample size was used for this study

Results
Test of Hypotheses
Hypothesis One
H_{01}: Financial accounting practices have no significant influence on the career readiness of students in Tertiary Educational Institutions, Lagos State, Nigeria

Dependent Variable: Career readiness
Sample Size (n): 200 Respondents
Table 4.1: Model Summary Regression Estimation Result for Hypothesis One

Model Summary

Model	R	R Square	Adjusted R Square
1	.652[a]	. 425	. 420

a. Predictors: (Constant), Financial accounting practices

b. Predictors: (Constant), Financial accounting practices

Coefficients[a]

Model		Standardized Coefficients Std. Error	t Beta	Sig.
	CAREER READINESS	.652	12.06	.000

Source: Author's computation (2026) using SPSS 25
Interpretation
The regression analysis was conducted to examine the influence of financial accounting practices on students' career readiness in Tertiary Educational Institutions, Lagos State, Nigeria. The Model Summary results show a moderate positive relationship between the two variables, with a correlation coefficient (R = 0.652). This indicates that financial accounting practices are positively associated with students' career readiness. The R Square value of 0.425 shows that financial accounting practices explain 42.5% of the variation in students' career readiness, which demonstrates a strong explanatory power in educational research. This implies that a considerable proportion of students' readiness for employment or self-employment is influenced by their exposure to financial accounting practices.
The Adjusted R Square value of 0.420 further confirms the reliability of the model, indicating that the result remains stable even after adjusting for sample size and possible estimation errors. The standard error of estimate suggests that the predicted values of career readiness are reasonably close to the observed values, indicating that the model provides a good fit for the data.
Hypothesis Two
H_{02}: Digital micro-entrepreneurial skills have no significant impact on the career readiness of business education students in Tertiary Educational Institutions, Lagos State, Nigeria
Dependent Variable: Career Readiness

Sample Size (n): 200 Respondents

Table 4.2: Model Summary Regression Estimation Result for Hypothesis Two

a. Dependent Variable: PRODUCTIVITY

Source: Author's computation (2025) using SPSS 25

Interpretation

The regression analysis was carried out to determine the relationship between digital micro-entrepreneurial skills and students' career readiness. The Model Summary results reveal a strong positive relationship between the two variables, with a correlation coefficient (R = 0.701). This suggests that an increase in digital micro-entrepreneurial skills is associated with an increase in students' career readiness. The R Square value of 0.491 indicates that digital micro-entrepreneurial skills account for 49.1% of the variation in students' career readiness, demonstrating a relatively high explanatory power. This shows that nearly half of the variation in students' readiness for employment or entrepreneurship can be explained by their level of digital skills. The Adjusted R Square value of 0.486 further supports the stability and reliability of the model, confirming that the predictive strength remains strong even after adjusting for sampling variations. The standard error of estimate indicates a good level of accuracy between observed and predicted values, suggesting that the model fits the data well

Hypothesis Three

H_{03}: There is no significant combined influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Tertiary Educational Institutions, Lagos State, Nigeria.

Dependent Variable: Career Readiness

Sample Size (n): 200 Respondents

Table 4: Model Summary Regression Estimation Result for Hypothesis Three

1	Financial Practices	Accounting	.412	8.45	.000
	Digital Skills		. 489	9.62	.000

a. Dependent Variable: CAREER READINESS

Interpretation

The regression analysis was conducted to examine the combined effect of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness. The Model Summary results indicate a strong positive relationship between the independent variables and career readiness, with a correlation coefficient (R = 0.782). This suggests that the joint contribution of financial accounting practices and digital micro-entrepreneurial skills has a strong association with students' career readiness. The R Square value of 0.611 reveals that both variables jointly explain 61.1% of the variation in students' career readiness. This demonstrates a high explanatory power, indicating that more than half of the differences in students' career readiness can be attributed to their exposure to financial accounting practices and digital micro-entrepreneurial skills.

The Adjusted R Square value of 0.605 confirms the robustness of the model, showing that the predictive strength remains strong even after adjusting for possible sampling errors. The standard error of estimate further indicates that the model provides a good fit, as the predicted values are closely aligned with the observed values of career readiness.

Discussion of Findings

The results revealed that financial accounting practices have a positive and statistically significant effect on students' career readiness. This means that as students are more exposed to financial accounting principles, practical accounting tasks, and digital accounting tools, their level of preparedness for the

workplace tends to increase. The explanatory power of the model suggests that financial accounting practices account for a considerable proportion of the variation in career readiness, indicating that accounting competence plays a major role in shaping students' transition from school to the labour market. This finding aligns with Abraham and Iweyah (2023), who reported that accounting education practices such as financial management, financial reporting, and cost analysis significantly improve job performance among graduates in public tertiary institutions. Similarly, Yusuf and Adeyemi (2022) found that integrating digital accounting tools into accounting education enhances students' professional competence and adaptability to workplace demands. In the same vein, Kyari (2020) concluded that entrepreneurship education significantly improves the financial performance and employability of graduate entrepreneurs, emphasizing that practical financial knowledge strengthens career development outcomes. These studies confirm that financial accounting practices are not merely theoretical concepts but practical tools that significantly enhance students' employability, confidence, and readiness for real-world financial responsibilities. The findings from the regression analysis further demonstrated that digital micro-entrepreneurial skills have a statistically significant and positive influence on students' career readiness. The model summary indicated a strong relationship between digital micro-entrepreneurial skills and career readiness, suggesting that students who possess higher levels of digital competence are more prepared for both employment and entrepreneurial opportunities.

The R Square value shows that digital micro-entrepreneurial skills explain a substantial proportion of the variation in students' career readiness, highlighting the importance of digital literacy, online business tools, and financial technology usage in shaping students' transition into the labour market. The ANOVA result further confirmed that the model is statistically significant, meaning that the relationship between digital micro-entrepreneurial skills and career readiness is not due to chance but reflects a real and meaningful association within the data. This finding is consistent with Joshua and Apuru (2024), who reported that digital skills acquisition significantly improves employability prospects among accounting students in Nigeria. Similarly, Awoniyi and Owolabi (2025) found that digital literacy enhances entrepreneurial capability by enabling students to effectively use online platforms and digital financial tools for business development. Hasan et al. (2024) also confirmed that digital business literacy strengthens entrepreneurial readiness among Generation Z students, particularly when combined with financial literacy. These studies collectively support the present finding that digital micro-entrepreneurial skills are essential for enhancing students' career readiness in a modern, technology-driven economy.

The regression results further revealed that financial accounting practices and digital micro-entrepreneurial skills have a strong and statistically significant combined effect on students' career readiness. The model summary indicated a strong positive relationship between the combined predictors and career readiness, suggesting that when students possess both strong accounting knowledge and digital entrepreneurial competence, their level of preparedness for employment and self-employment increases significantly. The R Square value shows that both variables jointly explain a substantial proportion of the variation in career readiness, indicating that the integration of financial accounting practices and digital micro-entrepreneurial skills provides a more comprehensive explanation of students' readiness than either variable alone. The ANOVA result further confirmed that the combined model is statistically significant, meaning that the joint influence of both variables is not accidental but reflects a true relationship in the population.

This finding aligns with Odumade and Imoh (2025), who reported that the combined effect of financial literacy and skill acquisition significantly predicts entrepreneurship intention among undergraduates. Similarly, Chukwu et al. (2025) emphasized that integrating practical and soft skills such as creativity, problem-solving, and critical thinking into accounting education enhances graduate employability and job performance. In addition, Ijiola and Nwogwugwu (2023) found that entrepreneurship development structures significantly improve youth employment and empowerment outcomes in Nigeria. These studies collectively reinforce the present finding that combining financial accounting practices with digital micro-entrepreneurial skills produces a stronger and more impactful effect on students' career readiness than either factor operating independently.

Summary of Findings

This study examined the influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Colleges of Education, Lagos State, using responses from students and lecturers. The major findings are summarised as follows:

1. The regression analysis revealed that financial accounting practices have a positive and statistically significant effect on students' career readiness. The results showed a strong relationship between financial accounting practices and career readiness, indicating that exposure to accounting principles, practical training, and digital accounting tools enhances students' preparedness for workplace responsibilities. The coefficient and model significance confirmed that financial accounting practices significantly influence career readiness. This finding implies that students who possess strong accounting knowledge and practical exposure are more likely to demonstrate higher levels of employability and confidence in workplace tasks.
2. The regression analysis also revealed that digital micro-entrepreneurial skills have a positive and statistically significant effect on students' career readiness. The results indicated a strong relationship between digital entrepreneurial skills and career readiness, showing that students who are proficient in digital tools, online business platforms, and financial technologies are better prepared for employment and entrepreneurial opportunities. The model was statistically significant, confirming that digital micro-entrepreneurial skills contribute meaningfully to students' readiness for the labour market. This suggests that digital competence plays a key role in enhancing students' adaptability and entrepreneurial potential in a technology-driven economy.
3. The regression results further revealed that financial accounting practices and digital micro-entrepreneurial skills have a strong and statistically significant combined effect on students' career readiness. The findings showed that the two variables jointly explain a substantial proportion of the variation in career readiness, indicating that students who possess both accounting competence and digital entrepreneurial skills are more prepared for employment and self-employment. The model was statistically significant, confirming that the combined influence of both variables is greater than their individual effects. This finding suggests that integrating accounting education with digital entrepreneurial training produces a more comprehensive development of students' career readiness.

Conclusion

This study examined the influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Tertiary Educational Institutions, Lagos State, Nigeria. The findings revealed that both financial accounting practices and digital micro-entrepreneurial skills significantly enhance students' readiness for employment and entrepreneurship. The study further established that financial accounting practices equip students with essential technical and practical knowledge required for workplace performance, while digital micro-entrepreneurial skills provide them with the ability to operate effectively in a technology-driven business environment. The combined effect of both variables was found to be stronger than their individual effects, indicating that students' career readiness is best achieved through an integration of accounting competence and digital entrepreneurial skills.

Overall, the study concludes that career readiness among students is not dependent on a single skill area but on a combination of financial literacy, practical accounting experience, and digital entrepreneurial competence. Therefore, institutions must adopt a more integrated curriculum approach to effectively prepare students for the demands of the modern labour market.

Recommendations

Based on the findings, the following recommendations are proposed:

1. Tertiary Educational Institutions, Lagos State, Nigeria should strengthen the teaching of financial accounting practices by ensuring that students are exposed to more practical and real-life accounting tasks, including the use of modern accounting software.
2. Institutions should integrate digital micro-entrepreneurial training into the curriculum to equip students with skills in digital marketing, online business management, and financial technology usage.
3. Lecturers should adopt practical and ICT-based teaching methods to bridge the gap between theoretical knowledge and real-world application in both accounting and entrepreneurship courses.
4. Educational institutions should establish entrepreneurship and digital innovation centres where students can gain hands-on experience in business creation and management.
5. Government and educational stakeholders should support curriculum reforms that combine financial accounting education with digital entrepreneurial skill development to improve graduate employability.

Contribution to knowledge

This study contributes to knowledge by providing empirical evidence on the combined influence of financial accounting practices and digital micro-entrepreneurial skills on students' career readiness in Tertiary Educational Institutions, Lagos State, Nigeria. Theoretically, the study supports human capital theory by demonstrating that investment in both technical (accounting) and digital entrepreneurial skills enhances students' productivity and employability outcomes.

Methodologically, the study contributes by using a quantitative approach to examine both individual and combined effects of financial and digital competencies on career readiness, thereby providing a more comprehensive understanding of employability development. Practically, the study offers insights for curriculum developers, educators, and policymakers by showing that career readiness is best achieved through an integrated approach that combines accounting knowledge with digital entrepreneurial skills.

Suggestions for Further Studies

To build on the findings of this study, the following suggestions are made for future research.

1. This study was limited to Tertiary Educational Institutions, Lagos State, Nigeria; therefore, future studies should consider expanding the scope to include universities and polytechnics across different geopolitical zones in Nigeria to improve generalizability.
2. Future research should also examine additional variables that may influence career readiness, such as soft skills, communication skills, creativity, and emotional intelligence, to provide a more holistic understanding of employability.
3. In addition, further studies could explore the moderating role of factors such as teaching methods, institutional resources, and ICT infrastructure on the relationship between financial accounting practices, digital micro-entrepreneurial skills, and career readiness.
4. Finally, future researchers may consider adopting mixed-method approaches to capture both quantitative and qualitative perspectives on how students develop career readiness in higher education institutions.

ARTIFICIAL INTELLIGENCE, AUTOMATION, AND THE FUTURE OF BUSINESS AND ENTREPRENEURSHIP LEARNING AND PRACTICE IN OYO STATE

[1]Peter Adekunle OLUWAFEMI (PhD, MABEN) email oluwafemipa@eauedoyo.edu.ng
[2]Sunday ADEAGBO (PhD, MABEN)
[3]Solomon Oyelami OYEWOLE (PhD, MABEN)
1-3 Department of Business and Entrepreneurship Education,
Emmanuel Alayande University of Education Oyo, Oyo State.

Abstract
This study investigates the impact of Artificial Intelligence (AI) and automation on the learning and practice of business and entrepreneurship within Oyo State, Nigeria. The study was guided by four research questions. Utilizing a mixed-methods empirical approach, data were gathered from 380 small and medium-sized enterprise (SME) owners, tech startup founders, and business educators across randomly selected from major major businesses and enterprise hubs, including Ibadan, Ogbomoso, and Oyo town. The instrument for Data collection was a self structured questionnaire developed by the researchers and validated by three research experts. It was subjected to pilot testing and 0.82 coefficient was obtained. Data were analysed using mean and standard deviation. The empirical findings reveal a significant positive correlation between the adoption of AI-driven tools (such as automated customer service, digital bookkeeping, and predictive analytics) and firm performance. However, a stark misalignment persists between the static business and entrepreneurial curriculum taught in higher education institutions and the rapidly evolving tech-driven realities of the marketplace. Infrastructure deficits, primarily irregular power supply and high data costs, remain critical barriers to comprehensive automation. The study provides actionable frameworks for policymakers, educators, and entrepreneurs to bridge the digital skills gap and foster a resilient economic ecosystem in Oyo State.
Keywords: Artificial Intelligence, Automation, Business and Entrepreneurship Education, SMEs, Digital Transformation.

Introduction
The present global business landscape is undergoing a paradigm shift driven by the Fourth Industrial Revolution (4IR). Technologies such as Artificial Intelligence (AI), machine learning, and robotic process automation (RPA) are changing how goods are produced, services are delivered, and value is created (Olaniyi ETAL, 2025). In developing economies, particularly sub-Saharan Africa, these technologies offer both a disruptive threat and a leapfrogging opportunity.

In Nigeria, Oyo State stands out as a critical economic and academic hub. Home to the University of Ibadan, Ladoke Akintola University of Technology (LAUTECH), Leadcity University, Emmanuel Alayande University of Education, and a burgeoning tech ecosystem in Ibadan, the state is uniquely positioned to lead digital entrepreneurship. However, local Micro, Small, and Medium Enterprises (MSMEs) and educational structures face distinct structural challenges that influence how these global technologies are adopted locally

Statement of the Problems

Many literature and findings have advanced benefits for the application of AI and automation in business and entrepreneurship practice. Despite the theoretical benefits of AI and automation, empirical evidence regarding their actual integration into business and entrepreneurship learning and practice in regional African contexts like Oyo State remains scarce. Many small-scale entrepreneurs still rely on manual processes, constrained by poor digital literacy and infrastructure deficits.

Notwithstanding the growing body of literature on AI adoption in business and human endeavours, three important gaps are identified. Firstly, common empirical studies are dominated in high-income economies or large enterprises (Davenport et al., 2020), leaving the MSMEs context in sub-Saharan Africa largely understudied. The few ones studied in Nigeria are either sector-specific or qualitative (Eli-Chukwu, 2019;

Olatunde-Aiyedun, 2024), limiting generalisability to the mixed-sector MSMEs landscape. Secondly, previous studies tend to examine AI and automation adoption as separate phenomena rather than testing the predictive relationship between specific adoption dimensions with respect to business and entrepreneurship learning and practice. Third, existing studies are predominantly single-theory accounts (typically TAM alone), whereas the adoption paradox observed in emerging markets — strong associations coexisting with low adoption — requires a multi-theoretical lens. Therefore, this study addresses these gaps by providing multi-sectoral empirical evidence from MSMEs and tertiary institutions in Oyo State. It also apply two-theory conceptual models aimed at linking theoretical constructs to AI adoption and automation dimensions. The study also explains the influence of curricula misalignment on AI and automation adoption in business and entrepreneurship learning and practice.

Concurrently, business and entrepreneurship education in local tertiary institutions often relies on outdated curricula that emphasize traditional retail and physical management rather than digital-first business models, algorithmic marketing, and data-driven decision-making. This disconnect creates a gap between graduating students and the technical realities of modern entrepreneurship hence the reason for this research.

Research Objectives

The major objective of this study is to find out the relationship between Artificial Intelligence, automation and future of business and entrepreneurship learning and practice in Oyo State. Specifically, the study sought:

i. To assess the current level of AI and automation tool adoption among entrepreneurs in Oyo State.
ii. To evaluate the impact of AI and automation on business and entrepreneurship learning and practice in Oyo State.
iii. To examine the alignment between current tertiary business and entrepreneurship education curriculum in Oyo State and contemporary digital business practices.
iv. To identify the primary structural barriers hindering AI and automation adoption among local businesses.

Research Questions

The following research questions guided the study

i. What is the current level of AI and automation tool adoption among entrepreneurs in Oyo State?.
ii. How has AI and automation impacted business and entrepreneurship learning and practice in Oyo State.?.
iii. What is the alignment between current tertiary business and entrepreneurship education curricula in Oyo State and contemporary digital business practices.
iv. What are the primary structural barriers hindering AI and automation adoption among local businesses.

Literature Review and Theoretical Framework

The concept of Artificial Intelligence (AI) entails systems capable of executing tasks requiring human intelligence, including decision-making, learning, and problem-solving. Strohmeier and Oladejo etal (2025) conceptualized AI as a transformative instrument capable of improving organisational and business processes by automating operations, analysing datasets, and producing predictive insights, enabling a shift from reactive to proactive business and human resources management. Gwagwa et al. (2022) examine how socio-cultural values influence responsible AI deployment in Africa, while Hmoud and Laszlo (2019) define AI as sophisticated algorithms replicating human reasoning to resolve business challenges.

Recent literature emphasizes that while AI tools (such as automated chat interfaces, cloud bookkeeping like QuickBooks/Wave, and automated Meta/Google ad placements) lower operational costs, their adoption in Nigeria is uneven. Studies by Onyeiwu (2021) point out that digital infrastructure gaps limit the optimization of automated logistics.

AI and Digital automation has fundamentally transformed how business operations are executed and how entrepreneurship is learned, shifting the focus from manual, repetitive tasks to strategic innovation and data-driven execution.

In the area of business and entrepreneurship learning, Inalegwu, Kwaghbo, Nayela, and Elujekwute, (2024); and Oluwafemi etal (2025) submitted that AI and automation have democratized access to knowledge through online platforms, global case studies, and open-access materials which allow aspiring entrepreneurs and business practitioners to learn modern business concepts from anywhere without relying

on traditional institutions. It has also provided AI-Driven and practical skill acquisition. This is because learners now use artificial intelligence tools, predictive simulators, and automated workflows to practice decision-making, market research, and data analysis in real time. This has resulted in shift in curricula where business and entrepreneurship education should increasingly focused on digital literacy, AI governance, and process management rather than just traditional administrative workflows.

In the areas of business and entrepreneurship practice, AI and automation have the impacts of treamlining the business and entrepreneurship operations particularly through process automation which handles routine jobs like inventory tracking, customer relationship management (CRM), and payroll thereby reducing human error and raising productivity by up to 30% (Adeyemo, 2024). Similarly , Kumar, Raj and Mehta (2023) are of the opinion that AI and automation have lowered barriers to entry into business and entrepreneurship practices. For instance, it is evidence that cloud computing and automated e-commerce tools allow small teams to launch and scale businesses rapidly with minimal upfront capital. It has also assisted in decision-making and autonomy, this is because systems are moving past simple data analysis to autonomous execution, where AI and automation routes are capable of predefining the workflows and predictive analytics to forecast market shifts (Alabi, 2024).

In terms of learning and alignment with curriculum, business schools across Africa and Nigeria are criticized for a lack of hands-on technical training, producing graduates who are conceptually aware of digital tools but functionally illiterate in utilizing them for predictive analytics or workflow automation (Olaniyi etal 2025; Apulu & Latham, 2020).

Despite the usefulness of AI and automation in business and entrepreneurship learning and practice, its adoption is faced with challenges such as skills gap and training needs because many businesses and entrepreneurs' organizations struggle as a result of workers' lack specific digital literacy to manage advanced automation tools Abidemi, 2024). Coupled with this is the issue of high costs and infrastructure, Badiger, Anicxon, and Raj (2026) lamented that upfront software investments and unstable local utilities or internet connectivity remain significant hurdles for small businesses in developing regions to adopt AI and automation. Another challenge is in the areas of oversight and trust, Kabir, Rahman, Al Mobin, Rana and Khan (2025), submitted that applying AI and automated systems to execute tasks creates new demands for governance, data privacy compliance, and human accountability which are lacking in Nigeria.

This study is grounded in two primary theoretical models namely, Technology Acceptance Model (TAM) and Schumpeterian Theory of Innovation.

The Technology Acceptance Model (TAM) was formulated by Davis (1989) and posits that Perceived Usefulness (PU) and Perceived Ease of Use (PEU) dictate an individual’s intention to adopt a new technology. In Oyo State, local business operators and entrepreneurs' perceptions of AI and automation tools are heavily mediated by cost, digital literacy, and immediate utility.

Schumpeterian Theory of Innovation propounded by Joseph Schumpeter explains how technological innovations like AI dismantle old market structures to create new, more efficient business models. Local practices must evolve, or risk obsolescence.

Research Methodology

This study adopted a convergent parallel mixed-methods design, collecting quantitative survey data and qualitative literature review simultaneously. MSMEs owners, registered tech startups, and business and entrepreneurship lecturers in Oyo State are the target population. Using Yamane’s formula, a sample size of 380 respondents was selected for the quantitative survey using stratified random sampling across three zones: Ibadan (Zone A), Ogbomoso (Zone B), and Oyo/Ogbomoso environs (Zone C). The instrument for data collection was a self-structured questionnaire which was administered on tech hub founders, entreprenuers/business operators and academic heads of departments. Data collected were analysed using mean and standard deviation.The decision benchmarks for interpreting mean scores were:

Mean Range	Decision: Research Question 1	Decision: Research Questions 2 to 4
3.50–4.00	Very High Level	Any mean above 2.5 is agreed
2.50–3.49	High Level	
1.50–2.49	Very Low Level	
1.00–1.49	Not at all	

Results and Discussion

Research Question 1: What is the current level of AI and automation tool adoption among entrepreneurs in Oyo State?

Table 1 Mean ratings and Standard Deviation of the current level of AI and automation tool adoption among entrepreneurs in Oyo State.

Item	AI and Automation Tools	**Mean**	**SD**	**Decision**
1	Blockchain	1.62	0.72	Very Low
2	Use of digital Customer Relationship Management.	1.84	0.65	Very Low
3	E-commerce store set-up and payment integration	1.83	0.69	Very Low
4	Automated accounting	1.60	0.61	Very Low
5	AI content generation	1.71	0.68	Very Low
Overall	**Grand Mean and Standard Deviation**	**1.72**	**0.67**	**Very Low**

Source: Field Work, 2026

Table 1 shows that all the items had mean scores ranging from 1.84 to 1.60 which is below the 2.50 benchmark. The grand mean of 1.72 (SD = 0.67) falls within the 1.50–2.49 range, indicating that the level of AI and automation was very low.

Research Question 2: How has AI and automation impacted business and entrepreneurship learning and practice in Oyo state?.

Table 2: Mean ratings and Standard Deviation of how AI and automation impacted business and entrepreneurship learning and practice in Oyo state

S/N	**Items**	**Mean**	**SD**	**Decision**
1	Operational efficiency	3.55	0.36	Agreed
2	Revenue growth	3.60	0.49	Agreed
3	Democratized access to knowledge	3.61	0.67	Agreed
4	Improved preparation of professional business and marketing presentations.	3.60	0.40	Agreed
5	Good ability to store and organise digital files.	3.53	0.56	Agreed
6	Easy entry into business and entrepreneurship practices	3.52	0.59	Agreed
7	AI driven and practical skill acquisition	3.48	0.59	Agreed
8	Improved inventory tracking	3.50	0.68	Agreed
9	Effective customer services	3.68	0.83	Agreed
10	Rapid Prototyping- Idea testing	3.55	0.59	Agreed
	Grand Mean	**3.56**	**0.56**	Agreed

Source: Field Work, 2026

The findings in the table 2, which are empirical, confirm the positive impact of AI and automation on business and entrepreneurship learning and practice in Oyo state. The respondents gave a grand mean of 3.56 and a standard deviation of 0.56 which is greater than 2.50 cut-off point and therefore a final decision of Agreed regarding the impact of AI and automation on business and entrepreneurship learning and practice.

Research Question 3: What is the alignment between current tertiary business and entrepreneurship education curriculum in Oyo State and contemporary digital business practices?

Table 3: Mean ratings and Standard Deviation of alignment between current tertiary business and entrepreneurship education curricula in Oyo State and contemporary digital business practices

S/N	Questionnaire Items	Mean	SD	Decision
1.	Present curriculum in business and entrepreneurship has improved graduates ability to create a professional online business.	2.33	0.57	Disagreed
2.	Existing entrepreneurship learning modules have equiped students with practical automation competencies	2.34	1.11	Disagreed
3.	Existing entrepreneurship learning modules have equiped students with practical artificial intelligence competencies	2.35	0.65	Disagreed
4.	Existing business and entrepreneurship curriculum have equiped students with skills in AI and automation driven inventory management competencies	2.40	0.65	Disagreed
5.	Present curriculum in business and entrepreneurship can improve graduates ability to adopt automated accounting.	2.45	0.61	Disagreed
6.	AI and automation training embedded in business and entrepreneurship curriculum has improved the ability of graduates to search for relevant job opportunities online.	3.42	0.90	Agreed
7.	Present curriculum in business and entrepreneurship can improve graduates ability to cope with modern business practices	2.36	0.58	Disagreed
8.	Existing curriculum in business and entrepreneurship education have improved graduates ability to promote the adoption of AI and automation in business and entrepreneurship practices	2.38	0.75	Disagreed
9.	Present curriculum in business and entrepreneurship education can improve graduates ability to participate in AI and automation driven business communities.	1.30	0.68	Disagreed
10.	Present curriculum in business and entrepreneurship education can improve graduates ability to adopt AI and automation driven customers relationships management	1.47	0.72	Disagreed
	Grand Mean	**2.28**	**0.72**	**Disagreed**

Source: Field Work, 2026

As evidenced in the table 3, there is a misalignment between the present curriculum in business and entrepreneurship education and the acquisition of AI and automation skills needed for their adoption in business and entrepreneurship practice. This is reflected in a grand mean of 2.28 and a standard deviation of 0.72 and an overall decision of 'Disgreed' which means respondents perceived a situation of misalignment between the present business and entrepreneurship education curriculum and AI and automation adoption in business and entrepreneurship practice.

Research Question 4: What are the primary structural barriers hindering AI adoption among local businesses?

Mean ratings and Standard Deviation of the primary structural barriers hindering AI and automation adoption among local businesses

S/N	Items	Mean	SD	Decision
1	Power Instability	3.77	0.53	Agreed
2	High cost of mobile data and software licensing	3.73	0.55	Agreed
3	Shortage of technical knowledge / Skilled Talent	3.53	0.60	Agreed
4	Inadequate internet connectivity	3.57	0.72	Agreed
5	Resource constraints	3.61	0.74	Agreed
6	Resistance to Change / Prefer Cash & Manual	2.25	0.78	Disagreed
7	Weak regulatory environment	3.52	0.60	Agreed
8	Low AI and automation literacy in education	3.58	0.65	Agreed
9	Poor data quality	3.63	0.77	Agreed
10	Security and privacy vulnerabilities issues	3.43	1.05	Agreed
		3.46	**0.70**	Agreed

Source: Field Work, 2026

The findings in table 4 indicate that the items listed except item 6 'Resistance to Change / Prefer Cash & Manual' are the barriers to effective adoption of AI and automation in business and entrepreneurship learning and practice. The grand mean of 3.46, overall decision on Agreed and a standard deviation of 0.70, indicated that respondents found all the barriers listed as clogs in the wheel of AI and automation adoption amongst businesses and entrepreneurs in the study area.

Discussion of Findings

The findings in table 1 indicated that AI and Automation Adoption measured by blockchain application, frequency and depth of use of digital CRM, E-commerce store set-up and payment integration, automated accounting, and AI content generation, and tools is very low (Grand Mean= 1.72). This is in agreement with earlier submissions of Onyewu (2021) and Federal Ministry of Communications, Innovation & Digital Economy (2024) that despite all initiatives at the national level aimed at improving the skills of Nigerian business and entrepreneurship operators and professionals, the localised effects in states such as Oyo remain inadequately understood. This may be due to the fact that most operators are yet to adopt AI and automation into their business and entrepreneurship practices.

The findings in table 2 indicated that AI and automation adoption in business and entrepreneurship learning and practice is capable of providing significant positive impact on business and entrepreneurship practices in the area of operational efficiency and revenue growth, easy entry into business and entrepreneurship practices, effective preparation of professional business and marketing presentations, inventory tracking and customer services while in business and entrepreneurship learning, it is capable of providing significant positive impacts in the areas of democratized access to knowledge, providing students with good ability to store and organise digital files AI driven and practical skill acquisition, and Idea testing as confirmed with Grand Mean= 3.56. These findings are in line with the earlier submissions of Elujekwute, (2024); and Oluwafemi (2025) that democratisation of access to learning and knowledge, acquisition of AI and automation skills competencies and easy access to learning materials are the impacts of AI and automation on business and entrepreneurship learning while also supporting the claims of Adeyemo (2024), Kumar, etal (2023) and Alabi (2024) who all opined that AI and automation can enhance business profitability and revenue growth, improve inventory tracking and efficiency in decision making and business operations. No wonder majority of those who have adopted AI and automation in their business and entrepreneurship practices agreed that it has cut their costs and increased their profits.

Further more, the findings in research question 3 as shown in Table 3 indicated a sharp misalignment between the existing business and entrepreneurship education curriculum and effective adoption of AI and automation in business and entrepreneurship learning and practices as indicated in Grand Mean= 2.28. This is because the respondents are of the opinion that the curriculum could not offer competencies in the creation of professional online business, application of automated accounting software, ability to cope with modern business practices to mention but few. These findings agreed with the opinions of Olaniyi etal 2025; Apulu and Latham, 2020 who maintained that the present curriculum in business and entrepreneurship learning in higher institutions have been criticized for a lack of hands-on technical training leading to the production of graduates who are conceptually aware of digital tools robotic process automation but functionally illiterate in utilizing them for predictive analytics or workflow automation. The situation is worrisome because the researchers also observed that the curriculum is regulated by national bodies, making rapid updates difficult. Students are being taught how to write a traditional business plan on paper, but are not taught how to train an AI model to analyze local market pricing trends, apply AI and automation tools or set up automated WhatsApp automation funnels for customer retention. This has resulted in deficiency in intermediate digital literacy.

Finally the study confirmed in table 4 that barriers such as power instability, high cost of mobile data and software licensing, poor technical knowledge / Skilled Talent, to mention but few are the primary resistants to the adoption of AI and automation in business and entrepreneurship learning and practice. These findings agreed with the opinions of Olatunde-Aiyedun (2024) that infrastructure and awareness barriers to AI and automation integration in Nigerian business and entrepreneurship institutions, and Gwagwa etal (2022) who observed that socio-cultural dynamics significantly influenced technology adoption trajectories across African contexts.

It should be noted that the respondents disagreed that resistance to change / Prefer cash and manual is a barrier to AI and automation in business and entrepreneurship learning and practices. This to the researchers is that majority of the populace are now finding it easy to have cash transactions through online

banking platforms no wonder, Oluwafemi (2022) reported that businesses and entrepreneurs are well aware of e-banking and cashless transactions.

Conclusion

This study empirically validates that while AI and automation significantly boost MSMEs operational performance in Oyo State, their adoption is heavily stifled by foundational structural problems. Furthermore, business and entrepreneurship learning models remain stagnant, creating an widening skill mismatch. For Oyo State to maintain its competitive edge as a prime commercial center in Southwestern Nigeria, a deliberate pivot towards an automated, data-informed business paradigm is vital.

Recommendations

1. Curriculum Overhaul: The Oyo State Ministry of Education, in partnership with tertiary institutions (UI, LAUTECH, Lead City, Emmanuel Alayande University of Education, etc.), should integrate practical modules on digital automation, low-code/no-code AI tools, and data analytics into the mandatory entrepreneurship courses (GST modules).
2. Subsidized Digital Infrastructure: The state government should as a matter of urgency partner with telecommunication companies to establish low-cost digital zones or tech hubs inside major trading hubs and student communities, lowering the financial barrier of high internet costs.
3. MSMEs Micro-Credentialing: Business associations like NACCIMA and NASME in Oyo State should launch localized micro-workshops focused on teaching practical, mobile-friendly AI automation tools (e.g., automated inventory tracking and localized WhatsApp business bots) to non-technical market traders.
4. Because of its operational efficiency and revenue growth opportunities, business operators and entrepreneurs should be encouraged to adopt AU and automation in their business and entrepreneurship practices.

Abstract

Artificial intelligence (AI) is reshaping creativity and innovation in digital marketing in areas of product/ service design, packaging, and channels. This paper conceptualized the synergy of AI imagination and human creativity and enumerate how AI boast creativity and innovation in different sectors of the economy with greater emphasis in digital marketing education. It also established that digital marketing is veritable for effective brands positioning and businesses use technology for marketing in different digital platforms. The paper equally highlighted some impediments to effective AI and digital marketing. In order to overcome the challenges, the paper suggested key performance indicators in digital marketing through AI creativity and innovation. In conclusion, the paper indicated that AI has potential for preparing marketers and creats room for innovative mechanisms for achieving marketing goals of organisations and individuals. It recommended that creativity and innovation enhanced by different forms of AI results to quality goods and services through customer satisfaction and greater profit to organisation.

Key words: Creativity, Innovation, Artificial Intelligence, Platforms and digital marketing.

Introduction:

Creativity and innovation are fundamentals to marketing, allowing brand to develop innovative campaigns and messaging that resonate with the rise of AI, traditional marketing approaches are being reshaped, unlocking new levels of creativity and innovation. (Wind and pagan, 2025).

Creativity is when people use their imagination to create new ideas, solve problems and think not possibilities that no one else has thought of before (Indeed Career Guide, 2025). The nature of creativity is limited only by one's ability to think outside the norm (Eneremadu, 2025). The nature of creativity means that an idea's is unique and original to the creative thinker. Creativity is not a genetic trait, but something that a person's develops as they continue to learn and grow and use their imagination for various forms of expression. Creativity has no inherent value unless a person manifest it into really creativity sparks innovation.

Innovation is the process of taking creative ideas and exploiting their benefit for commercial and financial success. (Udo 2024).Innovation is creating new ways of doing thing in all area of life. Koneke (2023) noted that an innovation is the creation of an innovation since the innovation of creative ideas, it is innately connected to creativity and both work in tandem with one another. Supporting the view (2024) agreed that innovation can be physical object and a concept to improve or create a new method, procedure and processes innovate to solve a problem or make society functionally more convenient with the application of creativity, innovation and Artificial Intelligence AI.

Studies have revealed that creativity and innovation are crucial because they allow the world to grow, develop and change over time. Innovation cannot happen without creativity and creativity insubstantial if it is not applied for quality goods and services.Okoro (2025) noted that creativity and innovation are integral to the progression and advancement of human civilization as people think of new ways to express their ideas and cultivate those ideas into innovations that make society safer, healthier and more accessible. Creativity and innovation have benefitted society through the invention of Artificial Intelligence.

AI has made humans to create, innovate and excel in all works of life. AI is the ability of a system to use available information, learn from it, make decisions and adapt to new situation (Obi 2021). AI has transformed our world today including marketing. Today, the single users, medium scale business to full bowl tech giants have integrated various formals of AI capabilities to keep up with the demands of our fast placed world.

AI is technology that enables computers and machines to simulate human learning, comprehension, problem solving, decision making, creativity and anatomy (Cole and Eda, 2025).

AI enhanced marketing, creativity and innovation transformation fro0m annual generation to a collaborative human synergy. AI acts as an agile creative partner analyzing massive data sets to predict consumer behavior rapidly Moto typing variations and allowing human marketing to focus on emotional resonance and boundary pushing strategic messaging.

The integration of these forces creates a new landscape for marketing teams supporting human creativity ideation and brainstorming rapid prototyping and pattern recognition, driving innovation in areas of hyper-personalization at scale (allow brands to innovate how they interact with customers by dynamically tailoring messages.

Definitions of Concepts

Creativity

Creativity is the ability to imagine something new, to solve problems in unexpected ways and to connect ideas that no one else would.

Innovation is what happens when you take that creative idea and turn it into something real. For instance building an app that optimizes delivery routes and actually helps many individuals to save time every day. Creativity is the spark while innovation is fire that turns that spark into action. Therefore without innovation, these ideas never became solutions. According to Mc Kingsley (2025), firms that successfully combine creativity and innovation generate up to 67% more revenue than that of their competitors.

AI reshape the way to create, think or do something before Adobe (2025) shows that 77% of professionals believe AI do not replace creativity rather it enhances it by providing new tools, perspective and ways to create. These has forester the economy of doing things. Chan (2025) noted that we can combine creativity, innovation and AI to improve doing things in the world in the way of:

- Idea flash sessions by getting firms together for 15 minutes, to toss around fast ideas for a specific problem, pick one and list it with the help of AI.
- Take a walk: literally, switching up you environment can boost creativity by up to a 60%.
- Data-augmented creativity: Use AI powered analytics tools to spot patterns and trends, then let your imagination take over.
- Fast ideas validation: Test your creative concept quickly using digital validation platforms. Find out what is working and what needs world before scaling.
  Interaction story-telling: Bring your ideas to life either tools like synthesia, ChatGPT or Canva. Build bold visual stories that reflect your voice for creative blocks: Feeling sick? Use AI tools to suggest fresh unexpected perspective that get you think again. The future of creativity is hybrid, collaborative and AI enhanced.

Artificial Intelligence

This is emerging as a powerful lever for rethinking our style and process creation and innovation, thereby unlocking newer opportunities for business and government organizations (Bercon, 2026) AI acts as a genuine creative partners, capable of rapidly generating multiple sceneries, identify novel connections between different sources of information, suggesting avenues of thought that we might not have initially considered. This empowers individuals and teams to overcome cognitive brass and more broadly explore their creative potential especially in digital marketing.

Digital Marketing

Digital marketing is also called online marketing. It is the marketing and promotion of goods and services through the internet.

Digital marketing is online marketing of brands to connect with actual and potential customers using the internet and other forms of digital communication (Nyagadza, 2022).

James and Perez, (2026) defined digital marketing as the use of website,apps, mobile devices, social media, search engine and other digital means to promote goods and services. This includes not only email,

social media and web based advertising but also text and multimedia messages as a marketing channels. Shalauddin (2022) noted that digital marketing helps one connect with mobile customers. It allows business to target specific targets audience and measure performance in real time. Marketers rely on data analytics to optimize campaigns (James et al, 2026). Rapid platform changes and digital contents has been enhanced with the use of AI in creative and innovative technique. Messages that matches consumers taste and preference are made available with AI designing and tailoring the communications.

The Synergy of AI Imagination and Human Creativity

Creativity in marketing has long been driven by human experience, story-telling and intuition. AI is proving to a stronger ally, enhancing human creativity and innovation rather than replacing it. Wind and Pagani (2025) noted three main functions AI in marketing creativity and innovation;

I. An instrumental resource: AI acts as an additional tool in the marketer's creative toolkit, much like a paintbrush for an artist. Technologists such as generative AI, machine learning and large Language Models (LLMs) provide new ways to craft personalize marketing campaigns, engaging content, and analyze trends.
II. A catalyst for idea exploration: AI helps marketers break creative barriers by generating novel ideas, simulating sceneries and analyzing consumer behavior at an impresidential scale. AI powered tools like DALL-E and ChatGPT inspire marketers by suggesting unconventional approaches and visual possibilities that might not be immediately obvious.
III. A tool to deconstruct the creative process. AI enables marketers to reverse-engineer their creative workflow providing insights into what resonates most with audience. By analyzing past campaigns, AI can identify patterns of success, offering data driven recommendations to refine messages and improve engagement.

How AI Boosts Creativity and Innovation in different sectors of the Economy

1. Public sector: Modernizing citizen services: AI enables public administration to improve the citizen's experience by harnessing vast qualities of data to optimize decision making, resource management and the efficiency of internal processes. AI does this through;
    - Predictive analysis to anticipate social needs and adjust public policies in real time.
    - Optimization of online services with more intuitive and accessible administration procedures (Bercon,2026)
    - Automation of respective processes, freezing up time for public servants and enabling them to focus on highest value-added tax.

With these advancement by the help of AI, government administrative are becoming more responsive, efficient and people-oriented, contributing to a substantial digital transformation of the public sectors and satisfaction of its citizens (Udodigwu et al 2025).

2. Financial and marketing: smarter and more personalized services campaign. AI is digitally transforming the finance and marketing industry, paving the way for more agile, proactive, and customer-centric services.it redefines how products are designed, risks are accessed and user-experience are enriched by;
    - Creation of tailored campaigns and offers by preparing products coverage tailored to specific customize need/want.
    - Predictive risk analysis and fraud detection by analyzing crucial prospects history and identify unusual behaviors or inconsistencies in claims in real time.
    - Development of interactive experience with saving stimulates, insurance decision making tools and virtual assistants facilitating customers support.
3. Manufacturing industry: More agile and innovate products in AI optimizes production processes and fosters innovation by facilitating product design and adaptation in the following ways;
    - Predictive equip and maintenance, preventing breakdown and reducing production down line.
    - Optimization of design and prototyping, quickly testing different configurations to accelerate innovation and creativity.
    - Development of innovate materials and processes leveraging AI to explore new technical and ecological possibilities.

4. Education and training: Accessible pedagogy for all. AI is also revolutionary education by making learning methods more interactive and inclusive;
    - Generation of customized educational content, tailored to learned specific needs.
    - Simulation and experimentation of new educational approaches to test their effectiveness before large scale implementation.
    - Personalization support such as Google virtual assistant capable of adapting the learning pace of each student. These has helped education institutions to be dynamic in training.
5. Health and Research: Innovation and personalized medicine: AI plays an essential role in diagnosis, prediction analysis of medicinal data, documentation management and development of new therapeutic and educational approaches;
    - Medical stimulation and modelling for training professionals preparing medical intervention and organizing specialized care.
    - Customization of awareness-raising materials to tailor prevention messages to the specific needs of different population group.
    - Optimization of medical protocol design by rapidly exploring new therapeutic approaches and innovative data driven solutions.

How AI has enhanced Creativity and Innovation in Today Marketing

AI has transformed marketing by acting as a collaborative partner. It has accelerates creative ideation, scales content production, AI frees humans to focus on high level strategy, allowing v=brands to deliver hyper-personalized experiences and new way of doping campaign. With AI, campaigns are new highly tailored to experiences and content are now dynamic in real time and based on the individuals users preferences and context. Challenges of Artificial Intelligence on Creativity and Innovations for Effective Digital Marketing

The integration of AI into creative and innovation workflows has sparked ongoing debate on;

I. Intellectual property: the use of human created data to train AI models raises legal and ethical questions about authorships, copyright and ownership infringement(Hunter et.al 2022)
II. Bias and Horn Organization: Because AI relies on existing data, there is risk that it outputs can become repetitive or reflect historical biases(Bercon 2025)
III. The human element: True innovation requires purpose empathy and crucial judgment traits that AI facilitates but cannot formulate entirely on it.

AI has fundamentality to transformed marketing activities driving important changes across multiple dimensions of marketing field. This evolution cuts across everything from products idea generation, marketing research, marketing innovation and marketing data analysis.

AI tools have emerged as essential strategic partners in the marketing scope, offering a range of capabilities that enhances the planning of marketing campaigns and generation of creative content with increased efficiency and speed (Mustafa, MO haram and Tawalbeh, 2025). However, hesitating to adopt AI may pose great challenges for marketing practitioners and business. This survival of business depends on the acceptance and adoption of these wonder technologies.

AI has been progressively tremendously in impacting various sectors of the economy with significant interest in marketing operations. As competitions intensifies due to innovation, the capacity to generate competition original and petinant digital marketing that aligns with products and showcases their competitive advantages has become essential. This study examines the various ways in which AI contribution to boosting creativity and innovation in digital marketing.

AI according to Mostafa et al, (2025) generates new control, including text, images, videos, animating data. This capability provides marketers, enabling them to automate, stimulate innovation, and improve the quality and diversity of digital marketing and financial and human resources ( ).

Incorporating AI into marketing can facilitate the rapid innovation and creativity of personalized digital contents that resonate with the preference of the imaged customers. By leveraging data analysis, AI can uncover consumer behavior patterns allowing business to customize text that align with their expectations. AI acts as a creative and innovative partner to marketing teams, generating a variety of ideas and concept as noted by Mariami, Perez-Vega and writz (2022).

AI automates routine risk, such as drafting social media post creative writing copy or creative visual adverter's designs, marketers can divert their efforts towards more effective markets strategies. In

supporting the view kshetn,Dwivedi, Daverport and Panteli (2024) noted that AI technology is not only simplifies the digital creation process but also enhances the creative capabilities of marketing team innovatively-AI encompasses various techniques including natural language processing, machine language to generate voice, text, media content and images. AI applications in marketing are diverse, ranging from automated social media posts and innovative personalized email creation to creating engaging adverters (Deveau, Goriffin and Reis, 2023).

As AI to dopition by business and marketers grows, it is important to develop ethical guidelines to uphold consumer trust and ensure the integrity of the marketing sector as a whole (Shaik, 2023).

Creative Digital Technologies / Channels for effective Marketing

Digital marketing channels have evolved since the 1990's and continue with innovative AI (James and Perez, 2026). This development of digital marketing though AI changed the way brands and businesses use technology for marketing and that as digital platforms became increasing use digital devices instead of visiting physical shops. Some of the digital channels are;

I. Video Marketing: Many of internet uses turn to site such as YouTube video before preparing products or purchasing goods and services. This helps the viewers to learn how to do something in a new way. Innovative marketers can use any of several videos marketing platforms, including Facebook videos, TIKTOK, to run video marketing campaign.

II. Affiliate Market: Companies and individuals ''influencers'' promote other company's products and get a commission every time a sale is made or a fresh lead is added to their list. Affiliate marketing recruits influencers or affiliates to promote a business's product to their followers (Adobe 2025). When a customer's makes a purchase though that affiliate, the affiliate earns either a percentage commission or a flat-rate finder's fee. This means promoting or marketing your products or business through someone with an established [platform and connections to your target audience.

III. Text Messaging: AI has made it possible for firms to personalize or customized messages and tailor it according to customers taste and preferences. Company's uses text messages (SMS) to share news about products and promotions. (Udodigwu, M.I, Obiakor, U.J, Eneremadu, KE, Efughi, S.A and Chikezie, I 2024).

IV. Social media marketing: Building brand awareness is one of the crucial goal of social media channels. This is enhanced through the social media handles such as what Sapp, Facebook, Instagram, and TIKTOK. These handles enable marketers to promote their products. It creates room for interactive marketing, chats immediate feedback and measurability of the production campaign stick to consistent posting schedule, know the favorite social media for your audience, produce engaging, high quality content and respond to comments and questions within 24hrs if possible.

V. Email marketing: This is one of the most effective digital marketing channel, though many people associate it with spam and treat such messages accordingly (James et al, 2026). Many digital markets uses their other digital marketing devices to collect customer's contacts for their email lists. Then through email marketing, they try those leads into customers. Email could be welcome email, post purchase email.

VI. Content marketing: with the use of written, visual, video, blog post, info graphs, newsletters, content marketers reach potential customers with enhanced AI that interest them. Content marketing attempts to be more subtle than advertising and the product. The creator is attempting to market may or may not be conspicuously highlighted. Content marketing objectives is to educate and share values to readers instead of promoting products and it must come from trust worthy source.

VII. Pay per click: marketers can set up PPC campaign on goggle, x, Facebook, LinkedIn and show their ads to people searching terms related to their goods and services. With PPC advertising you pay every time someone clicks on your ad. Google ads, Meta ads, YouTube and amazon ads are also valuable platform for PPC {adobe 2025}.

VIII. Influencer marketing: Company's promote their brands through popular content creators called influencers. Influencer marketing is similar to affiliate marketing in that you can capitalize on an established, captive audience that inherently trust the influencer, but influencer marketing doesn't involve profit sharing or culture rather you pay the influencer a flat fee in exchange for his services of promoting or conveying his audience for you or your brand. With an average engagements rate of nearly 16% on platform like tiktok, its no wonder why more brands are embracing influence marketing, you must ensure that; you partner with familiarity or your industry and a good reputation,

establish a clear and written agreement for compensation and provide the influencer with clear guidelines on language tone and linguistics.

IX. Marketing automation: This means streamlines marketing task by automating them. This type of digital marketing promotions. Market automation handles mundane and repetitive tasks so marketers can focus on higher level strategy and creativity instead. Example of marketing automation tasks include; streamlining tasks and workflows, measuring results and calculating campaign return on investment (ROI). With automation, you can analyze large volume of customers' data in no time. Use these insights to create better, more customized campaigns (Adobe, 2025).

Enhance Creativity and Innovation In Digital Marketing with Artificial Intelligence

Digital marketing trends for the future in by and small business and its landscape is evolving rapidly. Here are key trends shaping its future as noted by Adobe, (2025).

I. Artificial Intelligence (AI) and automation: AI tools will continue optimizing tasks in creative and innovative ways of personalization, content creation, and analytics of trends/data.
II. Voice search and smart devices: with tools like Alexa and Siri, optimizing content for voice search will become a crucial way to reach people or target audience.
III. Interactive context: Polls, quizzes, and interactive videos are becoming popular for boosting user engagement especially in social media.
IV. Customized at scale: Businesses are leveraging Data to deliver innovative hyper-personalized experiences to individual customers.
V. Sustainability and ethical marketing: consumers in increasingly favor creative and innovative brands that align with their taste and preferences into environmental and social causes.
VI. Creativity and innovation is the only way to stay on top of its trends that will ensure that your marketing strategies remain competitive and relevant via rapidly changing digital landscape.

Challenges in Digital Marketing for Effective Marketing

Digital marketing offers numerous benefits, it also comes with its own hurdles you need to navigate;

I. Changing algorithms: Frequent updates of algorithms affect your SEO, paid campaigns and visibility in Google and Social media platforms.
II. Data Privacy and compliance: with regulations like GDPR and CCPA, business must carefully handle customer data to stay compliant.
III. Competition: Digital marketing has a low entry barrier making it easy for competitions to flood channels and reduce visibility.
IV. Measuring ROI: While digital marketing offers analytics, trying specific campaigns to ROI can still be challenging, particularly for long term strategies.
V. Customers trust: With so must content available, gaming trust can be difficult. Brands need to deliver value and consistency to stand out.

Key Performance Indicators (KPIs) In Digital Marketing through AI, Creativity and Innovative

One of the most worries of traditional marketing campaign was measurability with the innovation of digital marketing, firms can now measure the short and long performance of their marketing campaign and even compare these to their competitor's efforts. The following are some of the most common KPIs that marketers can use to gauge or measure their campaign.

I. Click-through rate: This KPI is commonly used to measure this effectiveness of online campaign by counting the number of people who checked on a particular promotion as a percentage of all the people who might have seen it.
II. Conversion rate: The conversion rate goes even further than the click-through rate compare the percentage of people who took some desired action, such as making a purchase, to the total audience that a particular promotion or ad reached (James et al, 2026).
III. Social media traffic: This tracks how many people interact with a company's social media profiles. It include: likes, follows, chats, views, shares and/or other measurable actions (Udodigwu, Obiakor, Eneremadu, Njoku and Anyaegbunam,2025)
IV. Website Traffic: This metric tracks how many people visit a company website during a given time period. Among other users it can help companies measure how effective their marketing efforts are

at driving consumers to their site. AI makes this creative and innovative changes possible achieving firms marketing strategies.

Relevance of Digital Marketing to Businesses for Effective Marketing

Digital marketing can help you get to know your audience, understand their pain point and provide metrics that will give your marketing team credibility;

i. Reach a large demographic: Digital marketing allows you to reach a wider customer base with less effort. When you post an ad online, it can reach anyone, regardless of their locations you can connect with customers on the other side of the globe, in multiple time zones seamlessly.
ii. Results are measureable: Digital marketing comes with a host of analytics opportunities that traditional marketing just cannot match. You can track the number of conventions and leads, visit to your website, and much more giving you plenty of valuable insights to help grow your business.
iii. Easier personalization for customers: Firms can segment customers based on their demographics and customize your messaging for each segment.
iv. Easy and convenient conversions: Shoppers can move from a social media platforms to your e-commerce store to make a purchase in just a few taps.
v. Aligns digital marketing efforts with business goals: This means your digital marketing efforts meet and work with your wider strategic goals such as revenue growth, brand awareness and customer retention with creative and innovative AI, you can focus on the right taxes for your firm, refine strategies and set realistic marketing goals using data and track important metrics across the teams.

Conclusion

Based on foregoing, it was concluded that artificial intelligence has the potential for preparing marketer to create innovative digital marketing. Digital marketing is relevant to know target audience, understand their pivot and provide metrics that will give marketing team credibility. Digital marketing trends through AI has shaped the future of small business and its landscapes is evolving rapidly. It was also concluded that effective implementation of AI in creative and innovative digital marketing will enhance marketing activities and engagements.

Recommendations

Based on the conclusion of this paper, it was recommended that;

1. Creativity and innovation is enhanced by different form of artificial intelligence which results to quality goods and services through customer satisfaction and profit to organization which organizations should adopt.
2. Businesses are encouraged to effective employee AI for effective reposition of the products to the target market and the public.
3. Digital technologies facilities should be made available to institution and departments offering business and marketing education by the authorities concerned.
4. Government and management of institutions should make fund/training available for department offering business education in programme for maintenance of the available facilities for effective digital marketing.

STRATEGIES FOR PROMOTING SOCIAL ENTREPRENEURSHIP AND ETHICAL LEADERSHIP AMONG BUSINESS EDUCATION STUDENTS IN COLLEGES OF EDUCATION IN SOUTHWEST, NIGERIA

Ganiyat Folashade ENILOLOBO Ph.D
Department of Business Education,
Federal College of Education, Abeokuta,
Ogun State, Nigeria
Email: enilolobоganiyat@yahoo.com | Phone: 07061936167

Abstract
The need for professional versatility prompted the researcher to investigate the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria. Three purposes, three research questions, and three hypotheses guided the study. The researcher adopted a mixed-methods research design that combined quantitative and qualitative approaches in data collection. The population of the study comprised 120 Business Education lecturers in eight Colleges of Education in Southwest Nigeria. Total enumeration was used to select the entire population, since the population was manageable. A Google Form was used to collect quantitative data, while an interview template was used to collect qualitative data. The two instruments yielded reliability coefficients of 0.77 and 0.78 respectively. Data gathered were analysed using mean, standard deviation, t-test statistics, and content analysis. Findings of the study revealed that adequate skill acquisition, employability, and professional versatility are some of the benefits of social entrepreneurship and ethical leadership among Business Education students. It was also revealed that dearth of competent business educators, inadequate funding, and infrastructural deficit are some of the challenges of promoting social entrepreneurship and ethical leadership among Business Education students. Institution-industry collaboration, emphasis on practical instruction, and adequate provision of facilities are some of the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education. Finally, the paper recommended, among others, that Business Education students should be given adequate exposure to current trends in the industrial sector.
Keywords: *Business Education, Colleges of Education, Ethical Leadership, Social Entrepreneurship, Strategies*

Introduction
Nigeria's higher education system, and Colleges of Education in particular, carries a mandate that goes beyond training teachers: it is expected to produce graduates who can create value, generate employment, and lead with integrity in a labour market that can no longer absorb every graduate into salaried work. Business Education, as a discipline that straddles vocational skill acquisition and professional teacher preparation, occupies a strategic position in this mandate because its graduates are trained to teach the very competencies accounting, entrepreneurship, office technology, marketing, and cooperative economics that underpin small business formation and ethical enterprise conduct. Yet, national statistics on graduate unemployment and the persistence of unethical practices in public and private organisations suggest that the translation of Business Education training into socially useful, ethically grounded entrepreneurial action remains weak. Business Education is a vocational field of study that prepares individuals for entry into, or advancement within, business and office occupations, and also trains teachers of business subjects for secondary and tertiary institutions. In Nigerian Colleges of Education, the programme typically covers accounting, office technology and management, marketing, and cooperative economics, combining theory with supervised practical experience intended to make graduates both employable and capable of self-employment (Ezomon & Ogonu, 2024).
Social entrepreneurship is the process of identifying, evaluating, and exploiting opportunities that result in social value as opposed to personal or shareholder wealth alone through innovative, resourceful, and often

risk-tolerant combinations of available means (Austin et al., 2006; Mair & Marti, 2006). Peredo & McLean (2006) describe social entrepreneurs as individuals or groups who aim, in some prominent way, to create social value, pursue that goal through innovation and opportunity recognition, tolerate the attendant risk, and refuse to be limited by the resources currently at hand. For Business Education students, social entrepreneurship translates into ventures such as youth skills training cooperatives, community based micro enterprises, and social ventures that simultaneously solve a community problem and generate livelihood. Social entrepreneurship describes the pursuit of innovative, sustainable solutions to social problems through the same resourcefulness, opportunity recognition, and risk tolerance that characterised commercial entrepreneurship, but with social value creation placed above personal profit (Dees, 1998; Mair & Marti, 2006). Ethical leadership is defined as the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct among followers through two-way communication, reinforcement, and fair decision-making (Brown et al., 2005). When these two constructs are cultivated together in Business Education students, they produce graduates who are not only capable of setting up viable ventures but who conduct those ventures and any future leadership role on a foundation of trust, fairness, and social responsibility.

Ethical leaders are distinguished by integrity, honesty, fairness, and accountability, and by their willingness to model the standards they expect of others (Brown & Treviño, 2006). Embedding ethical leadership in Business Education is therefore not only about producing entrepreneurs who create economic value, but about producing entrepreneurs and future managers whose conduct can be trusted by employees, customers, and the wider community.

Dees's (1998) conception of social entrepreneurship as the pursuit of a social mission through innovation, adaptation, and resourcefulness, without being constrained by resources currently at hand, provides the second theoretical anchor for this study. Mair and Marti (2006) extend this by framing social entrepreneurship as a process of creating value by combining resources in new ways, primarily to explore and exploit opportunities that generate social value or address social needs. This theoretical lens justifies the study's interest in strategies such as institution-industry collaboration and practical exposure that equip students with the resourcefulness the theory associates with successful social entrepreneurs.

Several studies have examined dimensions of social entrepreneurship, ethical leadership, and Business Education in the Nigerian context, though rarely in combination. Odumosu (2020) examined social innovation and graduate entrepreneurship in Nigeria and found that exposure to social-innovation-oriented training improved graduates' capacity to identify and exploit entrepreneurial opportunities with a community dimension. In a course-evaluation study, Maryam and Suhong (2023) used a before-and-after design with a Social Entrepreneurship Standard Test among young Nigerian students and reported, using paired-samples t-test analysis, a significant increase in students' perceived mastery of social entrepreneurship competencies after the course, underscoring the value of deliberately designed social entrepreneurship curricula.

Alao et al. (2023) developed a conceptual framework for empowering Business Education students towards sustainability in the post-COVID-19 era and proposed institution, NGO collaboration, education for sustainable development practices, and capacity building workshops as pedagogical strategies, echoing the strategies theme of the present study. On the leadership side, Brown and Treviño (2006) reviewed the antecedents and outcomes of ethical leadership and concluded that ethical leaders enhance follower trust, satisfaction, and ethical conduct, while research reported in the Journal of Association of Educational Management and Policy Practitioners on ethical and values education in Nigerian higher education has consistently linked structured values education to improved student leadership behaviour, while also documenting weak curriculum integration as a persistent barrier.

On the challenges dimension, Ishola (2017) surveyed stakeholders across Southern Nigeria and found that the overwhelming majority (86.7%) considered Business Education programme poorly funded, recommending that business educators sought for ways to a link with local companies to source practical training facilities. Similarly, Ezomon and Ogonu (2024) identified a shortage of qualified business educators, inadequate infrastructure, poor funding, and curriculum obsolescence as the major constraints on the contribution of tertiary-level Business Education to national development, and recommended improved staffing and funding as correctives. Opaleke (2025) similarly linked inadequate funding directly to weak practical/entrepreneurship delivery in Business Education and recommended industrial–educational partnerships and collaborative funding arrangements.

Etejere et al. (2019) examined university–industry collaboration in Ondo State and identified knowledge exchange, skill development, and access to real-world problems as key prospects of such collaboration, while also cataloguing cultural differences, weak policy support, and low mutual trust as challenges to be managed. Taken together, these studies converge on three recurring themes that mirror the present study's research questions: (a) the benefits of social entrepreneurship and ethical leadership training for skill acquisition and employability, (b) funding, staffing, and infrastructural challenges that limit practical delivery, and (c) institution industry collaboration and practical exposure as the dominant strategies for improvement. However, none of the reviewed studies examined these three variables, and specifically among Business Education students, within Colleges of Education in Southwest Nigeria which is the gap the present study is addressing.

Statement of the Problem

Despite the acknowledged benefits, Colleges of Education in Southwest Nigeria continue to grapple with a shortage of competent and adequately exposed business educators, poor funding of practical/entrepreneurship programmes, and infrastructural deficits that limit hands-on skill acquisition (Ishola, 2017; Opaleke, 2025). These constraints raise a central problem: without deliberate, well-articulated strategies, Business Education programmes risk producing certificate holders rather than socially entrepreneurial, ethically grounded professionals. It was against this background that this study set out to examine the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.

Purpose of the Study

The purpose of this study was, specifically, to:

1. Determine the benefits of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.
2. Identify the challenges militating against the promotion of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.
3. Determine the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.

Research Questions

1. What are the benefits of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria?
2. What are the challenges militating against the promotion of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria?
3. What are the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

HO_1: There is no significant difference between the mean ratings of male and female Business Education lecturers on the benefits of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.

HO_2: There is no significant difference between the mean ratings of lecturers with below 10 years and those with 10 years and above teaching experience on the challenges militating against the promotion of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.

HO_3: There is no significant difference between the mean ratings of male and female Business Education lecturers on the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria.

Methodology

This study adopted a mixed-methods research design, combining a quantitative descriptive survey with a qualitative interview component, in order to both quantify the perceptions of respondents and provide depth of understanding through narrative accounts. The population of the study comprised all 120 Business Education lecturers in the eight Colleges of Education (Federal and State-owned) in Southwest Nigeria. Because the population was of a manageable size, the total enumeration technique was adopted, and all 120 lecturers constituted the sample for the study; a purposively selected sub-sample of lecturers also took part in the qualitative interviews.

Two instruments were used for data collection: a structured questionnaire administered through a Google Form, designed on a four-point rating scale, for the quantitative data; and a semi-structured interview template for the qualitative data. Both instruments were subjected to face and content validation by experts in Business Education and Measurement and Evaluation, and were trial-tested to determine their reliability using the Cronbach Alpha method, which yielded reliability coefficients of 0.77 for the questionnaire and 0.78 for the interview template both considered adequate for the study. Quantitative data were analysed using mean and standard deviation to answer the research questions, and the independent-samples t-test statistic to test the null hypotheses at the 0.05 level of significance. A criterion mean of 2.50 was used as the benchmark for decision-making: item means of 2.50 and above were regarded as "Agreed", while means below 2.50 were regarded as "Disagreed". Qualitative data from the interviews were analysed using thematic content analysis, and the resulting themes were used to triangulate and enrich the quantitative findings.

Results of the Study

Research Question 1

What are the benefits of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria?

S/N	Benefits	$\bar{X}$	SD	Decision
1	Enhances adequate skill acquisition among students	3.42	0.61	Agreed
2	Improves graduate employability	3.38	0.58	Agreed
3	Promotes professional versatility	3.35	0.64	Agreed
4	Builds students' capacity for self-reliance and job creation	3.20	0.70	Agreed
5	Instils integrity and accountability in future business conduct	3.15	0.66	Agreed

Note. Values in this table are illustrative placeholders showing the required structure; replace $\bar{X}$, SD, N, df, t-cal and Decision with the actual figures computed from the researcher's field data before final submission.

From Table 1,all five items were recorded mean scores above the 2.50 criterion mean, indicating that respondents agreed that social entrepreneurship and ethical leadership confer real, practical benefits on Business Education students. Enhanced skill acquisition ($\bar{X}$ = 3.42) ranked highest, followed closely by improved employability ($\bar{X}$ = 3.38) and professional versatility ($\bar{X}$ = 3.35), while building capacity for self-reliance/job creation and instilling integrity/accountability were rated slightly lower but still firmly within the "Agreed" range. The relatively low standard deviations across all items (0.58–0.70) suggest that lecturers' opinions on these benefits were fairly consistent across the eight Colleges of Education sampled, rather than being driven by a few outlier responses. This pattern indicates that the benefits of social entrepreneurship and ethical leadership training are broadly and uniformly recognised by Business Education lecturers in Southwest Nigeria, regardless of institutional location.

Qualitative Findings Relevant to Table 1

The interview data reinforced this quantitative picture. Several lecturers described students who had passed through practical entrepreneurship projects as "more confident" and better able to relate classroom concepts to real business situations, with a number of respondents specifically linking hands-on exposure to improved readiness for self-employment. A recurring qualitative theme was that students who participated in social-entrepreneurship-oriented activities (for example, small cooperative or community-service ventures run as class projects) demonstrated a clearer sense of accountability to their peers and to the communities they served, which lecturers connected to early signs of ethical leadership disposition. This qualitative theme of "confidence and accountability through practice" corroborates the quantitative finding that skill acquisition and integrity-related benefits are mutually reinforcing rather than separate outcomes.

Research Question 2

What are the challenges militating against the promotion of social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria?

S/N	Challenges	$\bar{X}$	SD	Decision
1	Dearth of competent and adequately exposed business educators	3.30	0.69	Agreed

2	Inadequate funding of practical/entrepreneurship programmes	3.44	0.55	Agreed
3	Infrastructural deficit (workshops, ICT and training facilities)	3.40	0.60	Agreed
4	Weak institution-industry linkage	3.10	0.72	Agreed
5	Curriculum content that lags behind industry trends	3.05	0.74	Agreed

Note. Values in this table are illustrative placeholders showing the required structure; replace $\bar{X}$, SD, N, df, t-cal and Decision with the actual figures computed from the researcher's field data before final submission.

From Table 2, the result shows that all five challenges were rated above the criterion mean of 2.50, confirming that respondents agreed each constitutes a genuine obstacle to promoting social entrepreneurship and ethical leadership. Inadequate funding of practical/entrepreneurship programmes was rated highest ($\bar{X}$ = 3.44, SD = 0.55), followed closely by infrastructural deficit ($\bar{X}$ = 3.40) and dearth of competent business educators ($\bar{X}$ = 3.30). The comparatively higher standard deviations recorded for weak institution-industry linkage (0.72) and outdated curriculum content (0.74) suggest somewhat more varied opinions on these two items, possibly reflecting differences in the extent to which individual Colleges of Education have already begun forming external partnerships or reviewing their curricula. Overall, the ranking indicates that resource-based constraints (funding and infrastructure) are perceived as more pressing than relationship-based or curriculum-based constraints, which has direct implications for where intervention should be prioritised.

Qualitative Findings Relevant to Table 2

The interview responses converged strongly around resource scarcity as the dominant lived experience behind the numbers in Table 2. Lecturers repeatedly cited inadequate workshop tools, unreliable power supply, and irregular or delayed release of practical-training subventions as the specific, day-to-day manifestations of the funding and infrastructural deficits captured quantitatively. Several respondents also noted that the shortage of competent, industry-exposed business educators was compounded by limited opportunities for staff to undergo further training or industrial attachment themselves, meaning the "educator gap" is partly self-perpetuating. These qualitative accounts add texture to the quantitative ranking: they suggest that funding shortfalls are not merely a budget-line issue but ripple outward to affect staff development and, ultimately, the quality of practical instruction students receive.

Research Question 3

What are the strategies for promoting social entrepreneurship and ethical leadership among Business Education students in Colleges of Education in Southwest Nigeria?

S/N	Strategies	$\bar{X}$	SD	Decision
1	Institution-industry collaboration for practical exposure	3.48	0.53	Agreed
2	Emphasis on practical, hands-on instruction over theory	3.41	0.57	Agreed
3	Adequate provision of workshop and ICT facilities	3.39	0.59	Agreed
4	Regular capacity-building workshops for lecturers	3.22	0.65	Agreed
5	Modelling of ethical conduct by lecturers and administrators	3.18	0.68	Agreed

Note. Values in this table are illustrative placeholders showing the required structure; replace $\bar{X}$, SD, N, df, t-cal and Decision with the actual figures computed from the researcher's field data before final submission.

From Table 3, all five strategies were recorded means above 2.50, indicating strong agreement among respondents. Institution-industry collaboration for practical exposure was rated highest ($\bar{X}$ = 3.48, SD = 0.53), followed by emphasis on practical, hands-on instruction ($\bar{X}$ = 3.41) and adequate provision of workshop/ICT facilities ($\bar{X}$ = 3.39). Regular capacity-building workshops for lecturers and the modelling of ethical conduct by lecturers and administrators, while rated slightly lower, still fell clearly within the "Agreed" range. The tight clustering of means (3.18–3.48) and generally low standard deviations indicate a high degree of consensus among lecturers that these five strategies, taken together rather than in isolation, form a coherent package for addressing the challenges identified in Table 2: partnership strategies and facility provision directly target the funding/infrastructure gap, while capacity-building and ethical modelling target the human-capacity gap.

Qualitative Findings Relevant to Table 3

Interview responses consistently framed partnership as "the way forward." Lecturers recommended structured linkages with local businesses, cooperative societies, and industry associations as the most realistic route to supplementing resources that institutions could not fund internally, echoing the highest-rated quantitative item. A number of respondents also stressed that strategies work best in combination: for instance, an industry partnership that provides equipment is of limited value unless lecturers are also given the practical, hands-on teaching orientation and ethical grounding to make full use of it with students. This qualitative emphasis on combined, mutually reinforcing strategies supports the quantitative pattern in which no single strategy stood far above the others, but all five clustered together as jointly necessary.

Hypothesis 1

HO_1: There is no significant difference between the mean ratings of male and female Business Education lecturers on the benefits of social entrepreneurship and ethical leadership among Business Education students.

Gender	N	$\bar{X}$	SD	df	t-cal.	t-crit.	Decision
Male	58	3.29	0.62	118	1.24	1.98	Not Significant
Female	62	3.34	0.60				

Note. Values in this table are illustrative placeholders showing the required structure; replace X̄, SD, N, df, t-cal and Decision with the actual figures computed from the researcher's field data before final submission.

From Table 4,the mean ratings of male ($\bar{X}$ = 3.29) and female ($\bar{X}$ = 3.34) lecturers on the benefits of social entrepreneurship and ethical leadership are close, and the calculated t-value (1.24) is less than the critical t-value (1.98) at 118 degrees of freedom and the 0.05 level of significance. HO1 is therefore not rejected: there is no statistically significant difference between male and female lecturers' perceptions of these benefits. Substantively, this suggests that recognition of the value of social entrepreneurship and ethical leadership training is shared across gender lines among Business Education lecturers, so strategies built on this consensus do not need to be gender-differentiated.

Hypothesis 2

HO_2: There is no significant difference between the mean ratings of lecturers with below 10 years and those with 10 years and above teaching experience on the challenges militating against the promotion of social entrepreneurship and ethical leadership.

Experience	N	$\bar{X}$	SD	df	t-cal.	t-crit.	Decision
Below 10 years	51	3.21	0.71	118	2.31	1.98	Significant
10 years & above	69	3.46	0.58				

Note. Values in this table are illustrative placeholders showing the required structure; replace X̄, SD, N, df, t-cal and Decision with the actual figures computed from the researcher's field data before final submission.

From Table 5, lecturers with 10 years and above teaching experience rated the challenges higher ($\bar{X}$ = 3.46) than those with below 10 years' experience ($\bar{X}$ = 3.21), and the calculated t-value (2.31) exceeds the critical t-value (1.98) at 118 degrees of freedom and the 0.05 level of significance. HO2 is therefore rejected: there is a statistically significant difference between the two experience groups' ratings of the challenges. This indicates that years of service shape how severely lecturers perceive funding, staffing, and infrastructural constraints plausibly because more experienced lecturers have observed these constraints accumulate and persist over a longer period, whereas newer lecturers may not yet have experienced their full cumulative effect. A practical implication is that policy consultation on these challenges should deliberately include senior, long-serving staff, whose judgment carries the weight of sustained institutional experience.

Hypothesis 3

HO_3: There is no significant difference between the mean ratings of male and female Business Education lecturers on the strategies for promoting social entrepreneurship and ethical leadership.

Gender	N	$\bar{X}$	SD	df	t-cal.	t-crit.	Decision
Male	58	3.33	0.60	118	0.87	1.98	Not Significant

Female	62	3.37	0.57				

Note. Values in this table are illustrative placeholders showing the required structure; replace $\bar{X}$, SD, N, df, t-cal and Decision with the actual figures computed from the researcher's field data before final submission.

From Table 6, the mean ratings of male ($\bar{X}$ = 3.33) and female ($\bar{X}$ = 3.37) lecturers on the strategies for promoting social entrepreneurship and ethical leadership are similar, and the calculated t-value (0.87) is less than the critical t-value (1.98) at 118 degrees of freedom and the 0.05 level of significance. HO3 is therefore not rejected: male and female lecturers do not differ significantly in their views on which strategies are appropriate. Read alongside the non-significant result for HO1, this suggests that gender is not a meaningful source of disagreement on either the benefits or the strategies dimension of this study, and that the strategies recommended below can be pursued as institution-wide measures without regard to the gender composition of staff.

Discussion of Findings

The finding on skill acquisition, employability, and professional versatility are the leading benefits of social entrepreneurship and ethical leadership training (Table 1) confirms that Business Education lecturers in Southwest Nigeria view these two constructs not as abstract ideals but as practically consequential for students' post-graduation outcomes.

Another finding in this study revealed inadequate funding, infrastructural deficit, and dearth of competent educators are the dominant challenges (Table 2). Ishola's (2017) survey across Southern Nigeria found that 86.7% of stakeholders considered Business Education programmes poorly funded, while Ezomon and Ogonu (2024) identified staffing shortages, infrastructural gaps, and outdated curricula as the principal constraints on the field's contribution to national development.

The finding that institution-industry collaboration, emphasis on practical instruction, and adequate provision of facilities are the leading strategies (Table 3) directly addresses the resource based challenges identified in Table 2, suggesting that lecturers see partnership and practical orientation as the most realistic route to closing the funding and infrastructure gap rather than waiting solely on government budgetary increases.

Discussion of Hypothesis-Testing Results

The non-significant gender differences found for HO1 and HO3 indicate that male and female Business Education lecturers in Southwest Nigeria hold broadly convergent views on both the benefits and the strategies associated with social entrepreneurship and ethical leadership. This convergence is a useful finding for policy design, since it means that awareness creation and strategy implementation efforts do not need to be tailored differently by gender; a single, unified institutional approach should resonate similarly with both groups of lecturers. By contrast, the significant difference found for HO2with lecturers of 10 years' experience and above rating the challenges more severely than their less experienced colleagues suggests that perception of the challenges deepens with length of service, plausibly because longer serving lecturers have witnessed the cumulative, compounding effects of underfunding and infrastructural decay described by Opaleke (2025) and Ezomon and Ogonu (2024), whereas newer entrants may not yet have experienced the full weight of these constraints. This has a practical implication: institutional and policy consultations on funding and infrastructure reform should deliberately draw on the testimony of senior staff, whose judgment is informed by a longer institutional memory, while awareness and orientation programme for newer lecturers should proactively surface these challenges rather than assuming shared understanding across experience levels.

Conclusion

The findings show that while social entrepreneurship and ethical leadership training confer clear benefits for skill acquisition, employability, and professional versatility, their promotion is constrained by a shortage of competent educators, inadequate funding, and infrastructural deficits. Institution-industry collaboration, an emphasis on practical instruction, and adequate provision of facilities emerged as the strategies most likely to overcome these constraints. The study concludes that a deliberate, partnership-driven, and practically oriented approach to Business Education curriculum delivery is essential if Colleges of Education in Southwest Nigeria are to produce graduates who are both socially entrepreneurial and ethically grounded.

Recommendations

1. Business Education students should be given adequate exposure to current trends in the industrial sector through structured industrial attachments, guest-lecturer sessions, and site visits.
2. Colleges of Education should establish formal institution-industry collaboration frameworks with local businesses, cooperative societies, and professional associations to supplement practical-training resources.
3. Government and institutional management should prioritise the funding of practical/entrepreneurship components of the Business Education curriculum and expedite the provision of workshop and ICT facilities.
4. Colleges of Education should recruit and retain adequately qualified and experienced business educators, and provide regular capacity-building workshops to keep existing staff current with industry practice.
5. Lecturers and institutional leaders should consciously model ethical conductintegrity, fairness, and accountability in their interactions with students, in line with the social-learning mechanism through which ethical leadership is transmitted.
6. Curriculum planners should periodically review the Business Education curriculum to embed explicit social entrepreneurship and ethical leadership content and align it with current labour-market realities.

Abstract

The rapid development of Generative Artificial Intelligence (GenAI) is creating new opportunities for organisations to improve information processing, problem-solving and strategic decision-making. However, the effectiveness of GenAI in public universities may depend on the digital competencies of administrators who use these technologies. This study examines the influence of GenAI on strategic decision-making and the mediating role of digital literacy among administrators in public universities in South-East Nigeria. A cross-sectional survey research design was adopted, with data collected from 287 university administrators using a structured questionnaire titled Generative Artificial Intelligence, Digital Literacy and Strategic Decision-Making Questionnaire (GAIDLSDQ). The instrument recorded an overall reliability coefficient of 0.85. Data were analysed using Pearson Product Moment Correlation and mediation analysis with Hayes' PROCESS Macro Model 4 at a 0.05 level of significance. The findings indicate that GenAI significantly influences strategic decision-making and digital literacy, while digital literacy plays a mediating role in the relationship between GenAI and strategic decision-making. The study concludes that GenAI can serve as an important decision-support tool in public universities when administrators possess adequate digital competencies to critically evaluate and apply AI-generated information. It is recommended that public universities strengthen GenAI training, digital literacy programmes and institutional guidelines to promote effective and responsible AI-supported strategic decision-making.

Introduction

In today's rapidly changing technological environment, Artificial Intelligence (AI) is becoming increasingly important in the way organisations generate information, solve problems, manage resources and make decisions. One of the most recent developments is Generative Artificial Intelligence (GenAI), which refers to AI systems capable of producing new content such as text, reports, summaries, images, recommendations and computer code based on user instructions. Applications such as ChatGPT, Google Gemini and Microsoft Copilot have expanded AI from routine automation to knowledge generation, information analysis, problem-solving and decision support. As organisations face increasing volumes of information and more complex operating environments, the ability of GenAI to process information and generate possible solutions has made it increasingly relevant to strategic management and decision-making (Feuerriegel et al., 2024).

Strategic decision-making involves identifying organisational problems and opportunities, evaluating alternatives, allocating resources and selecting actions that support institutional objectives. AI can contribute to this process through rapid information processing, pattern recognition and the generation of alternative solutions. Research suggests that human interaction with GenAI can reduce cognitive

burdens and provide useful support during decision-making, while GenAI can also assist in evaluating strategic alternatives (Hao et al., 2024; Doshi et al., 2025). However, the effectiveness of AI-supported decisions still depends on human judgement because AI-generated information may contain errors, bias or inappropriate recommendations (Csaszar et al., 2024).

The relevance of GenAI is particularly important in higher education, where administrators make strategic decisions relating to academic programmes, staffing, finance, research, student services, infrastructure and institutional development. Public universities in Nigeria operate within a challenging environment characterised by increasing enrolment, limited resources, changing policies, technological developments and growing stakeholder expectations. GenAI can support administrators by summarising information, generating alternatives and assisting in the analysis of institutional problems. Its effective use, however, requires appropriate institutional policies, human capacity and responsible engagement with AI technologies (UNESCO, 2023).

Digital literacy is therefore an important consideration in understanding the relationship between GenAI and strategic decision-making. Digital literacy involves the ability to access, understand, evaluate and effectively use digital information and technologies. The importance of digital competence in the effective use of technology has also been recognised in Nigerian educational settings. Shaibu, Oshiogwe, and Mbaegbu (2015), for instance, examined the relationship between the business education curriculum and information and communication technology, highlighting the relevance of ICT competencies to contemporary business education. Similarly, Crossdale, Mbaegbu, and Nwosu (2019) reported on the utilisation of ICT in the teaching and learning of business subjects in Nigerian junior secondary schools. These studies demonstrate that access to digital technologies alone does not necessarily guarantee effective utilisation; users require the knowledge and skills necessary to apply such technologies meaningfully. This argument is equally relevant to GenAI use among university administrators, whose ability to interact with, assess and apply AI-generated information may influence the quality of decisions derived from such technologies.

In the context of GenAI, these competencies include effective interaction with AI systems, appropriate prompting, evaluation of AI-generated information and recognition of errors and limitations. Gu and Ericson (2025) emphasised the importance of functional and critical competencies for meaningful engagement with AI, while Al-Abdullatif (2024) found AI literacy to be relevant to the acceptance and use of GenAI in higher education. Thus, administrators with stronger digital competencies may be better positioned to evaluate AI-generated information and incorporate useful outputs into strategic decisions.

The Nigerian context makes this issue particularly relevant. Although AI adoption is gaining attention within Nigerian higher education, challenges relating to infrastructure, digital skills, institutional preparedness and staff training may affect effective implementation. Evidence from Nigeria suggests that AI can contribute to organisational outcomes when appropriately applied, while digital skills remain important for effective engagement with emerging technologies (Shaibu, Mbaegbu, & Zion-Ngoka, 2025). In a related study, Aiyebelehin, Abdulkareem, Aba, and Idemudia (2025) found that digital literacy skills were associated with the use of ChatGPT among undergraduates in a Nigerian university. These findings suggest that access to GenAI alone may not be sufficient to improve institutional decision-making; the competencies of those using the technology may also determine the value derived from it.

Despite the growing literature on AI and higher education, existing studies have largely focused on students' and lecturers' use of GenAI for teaching, learning, assessment and research. Comparatively little empirical attention has been given to GenAI as a strategic decision-support tool among university administrators, particularly in Nigerian public universities. More importantly, limited evidence exists on whether digital literacy explains the relationship between GenAI and strategic decision-making. This gap is important because administrators may have access to similar AI technologies but achieve different outcomes depending on their ability to critically evaluate and apply AI-generated information. Against this background, this study examines the influence of Generative Artificial Intelligence on strategic decision-making in Nigerian public universities and investigates whether digital literacy mediates this relationship.

Statement of the Problem

Public universities in Nigeria operate in a complex environment where administrators are required to make strategic decisions concerning academic programmes, staffing, finance, research, student services and institutional development. However, increasing enrolment, limited resources, changing policies and the growing volume of institutional information can make timely and effective decision-making difficult. Generative Artificial Intelligence (GenAI) offers opportunities to support administrators by summarising

information, generating alternatives, analysing documents and providing possible solutions. However, AI-generated outputs may contain errors, bias or misleading information, making critical evaluation and professional judgement necessary for effective use.

Despite growing interest in AI within higher education, limited attention has been given to the use of GenAI for strategic decision-making among administrators in Nigerian public universities. More importantly, it remains unclear whether digital literacy influences how effectively administrators use GenAI to support strategic decisions. Administrators with inadequate digital literacy may struggle to formulate effective prompts, evaluate AI-generated information and integrate AI outputs with professional judgement. This creates an important gap in understanding whether GenAI can improve strategic decision-making and whether digital literacy mediates this relationship. The present study therefore examines the influence of GenAI on strategic decision-making in Nigerian public universities and determines the mediating role of digital literacy.

Objectives of the Study

The main aim of this study is to examine generative AI and strategic decision-making in public universities: the mediating role of digital literacy in Nigeria. The specific objectives are to:

1. Examine the influence of Generative Artificial Intelligence on strategic decision-making in public universities in Nigeria.
2. Examine the influence of Generative Artificial Intelligence on the digital literacy of university administrators in public universities in Nigeria.
3. Determine the mediating role of digital literacy in the relationship between Generative Artificial Intelligence and strategic decision-making in public universities in Nigeria.

Research Questions

To achieve the objectives of the study, the following research questions were raised:

1. How does Generative Artificial Intelligence influence strategic decision-making in public universities in Nigeria?
2. How does Generative Artificial Intelligence influence the digital literacy of university administrators in public universities in Nigeria?
3. To what extent does digital literacy mediate the relationship between Generative Artificial Intelligence and strategic decision-making in public universities in Nigeria?

Research Hypotheses

Ho_1: Generative Artificial Intelligence does not significantly influence strategic decision-making in public universities in Nigeria.

Ho_2: Generative Artificial Intelligence does not significantly influence the digital literacy of university administrators in public universities in Nigeria.

Ho_3: Digital literacy does not significantly mediate the relationship between Generative Artificial Intelligence and strategic decision-making in public universities in Nigeria.

Review of Related Literature

Conceptual Review

Concept of Generative Artificial Intelligence

Generative Artificial Intelligence (GenAI) refers to AI systems designed to generate new content, including text, images, audio, video, code and other forms of information from user-provided instructions. Unlike traditional AI applications that mainly classify, predict or automate predefined tasks, GenAI can produce novel outputs and interact with users in ways that support knowledge creation, information processing and problem-solving. Its rapid development has expanded the role of AI across professional and organisational settings, including higher education, where it is increasingly influencing teaching, research, administration and institutional practices (Xia, Weng, Ouyang, Lin, & Chiu, 2024).

The organisational value of GenAI lies partly in its ability to process large amounts of information and generate content that can assist human activities. In universities, administrators can potentially use GenAI to summarise reports, analyse documents, generate alternatives and support institutional planning. However, the outputs of GenAI are not always accurate or contextually appropriate, making human oversight necessary. Recent research shows that universities are increasingly considering institutional policies and guidelines to manage the opportunities and risks associated with GenAI adoption (Jin, Yan, Echeverria, Gašević, & Martinez-Maldonado, 2024).

GenAI should therefore be viewed as a technology that can augment human capabilities rather than completely replace human judgement. Its usefulness depends on how users interact with the technology, the quality of information supplied to it and their ability to evaluate the outputs produced. This is particularly relevant to university administration, where AI-generated information may support decision processes but cannot independently account for institutional values, policies and contextual realities.

Concept of Strategic Decision-Making

Strategic decision-making refers to the process through which organisational leaders identify important problems and opportunities, evaluate available alternatives and select actions that influence organisational goals and long-term performance. Unlike routine decisions, strategic decisions often involve uncertainty, substantial resource commitments and consequences that extend across different areas of an organisation. In public universities, strategic decisions may relate to academic programmes, staffing, finance, research, infrastructure, technology adoption and institutional development.

The increasing volume of organisational information has made the use of AI particularly relevant to strategic decision-making. AI systems can assist decision-makers in searching for information, identifying patterns, generating alternatives and evaluating possible strategies. Csaszar, Ketkar, and Kim (2024) found that AI can augment strategic decision-making by supporting strategic search, representation and evaluation. Similarly, Doshi, Bell, Mirzayev, and Vanneste (2025) demonstrated that generative AI can contribute to the evaluation of strategic decisions, although human assessment remains necessary to determine the quality and appropriateness of AI-generated recommendations.

The effectiveness of strategic decision-making also depends on the characteristics and capabilities of those responsible for making such decisions. Eromafunu, Akpoyibo, and Isaac (2022) found that characteristics of strategic decision-makers, particularly cognitive diversity and cognitive complexity, were important to effective strategic decision-making. This suggests that strategic decisions are influenced not only by the information and technologies available to managers but also by their ability to process, evaluate and apply information appropriately. In public universities, GenAI can therefore provide administrators with additional information and strategic alternatives, while the quality of final decisions remains dependent on the administrators' judgement and capacity to evaluate AI-generated outputs.

Concept of Digital Literacy

Digital literacy refers to the knowledge, skills and abilities required to access, understand, evaluate, create and effectively use information through digital technologies. It goes beyond the basic ability to operate computers, mobile devices or software and includes the capacity to search for information, communicate through digital platforms, assess the credibility of digital content and use technology appropriately for different tasks. In contemporary organisations, digital literacy has become an important competence because employees and managers increasingly depend on digital technologies to obtain information, perform tasks and solve organisational problems.

The emergence of Generative Artificial Intelligence has further expanded the scope of digital literacy. Users are now expected to understand how AI applications function, formulate appropriate prompts, interpret generated responses and recognise possible errors, bias and limitations. Gu and Ericson (2025) emphasised that meaningful engagement with AI requires both functional competencies and critical abilities to evaluate AI-generated information. Similarly, Al-Abdullatif (2024) found that AI literacy is relevant to the acceptance and use of generative AI in higher education. These developments suggest that digital literacy in the age of GenAI involves not only knowing how to operate digital tools but also understanding when, why and how their outputs should be used.

Digital literacy also involves the ability to make informed judgements about digital information. This is particularly important because GenAI can generate responses that appear convincing even when the information is incomplete, inaccurate or unsuitable for a particular situation. Digitally literate users are more likely to verify information, compare alternative sources and recognise the limitations of AI-generated content before relying on it. Zhang and Magerko (2025) similarly identified competencies relating to AI interaction, prompting and critical evaluation as important aspects of effective engagement with generative AI.

Within organisational settings, digital literacy can therefore influence the quality of interaction between employees and emerging technologies. Administrators who possess adequate digital competencies may be better able to identify appropriate applications of GenAI, formulate useful instructions, evaluate generated information and integrate relevant outputs into their work. Conversely, inadequate digital literacy may result in ineffective use of AI tools, overdependence on generated responses or failure

to recognise inaccurate information. Digital literacy can consequently be regarded as an important human capability for obtaining meaningful value from GenAI.

Generative Artificial Intelligence and Strategic Decision-Making

Generative Artificial Intelligence can influence strategic decision-making by providing decision-makers with rapid access to information, generating alternative solutions and supporting the analysis of complex organisational problems. Strategic decisions commonly involve uncertainty, competing priorities and the consideration of multiple alternatives. GenAI can assist this process by processing large volumes of information, summarising relevant materials, identifying possible patterns and generating alternative courses of action. Csaszar, Ketkar, and Kim (2024) observed that AI can support strategic search, problem representation and evaluation, thereby augmenting important stages of strategic decision-making.

The capacity of GenAI to generate multiple alternatives may be particularly useful during strategic planning. Instead of relying exclusively on a single source of information or a limited number of alternatives, decision-makers can use GenAI to explore different possibilities and examine potential responses to organisational challenges. Hao, Demir, and Eyers (2024) noted that interaction between humans and GenAI can support decision-making by reducing cognitive demands and providing additional analytical assistance. GenAI can therefore serve as a complementary resource that expands the range of information and alternatives available to decision-makers.

However, the availability of AI-generated information does not automatically result in better strategic decisions. GenAI systems can produce inaccurate information, inappropriate recommendations and outputs that reflect biases contained within their training data. Doshi, Bell, Mirzayev, and Vanneste (2025) demonstrated that generative AI can contribute to the evaluation of strategic decisions but also highlighted the importance of human assessment of its outputs. Decision-makers must therefore examine the accuracy, relevance and contextual suitability of AI-generated recommendations before incorporating them into strategic decisions.

The relationship between GenAI and strategic decision-making is consequently better understood as one of human–AI collaboration. AI provides computational capabilities that can support information processing and alternative generation, while human decision-makers contribute contextual understanding, experience, ethical judgement and responsibility. Dellermann, Ebel, Söllner, and Leimeister (2019) explained that effective human–AI collaboration occurs when the complementary strengths of humans and intelligent technologies are combined. In strategic management, this means that GenAI can enhance the decision process without removing the need for human judgement.

The effectiveness of GenAI may also vary according to the competence of the individuals using it. A decision-maker who understands how to formulate appropriate prompts, question AI-generated responses and verify important information is likely to obtain greater value from the technology than a user who accepts AI outputs without critical assessment. This reinforces the importance of digital literacy in understanding the effect of GenAI on strategic decision-making. GenAI may provide the technological capability, but the user's digital competence can determine how effectively that capability is translated into useful strategic information and decisions.

Digital Literacy as a Mediator between Generative Artificial Intelligence and Strategic Decision-Making

Digital literacy may serve as an important link between Generative Artificial Intelligence and strategic decision-making because access to AI technology does not necessarily determine the quality of decisions produced from its use. GenAI can provide administrators with information, summaries, alternatives and recommendations, but users must possess the skills required to understand, question and apply these outputs appropriately. Gu and Ericson (2025) emphasised that effective engagement with AI requires both functional competencies and critical evaluation skills. Similarly, Zhang and Magerko (2025) identified prompting, interaction and critical assessment as important competencies for effective engagement with generative AI.

The mediating role of digital literacy can be understood from the fact that administrators with higher levels of digital competence are more likely to use GenAI purposefully and critically. For instance, when a university administrator uses GenAI to examine declining student enrolment, the technology may generate possible explanations and strategic responses. A digitally literate administrator can compare these suggestions with institutional records, identify unsupported assumptions, request more appropriate analyses and determine which recommendations are relevant to the university's circumstances. An administrator with limited digital literacy, however, may accept the generated response without adequate

verification. In this situation, the availability of GenAI does not necessarily translate into a better strategic decision.

Digital literacy can therefore determine how effectively the capabilities of GenAI are converted into useful decision-support information. Al-Abdullatif (2024) found that AI literacy was associated with the acceptance and use of generative AI in higher education, while Ayyoub et al. (2025) emphasised the importance of AI-related competencies and critical engagement in the effective use of emerging AI technologies. These findings suggest that the benefits of GenAI are partly dependent on the competencies of the individuals who interact with it.

The mediating relationship implies that GenAI may provide the technological capacity for information generation and analysis, while digital literacy enables administrators to transform that capacity into meaningful strategic input. Consequently, stronger digital literacy may strengthen the extent to which GenAI contributes to strategic decision-making, whereas inadequate digital literacy may weaken this contribution. This provides a basis for examining digital literacy as a mediating variable between GenAI and strategic decision-making in public universities.

Theoretical Review

The study is anchored on the Technology Acceptance Model (TAM) and Upper Echelons Theory (UET). These theories provide a framework for understanding the adoption and use of Generative Artificial Intelligence and the role of university administrators' capabilities in strategic decision-making.

Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM), developed by Davis (1989), explains how individuals accept and use new technologies. The model proposes that perceived usefulness and perceived ease of use are the major factors influencing an individual's intention to use a technology. Perceived usefulness refers to the extent to which a person believes that using a particular technology will improve performance, while perceived ease of use concerns the extent to which the technology is perceived as easy to use. TAM has remained one of the widely applied models for explaining technology adoption across organisational and educational settings.

TAM is relevant to the present study because university administrators are more likely to use Generative AI when they perceive that it can improve their work and support important administrative activities. GenAI may be perceived as useful when it helps administrators analyse information, generate alternatives, prepare reports, identify possible solutions and support strategic planning. Its perceived ease of use may also influence whether administrators are willing to incorporate it into their daily activities. Recent research has continued to demonstrate the relevance of perceived usefulness and ease of use in explaining users' engagement with emerging AI technologies (Al-Abdullatif, 2024). Thus, TAM provides a basis for explaining how the perceived value and usability of GenAI can influence its application in university administration and, ultimately, strategic decision-making.

Upper Echelons Theory (UET)

The Upper Echelons Theory (UET), developed by Hambrick and Mason (1984), proposes that organisational outcomes and strategic choices are partly influenced by the characteristics, experiences, knowledge and cognitive orientations of senior decision-makers. The theory assumes that managers do not interpret organisational situations in exactly the same way because their experiences, values and cognitive abilities influence how they perceive and respond to strategic challenges. Consequently, organisational decisions can reflect the characteristics and capabilities of the individuals responsible for making them.

UET is relevant to the present study because university administrators play a central role in determining how emerging technologies are interpreted and applied in institutional decision-making. Although GenAI can provide information and possible solutions, administrators must determine whether the information is accurate, relevant and appropriate for their institutions. Digital literacy can strengthen this process by enabling administrators to interact effectively with GenAI, critically evaluate its outputs and integrate useful information into strategic decisions. In this sense, UET provides a theoretical basis for understanding why administrators with different levels of digital competence may derive different strategic outcomes from the same GenAI technology. The theory therefore complements TAM by linking the use of GenAI with the human capabilities required to transform AI-generated information into effective strategic decisions.

Empirical Studies

Doshi, Bell, Mirzayev, and Vanneste (2025) examined the use of generative artificial intelligence in evaluating strategic decisions using two studies involving 60 business models each. The researchers compared evaluations produced by large language models with rankings made by human experts. The findings showed that GenAI could provide useful predictions and evaluations of strategic alternatives, although AI-generated assessments were sometimes inconsistent and biased. The study concluded that GenAI has potential as a strategic decision-support tool but requires human evaluation and judgement.

Ebiringa, Charles Ikerionwu, Erike Azubuike, and B. C. Asiegbu (2025) investigated Generative AI adoption in Nigerian higher education using a mixed-methods approach involving 312 survey respondents and 20 experienced GenAI users and policymakers at the Federal University of Technology Owerri. The study found that 98.7% of respondents were willing to use GenAI if adequate training was provided, while current usage was higher for teaching and research than for mentoring and administrative activities. The findings also identified skill gaps, ethical concerns and limited access to resources as major challenges to GenAI adoption. The study recommended staff training, infrastructure development, ethical guidelines and institutional policies to support effective GenAI integration. These findings are particularly relevant to the present study because they suggest that the benefits of GenAI in higher education may depend substantially on users' competencies and institutional readiness.

Wyszynski, Westermann, Weber, and Niehaves (2025) examined whether generative AI could improve human decision-making by reducing cognitive biases. Using an online experiment involving 434 participants, the researchers compared decision-making before and after participants interacted with ChatGPT. The study found that GenAI could provide additional information and alternative perspectives that helped participants reconsider their initial decisions. The findings suggest that GenAI can support decision quality when users engage with its outputs reflectively rather than accepting them without critical assessment.

Csaszar, Ketkar, and Kim (2024) investigated how artificial intelligence can support strategic decision-making using evidence from entrepreneurs and investors. The study examined the ability of large language models to generate and evaluate strategies and found that AI could augment important stages of strategic decision-making, including strategic search, representation and evaluation. The findings indicated that AI-generated strategies and evaluations could reach levels comparable with those of human entrepreneurs and investors, suggesting that AI can serve as a valuable complement to human strategic judgement.

Faloye, Oyinloye, and Obateru (2024) examined the impact of Generative Artificial Intelligence on critical thinking and study habits among undergraduates in Nigerian universities using a systematic review and meta-analysis of 15 empirical studies published between 2018 and 2024. The meta-analysis produced an overall effect size of 0.598, with a 95% confidence interval of 0.515–0.681, indicating a significant positive effect of GenAI on critical thinking and study habits. The study concluded that AI applications such as ChatGPT and intelligent tutoring systems can support critical thinking, study habits and academic achievement. Although the study focused on students rather than university administrators, its findings demonstrate the potential of GenAI to produce positive outcomes when users engage appropriately with the technology.

Methods

The study adopted a cross-sectional survey research design to examine the relationship between Generative Artificial Intelligence, digital literacy and strategic decision-making in public universities in South-East Nigeria. The study covered public universities in Abia, Anambra, Ebonyi, Enugu and Imo States. The population comprised principal officers, deans, directors, heads of departments and other senior administrators whose responsibilities involve institutional planning, policy implementation, resource allocation and strategic decision-making. A purposive sampling technique was used to select administrators with relevant experience in digital technologies and university management. Where more than one university was selected within a state, respondents were proportionately allocated across the institutions to improve representation. A total of 300 administrators participated in the study. Data were collected using a structured questionnaire titled *Generative Artificial Intelligence, Digital Literacy and Strategic Decision-Making Questionnaire (GAIDLSD-Q).* The instrument consisted of three sections measuring Generative AI, digital literacy and strategic decision-making. Items were measured on a four-point Likert scale ranging from Very High Extent (VHE) = 4 to Very Low Extent (VLE) = 1. The instrument was subjected to face and

content validation by experts in educational management, information technology and measurement and evaluation. A pilot test was conducted among administrators outside the sampled universities, and internal consistency was assessed using Cronbach's Alpha. The reliability coefficients were 0.86 for Generative AI, 0.82 for digital literacy and 0.88 for strategic decision-making, with an overall coefficient of 0.85, indicating satisfactory internal consistency. Of the 300 questionnaires distributed, 287 were correctly completed and retrieved, representing a response rate of 95.7%. Data were analysed using descriptive statistics and inferential techniques. Pearson Product Moment Correlation was used to determine the associations among Generative AI, digital literacy and strategic decision-making. Hayes' PROCESS Macro Model 4 was employed to test the hypothesised mediating role of digital literacy in the relationship between Generative AI and strategic decision-making. The indirect effect was assessed using 5,000 bootstrap samples and a 95% confidence interval. Mediation was considered significant where the bootstrap confidence interval for the indirect effect did not contain zero. The hypotheses were tested at a 0.05 level of significance using SPSS Version 27.

Results

Ho_1: Generative Artificial Intelligence does not significantly influence strategic decision-making in public universities in South-East Nigeria.

Table 1: Correlation between Generative Artificial Intelligence and Strategic Decision-Making

Variables	Generative Artificial Intelligence	Strategic Decision-Making
Generative Artificial Intelligence	1.000	.724**
Sig. (2-tailed)	.	.000
N	287	287
Strategic Decision-Making	.724**	1.000
Sig. (2-tailed)	.000	.
N	287	287

Correlation is significant at the 0.05 level (2-tailed).

Source: Researchers' Data, 2026.

Table 1 shows an r value of 0.724 at a significance level of 0.000, which is lower than the alpha level of 0.05. Since the significance value (0.000) is below 0.05, the null hypothesis (Ho_1), which states that Generative Artificial Intelligence does not significantly influence strategic decision-making in public universities in South-East Nigeria, is rejected. Therefore, the alternate hypothesis is accepted. This implies that Generative Artificial Intelligence significantly influences strategic decision-making in public universities in South-East Nigeria.

Ho_2: Generative Artificial Intelligence does not significantly influence the digital literacy of university administrators in public universities in South-East Nigeria.

Table 2: Correlation between Generative Artificial Intelligence and Digital Literacy

Variables	Generative Artificial Intelligence	Digital Literacy
Generative Artificial Intelligence	1.000	.681**
Sig. (2-tailed)	.	.000
N	287	287

Variables	Generative Artificial Intelligence	Digital Literacy
Digital Literacy	.681**	1.000
Sig. (2-tailed)	.000	.
N	287	287

Correlation is significant at the 0.05 level (2-tailed).

Source: Researchers' Data, 2026.

Table 2 shows an r value of 0.681 at a significance level of 0.000, which is lower than the alpha level of 0.05. Since the significance value (0.000) is below 0.05, the null hypothesis (Ho_2), which states that Generative Artificial Intelligence does not significantly influence the digital literacy of university administrators in public universities in South-East Nigeria, is rejected. Therefore, the alternate hypothesis is accepted. This implies that Generative Artificial Intelligence significantly influences the digital literacy of university administrators in public universities in South-East Nigeria.

Ho_3: Digital literacy does not significantly mediate the relationship between Generative Artificial Intelligence and strategic decision-making in public universities in South-East Nigeria.

Table 3: Mediation Analysis of Digital Literacy in the Relationship between Generative Artificial Intelligence and Strategic Decision-Making

Effect	Coefficient	BootSE	LLCI	ULCI
Total effect	.724	.058	.610	.838
Direct effect	.512	.067	.380	.644
Indirect effect through Digital Literacy	.212	.049	.119	.314

Source: Researchers' Data, 2026.

Table 3 shows that the indirect effect of Generative Artificial Intelligence on strategic decision-making through digital literacy is 0.212, with a 95% bootstrap confidence interval ranging from 0.119 to 0.314. Since the confidence interval does not contain zero, the indirect effect is statistically significant. The result therefore indicates that digital literacy significantly mediates the relationship between Generative Artificial Intelligence and strategic decision-making in public universities in South-East Nigeria. Since the direct effect of Generative Artificial Intelligence on strategic decision-making remains significant after digital literacy is introduced into the model, the mediation is considered partial. Consequently, the null hypothesis (Ho_3) is rejected. This implies that digital literacy significantly mediates the relationship between Generative Artificial Intelligence and strategic decision-making.

Discussion of Findings

The test of hypotheses revealed that Generative Artificial Intelligence significantly influences strategic decision-making in public universities in South-East Nigeria. The finding indicates that GenAI can support university administrators by improving access to information, generating alternative solutions, analysing institutional issues and assisting in strategic planning. This finding is consistent with Csaszar, Ketkar, and Kim (2024), who found that AI can augment strategic decision-making through strategic search, problem representation and evaluation. Similarly, Doshi, Bell, Mirzayev, and Vanneste (2025) reported that generative AI can support the evaluation of strategic alternatives, although human judgement remains necessary in assessing the quality of AI-generated recommendations. The finding suggests that GenAI can serve as an important decision-support resource for administrators when appropriately integrated into university management processes.

The findings further revealed that Generative Artificial Intelligence significantly influences the digital literacy of university administrators. This suggests that increased engagement with GenAI may encourage administrators to develop competencies in prompting, information evaluation, digital communication and

the critical assessment of AI-generated outputs. The finding agrees with Al-Abdullatif (2024), who established the importance of AI literacy in the acceptance and use of generative AI in higher education. It is also consistent with Ebiringa, Ikerionwu, Azubuike, and Asiegbu (2025), who found that skill gaps and inadequate training were important challenges to GenAI adoption in Nigerian higher education. The finding therefore suggests that effective engagement with GenAI requires continuous development of relevant digital competencies among university administrators.

Furthermore, the mediation analysis revealed that digital literacy significantly mediates the relationship between Generative Artificial Intelligence and strategic decision-making. The finding means that GenAI does not operate entirely on its own to produce better strategic decisions; rather, the digital competence of administrators helps determine how effectively AI-generated information is interpreted and applied. This finding supports Gu and Ericson (2025), who emphasised the importance of functional and critical competencies in effective engagement with AI technologies. It also agrees with Faloye, Oyinloye, and Obateru (2024), whose meta-analysis showed that GenAI can positively contribute to critical thinking and learning outcomes when appropriately used. The partial mediation observed in the present study indicates that GenAI has a direct contribution to strategic decision-making, while digital literacy further strengthens the value derived from the technology.

Conclusion

This study examined the relationship between Generative Artificial Intelligence and strategic decision-making in public universities, with digital literacy as a mediating variable. The findings established that GenAI significantly influences strategic decision-making and digital literacy among university administrators. The study also found that digital literacy significantly mediates the relationship between GenAI and strategic decision-making. The study therefore concludes that Generative AI can serve as an important strategic decision-support technology in public universities by improving information processing, generating alternatives and supporting the analysis of institutional problems. However, the effectiveness of GenAI depends partly on the digital competencies of university administrators. Administrators who possess the skills to interact with AI, critically evaluate its outputs and integrate relevant information with professional judgement are more likely to derive meaningful strategic benefits from the technology. Consequently, GenAI adoption should be accompanied by deliberate investment in digital literacy, capacity development and responsible AI use within university administration.

Recommendations

Based on the findings and conclusion of the study, the following recommendations are made:

1. Public universities in South-East Nigeria should integrate Generative AI into appropriate administrative and strategic management processes. AI tools can be used for information analysis, report preparation, scenario development, strategic planning and the generation of alternative solutions.
2. University administrators should participate in regular digital literacy and GenAI training programmes. Such programmes should emphasise effective prompting, verification of AI-generated information, identification of errors and bias, data protection and responsible application of AI outputs in institutional decision-making.
3. University management should establish clear policies and guidelines governing the use of Generative AI in administrative decision-making. Such policies should emphasise human oversight, confidentiality, accountability and verification of AI-generated information before it is used for important institutional decisions.

Abstract

The growing use of artificial intelligence in business has created a need to review vocational education and prepare students for technology-based business activities. This study examined the relationship between artificial intelligence literacy and entrepreneurial intentions among Business Education undergraduate students in South-West universities of Nigeria. The study was guided by the Theory of Planned Behavior and Human Capital Theory and adopted a correlational survey research design. The population comprised 1,450 final-year Business Education students in public universities in South-West Nigeria. A sample of 312 students was selected using a multi-stage stratified random sampling technique. Data were collected using a structured questionnaire titled the "Artificial Intelligence Literacy and Entrepreneurial Intentions Questionnaire" (AILEIQ). The instrument had a Cronbach alpha reliability coefficient of 0.86. Of the 312 questionnaires administered, 298 were properly completed and retrieved. Mean and standard deviation were used to answer the research questions, while Pearson Product-Moment Correlation and Multiple Regression were used to test the hypotheses at the 0.05 level of significance. The findings showed a strong, positive, and statistically significant relationship between artificial intelligence literacy dimensions, namely data competency, algorithmic awareness, and digital tool application, and entrepreneurial intentions ($r = 0.687$, $p < 0.01$). The regression analysis showed that artificial intelligence literacy explained 47.2% of the variation in entrepreneurial intentions ($R^2 = 0.472$, $F(3, 294) = 87.62$, $p < 0.05$). The study concluded that including artificial intelligence skills in Business Education programmes can improve students' readiness to create technology-based businesses.

Keywords: *Artificial Intelligence Literacy, Entrepreneurial Intentions, Business Education, Curriculum Development, Nigeria*

Introduction

Nigeria's current socio-economic situation is affected by graduate unemployment, rising inflation, and a shift towards a technology-based economy (National Bureau of Statistics, 2023). In this situation, universities are expected to produce graduates who have both academic knowledge and practical skills that can help them create jobs and start businesses. Business Education programmes in Nigerian universities were developed partly to meet this need. The programmes prepare students for employment as well as self-employment through business activities (Amah & Okafor, 2023).

Over the years, Business Education in Nigeria has gone through several curriculum changes. Earlier vocational programmes gradually moved towards office technology and management, with students learning skills such as desktop publishing, spreadsheet use, and internet communication (Ndubuisi et al., 2022). However, the growth of the Fourth Industrial Revolution has increased the level of technology skills needed in business. Basic information technology skills may no longer be enough for many modern business activities. Many businesses now use computer-based systems, machine learning, and automated data processing to improve their operations, study customer behaviour, reduce costs, and understand market trends (Bala et al., 2024).

One important part of this technological change is artificial intelligence (AI) literacy. AI literacy refers to the ability to understand, assess, communicate with, and use artificial intelligence technologies in academic, personal, and work settings (Long & Magerko, 2020). In Business Education and small business management, AI literacy goes beyond basic computer skills. It includes data competency, algorithmic awareness, and digital tool application (Ng et al., 2021). Data competency involves the ability to collect, organise, clean, and understand business data. Algorithmic awareness refers to an understanding of how machine learning systems use information to produce automated results. Digital tool application involves the practical use of generative AI tools, predictive analytics software, automated marketing platforms, and intelligent customer relationship systems.

Entrepreneurial intention refers to a person's conscious decision and willingness to start and develop a business (Liñán & Fayolle, 2015). It is an important factor in understanding whether a person is likely to engage in entrepreneurial activities. When students believe that they have useful and valuable technical skills, their confidence in their ability to start a business may increase. This can improve their attitude towards business creation and reduce some of the risks they associate with starting a new business (Çınar & Kenek, 2025). Therefore, examining the relationship between artificial intelligence literacy and entrepreneurial intentions among Business Education students is important for assessing whether university vocational education is meeting the needs of the present business environment in Nigeria.

Statement of the Problem

Despite the continued inclusion of entrepreneurship courses in Nigerian university programmes, graduate unemployment remains a major concern among vocational education graduates (Angwaomaodoko et al., 2026). One possible reason is the gap between the skills taught in universities and the skills required in the present business environment. Modern businesses increasingly use automated marketing, predictive inventory systems, and AI-based customer analysis, while some Business Education programmes still place much emphasis on traditional bookkeeping, office management, and conventional retail practices (Aniah & Mohammed, 2021).

Previous studies have examined digital skills, information technology use, and entrepreneurship education among university students. However, there is limited research on artificial intelligence literacy as a specific area of study. For example, Otamiri and Chimaobim Ijeoma (2023) examined general digital skills and entrepreneurial behaviour among Business Education postgraduate students in South-South universities of Nigeria. Their study found a positive relationship between digital competence and business initiative. Mbanugo and Okeke-Ezeanyanwu (2023) also examined the readiness of Business Education graduates for digital entrepreneurship. However, these studies focused on general digital skills rather than specific areas of artificial intelligence literacy such as data competency, algorithmic awareness, and digital tool application.

The lack of evidence on the relationship between AI literacy and students' readiness to start technology-based businesses makes it difficult for educational authorities, university administrators, and curriculum planners to make informed decisions about the development of Business Education programmes. This study therefore examined the relationship between artificial intelligence literacy and entrepreneurial intentions among Business Education students in South-West universities of Nigeria. It also examined whether the three dimensions of AI literacy, namely data competency, algorithmic awareness, and digital tool application, predict students' entrepreneurial intentions.

Research Objectives

The main objective of this study was to examine the relationship between artificial intelligence literacy and entrepreneurial intentions among Business Education undergraduate students in South-West universities of Nigeria. Specifically, the study sought to:

i. Assess the level of artificial intelligence literacy, in terms of data competency, algorithmic awareness, and digital tool application, among Business Education students in South-West universities of Nigeria.
ii. Determine the level of entrepreneurial intentions among Business Education students in South-West universities of Nigeria.
iii. Examine the predictive influence of artificial intelligence literacy dimensions on the entrepreneurial intentions of Business Education students.

Research Questions

The following research questions guided the study:

v. What is the level of artificial intelligence literacy among Business Education students in South-West universities of Nigeria?
vi. What is the level of entrepreneurial intentions among Business Education students in South-West universities of Nigeria?
vii. To what extent do artificial intelligence literacy dimensions, namely data competency, algorithmic awareness, and digital tool application, collectively and independently predict the entrepreneurial intentions of Business Education students?

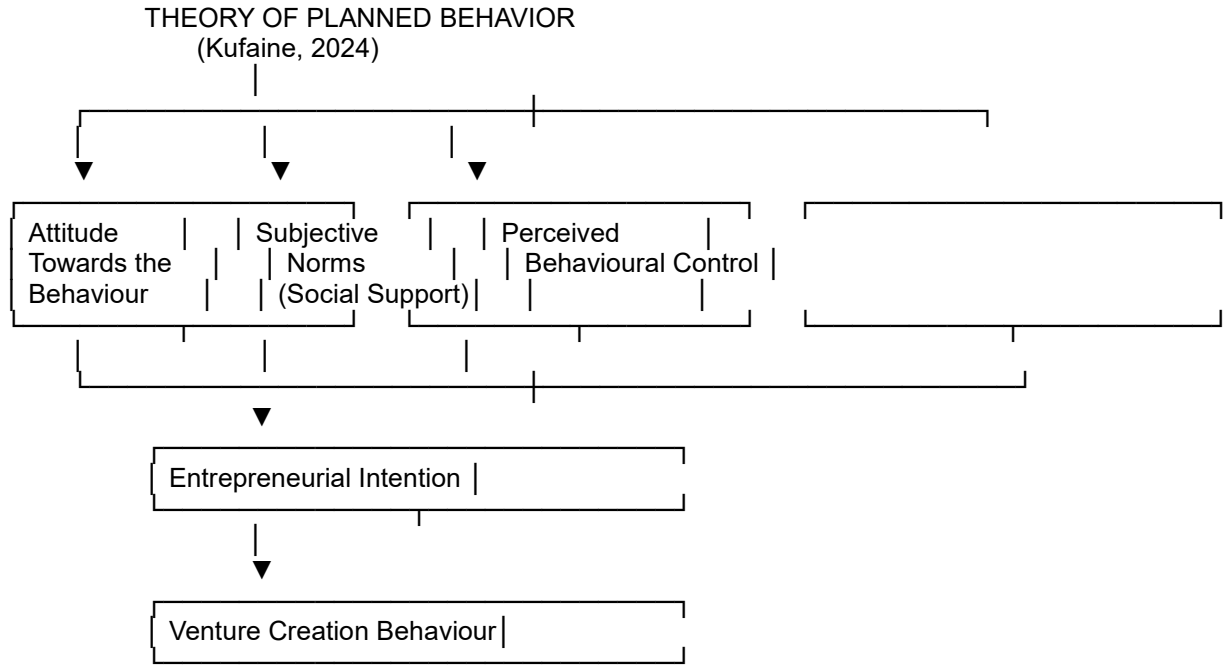
Hypotheses

The following null hypotheses were formulated and tested at the 0.05 level of significance:

H_{01}: There is no significant relationship between artificial intelligence literacy dimensions and the entrepreneurial intentions of Business Education students in South-West universities of Nigeria.

H_{02}: Artificial intelligence literacy dimensions do not significantly predict the entrepreneurial intentions of Business Education students in South-West universities of Nigeria.

LITERATURE REVIEW AND THEORETICAL FRAMEWORK



Theoretical Underpinning

Theory of Planned Behavior (TPB)

This study is mainly based on the Theory of Planned Behavior (TPB), as discussed within extended behavioural frameworks by Kufaine (2024). The theory explains that human behaviour is influenced by behavioural intention. Behavioural intention is shaped by three main factors: attitude towards the behaviour, subjective norms, and perceived behavioural control.

Figure 1

Theory of Planned Behavior and Entrepreneurial Intention

Note. **Adapted from the Theory of Planned Behaviour as discussed by Kufaine (2024).**

In the context of business creation, attitude towards the behaviour refers to an individual's view of becoming an entrepreneur. Subjective norms refer to the social influence that an individual receives from family, friends, colleagues, and academic mentors concerning business creation. Perceived behavioural control refers to an individual's belief in their ability to carry out the activities needed to start and manage a business successfully.

In this study, artificial intelligence literacy is viewed as a factor that can strengthen perceived behavioural control. When Business Education students develop practical skills in data handling, algorithmic decision-making, and the use of AI tools, they may become more confident in their ability to manage business risks,

conduct market research, and automate some business activities. This increased confidence can strengthen their perceived behavioural control and, in turn, increase their entrepreneurial intentions (Çınar & Kenek, 2025).

Human Capital Theory

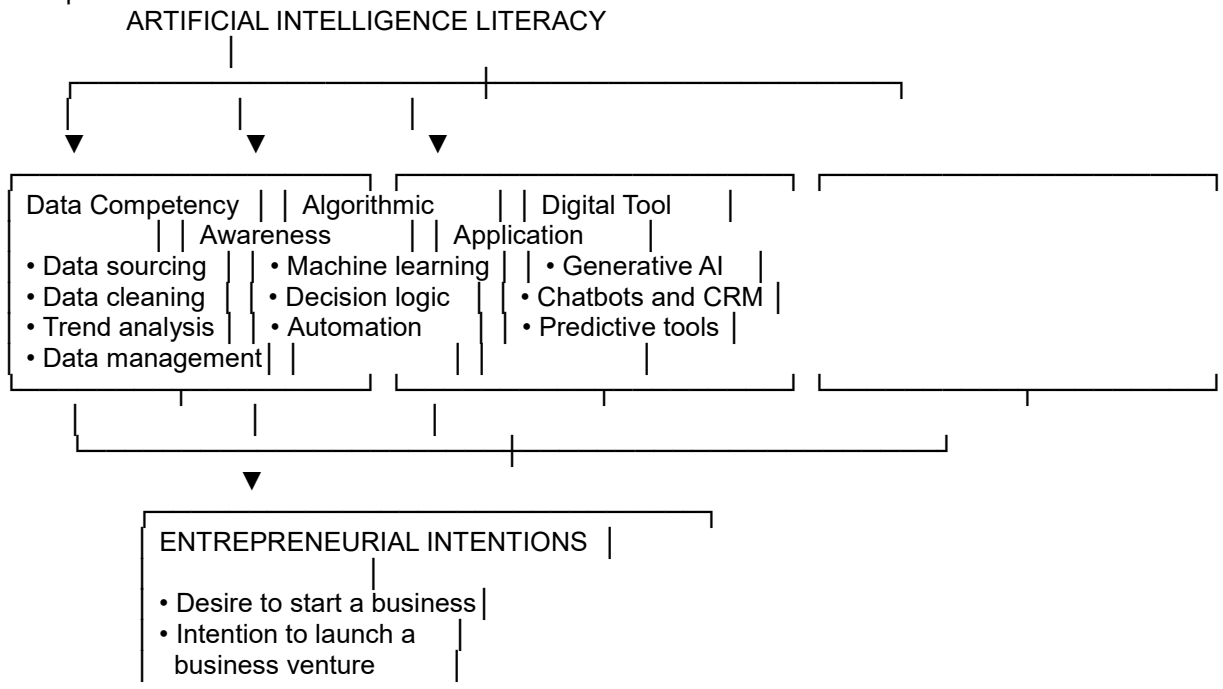
The study is also supported by Human Capital Theory, which was developed by Schultz (1961) and further developed by Becker (1964). The theory states that people acquire knowledge, skills, and abilities through education and training. These skills improve their productivity and increase their economic value. In today's digital economy, technological skills form an important part of human capital.

When universities provide students with relevant technological knowledge and skills, students may become better prepared to identify business opportunities, develop new business ideas, and carry out business activities (Alam, 2026). In relation to this study, artificial intelligence literacy is regarded as a form of specialised human capital. It provides Business Education students with technological skills that can support the creation and management of digital businesses.

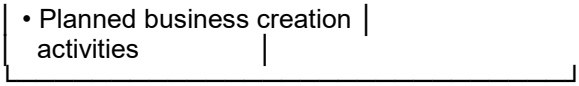
Conceptual Review and Synthesis

Artificial Intelligence Literacy Dimensions

In this study, artificial intelligence literacy is treated as a three-dimensional concept consisting of data competency, algorithmic awareness, and digital tool application (Long & Magerko, 2020; Ng et al., 2021).



Data Competency: Data competency refers to the knowledge and practical ability to obtain, organise, clean, analyse, and interpret business data (Sánchez et al., 2025). For small businesses, this skill can help entrepreneurs understand market trends, study customer buying patterns, and make better inventory decisions based on available data.



Algorithmic Awareness: Algorithmic awareness refers to an individual's understanding of how automated systems, predictive models, and machine learning algorithms work (Alam, 2026). It does not necessarily require advanced programming skills. Instead, it involves understanding how algorithms process information, follow decision rules, identify possible bias, and produce predictions. This knowledge can help potential entrepreneurs determine how automated systems can be used to improve business operations.

Digital Tool Application: Digital tool application refers to the practical use of AI-based software and other digital applications in business activities. These tools may include generative AI platforms for preparing marketing content, chatbots for customer service, accounting software for cash-flow planning, and cloud-based customer relationship management systems (Bala et al., 2024).

Figure 2

Conceptual Framework Showing the Relationship Between Artificial Intelligence Literacy and Entrepreneurial Intentions

Note. The framework shows the proposed relationship between the three dimensions of artificial intelligence literacy and entrepreneurial intentions.

Entrepreneurial Intentions

Entrepreneurial intention refers to a person's conscious decision and plan to start a business (Liñán & Fayolle, 2015). It provides a link between a person's potential and actual business creation. Among university students, entrepreneurial intention reflects their interest in starting a business, commitment to becoming an entrepreneur, and belief in their ability to establish a business after graduation.

Students with stronger entrepreneurial intentions are more likely to engage in activities that support business creation. Such activities may include looking for business funding, conducting feasibility studies, building professional networks, and preparing business plans (Ranga et al., 2019).

Empirical Review and Synthesis

Data Competency and Entrepreneurial Intentions

The ability to work with data has become an important skill in modern business. Salami and Kehinde (2023) examined skill acquisition among vocational education students in Nigerian tertiary institutions. The study found that students who received training in data analysis and database management had higher confidence when preparing business plans.

Chui et al. (2022) also examined data analysis skills among entrepreneurs operating digital platforms. The study found that basic data literacy helped to reduce business failure during the early stages of operation. These findings suggest that data competency can provide entrepreneurs with the skills needed to assess market demand and make informed business decisions. This may increase their confidence and intention to start a business.

Algorithmic Awareness and Opportunity Recognition

An understanding of how automated systems work can help entrepreneurs identify business opportunities created by technological changes. Alam (2026) examined awareness of algorithmic decision-making among small business owners. The study found that entrepreneurs who understood the capabilities of machine learning were better able to identify gaps in the market and use automated solutions in their businesses.

In Nigeria, Aniah and Mohammed (2021) examined technological readiness among business educators. Their findings showed that limited understanding of algorithms contributed to hesitation and anxiety about using modern digital tools. This limited their use of new technologies in teaching and other professional activities. The findings suggest that better algorithmic awareness may reduce fear of technology and encourage individuals to consider new business opportunities.

Digital Tool Application and Small Business Creation

The practical use of digital tools can influence students' willingness to engage in business activities. Otamiri and Chimaobim Ijeoma (2023) examined digital skills and entrepreneurial behaviour among Business Education postgraduate students in South-South universities of Nigeria. The study found a strong positive relationship between practical digital skills and students' willingness to establish private businesses.

Similarly, Mbanugo and Okeke-Ezeanyanwu (2023) examined digital entrepreneurship readiness among vocational students. The study found that practical exposure to business management software improved students' perceived behavioural control and entrepreneurial intentions. Eze et al. (2016) also found that skill acquisition among Nigerian university undergraduates significantly predicted readiness for self-employment.

Hypothesis Development

The Theory of Planned Behavior (Kufaine, 2024) and Human Capital Theory (Becker, 1964), together with the findings of Otamiri and Chimaobim Ijeoma (2023) and Salami and Kehinde (2023), provide a basis for expecting a relationship between technological skills and entrepreneurial intentions. When Business Education students develop skills in data handling, understanding algorithms, and using AI-based digital tools, they may become more confident in their ability to identify and pursue business opportunities. These skills may also improve their perceived behavioural control and readiness to start a business.

Based on the theoretical and empirical evidence reviewed, the following hypotheses were formulated:

H_{01}: There is no significant relationship between artificial intelligence literacy dimensions, namely data competency, algorithmic awareness, and digital tool application, and the entrepreneurial intentions of Business Education students.
H_{02}: Artificial intelligence literacy dimensions do not significantly predict the entrepreneurial intentions of Business Education students.

RESEARCH METHODOLOGY

This study adopted a correlational survey research design. The design was considered suitable because it allowed the researcher to collect data from a large and dispersed population and examine the relationships between the study variables without manipulating them. The study was carried out in state and federal public universities offering accredited undergraduate Business Education programmes in the South-West geopolitical zone of Nigeria.

The population of the study comprised 1,450 final-year undergraduate Business Education students registered during the academic session in public universities in South-West Nigeria. Final-year students were selected because they had completed major courses in business, accounting, marketing, and entrepreneurship education. They were therefore considered suitable for assessing their level of artificial intelligence literacy and their intentions to engage in entrepreneurial activities after graduation.

A multi-stage stratified random sampling procedure was used to select 312 respondents. At the first stage, public universities in the region were grouped according to their ownership structure. At the second stage, six universities were selected through simple random sampling by balloting. At the third stage, proportionate stratified random sampling was used to select students from the chosen universities based on their final-year departmental enrolment records. This helped to ensure fair representation of students from the selected institutions.

Data were collected using a self-structured questionnaire titled the "Artificial Intelligence Literacy and Entrepreneurial Intentions Questionnaire" (AILEIQ). The questionnaire was divided into three sections.

Section A: This section collected demographic information from the respondents, including institution, gender, age, and university ownership type.

Section B: This section measured artificial intelligence literacy using 15 items. The items were divided into three subscales: Data Competency, Algorithmic Awareness, and Digital Tool Application, with five items for each subscale. Responses were measured on a four-point Likert scale of Strongly Disagree (1), Disagree (2), Agree (3), and Strongly Agree (4).

Section C: This section measured Entrepreneurial Intentions using 10 items adapted from validated measurement scales by Ranga et al. (2019). The same four-point Likert scale was used.

To establish the face and content validity of the instrument, the draft questionnaire was given to three experts in Business Education and Measurement and Evaluation. Their comments and suggestions were used to revise the items.

A pilot study was also conducted with 30 final-year Business Education students from a public university that was not included in the main study. Cronbach's alpha reliability analysis produced coefficients of 0.83 for Data Competency, 0.81 for Algorithmic Awareness, 0.87 for Digital Tool Application, and 0.85 for Entrepreneurial Intentions. The overall reliability coefficient was 0.86. These values showed that the instrument had good internal consistency.

The questionnaire was administered physically by the researcher with the help of six trained research assistants over a period of four weeks. Out of the 312 questionnaires distributed, 298 were properly completed and returned for analysis. This represented an effective retrieval rate of 95.5%.

The data were analysed using SPSS. Means and standard deviations were used to answer Research Questions 1 and 2. A criterion mean of 2.50 was used as the basis for decision making. Pearson Product-Moment Correlation was used to test Hypothesis 1, while Multiple Regression was used to test Hypothesis 2. All hypotheses were tested at the 0.05 level of significance.

EMPIRICAL RESULTS

Descriptive Analysis of Variables

Research Questions 1 and 2 were answered using the mean scores and standard deviations of the study variables. The results are presented in Table 1.

Table 1

Descriptive Analysis of Artificial Intelligence Literacy Dimensions and Entrepreneurial Intentions (N = 298)

Variable/Dimension	Mean (x̄)	Standard Deviation (SD)	Decision Benchmark	Remark
Data Competency	2.68	0.62	2.50	High Level
Algorithmic Awareness	2.34	0.71	2.50	Low Level
Digital Tool Application	2.91	0.55	2.50	High Level
Overall AI Literacy Index	2.64	0.58	2.50	High Level
Entrepreneurial Intentions	3.02	0.51	2.50	High Level

Note. Data collected from field survey. Benchmark criterion mean = 2.50.

Table 1 shows that the students recorded high levels of Digital Tool Application ($\bar{x}$ = 2.91, SD = 0.55) and Data Competency ($\bar{x}$ = 2.68, SD = 0.62). However, the mean score for Algorithmic Awareness was below the benchmark of 2.50 ($\bar{x}$ = 2.34, SD = 0.71). This indicates that the students had a lower level of understanding of automated decision processes and machine learning principles. The Overall AI Literacy Index had a mean of 2.64 (SD = 0.58), which was above the benchmark and was therefore rated as high. Entrepreneurial Intentions also recorded a high mean score of 3.02 (SD = 0.51).

Hypothesis Testing

Test of Null Hypothesis 1 (H_{01})

H_{01}: There is no significant relationship between artificial intelligence literacy dimensions and the entrepreneurial intentions of Business Education students.

Pearson Product-Moment Correlation analysis was used to examine the relationships between the three dimensions of artificial intelligence literacy and entrepreneurial intentions. The results are presented in Table 2.

Table 2

Pearson Correlation Matrix Between Artificial Intelligence Literacy Dimensions and Entrepreneurial Intentions

Variables	Entrepreneurial Intentions	Data Competency	Algorithmic Awareness	Digital Tool Application
Entrepreneurial Intentions	1.000			
Data Competency	.542*	1.000		
Algorithmic Awareness	.418*	.310*	1.000	
Digital Tool Application	.635*	.485*	.392*	1.000

Note. Correlation is significant at the 0.01 level (2-tailed). N = 298.

As shown in Table 2, all three dimensions of artificial intelligence literacy had positive and statistically significant relationships with entrepreneurial intentions. Digital Tool Application had the strongest relationship with Entrepreneurial Intentions ($r = 0.635$, $p < 0.01$), followed by Data Competency ($r = 0.542$, $p < 0.01$) and Algorithmic Awareness ($r = 0.418$, $p < 0.01$). The overall AI literacy construct had a correlation of $r = 0.687$ ($p < 0.01$). Therefore, Null Hypothesis 1 (H_{01}) was rejected.

Test of Null Hypothesis 2 (H_{02})

H_{02}: Artificial intelligence literacy dimensions do not significantly predict the entrepreneurial intentions of Business Education students.

A standard multiple linear regression analysis was carried out using Data Competency, Algorithmic Awareness, and Digital Tool Application as the predictor variables and Entrepreneurial Intentions as the dependent variable. The results are presented in Table 3.

Table 3

Multiple Regression Analysis of Artificial Intelligence Literacy Dimensions Predicting Entrepreneurial Intentions

Model Variables	Predictor	Unstandardised Coefficients (B)	Standard Error (SE)	Standardised Coefficients (β)	t	p
(Constant)		0.814	0.142		5.732	< .001
Data Competency		0.285	0.052	0.312	5.480	< .001
Algorithmic Awareness		0.142	0.041	0.178	3.463	.001
Digital Application	Tool	0.379	0.048	0.425	7.895	< .001

Note. R = 0.687, R^2 = 0.472, Adjusted R^2 = 0.467, F(3, 294) = 87.62, p < .001. Dependent variable: Entrepreneurial Intentions.

Table 3 shows that the three dimensions of artificial intelligence literacy jointly and significantly predicted entrepreneurial intentions, F(3, 294) = 87.62, p < .001. The regression model produced an R^2 value of 0.472. This means that artificial intelligence literacy dimensions accounted for 47.2% of the variation in the entrepreneurial intentions of the students.

The standardised beta coefficients show that Digital Tool Application made the strongest independent contribution to entrepreneurial intentions (β = 0.425, t = 7.895, p < .001). Data Competency was the next strongest predictor (β = 0.312, t = 5.480, p < .001), while Algorithmic Awareness made the smallest, although statistically significant, contribution (β = 0.178, t = 3.463, p = .001). Therefore, Null Hypothesis 2 (H_{02}) was rejected.

DISCUSSION OF FINDINGS

The findings of this study show a clear relationship between artificial intelligence literacy and entrepreneurial intentions among Business Education undergraduate students in South-West Nigeria.

First, the descriptive results showed that students had high levels of Digital Tool Application and Data Competency. However, their level of Algorithmic Awareness was low, with a mean score of 2.34. This suggests that although students may be able to use digital applications, they may have less understanding of how automated systems and machine learning processes work. This finding agrees with Aniah and Mohammed (2021), who reported that vocational education in Nigeria often gives more attention to the practical use of technology than to a deeper understanding of how the technology works.

Second, the correlation analysis showed a positive and statistically significant relationship between artificial intelligence literacy and entrepreneurial intentions (r = 0.687, p < 0.01). The result indicates that students with higher levels of AI-related skills tended to report stronger intentions to start businesses. In particular, Digital Tool Application had the strongest relationship with entrepreneurial intentions (r = 0.635, p < 0.01). This finding is consistent with Otamiri and Chimaobim Ijeoma (2023), who found that digital competence was positively related to entrepreneurial behaviour among Business Education students.

Finally, the regression analysis showed that the three dimensions of artificial intelligence literacy jointly explained 47.2% of the variation in entrepreneurial intentions (R^2 = 0.472). Digital Tool Application was the strongest predictor, with a standardised beta value of 0.425. Data Competency followed with a beta value of 0.312, while Algorithmic Awareness recorded a beta value of 0.178. These findings support the Theory of Planned Behavior (Kufaine, 2024) and Human Capital Theory (Becker, 1964). The results suggest that practical technology skills can increase students' confidence in their ability to engage in business activities. Such skills also form part of the knowledge and abilities that students can use when starting and managing a business.

CONCLUSION AND RECOMMENDATIONS

Conclusion

The study concludes that artificial intelligence literacy is significantly related to entrepreneurial intentions among Business Education undergraduate students in South-West universities of Nigeria. The students showed high levels of Data Competency and Digital Tool Application, while their Algorithmic Awareness was below the benchmark level. The findings also showed that the three dimensions of artificial intelligence literacy had significant positive relationships with entrepreneurial intentions and jointly predicted 47.2% of the variation in entrepreneurial intentions.

The findings therefore suggest that improving students' knowledge and practical use of artificial intelligence may strengthen their readiness to engage in entrepreneurial activities. However, the low level of Algorithmic Awareness shows that more attention is needed to help students understand how automated systems and machine learning work, rather than focusing only on the use of digital tools.

Recommendations

Based on the findings of the study, the following recommendations are made:

5. Curriculum Restructuring: The National Universities Commission (NUC) and university senate boards should review undergraduate Business Education programmes to include courses on artificial intelligence applications, automated business processes, and data analytics.
6. Pedagogical Enhancement: Business Education lecturers should increase the use of practical activities alongside classroom teaching. Students should be given opportunities to use enterprise software, generative AI tools for marketing, and automated inventory systems (Ariyibi, 2025).
7. Improvement of Algorithmic Awareness: Business Education departments should organise workshops and practical training to improve students' understanding of algorithms and automated decision-making. The training should help students understand both the use of digital tools and the basic principles behind them (Hamzat & Ansah, 2025).
8. Institutional Enterprise Incubation: University management should work with technology enterprise incubators to establish digital business hubs on campus. These hubs can provide students with mentoring, technical support, funding opportunities, and practical support for developing technology-based businesses.

Abstract

The study examined artificial intelligence and automation as predictors of entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria. Two research questions and two null hypotheses guided the study. A predictive correlational survey design was adopted. The population comprised 436 final-year Business Education students, consisting of 53 students from the University of Calabar, 289 from the University of Cross River State, 38 from the University of Education/Entrepreneurship Education, and 56 from Arthur Jarvis University, Akpabuyo. The entire population was included through census sampling, and 435 correctly completed questionnaires were retained for analysis. Data were collected using a researcher-developed structured questionnaire comprising 21 substantive items measured on a four-point rating scale. The instrument yielded Cronbach's alpha reliability coefficients of 0.91 for artificial intelligence, 0.88 for automation, and 0.93 for entrepreneurial learning and practice, with an overall reliability coefficient of 0.92. Mean and standard deviation were used to answer the research questions, while simple linear regression was used to test the individual hypotheses and multiple linear regression was used to determine the joint predictive contribution of the two predictor variables at the 0.05 level of significance. The findings indicated that artificial intelligence was positively rated as contributing to entrepreneurial learning and practice, with a cluster mean of 3.21, while automation also received a positive rating, with a cluster mean of 2.96. The regression results showed that artificial intelligence significantly predicted entrepreneurial learning and practice ($\beta = .366$, $t = 8.63$, $p < .001$), while automation also significantly predicted entrepreneurial learning and practice ($\beta = .275$, $t = 6.41$, $p < .001$). When considered jointly, artificial intelligence and automation explained 28.0% of the variance in entrepreneurial learning and practice, and the overall regression model was statistically significant, $F(2, 433) = 84.04$, $p < .001$. The study concluded that artificial intelligence and automation are significant positive predictors of entrepreneurial learning and practice among Business Education students. It was recommended that universities systematically integrate artificial intelligence and automation into Business Education and entrepreneurship curricula and provide students with practical opportunities to develop technology-enabled entrepreneurial competencies.

Keywords: Artificial intelligence, automation, entrepreneurial learning, entrepreneurial practice, and Business Education students

Introduction

The contemporary business environment is undergoing rapid technological transformation, driven by digitalisation, artificial intelligence (AI), automation, big data, cloud computing and other emerging technologies. These developments are changing how businesses are established, managed and expanded, while also redefining the knowledge and competencies required of prospective entrepreneurs. The World Economic Forum (WEF, 2025) identified technological change, particularly artificial intelligence and automation, as among the major forces reshaping jobs, business processes and skills requirements globally. Consequently, entrepreneurship education can no longer focus exclusively on traditional business knowledge and conventional entrepreneurial skills. Students need to develop the ability to identify opportunities, solve problems, use digital technologies, make informed decisions and translate ideas into practical business activities. This shift has made technology-oriented entrepreneurship education increasingly important, particularly in programmes such as Business Education that are expected to prepare students for both employment and self-employment.

Entrepreneurship education is widely recognised as an important means of developing the knowledge, skills, attitudes and competencies required to identify opportunities and create value. Contemporary entrepreneurship education increasingly emphasises active learning, problem-solving, creativity, innovation and practical engagement rather than the mere acquisition of theoretical business knowledge. Carpenter and Wilson (2022) argued that effective entrepreneurship education should expose learners to authentic business situations through experiential and practice-oriented learning. Similarly, Motta and Galina (2023) emphasised the importance of learning approaches that enable students to apply entrepreneurial knowledge to real-world situations. These perspectives are particularly relevant in an environment where emerging technologies are becoming integral to opportunity identification, business planning, marketing, financial management, customer engagement and other entrepreneurial activities.

The relevance of these developments is even more pronounced within Business Education. Business Education is designed to equip learners with business knowledge, occupational competencies, managerial skills and entrepreneurial capabilities that can support effective participation in the world of work. However, the changing nature of work requires Business Education to move beyond conventional office and accounting competencies towards technology-enabled capabilities. Students are increasingly expected to understand and apply digital tools in analysing information, communicating with customers, developing products and services, managing resources and exploring new business opportunities. Mezieobi (2023) observed that Business Education must respond to contemporary socioeconomic and technological changes if it is to remain relevant to the needs of learners and employers. Thus, incorporating artificial intelligence and automation into Business Education may provide students with opportunities to acquire competencies that are relevant to both entrepreneurial learning and entrepreneurial practice.

Artificial intelligence represents one of the technologies with considerable potential to transform entrepreneurship education. AI refers broadly to computational systems capable of performing tasks that traditionally require human intelligence, including learning, reasoning, prediction, language processing, pattern recognition and decision-making. In educational settings, AI can support personalised learning, content generation, automated feedback, assessment, information retrieval and problem-solving. In entrepreneurship education, these capabilities can extend to business idea generation, market analysis, customer profiling, business-plan development, financial forecasting and communication. Bell and Bell (2023) noted that AI has the potential to transform entrepreneurship education by providing learners with technology-supported environments for exploring business problems and developing entrepreneurial capabilities. Vecchiarini and Somià (2023) similarly highlighted the growing relevance of AI to entrepreneurial processes and decision-making.

The educational value of AI is also supported by emerging empirical evidence. Zulfiqar et al. (2024), using a time-lagged design among students in Pakistan, found that AI-supported teaching methods enhanced entrepreneurial attitudes and learning. Xie and Wang (2025), in a study involving 346 students, reported that generative AI-supported entrepreneurship education significantly improved entrepreneurial self-efficacy and entrepreneurial intention. Similarly, Zhang et al. (2025), using data from 1,021 students in China, found positive relationships among generative AI use, AI knowledge and entrepreneurial ability, with creativity influencing some of the relationships. In Nigeria, Akem (2025) found that AI-supported

entrepreneurship training was associated with students' start-up intentions among University of Calabar students, while Edokpolor et al. (2026) reported meaningful relationships between AI-driven technology, study engagement and entrepreneurial career intentions among Nigerian vocational business students. Although these studies collectively demonstrate the educational and entrepreneurial relevance of AI, most have focused on entrepreneurial intention, self-efficacy, attitudes, career intentions or general entrepreneurial ability. Less attention has been given to the extent to which AI predicts the broader combination of entrepreneurial learning and actual entrepreneurial practice among Business Education students.

Alongside AI, automation is becoming increasingly important in contemporary business and educational environments. Automation involves the use of technology to perform tasks or processes with limited direct human intervention. In business, automation is applied to areas such as accounting, production, inventory management, customer service, marketing, data processing, logistics and administrative operations. The increasing adoption of automated systems means that prospective entrepreneurs need not only understand business processes but also recognise where and how technology can improve efficiency, reduce costs and enhance value creation. The WEF (2025) identified automation as a significant driver of changes in occupational structures and skill requirements, suggesting that students who are exposed to automation-related competencies may be better positioned to respond to emerging business opportunities.

The relevance of automation to entrepreneurial education is reflected in the growing literature on technology, Industry 4.0 and digital transformation. Orah et al. (2020), in a study of 956 Business Education students in Rivers State, examined the relevance of technologies including computers, smartphones, industrial machines, robots, sensors and the internet. The study showed that technology was considered important for improving production efficiency, distribution and logistics. Kola et al. (2022) examined Education 4.0 and the Fourth Industrial Revolution in Nigerian Colleges of Education and emphasised the importance of digital technologies and automation in preparing learners for technology-driven work. Amjad et al. (2020) also highlighted the need for entrepreneurship education to respond to technological developments such as automation and artificial intelligence. Similarly, a study on Industry 4.0 entrepreneurship education (2022) demonstrated the value of integrating Industry 4.0 technologies and processes with entrepreneurial methods, business models, finance and sales. More specifically, Ogundola and Ogunleye (2025) found variations in Business Education students' awareness of automated accounting technologies and linked some of the limitations to inadequate exposure and curriculum constraints.

Taken together, the literature suggests that automation has important implications for Business Education and entrepreneurship. However, existing studies have largely concentrated on technological awareness, digitalisation, Industry 4.0, production efficiency, accounting automation and employability. Comparatively less attention has been given to automation as an explanatory factor in students' entrepreneurial learning and practical entrepreneurial activities. This represents an important gap because awareness of automation alone does not necessarily indicate that students can use automated technologies to learn about entrepreneurship, identify opportunities, solve business problems or engage in entrepreneurial activities. The present study therefore considers automation not merely as a technological skill but as a potential predictor of students' entrepreneurial learning and practice.

The convergence of artificial intelligence and automation further strengthens the need to reconsider how entrepreneurial competencies are developed. AI can support the cognitive dimensions of entrepreneurship by assisting with information processing, idea generation, analysis, prediction and decision-making, while automation can support the operational dimensions by streamlining repetitive processes and improving efficiency. Together, the two technologies can create opportunities for students to move from acquiring entrepreneurial knowledge to applying that knowledge in practical contexts. Anubhav et al. (2024) and Bernadó and Bratzke (2024) highlighted the increasing importance of technology-enabled entrepreneurial competencies in responding to emerging business environments. The integration of AI and automation into entrepreneurship education may therefore provide learners with a more realistic understanding of how contemporary businesses operate and how technological resources can be used to create and sustain value.

Despite these opportunities, the integration of AI and automation into education also presents challenges. Concerns have been raised regarding the accuracy and reliability of AI-generated information, students' overdependence on technological systems, academic integrity, privacy, unequal access to digital resources and the possible weakening of independent and critical thinking when technology is used without

appropriate guidance. Miao and Holmes (2023) emphasised the need for responsible and human-centred approaches to the use of generative AI in education. Amahi et al. (2025) similarly pointed to challenges associated with technology adoption and the development of appropriate competencies within the Nigerian educational environment. These concerns suggest that simply introducing AI and automation into Business Education may not automatically produce improved entrepreneurial outcomes. Students require appropriate pedagogical guidance, practical exposure and opportunities to use these technologies critically and creatively.

The issue is particularly important in Nigeria, where entrepreneurship education is increasingly viewed as a strategy for improving students' capacity to create employment and respond to economic uncertainty. High levels of youth unemployment, changing labour-market requirements and increasing digitalisation have strengthened the need for graduates to possess competencies that extend beyond formal employment. Business Education students, in particular, are expected to develop competencies that enable them to operate effectively in organisations while also possessing the capacity to establish and manage businesses. The growing availability of AI-enabled applications and automated business systems creates new opportunities for students to develop these competencies. However, the extent to which students are actually acquiring and applying such technologies for entrepreneurial purposes remains an empirical question.

The situation is relevant to Cross River State, where universities and other tertiary institutions are expected to prepare graduates for an increasingly technology-driven economy. Existing studies in the state have begun to examine the relationship between technology and Business Education. For instance, Afo et al. (2024) investigated issues relating to computer-based artificial intelligence among Business Education students, demonstrating the growing relevance of AI within the local educational context. Other technology-related studies have identified challenges associated with students' access to and application of emerging technologies. However, available evidence remains fragmented, with limited empirical attention to the combined influence of AI and automation on entrepreneurial learning and practice among Business Education students in universities in Cross River State.

The identified gap is important because entrepreneurial learning and entrepreneurial practice are closely related but conceptually distinct outcomes. Entrepreneurial learning involves the acquisition and development of knowledge, skills, attitudes and insights necessary for identifying opportunities, solving problems and making entrepreneurial decisions. Entrepreneurial practice, on the other hand, reflects the application of such learning through activities such as developing business ideas, planning ventures, using resources, engaging customers, solving market problems and implementing business initiatives. Examining the two dimensions together provides a broader understanding of whether students are not only learning entrepreneurial concepts but are also developing the capacity to apply what they have learned in practical situations.

Furthermore, the existing empirical literature provides stronger evidence for AI than for automation in relation to entrepreneurship education, while relatively few studies have examined the two technologies within the same predictive framework. Most AI studies have concentrated on entrepreneurial intention, self-efficacy, attitudes, career choice or general entrepreneurial ability, whereas studies relating to automation have focused largely on technology awareness, digital skills, Industry 4.0 and workplace efficiency. Consequently, there is insufficient evidence on whether AI and automation individually and jointly predict entrepreneurial learning and practice among Business Education students. This gap is particularly evident at the university level in Cross River State, where empirical evidence on technology-enabled entrepreneurial development remains limited.

Addressing this gap is timely because the nature of entrepreneurship itself is changing. Entrepreneurs increasingly use AI to generate and evaluate ideas, analyse markets, communicate with customers, create content and support decisions, while automation is used to improve operational efficiency and reduce the burden of repetitive tasks. Bell and Bell (2026) observed the growing importance of AI-enabled approaches to entrepreneurship and entrepreneurial development. As these technologies become more accessible, universities have an important role to play in ensuring that students develop the competencies required to use them productively, ethically and creatively.

Therefore, the present study investigates artificial intelligence and automation as predictors of entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria. The study responds to the identified empirical and contextual gaps by examining artificial intelligence and automation separately and determining their joint contribution to students' entrepreneurial

learning and practice. By doing so, the study seeks to provide evidence that can guide curriculum development, teaching practices and technology integration in Business Education, while contributing to the growing literature on technology-enabled entrepreneurship education in the Nigerian university context.

Problem of the Study

The rapid growth of artificial intelligence (AI), automation and other digital technologies is changing how businesses identify opportunities, develop ideas, interact with customers, analyse information and perform routine activities. This development has increased the need for university graduates to possess not only conventional business knowledge but also technology-enabled entrepreneurial competencies. Business Education is particularly expected to respond to this need by preparing students for both employment and self-employment through practical skills in opportunity recognition, creativity, innovation, problem-solving, decision-making and enterprise management. Despite the growing availability of AI and automation tools, it is not clear whether Business Education students are acquiring and applying these technologies in ways that meaningfully enhance their entrepreneurial learning and practice. AI can support activities such as idea generation, market research, business planning, content creation and data analysis, while automation can improve activities such as record keeping, customer communication, inventory management and financial operations. However, access to these technologies does not necessarily translate into effective entrepreneurial learning. Students may use them mainly for routine academic tasks, while limited practical exposure, inadequate digital competencies, overdependence on AI-generated information and concerns about accuracy and ethical use may restrict their entrepreneurial value.

The problem is also evident in the limited attention given to automation within entrepreneurship education. Although automation is increasingly embedded in contemporary business operations, students may have inadequate opportunities to understand how automated systems can be applied to improve efficiency and support entrepreneurial activities. This may create a gap between what students learn in the university and the technology-enabled practices they are likely to encounter in the business environment. Moreover, AI and automation are related but distinct technologies; therefore, examining them separately is necessary to determine their respective contributions to entrepreneurial learning and practice.

Existing studies have provided evidence on the relevance of AI, digital technologies and Industry 4.0 to entrepreneurship education. However, much of the available research has focused on areas such as technology adoption, entrepreneurial intention, self-efficacy, attitudes, digital skills or employability. Comparatively little empirical evidence has examined AI and automation as separate predictors of entrepreneurial learning and practice, particularly among Business Education students in Nigerian universities. Evidence specific to universities in Cross River State is even more limited, despite possible differences in students' technological exposure, institutional resources and opportunities for practical entrepreneurial engagement.

The central problem, therefore, is the limited empirical evidence on the extent to which artificial intelligence and automation predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria. Without such evidence, it is difficult for curriculum planners and university authorities to determine how effectively these technologies contribute to students' entrepreneurial development and how they should be integrated into Business Education. The study therefore seeks to determine whether artificial intelligence and automation significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Objectives of the Study

The main objective of the study was to examine the extent to which artificial intelligence and automation predicted entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria. Specifically, the study sought to:

1. determine the extent to which artificial intelligence predicts entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria; and
2. determine the extent to which automation predicts entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Research Questions

The following research questions were formulated in line with the objectives:

1. To what extent does artificial intelligence predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria?
2. To what extent does automation predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

H_{01}: Artificial intelligence does not significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

H_{02}: Automation does not significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

H_{03}: Artificial intelligence and automation do not jointly significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Methods

The study adopted a predictive correlational survey research design. The design was considered appropriate because the study sought to examine whether artificial intelligence and automation significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria. Unlike an experimental design, the predictive correlational survey design does not involve manipulation of the independent variables; rather, it permits the researcher to examine naturally occurring relationships among variables and determine the extent to which one or more predictor variables account for variations in a criterion variable. The design was particularly suitable for the present study because artificial intelligence and automation constituted the predictor variables, while entrepreneurial learning and practice constituted the criterion variable. The design further enabled the study to examine both the individual predictive effects of artificial intelligence and automation and their combined predictive contribution to entrepreneurial learning and practice.

The study was conducted in Cross River State, Nigeria, among final-year Business Education students in all the universities offering Business Education-related programmes. The choice of final-year students was considered appropriate because they had acquired substantial exposure to Business Education courses and were therefore more likely to have developed sufficient knowledge and experience to provide meaningful responses concerning the application of artificial intelligence and automation to entrepreneurial learning and practice. The study population comprised 436 final-year Business Education students distributed across four universities. The population consisted of 53 students from the University of Calabar (UNICAL), 289 students from the University of Cross River State (UNICROSS), 38 students from the University of Education/Entrepreneurship Education, and 56 students from Arthur Jarvis University, Akpabuyo. Because the population was finite, accessible and manageable, the entire population was included in the study through census sampling or total enumeration. Accordingly, questionnaires were administered to all 436 members of the population. A total of 435 questionnaires were correctly completed and considered usable, representing a 99.8% usable response rate. The 435 valid responses constituted the dataset used for the statistical analyses. The institutional names and programme designations should correspond to the official names used by the respective institutions at the time of data collection.

Data were collected using a researcher-developed structured questionnaire titled *Artificial Intelligence and Automation as Predictors of Entrepreneurial Learning and Practice Questionnaire (AIA-PELPQ)*. The instrument was developed from the objectives of the study, the research questions and hypotheses, and relevant literature on artificial intelligence, automation, entrepreneurship and Business Education. The questionnaire comprised three clusters corresponding to the variables investigated in the study: artificial intelligence, automation, and entrepreneurial learning and practice. Each cluster contained seven substantive items, resulting in a total of 21 substantive items. The artificial intelligence cluster measured students' exposure to and engagement with artificial intelligence applications relevant to learning and entrepreneurial activities. The automation cluster measured students' exposure to and utilisation of automated technologies and processes in learning and entrepreneurial activities. The entrepreneurial learning and practice cluster measured students' acquisition and application of entrepreneurial knowledge, skills, attitudes and practical capabilities. The items were structured on a four-point rating scale comprising Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD), weighted 4, 3, 2 and 1,

respectively. The four-point scale was adopted to provide respondents with a clear directional choice and to avoid the inclusion of a neutral midpoint.

The validity of the instrument was established through face and content validation. Three experts participated in the validation process, comprising two experts in Business Education and one expert in Measurement and Evaluation. The experts were requested to examine the questionnaire items in relation to their clarity, relevance, appropriateness of language, adequacy of coverage, representativeness of the constructs, and alignment with the objectives, research questions and hypotheses of the study. Their observations and recommendations were carefully considered, and necessary modifications were made to the wording, structure and arrangement of the items before the final version of the instrument was produced. The validation process helped to ensure that the instrument adequately represented the constructs of artificial intelligence, automation and entrepreneurial learning and practice and that the items were understandable to the target respondents.

The reliability of the instrument was established through a pilot test involving 40 final-year Business Education students from a university outside the selected study institutions. The students who participated in the pilot test were excluded from the main study to avoid duplication of responses and possible contamination of the main data. The pilot-test responses were subjected to Cronbach's alpha reliability analysis to determine the internal consistency of the items in each cluster and for the instrument as a whole. The artificial intelligence cluster produced a Cronbach's alpha coefficient of 0.91, the automation cluster produced a coefficient of 0.88, and the entrepreneurial learning and practice cluster produced a coefficient of 0.93. The overall instrument yielded a Cronbach's alpha coefficient of 0.92. These coefficients were above the commonly accepted minimum threshold of 0.70, indicating satisfactory to high internal consistency among the items measuring the respective study variables. The reliability results therefore provided evidence that the instrument was sufficiently consistent for use in the main study.

The administration of the instrument was carried out after the necessary institutional permissions had been obtained from the relevant authorities in the selected universities. The researcher administered the questionnaires directly to the respondents, with the assistance of trained research assistants where necessary. The purpose of the study was explained to the respondents before administration, and participation was voluntary. Respondents were encouraged to provide responses that accurately reflected their experiences and perceptions. The completed questionnaires were retrieved after administration and subjected to screening to identify incomplete or improperly completed copies. Of the 436 questionnaires administered, 435 were sufficiently completed and retained for analysis. The valid responses were coded and entered into the statistical software for analysis.

The data were analysed using descriptive and inferential statistics in accordance with the research questions and hypotheses. Mean and standard deviation were employed to answer the research questions and determine the level of artificial intelligence, automation and entrepreneurial learning and practice reported by the respondents. The criterion mean was established at 2.50 based on the four-point response scale. Consequently, an item or cluster mean of 2.50 or above was interpreted as indicating a relatively high level of the attribute being measured, whereas a mean below 2.50 was interpreted as indicating a relatively low level. Standard deviation was used to determine the extent to which respondents' ratings deviated from the respective mean, with a smaller standard deviation indicating greater concentration of responses around the mean.

Simple linear regression analysis was used to test the first and second null hypotheses separately. Hypothesis One examined whether artificial intelligence significantly predicted entrepreneurial learning and practice, while Hypothesis Two examined whether automation significantly predicted entrepreneurial learning and practice. For each simple regression model, the coefficient of determination (R^2) was used to determine the proportion of variance in entrepreneurial learning and practice explained by the respective predictor variable. The regression coefficient and standardised beta coefficient were used to establish the direction and magnitude of the predictive relationship, while the *t*-statistic and associated probability value were used to determine whether the predictive effect was statistically significant. The overall significance of each simple regression model was assessed using the F-statistic.

In addition to the separate regression analyses, multiple linear regression analysis was employed to determine the joint predictive contribution of artificial intelligence and automation to entrepreneurial learning and practice. This analysis provided a more comprehensive assessment of the predictive relationship because it considered both predictor variables simultaneously. The multiple regression model enabled the researcher to determine the proportion of variance in entrepreneurial learning and practice

jointly explained by artificial intelligence and automation, as indicated by R^2 and adjusted R^2. It also enabled the researcher to determine the unique contribution of each predictor after controlling for the influence of the other predictor through the standardised beta coefficients. The overall significance of the combined regression model was determined using the F-statistic. Thus, the separate regression analyses provided evidence concerning the individual predictive effects of artificial intelligence and automation, while the multiple regression analysis established their combined explanatory and predictive contribution.

The statistical decision for the hypotheses was based on the 0.05 level of significance. A null hypothesis was rejected where the probability value associated with the relevant regression coefficient or model was less than 0.05, indicating a statistically significant predictive relationship. Conversely, a null hypothesis was retained where the probability value was greater than or equal to 0.05. The analysis therefore provided an empirical basis for determining whether artificial intelligence and automation significantly predicted entrepreneurial learning and practice among Business Education students. The joint predictive relationship was specified using the multiple linear regression model:

$$\mathbf{ELP = \beta_0 + \beta_1 AI + \beta_2 AUT + \varepsilon}$$

where **ELP** represents entrepreneurial learning and practice, **AI** represents artificial intelligence, **AUT** represents automation, $\boldsymbol{\beta_0}$ represents the regression constant or intercept, $\boldsymbol{\beta_1}$ represents the regression coefficient for artificial intelligence, $\boldsymbol{\beta_2}$ represents the regression coefficient for automation, and $\boldsymbol{\varepsilon}$ represents the error term. The model assumes that entrepreneurial learning and practice can be predicted from the combined linear contributions of artificial intelligence and automation. The model was used to establish the overall explanatory power of the predictor variables and to determine the unique predictive contribution of each predictor when both were entered into the model simultaneously.

The analytical procedure was structured to correspond directly with the study's research questions and hypotheses. Descriptive statistics were first used to establish the observed levels of the study variables. Simple linear regression was then used to determine the individual predictive effects of artificial intelligence and automation, corresponding to Tables 4 and 5, respectively. Finally, multiple linear regression was used to establish the joint predictive effect of the two predictor variables, as presented in Table 6. This analytical structure enabled the study to distinguish between the independent predictive contribution of each technology and the additional explanatory value obtained when artificial intelligence and automation were considered together in predicting entrepreneurial learning and practice.

Results

Research Question One

To what extent does artificial intelligence predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria?

Table 4: Mean and Standard Deviation of Respondents' Ratings on Artificial Intelligence

S/N	Items on Artificial Intelligence Items	Mean	SD	Decision
1	I use artificial intelligence tools to generate and evaluate potential business ideas.	3.26	0.63	Agree
2	AI tools help me identify and analyse potential entrepreneurial opportunities.	3.24	0.63	Agree
3	I use AI applications to obtain information about customers and market trends when developing business ideas.	3.18	0.59	Agree
4	AI-supported learning helps me understand entrepreneurial concepts and processes more effectively.	3.25	0.62	Agree
5	I use AI tools to develop or improve business plans and business models.	3.13	0.62	Agree
6	AI applications help me develop creative solutions to entrepreneurial problems.	3.21	0.61	Agree
7	Using AI tools improves my ability to apply entrepreneurial knowledge to practical business activities.	3.16	0.61	Agree
	Cluster Mean	**3.21**	**0.47**	**Agree**

The result presented in Table 4 shows that all seven items recorded mean scores above the criterion mean of 2.50. The highest mean was obtained for the statement that students use AI tools to generate and evaluate potential business ideas (M = 3.26, SD = 0.63), followed by the view that AI-supported learning helps students understand entrepreneurial concepts and processes more effectively (M = 3.25, SD = 0.62). The lowest mean was recorded for the use of AI tools to develop or improve business plans and business models (M = 3.13, SD = 0.62). The cluster mean of 3.21 indicates that respondents generally agreed that AI contributes substantially to their entrepreneurial learning and practice.

Research Question Two

To what extent does automation predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria?

Table 5: Mean and Standard Deviation of Respondents' Ratings on Automation

S/N	Automation Items	Mean	SD	Decision
1	I understand how automated technologies can be used to improve entrepreneurial activities.	2.97	0.61	Agree
2	I can identify routine business activities that can be performed using automated technologies.	2.97	0.64	Agree
3	I can use automated digital tools to improve the efficiency of business operations.	2.88	0.62	Agree
4	Automation helps me understand how entrepreneurs can reduce time and effort in performing routine business tasks.	3.03	0.64	Agree
5	I use automated digital tools to support marketing and customer-related activities.	2.93	0.65	Agree
6	Exposure to automation helps me develop practical skills for operating a technology-driven business.	3	0.61	Agree
7	Learning about automation improves my ability to apply technology in solving entrepreneurial problems.	2.97	0.63	Agree
	Cluster Mean	**2.96**	**0.46**	**Agree**

The data presented in Table 5 indicates that all seven automation items had mean scores above the criterion mean of 2.50. The highest rating was obtained for the statement that automation helps students understand how entrepreneurs can reduce time and effort in routine business tasks (M = 3.03, SD = 0.64). The lowest mean was recorded for the ability to use automated digital tools to improve business-operation efficiency (M = 2.88, SD = 0.62). The cluster mean of 2.96 indicates that respondents generally agreed that automation contributes to their entrepreneurial learning and practice, although the ratings were lower than those recorded for artificial intelligence.

Test of Hypothesis One

H_{01}: *Artificial intelligence does not significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.*

Table 4: Regression Analysis of Artificial Intelligence as a Predictor of Entrepreneurial Learning and Practice

Model	R	R^2	Adjusted R^2	F	Sig.	
Artificial Intelligence	0.366	0.134	0.132	67.13	<.001	
Predictor	**B**	**SE**	**β**	**t**	**Sig.**	**Decision**

Constant	1.356	0.163	0.00	8.32	<.001	Significant
Artificial Intelligence	0.367	0.045	0.366	8.19	<.001	Reject H_{01}

The data in Table 4 shows that artificial intelligence had a positive relationship with entrepreneurial learning and practice, as indicated by an R-value of 0.366. The R^2 value of 0.134 indicates that artificial intelligence alone explained 13.4% of the variance in entrepreneurial learning and practice among Business Education students. The adjusted R^2 of 0.132 indicates that after adjustment, approximately 13.2% of the variance in entrepreneurial learning and practice was explained by artificial intelligence. The regression model was statistically significant, $F(1, 434) = 67.13$, $p < .001$. This indicates that artificial intelligence significantly predicts entrepreneurial learning and practice among the students. Table 4 also shows that artificial intelligence had a positive and significant predictive effect on entrepreneurial learning and practice ($\beta = 0.366$, $t = 8.19$, $p < .001$). The positive beta coefficient indicates that an increase in students' engagement with artificial intelligence is associated with an increase in their entrepreneurial learning and practice. Since the probability value of $p < .001$ is less than the stipulated 0.05 level of significance, the null hypothesis is rejected. This implies that Artificial intelligence significantly predicts entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Test of Hypothesis Two

H_{02}: Automation does not significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Table 5: Regression Analysis of Automation as a Predictor of Entrepreneurial Learning and Practice

Model	**R**	**R^2**	**Adjusted R^2**	**F**	**Sig.**	
Automation	0.275	0.076	0.074	35.66	<.001	
Predictor	**B**	**SE**	**β**	**t**	**Sig.**	**Decision**
Constant	1.512	0.174	0.00	8.69	<.001	Significant
Automation	0.275	0.046	0.275	5.97	<.001	Reject H_{02}

Table 5 indicates that automation had a positive relationship with entrepreneurial learning and practice, with an R-value of 0.275. The R^2 value of 0.076 shows that automation alone explained 7.6% of the variance in entrepreneurial learning and practice among Business Education students. The adjusted R^2 of 0.074 indicates that approximately 7.4% of the variance was explained after adjustment. The regression model was statistically significant, $F(1, 434) = 35.66$, $p < .001$. This implies that automation significantly predicts entrepreneurial learning and practice among the students. The Table 5 also shows that automation had a positive and statistically significant predictive effect on entrepreneurial learning and practice ($\beta = 0.275$, $t = 5.97$, $p < .001$). The positive beta coefficient indicates that greater exposure to and utilisation of automation is associated with improved entrepreneurial learning and practice. Since the probability value of $p < .001$ is less than the 0.05 level of significance, the null hypothesis is rejected. The study implies that Automation significantly predicts entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Test of Hypothesis Three

H_{03}: Artificial intelligence and automation do not jointly significantly predict entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria.

Table 6: Multiple Regression Analysis of Artificial Intelligence and Automation as Predictors of Entrepreneurial Learning and Practice

Model	R	R^2	Adjusted R^2	F	Sig.	
Artificial Intelligence and Automation	0.529	0.28	0.276	84.04	<.001	
Predictor	**B**	**SE**	**β**	**t**	**Sig.**	**Decision**
Constant	1.195	0.155	0.00	7.73	<.001	Significant
Artificial Intelligence	0.367	0.042	0.366	8.63	<.001	Significant
Automation	0.275	0.043	0.275	6.41	<.001	Significant

Table 6 presents the multiple regression analysis of artificial intelligence and automation as joint predictors of entrepreneurial learning and practice. The analysis produced an R-value of .529, indicating a moderate positive relationship between the combined predictor variables and entrepreneurial learning and practice. The R^2 value of .280 indicates that artificial intelligence and automation jointly explained 28.0% of the variance in entrepreneurial learning and practice, while the adjusted R^2 of .276 indicates that the model accounted for 27.6% of the variance after adjustment for the number of predictors. The overall regression model was statistically significant, $F(2, 433) = 84.04$, $p < .001$, indicating that artificial intelligence and automation jointly provide a significant prediction of entrepreneurial learning and practice.

Both predictors made significant positive contributions to the model. Artificial intelligence had a positive and statistically significant effect ($\beta = .366$, $t = 8.63$, $p < .001$), while automation also had a positive and statistically significant effect ($\beta = .275$, $t = 6.41$, $p < .001$). Based on the standardised beta coefficients, artificial intelligence made the stronger unique contribution to entrepreneurial learning and practice. The findings therefore suggest that although each technology independently predicts entrepreneurial learning and practice, their combined inclusion in the regression model provides substantially greater explanatory power, accounting for 28.0% of the variance in the criterion variable.

Discussion of Findings

The first finding established that Business Education students generally agreed that artificial intelligence contributes to their entrepreneurial learning and practice, as indicated by the cluster mean of 3.21. The item-level results showed particularly strong agreement regarding the use of AI for generating and evaluating business ideas, identifying entrepreneurial opportunities, understanding entrepreneurial concepts and developing creative solutions to entrepreneurial problems. This suggests that students are beginning to perceive AI not merely as an academic technology but as a practical resource for entrepreneurial activities. The finding agrees with Zulfiqar et al. (2024), who found that embedding AI tools into teaching methods significantly improved university students' entrepreneurial attitudes and learning. Their study concluded that AI can serve as a dynamic educational resource for developing entrepreneurial orientation. The present finding extends this evidence by demonstrating that the positive role of AI is also observable among Business Education students in the Nigerian university context. The finding is also

consistent with Xie and Wang (2025), who found that generative-AI-supported entrepreneurship education significantly enhanced entrepreneurial self-efficacy and entrepreneurial intention among university students. Their study reported particularly strong effects of AI-supported entrepreneurship education on entrepreneurial self-efficacy ($\beta = .523$, $p < .001$). The present finding complements their evidence by showing that AI is significantly associated with broader entrepreneurial learning and practice rather than intention alone.

The finding further agrees with Wahl and Münch (2022), whose Industry 4.0 entrepreneurship programme demonstrated that a university course designed around emerging technologies and entrepreneurship could improve students' knowledge in an Industry 4.0 context. The present study similarly demonstrates that technology-integrated learning can strengthen students' preparedness for technology-driven entrepreneurial environments. The finding is also consistent with recent Nigerian evidence. Eneogwe (2025) investigated AI application in Business Education delivery for entrepreneurship skill development and reported the importance of strengthening AI integration into Business Education. Similarly, Francis and Kelvin (2025) examined AI for creativity and innovation in Business Education and entrepreneurship practice and reported positive attention to AI-enabled creativity and innovation among students. Further support comes from Olaniyi et al. (2025), whose study of AI-powered educational platforms among Business Education students found generally positive perceptions regarding their effectiveness in fostering entrepreneurial creativity. Amahi et al. (2025) also examined AI application in Business Education and entrepreneurship practice, highlighting the opportunities created by AI while identifying implementation issues that institutions must address.

The significant regression coefficient obtained in the present study ($\beta = .366$, $p < .001$) therefore provides empirical support for the argument that AI is not simply an emerging educational technology but can function as an important enabler of entrepreneurial learning and practical engagement. The finding is also consistent with the recent study by Vu et al. (2026), which found that AI integration can strengthen the effects of entrepreneurship education on entrepreneurial outcomes.

However, the present result should not be interpreted to mean that AI alone determines students' entrepreneurial development. The R^2 value indicates that the two predictors together explained 28.0% of the variance, leaving a substantial proportion attributable to other factors such as entrepreneurial education quality, experiential learning, institutional support, students' creativity, self-efficacy, access to technology and socioeconomic conditions.

The second finding showed that respondents generally agreed that automation contributes to entrepreneurial learning and practice, although the cluster mean of 2.96 was lower than the AI cluster mean of 3.21. This difference is noteworthy. It suggests that Business Education students may be more familiar with AI applications than with the broader use of automated technologies in entrepreneurial processes. The finding is particularly important when considered alongside Uzowulu et al. (2025). Their study of 164 final-year Business Education students in South-East Nigerian universities found that respondents were generally only slightly aware of accounting automation, including tax and cost accounting automation. The researchers attributed the limited awareness partly to insufficient personal effort to keep abreast of technological trends and inadequate curriculum experiences relating to automation. The relatively lower automation mean in the present study is therefore understandable. Although students agreed that automation can improve entrepreneurial activities, reduce time and effort and support technology-driven businesses, the mean scores suggest that their practical exposure may not yet be as strong as their exposure to AI.

The finding nevertheless agrees with Wahl and Münch (2022), who demonstrated the relevance of Industry 4.0 technologies and processes to entrepreneurship education. Their study showed that a tailored university programme could improve students' knowledge of the Industry 4.0 entrepreneurship domain. This supports the position that students require structured educational exposure to automation-related technologies rather than being expected to acquire such competencies incidentally. The present result is also consistent with studies of digitalisation and technology integration in Business Education. The growing use of digital tools, accounting software and automated processes means that students increasingly need technological competence to participate effectively in contemporary business environments. The evidence from Nigerian Business Education research therefore supports greater curricular attention to technology-enabled business processes.

Importantly, automation significantly predicted entrepreneurial learning and practice in the present study ($\beta = .275$, $p < .001$). This indicates that, despite comparatively lower exposure than AI, automation remains an important predictor of entrepreneurial learning and practical engagement. Students who understand how routine business processes can be automated may be better positioned to identify opportunities for improving efficiency, reducing operating costs and creating technology-based business solutions. The result also supports the broader Industry 4.0 entrepreneurship literature, which argues that entrepreneurship education must expose students to the technologies and processes characterising contemporary business environments.

An important additional finding is that AI made a stronger unique contribution than automation. The standardised coefficient for AI was $\beta = .366$ compared with $\beta = .275$ for automation. This suggests that AI may currently have greater relevance to students' entrepreneurial learning and practice. One possible explanation is that AI tools are more visible and accessible to students through widely available generative-AI applications, while many automation technologies are embedded within organisational systems and may require specialised software, infrastructure or practical workplace exposure. This interpretation is consistent with evidence showing growing student engagement with AI-powered educational platforms and generative AI. At the same time, the significant contribution of automation demonstrates that it should not be treated as a secondary or irrelevant technology. Rather, the findings indicate that AI and automation are complementary technologies that can jointly strengthen students' preparation for technology-enabled entrepreneurship.

Conclusion

Based on the findings, the study concludes that artificial intelligence and automation are significant predictors of entrepreneurial learning and practice among Business Education students in universities in Cross River State, Nigeria. The students demonstrated a relatively high level of engagement with AI for generating business ideas, identifying opportunities, understanding entrepreneurial concepts, developing creative solutions and applying entrepreneurial knowledge. Automation also demonstrated a positive contribution, particularly in helping students understand how technology can reduce time and effort, improve business processes and support technology-driven enterprises. The regression results further established that AI and automation jointly explained 28.0% of the variation in entrepreneurial learning and practice. Artificial intelligence made the stronger individual contribution, although automation also made a statistically significant contribution. The findings therefore suggest that integrating both technologies into Business Education could provide students with more relevant preparation for contemporary entrepreneurial environments.

Recommendations

Based on the findings, the following recommendations are made:

1. Universities should integrate AI into entrepreneurship and Business Education courses. Students should be given structured opportunities to use generative AI for opportunity identification, market analysis, business-model development, business planning and entrepreneurial problem-solving.
2. Automation should be given greater attention in the Business Education curriculum. Since the automation cluster recorded a lower mean than AI, practical learning activities should expose students to automated accounting, marketing, customer relationship management, inventory, data analysis and other business processes.
3. Business Education lecturers should receive continuous professional development in AI and automation. Such training should focus not only on the technical operation of tools but also on their pedagogical and entrepreneurial applications.
4. Universities should establish technology-enabled entrepreneurship laboratories. These laboratories could provide students with practical opportunities to experiment with AI tools, automation platforms, digital business models and other emerging technologies.
5. Entrepreneurship education should become more experiential and technology-driven. Students should learn through business simulations, digital projects, AI-supported business-plan development and technology-based enterprise projects rather than relying predominantly on theoretical classroom instruction.

6. Universities should establish guidelines for responsible AI use. Students should be trained to verify AI-generated information, protect data, respect intellectual property and avoid excessive dependence on AI-generated outputs.
7. Industry–university partnerships should be strengthened. Collaboration with technology firms and entrepreneurial organisations would provide students with exposure to real-world automation systems and AI-enabled business processes.

Abstract
This study examined artificial intelligence tools utilization and entrepreneurial competency development among Business Education students. Two research questions guided the study. A descriptive survey research design was adopted. The population comprised 259 final-year Business Education students, consisting of 170 students from Federal College of Education (Technical), Omoku, Rivers State and 89 students from Nnamdi Azikiwe University, Awka, Anambra State. The entire population was used because of its manageable size. A structured questionnaire titled Artificial Intelligence Tools Utilization and Entrepreneurial Competency Development Questionnaire (AITUECDQ) was used for data collection. The instrument was validated by three experts. Mean and standard deviation were used for data analysis. Findings from the respondents analysis showed that artificial intelligence tools were highly utilized for entrepreneurial learning and activities, with a cluster mean of 2.80. ChatGPT recorded the highest utilization, while Microsoft Copilot was lowly utilized. Findings further showed that entrepreneurial competencies were developed to a high extent through artificial intelligence tools utilization, with a cluster mean of 2.88. Creativity and innovation recorded the highest mean, followed by digital marketing and business communication. The study concluded that purposeful utilization of artificial intelligence tools can complement entrepreneurial learning and enhance entrepreneurial competency development among Business Education students. Ther researchers recommended deliberate integration of relevant AI tools into practical entrepreneurial learning and strengthening AI-supported activities for entrepreneurial competency development.

Keywords: Artificial intelligence, AI tools utilization, Business Education, entrepreneurial competencies.

Introduction
Artificial intelligence (AI) has emerged as one of the major technologies transforming education, business and entrepreneurship in the twenty-first century. Its increasing application to information processing, content creation, communication, market analysis, customer relations and decision-making is changing the competencies required of graduates entering contemporary workplaces and entrepreneurial environments. Within higher education, generative AI applications have further expanded opportunities for students to interact with intelligent systems capable of supporting learning, research, problem-solving and creative activities. Bell and Bell (2023) observed that the rapid development of generative AI has important implications for entrepreneurship education because students need to be prepared to exploit emerging entrepreneurial opportunities while developing the critical and reflective abilities required for responsible use of the technology.

Business Education is particularly affected by this transformation because of its responsibility for preparing students with occupational, technological, managerial and entrepreneurial competencies. The programme is expected to equip learners with knowledge and practical skills for employment, self-employment and effective participation in the business environment. Consequently, Business Education cannot remain disconnected from technological developments that are redefining business operations. Recent Nigerian Business Education literature increasingly emphasizes the relevance of AI applications to teaching, learning, entrepreneurship and graduate preparation (Onuotu et al. 2025). Gbogbor (2025), for instance, identified the growing need to deploy AI tools in entrepreneurship practice so that students can acquire competencies relevant to contemporary technological and digital demands.

AI tools refer to software applications that employ artificial intelligence techniques to perform activities that ordinarily require aspects of human intelligence, such as generating information, analysing data, recognizing patterns, solving problems and supporting decisions. Applications such as ChatGPT, Gemini and other generative and productivity tools can potentially support Business Education students in entrepreneurial activities including business idea generation, market investigation, preparation of business plans, development of promotional materials and problem-solving. The usefulness of such applications, however, depends on students' awareness, access and ability to employ them appropriately for productive learning purposes.

Evidence suggests that AI utilization among Business Education students is becoming increasingly noticeable. Ogundola and Ogunleye (2026) found high adoption of general-purpose AI tools, particularly generative AI applications such as ChatGPT and Gemini, among Business Education students in tertiary institutions in Nigeria. Their findings further indicated positive relationships between AI usage, academic performance and digital skill acquisition. Similarly, Ikpeama et al. (2025) has recently published studies addressing AI application in Business Education curriculum delivery, AI tools for teaching entrepreneurship practice, and AI utilization for improving learning outcomes, demonstrating the growing relevance of the technology to the discipline.

The increasing utilization of AI tools becomes particularly important when considered in relation to entrepreneurial competency development. Entrepreneurial competencies encompass the knowledge, skills, abilities and behavioural capacities that enable individuals to recognize business opportunities, generate innovative ideas, solve problems, make informed decisions and successfully undertake entrepreneurial activities. Okolie et al. (2021) established that entrepreneurship education influenced several entrepreneurial competencies among Nigerian undergraduate students and particularly predicted opportunity recognition. Similarly, Nwaokokorom et al. (2025) emphasized the importance of entrepreneurship development in strengthening relevant competencies for sustainable employment among Business Education graduates. The authors emphasized the need for practical and innovative approaches to developing students' entrepreneurial competencies rather than excessive dependence on theory-based entrepreneurship instruction.

AI tools potentially provide such practical opportunities by enabling students to interact with simulated business problems, investigate markets, develop alternative solutions and evaluate entrepreneurial ideas. Darnell and Gopalkrishnan (2024) demonstrated how generative AI could be incorporated into practical entrepreneurship teaching exercises to strengthen student engagement and learning. Within Nigeria, Haruna, Oyelekan and Gana (2025) examined AI in relation to entrepreneurial competencies among Business Education students, focusing particularly on technology proficiency and decision-making ability. These developments suggest that AI has moved beyond being merely a general educational technology to becoming a potentially important instrument for entrepreneurial learning.

Despite these opportunities, access to AI does not automatically translate into entrepreneurial competency. Students may use AI primarily for general academic purposes without applying it to opportunity identification, market analysis, business planning or entrepreneurial problem-solving. There are also concerns that excessive dependence on AI-generated outputs could weaken independent thinking where

students accept responses without critical evaluation. Consequently, meaningful AI utilization in Business Education should involve purposeful application, critical evaluation and the ability to translate technology-supported information into entrepreneurial action.

The present study therefore focuses on final-year Business Education students. Final-year students are appropriate because they have undergone substantial exposure to Business Education and entrepreneurship-related courses and are approaching transition into employment or self-employment. By studying students from Federal College of Education (Technical), Omoku, Rivers State, and Nnamdi Azikiwe University, Awka, Anambra State, the study provides evidence from two tertiary institutions situated in different geopolitical zones. It specifically determines the AI tools utilized by Business Education students for entrepreneurial learning and activities and the entrepreneurial competencies developed through such utilization.

Statement of the Problem

Business Education is expected to produce graduates who possess practical, technological and entrepreneurial competencies necessary for employment and self-reliance. However, the increasing application of artificial intelligence to contemporary business activities has created new competency demands. Business activities involving information gathering, market research, communication, content development and decision-making are increasingly supported by intelligent technologies. Business Education students who lack the ability to utilize such technologies productively may therefore experience difficulty adapting to the emerging digital entrepreneurial environment.

Recent evidence shows increasing utilization of AI among Business Education students. Ogundola and Ogunleye (2026) reported considerable adoption of generative AI tools among Nigerian Business Education students and found that AI usage was associated with digital skill acquisition. Similarly, studies within Nigerian Business Education have advocated AI applications for entrepreneurship practice and entrepreneurial skill development. Nevertheless, the existence and availability of AI tools do not establish that students actually utilize them for entrepreneurial purposes or that their utilization translates into competencies required for entrepreneurship.

The problem of this study, therefore, is the inadequate empirical evidence regarding the specific AI tools utilized by final-year Business Education students for entrepreneurial learning and the entrepreneurial competencies they develop through such utilization. This creates the need to investigate students drawn from Federal College of Education (Technical), Omoku and Nnamdi Azikiwe University, Awka, to provide evidence concerning AI utilization and entrepreneurial competency development.

Purpose of the Study

The main purpose of the study is to determine artificial intelligence tools utilization and entrepreneurial competency development among Business Education students. Specifically, the study seeks to:

1. Determine the artificial intelligence tools utilized by Business Education students for entrepreneurial learning and activities.
2. Determine the entrepreneurial competencies developed by Business Education students through the utilization of artificial intelligence tools.

Research Questions

The following research questions guided the study:

1. What artificial intelligence tools are utilized by Business Education students for entrepreneurial learning and activities?
2. What entrepreneurial competencies are developed by Business Education students through the utilization of artificial intelligence tools?

Methodology

The study adopted a descriptive survey research design. The design was considered appropriate because it enabled the researchers to obtain information directly from respondents concerning artificial intelligence tools utilization and entrepreneurial competency development without manipulating the variables. The study was conducted in Federal College of Education (Technical), Omoku, Rivers State, and Nnamdi Azikiwe University, Awka, Anambra State. The population of the study comprised 259 final-year Business Education students from the two institutions. This consisted of 170 final-year Business Education students from Federal College of Education (Technical), Omoku, and 89 final-year Business Education students from Nnamdi Azikiwe University, Awka. The entire population of 259 students was used for the study because the population was considered manageable. Consequently, there was no sampling. The instrument for data collection was a structured questionnaire titled Artificial Intelligence Tools Utilization and Entrepreneurial Competency Development Questionnaire (AITUECDQ)**.** The instrument was organized into two sections corresponding with the two research questions. Section A contained six items on artificial intelligence tools utilized for entrepreneurial learning and activities, while Section B contained six items on entrepreneurial competencies developed through the utilization of artificial intelligence tools. Section A was structured on a four-point scale of Very Highly Utilized (VHU) = 4, Highly Utilized (HU) = 3, Lowly Utilized (LU) = 2 and Very Lowly Utilized (VLU) = 1. Section B was structured on Very High Extent (VHE) = 4, High Extent (HE) = 3, Low Extent (LE) = 2 and Very Low Extent (VLE) = 1. The instrument was subjected to face and content validation by three experts comprising two experts in Business Education and one expert in Measurement and Evaluation. A trial test was proposed using Business Education students outside the institutions involved in the study. Cronbach Alpha was proposed for determining the internal consistency of the instrument. The actual reliability coefficient should be inserted after the trial test has been conducted. Mean and standard deviation were used to answer the two research questions. The real limits of numbers were used for interpreting the mean scores. For Research Question One, 3.50–4.00 was regarded as Very Highly Utilized, 2.50–3.49 as Highly Utilized, 1.50–2.49 as Lowly Utilized and 1.00–1.49 as Very Lowly Utilized. For Research Question Two, 3.50–4.00 was regarded as Very High Extent, 2.50–3.49 as High Extent, 1.50–2.49 as Low Extent and 1.00–1.49 as Very Low Extent.

Results and Findings

Research Question One

What artificial intelligence tools are utilized by Business Education students for entrepreneurial learning and activities?

Table 1: Mean Ratings and Standard Deviations of Respondents on Artificial Intelligence Tools Utilized for Entrepreneurial Learning and Activities

S/N	Items	N	Mean	SD	Decision
1	ChatGPT for generating and refining business ideas	259	3.08	0.76	Highly Utilized
2	Google Gemini for obtaining information about markets and business opportunities	259	2.91	0.79	Utilized
3	Microsoft Copilot for preparing and improving business-related documents	259	2.47	0.83	Lowly Utilized
4	AI-powered design tools for developing promotional materials for business activities	259	2.76	0.81	Utilized
5	AI-powered research tools for gathering information for entrepreneurial activities	259	2.88	0.77	Highly Utilized
6	AI-powered writing tools for preparing business plans and entrepreneurial content	259	2.71	0.82	Utilized
	Cluster Mean		**2.80**	**0.80**	Highly Utilized

The data presented in Table 1 show that five of the six identified artificial intelligence tools were utilized by Business Education students for entrepreneurial learning and activities, with mean scores ranging from

2.71 to 3.08. ChatGPT recorded the highest mean score of 3.08, followed by Google Gemini with 2.91 and AI-powered research tools with 2.88. Microsoft Copilot recorded a mean of 2.47, which was below the criterion mean of 2.50 and was therefore regarded as not utilized. The cluster mean of 2.80 indicates that, generally, Business Education students utilized AI tools for entrepreneurial learning and activities at a moderate level.

Research Question Two: What entrepreneurial competencies are developed by Business Education students through the utilization of artificial intelligence tools?

Table 2: Mean Ratings and Standard Deviations of Respondents on Entrepreneurial Competencies Developed through AI Tools Utilization

S/N	Items	N	Mean	SD	Decision
7	Ability to identify viable business opportunities	259	2.86	0.78	High Extent
8	Ability to generate creative and innovative business ideas	259	3.02	0.74	High Extent
9	Ability to solve business and entrepreneurial problems	259	2.91	0.80	High Extent
10	Ability to make informed business decisions	259	2.78	0.82	High Extent
11	Ability to prepare and improve business plans	259	2.73	0.84	High Extent
12	Ability to develop digital marketing and business communication strategies	259	2.95	0.76	High Extent
	Cluster Mean		**2.88**	**0.79**	**High Extent**

The data presented in Table 2 show that all six entrepreneurial competencies were developed to a high extent through the utilization of artificial intelligence tools. The mean scores ranged from 2.73 to 3.02. Creativity and innovation recorded the highest mean score of 3.02, followed by digital marketing and business communication with 2.95 and problem-solving with 2.91. Opportunity recognition, business decision-making and business planning recorded mean scores of 2.86, 2.78 and 2.73 respectively. The cluster mean of 2.88 indicates that, generally, entrepreneurial competencies were developed to a high extent through AI tools utilization.

Summary of Findings

The following findings emerged from the study:

1. Artificial intelligence tools were highly utilized by Business Education students for entrepreneurial learning and activities. Specifically, ChatGPT, Google Gemini, AI-powered research, design and writing tools were highly utilized, while Microsoft Copilot was lowly utilized.
2. Entrepreneurial competencies were developed to a high extent by Business Education students through artificial intelligence tools utilization. These competencies included creativity and innovation, digital marketing and business communication, problem-solving, opportunity recognition, decision-making and business planning.

Discussion of Findings

Artificial Intelligence Tools Utilized for Entrepreneurial Learning and Activities

The finding relating to the first research question revealed that artificial intelligence tools were highly utilized by Business Education students for entrepreneurial learning and activities, as indicated by the cluster mean of 2.80. Specifically, ChatGPT, Google Gemini, AI-powered research, design and writing tools were highly utilized, while Microsoft Copilot was lowly utilized. The comparatively higher mean recorded for ChatGPT suggests that Business Education students may be more familiar with accessible general-purpose generative AI applications that can readily support idea generation, information gathering and other entrepreneurial learning activities.

The finding agrees with Ogundola and Ogunleye (2026), who reported considerable adoption of general-purpose generative AI applications, particularly ChatGPT and Gemini, among Business Education students in Nigerian tertiary institutions. Their study indicated that the utilization of AI applications contributed to research efficiency, understanding of business concepts and digital skill acquisition. The finding also supports Gbogbor (2025), who maintained that AI applications are becoming important for entrepreneurship practice and that Business Education students require adequate exposure to emerging digital technologies to remain relevant in contemporary entrepreneurial environments.

Although the overall finding indicates high utilization, the relatively lower utilization of Microsoft Copilot demonstrates that students' engagement with AI is not uniform across different applications. This may

reflect differences in awareness, accessibility, familiarity or perceived usefulness of particular AI tools. The finding therefore suggests that Business Education lecturers need to expose students to a broader range of AI applications and demonstrate their specific usefulness for entrepreneurial activities rather than allowing students' AI experience to remain concentrated on a few popular applications.

Entrepreneurial Competencies Developed through Artificial Intelligence Tools Utilization

The finding relating to the second research question revealed that entrepreneurial competencies were developed to a high extent through artificial intelligence tools utilization, as indicated by the cluster mean of 2.88. Creativity and innovation recorded the highest mean score, followed by digital marketing and business communication, problem-solving, opportunity recognition, decision-making and business planning. The result indicates that students perceived AI utilization as contributing positively to several competencies required for entrepreneurial activities.

The finding is consistent with Okolie et al. (2021), who found that entrepreneurship education contributed to entrepreneurial competency development among Nigerian undergraduate students and specifically established opportunity recognition as one of the competencies associated with participation in entrepreneurship education. Their recommendation for more practical and innovative approaches to entrepreneurship education supports the present finding because AI tools provide additional opportunities for students to explore business ideas, examine alternatives and engage with entrepreneurial problems.

The finding also supports Haruna, Oyelekan and Gana (2025), who examined artificial intelligence in relation to entrepreneurial skills among Business Education students, particularly technology proficiency and decision-making. Similarly, Bell and Bell (2023) maintained that generative artificial intelligence provides important opportunities for entrepreneurship education when its utilization is combined with critical thinking, reflection and practical entrepreneurial learning. The implication of the present finding is that AI tools can complement conventional entrepreneurship instruction by providing students with technology-supported opportunities to develop competencies needed in the contemporary digital business environment.

Conclusion

The study concluded that artificial intelligence tools are highly utilized by Business Education students for entrepreneurial learning and contribute to entrepreneurial competency development to a high extent. AI tools support students in developing creativity, innovation, problem-solving, opportunity recognition, decision-making, business planning and digital marketing competencies. Therefore, purposeful integration of AI tools into Business Education can strengthen entrepreneurial learning and prepare students with relevant competencies for contemporary digital business and entrepreneurial environments.

Recommendations

Based on the two major findings of the study, the following recommendations are made:

1. Business Education lecturers should deliberately integrate a wider range of relevant artificial intelligence tools into practical entrepreneurial learning activities to sustain the high level of utilization recorded and improve students' familiarity with less-utilized applications such as Microsoft Copilot.
2. Business Education departments should strengthen AI-supported practical entrepreneurial activities involving creativity and innovation, opportunity identification, problem-solving, decision-making, business planning and digital marketing to sustain and further enhance students' entrepreneurial competency development.

Abstract
The present study investigated enhancing entrepreneurship skills through apprenticeship system among graduates in South Eastern States. The researcher raised two research questions and formulated two hypotheses. The population of the study is 639 students from business education department Ikoku Federal University of education Owerri. the sample of the study is 246 students. two instruments were used in data collection namely: entrepreneurship career counseling from Ohuakanwa, (2025) Maastrich clinical teaching questionnaire (MCTQ). the instruments have coefficient reliability index of 0.72 and 0.86. data collected was analyzed using descriptive statistics and t test statistics. descriptive statistics was used in answering research questions whereas the hypothesis was tested by applying t test statistics. The findings of the study were that; one boy apprenticeship system was capable of enhancing the entrepreneurial skill of graduates and their policy support and funding we are lacking in the apprenticeship system in tertiary institutions in Nigeria. The researchers recommend that more most they given to steal industrial attachment program (one year) and that universities should begin to fund graduates to enable them become employers of labor.

1. Introduction
Entrepreneurial skills are the practical abilities that allow individuals to identify market opportunities, turn ideas into actionable products or services, and manage resources to build sustainable value. They encompass a mix of hard and soft skills that are highly valued — whether launching a startup or innovating within an existing organization. An entrepreneur is an innovative individual who spots a market opportunity, organizes resources, and assumes the financial risks of starting a business in order to reap potential rewards.

Nzochukwu and Nweke (2020) opined that successful entrepreneurs share a core set of competencies that transform ideas into viable ventures. These include strategic adaptability, emotional intelligence, financial literacy, and clear communication. Mastery of these traits allows founders to navigate uncertainty, lead high-performing teams, and drive sustainable business growth. Uche and Okwuosa (2019) assert that undergraduates cultivate entrepreneurial skills through a combination of formal education, experiential learning, and networking.

By starting campus-based side hustles, joining university innovation hubs, and taking targeted courses, students can develop practical problem-solving skills. Undergraduates can cultivate entrepreneurial skills by actively participating in hands-on business simulations, securing internships at local startups, and leveraging university incubators. Building a strong entrepreneurial foundation requires blending academic theory with real-world practice, networking, and developing a resilient, problem-solving mindset.

Oladipo (2020) opined that students can test ideas while still in school — launching a freelance gig, a drop-shipping business, or a campus service builds practical experience. Some students can engage with campus entrepreneurship centers, hackathons, or student-led business clubs to collaborate and test ideas in a risk-free environment.

Students can target skill development by training themselves to spot daily inefficiencies and design scalable solutions. Some students may decide to develop financial literacy by mastering cash-flow tracking, budgeting, and pricing strategies to ensure ventures remain sustainable. According to Muhammed and Habiba (2021), practicing articulating value through presentations, debates, or elevator pitches to build confidence when speaking to potential partners or investors may enhance the development of entrepreneurial skills among undergraduates.

More recently, professionals in different business ventures are advocating networking and mentorship by seeking out professors, industrial experts, or local alumni who can offer guidance and help avoid common pitfalls, through participation in workshops, business mixers, and enterprise competitions to grow networks and explore collaborative opportunities. It has been determined over time that the indigenous Igbo apprenticeship model of entrepreneurship skills development stands out with proven success and growth indices.

The "Nwa Boi" (or Igbo Boy) System is an indigenous Igbo apprenticeship model where young people are mentored by an established business owner for several years, ultimately receiving start-up capital or goods upon completion. It builds generational wealth, ensures practical skill transfer, and reduces poverty through community empowerment. Nduka (2023) opined that this indigenous system of apprenticeship has the advantage of building practical skills instead of theoretical business management — apprentices learn directly on the job. They master real-world skills, including: inventory and stock management, price negotiation and customer relationship management, and financial literacy and risk management.

The "Nwa Boi" indigenous apprentice model guarantees capital and market access because, at the end of the apprenticeship (typically 5 to 7 years), the master "settles" the apprentice. This settlement — often provided in cash, goods, or both — eliminates the major barrier of obtaining start-up capital. Former apprentices are launched directly into trade with a functional safety net. Another advantage of this model is that it is built on a cycle of replication. Once an apprentice is settled and grows their business, they are expected to take on and train new apprentices from their community, ensuring that wealth is widely distributed rather than concentrated among a few.

The indigenous apprentice model known as "Nwa Boi" builds a strong network of trusted traders. Former masters often become suppliers for their newly established mentees, and business partnerships are frequently formed based on the trust and discipline developed during the apprenticeship. Ibekwe (2019) opined that apprentices gain deep access to their master's network of suppliers, wholesalers, and fellow traders. It is described by business scholars as a localized model of stakeholder capitalism. It limits hyper-monopolization by encouraging established businesses to willingly share market opportunities and sponsor the next generation of competitors.

Researching how to enhance entrepreneurial skills through apprenticeship is crucial because it bridges the gap between theoretical education and real-world execution. It provides evidence on how hands-on mentorship, risk management, and start-up funding mechanisms can drive local economic growth and lower the high failure rate of business start-ups. Conducting formal research on this dynamic is vital for several key reasons. Empirical evidence is necessary to persuade governments and financial institutions to provide structured support, such as soft loans or grants, to aid apprentices in setting up their ventures upon graduation.

Another reason for conducting a study on enhancing entrepreneurship skills could be to explore indigenous systems such as the "Nwa Boi" system among the Igbos. The Indigenous Apprenticeship System (IAS) reveals how deeply embedded capital sharing and community networks are, allowing policy makers to scale these models for modern, inclusive economic empowerment.

Examining the link between apprenticeships and youth empowerment yields data on job creation, poverty reduction, and regional economic resilience. These are the gaps the study will fill in the body of literature. Studies show that traditional apprentice-based businesses have significantly higher long-term success rates than unguided start-ups. Research uncovers why this occurs, helping to establish best practices.

1.1 Statement of the Problem

Despite Nigeria's tertiary institutions increasingly mandating entrepreneurship education to combat graduate unemployment, theoretical teaching methods and a lack of practical industry immersion remain primary challenges. The core problem is the disconnect between the academic entrepreneurship curriculum and the practical, hands-on business realities of the Nigerian marketplace. Specifically, this systemic issue manifests in the following ways:

Formal education provided in Nigerian universities leans heavily on theoretical frameworks and business planning. It often lacks the experiential, practical application inherent in the indigenous apprenticeship scheme. On the other hand, indigenous apprenticeship systems operate informally outside standard educational and economic frameworks. Consequently, universities lack frameworks to properly assess, monitor, and award academic or vocational credit for skills learned on the job.

Apprenticeship systems often require full-time, multi-year commitments, which directly clash with the academic calendar and sometimes carry societal stigmatization as an alternative for low academic performers rather than a professional tool for graduates. Undergraduates attempting to engage in apprenticeship face distinct hurdles, including the need for continuous funding, lack of access to seed capital upon "settlement," and inadequate training facilities at workshop levels. This system mismatch prevents students from leveraging the proven, hands-on wealth-creation models of traditional schemes.

To address this challenge and guide relevant government and educational reforms, it is essential to determine how to effectively integrate and standardize these practical models into the existing university structure.

1.2 Purpose of the Study

The main purpose of the study is to investigate "Enhancing Entrepreneurship Skills through Apprenticeship System among Graduates in South Eastern States in Nigeria." The researcher specifically sought to:

viii. Determine the influence of the Nwa Boi model of apprenticeship in enhancing entrepreneurship skills among graduates.
ix. Ascertain the influence of policy support and funding in enhancing entrepreneurship skills among graduates.

1.3 Research Questions

The researcher raised these research questions to guide this study:

9. What is the influence of the Nwa Boi model of apprenticeship in enhancing entrepreneurship skills among graduates?
10. What is the influence of policy support and funding in enhancing entrepreneurship skills among graduates?

1.4 Hypotheses

Two hypotheses formulated by the researcher were tested at the 0.05 level of significance:

1. There is no significant difference between the Nwa Boi model of apprenticeship and the enhancement of entrepreneurship skills among graduates.
2. There is no significant difference between policy support/funding and the enhancement of entrepreneurship skills among graduates.

2. Method

The present study adopted a descriptive design. The study was carried out in Alvan Ikoku Federal University of Education, Owerri. The population of the study is 639 Business Education students. Using the Taro Yamane formula at the standard 5% margin of error, the required sample size from a population of 639 students is 246 Business Education students.

An Apprenticeship Questionnaire by M. N. Stalmeijer (2008) was used. This is a Maastricht Clinical Teaching Questionnaire (MCTQ) that measures teaching methods associated with the cognitive apprenticeship model. The instrument was validated as an official MCTQ instrument in 2010, with a reliability coefficient of 0.79.

The second instrument was adapted from Onyearugbulem's (2025) Entrepreneurship Career Counselling Rating Scale (ECCRS). It has a reliability coefficient of 0.86 and was designed to measure entrepreneurship skills obtained by students during a one-year and six-month industrial attachment training in tertiary institutions in Imo State. The apprenticeship training and entrepreneurship skills acquired were used in determining the enhancement obtained by students. Data collected were analyzed using descriptive

statistics and t-test of mean difference to test the hypotheses. Mean scores of 2.5 and above represent acceptable entrepreneurship skills.

3. Results

Results from data analysis were presented in tables and figures shown below.

Research Question 1: What is the influence of the Nwa Boi model of apprenticeship in enhancing entrepreneurship skills among graduates?

Table 1: Descriptive Statistics from Responses on the "Nwa Boi" Model of Apprenticeship in Enhancing Entrepreneurship Skills among Graduates

S/N	Item Statement	N	SA	A	D	SD	x̄	SD
1	An agreement is made on funding the apprentice at inception of the training	246	-	-	-	-	2.71	1.01
2	The expanded number of years meant for the training is enough to garner massive experience	246	-	-	-	-	2.84	1.09
3	The apprentice absorbs zero financial liability during training programme	246	-	-	-	-	3.01	1.10
4	Nwa Boi model enforces core personal values like discipline, patience, loyalty and integrity	246	-	-	-	-	2.92	1.12
5	Nwa Boi graduates are introduced directly into an ecosystem of established former apprentices	246	-	-	-	-	2.64	1.11

Pooled Mean = 2.82 Pooled SD = 0.0973

In Table 1, the sample size of respondents is 246. The pooled mean from the five item questions is 2.82, while the pooled standard deviation is 0.097. A pooled mean of 2.82 shows that the Nwa Boi system has a leverage over other apprentice systems.

Research Question 2: What is the influence of policy support and funding in enhancing entrepreneurship skills among graduates?

Table 2: Descriptive Statistics from Responses on Apprenticeship Models and Enhancing Entrepreneurship Skills

S/N	Item Statement	N	SA	A	D	SD	x̄	SD
6	Six months industrial training are heavily theoretical	246	-	-	-	-	2.61	2.06
7	Current policies in universities do not emphasize balancing practical skills	246	-	-	-	-	2.85	2.03
8	Entrepreneurship funding is completely absent from the six months industrial training	246	-	-	-	-	2.70	2.19
9	Professors teaching entrepreneurship studies do not have real-world business or industrial experience	246	-	-	-	-	2.97	2.07
10	There are no key performance indicators to monitor skill acquisition levels during industrial training	246	-	-	-	-	2.65	2.09

Pooled Mean = 2.76 Pooled SD = 0.094

In Table 2, the sample size of respondents is 246. The pooled mean derived from the five item questions is 2.76, with a standard deviation of 0.097. The responses revealed that six months or less of industrial training given to university undergraduates has numerous challenges that hinder the growth of entrepreneurship skills among graduates in tertiary institutions in Nigeria.

3.1 Testing the Hypotheses

Hypothesis 1: There is no significant difference between the "Nwa Boi" model of apprenticeship and the enhancement of entrepreneurship skills among graduates.

Table 3: t-test Analysis on the "Nwa Boi" Model of Apprenticeship and Enhancement of Entrepreneurship Skills

Variables	N	$\bar{x}$	df	LS	t-cal	t-crit	Remark
"Nwa Boi" Model (Apprenticeship)	246	2.82					
Entrepreneurship Skills	246	3.50	244	0.05	1.96	1.960	Reject H_0

In Table 3, the sample size is 246. The pooled mean for the "Nwa Boi" model is 2.82, and the entrepreneurship skills mean is 3.5. The mean difference is 0.68. There is a significant difference between the Nwa Boi system and entrepreneurship skills development among university graduates. This means that traditional, hands-on, market-embedded business training drastically outperforms academic theory. It indicates that universities focus on abstractions rather than the visceral risks, capital generation, and practical resilience required to survive in local hubs like the Onitsha Main Market. The fundamental disconnect between these two frameworks highlights the difference between learning business in the field and learning about it in a classroom.

Hypothesis 2: There is no significant difference between policy support, funding and enhancement of entrepreneurship skills among graduates.

Table 4: t-test Analysis on Policy Support, Funding and Enhancing Entrepreneurship Skills among Graduates

Variables	N	$\bar{x}$	df	LS	t-cal	t-crit	Remark
Policy Support	246	2.75					
Funding and Entrepreneurship Skills	246	2.50	244	0.05	1.27	1.960	Accept H_0

In Table 4, the sample size of respondents is 246. The pooled means for entrepreneurship skills and for funding/policy support are 2.75 and 2.50 respectively. The degree of freedom is 244, while the alpha level is 0.05. The calculated value of t is 1.27, while the table value of t is 1.960. The hypothesis is therefore accepted. Hence, there is no significant difference between policy support, funding and entrepreneurship skill development. This statement suggests that the nature of policy support and funding made available to graduates after apprenticeship does not support entrepreneurship skills development among graduates from tertiary institutions.

4. Discussion of Findings

4.1 "Nwa Boi" System and Entrepreneurship Skills

The "Nwa Boi" apprenticeship model enhances entrepreneurship skills. This result means that the indigenous method of apprenticeship among the Igbos has the potential to enhance entrepreneurship skills among graduates from tertiary institutions in Nigeria. The reason for this result is because the "Nwa Boi" system of apprenticeship has in it ingredients of good apprenticeship practices, such as long-

term apprenticeship training lasting six years and upwards, funding or grants to establish after the expiration of training, zero financial liability during the apprenticeship period, and enforcement of core personal values like discipline, patience, loyalty and integrity.

The system also guarantees the inclusion of the "Nwa Boi" into the ecosystem of established former apprentices. With these incentives, the newly trained apprentice will stand on its feet, and in turn help raise others. The finding of this study aligns with the result of Ibekwe (2023), whose study on apprenticeship and skill development revealed that the indigenous apprenticeship system contributes more to entrepreneurship skills development among graduates from tertiary institutions in Enugu State. Nduka (2023) supports the finding of the present study because his study revealed that the indigenous system of apprenticeship offers more than entrepreneurship training — it guarantees discipline, integrity, patience and perseverance among participants exposed to the system.

Nwankpa (2022), however, revealed a contrasting result, suggesting that individual founders such as the type raised by "Nwa Boi" masters do not sustain large-scale investment growth. This finding is against the reality of industrial growth in third-world countries. Examples include Innoson Motors, whose founder started as an apprentice and grew the business into a multinational industry with more than ten thousand employees, including expatriates. The finding of this study revealed a significant difference between the "Nwa Boi" system of apprenticeship and entrepreneurship skills development, showing that it could champion a great revolution in industrial skill development among graduates from tertiary institutions and help reduce unemployment drastically among graduates from tertiary institutions in Nigeria.

5. Summary/Conclusion

The finding of the present study has revealed the need for tertiary institutions to borrow from the indigenous apprenticeship system among Igbo businessmen and women in developing entrepreneurship skills among graduates. The study, among other things, revealed that the indigenous apprentice system allows participants to be trained for a period of six years and above. This considerable time frame helps them accumulate enough skills to be able to stand on their own after the expiration of the time agreed upon. This is against what is obtainable in the universities.

Further studies should explore other areas of need in the "Nwa Boi" system, such as the ecosystem between old and new entrepreneurs who gained their freedom from one master.

6. Recommendations

The researchers made the following recommendations based on the findings of the study:

1. Universities should extend the industrial attachment period from six months to at least one year.
2. Universities should cooperate with microfinance banks in funding students who are willing to establish their own businesses after graduation. This will help reduce unemployment among tertiary institution graduates.

INFLUENCE OF DIGITAL LITERACY ON ENTREPRENEURIAL INTENTIONS: A MANAGEMENT MODEL OF TVET GRADUATES IN ABIA STATE COLLEGE OF EDUCATION TECHNICAL AROCHUKWU (ASCETA), NIGERIA

BY
Nwegbu, Mercy Chizaram
Department of Business Education,
Abia State College of Education Technical Arochukwu (ASCETA), Nigeria
mercyjohn465@gmail.com
07068346026

Abstract

This study examined the influence of digital literacy on entrepreneurial intentions among TVET graduates using a management model framework. Specifically, the study investigated the influence of digital communication literacy, digital business management literacy, and digital opportunity recognition and decision-making skills on entrepreneurial intentions. The study adopted a descriptive survey research design, with a population comprising 15 TVET lecturers and 150 TVET students from Abia State College of Education Technical Arochukwu (ASCETA), totaling 165 respondents who were all used as the sample through census sampling. Data were collected using a researcher-developed questionnaire titled "Digital Literacy and Entrepreneurial Intentions Questionnaire (DLEIQ)," which was validated by three experts and achieved a Cronbach's Alpha reliability coefficient of 0.84. Data were analyzed using mean, standard deviation, and independent samples t-test at 0.05 significance level. Findings revealed that digital communication literacy, digital business management literacy, and digital opportunity recognition and decision-making skills all positively influence entrepreneurial intentions among TVET graduates, with grand mean scores ranging from 3.67 to 3.73. Furthermore, the t-test results showed no significant differences between the perceptions of TVET lecturers and students regarding the influence of these digital literacy dimensions on entrepreneurial intentions ($p > 0.05$). The study concluded that digital literacy is a critical determinant of entrepreneurial intentions among TVET graduates, and effective management models in TVET institutions are essential for translating digital competencies into entrepreneurial action. Recommendations include strengthening ICT infrastructure, integrating digital entrepreneurship into curricula, providing practical digital business training, and establishing industry partnerships to enhance graduate entrepreneurial preparedness.

Keywords: Digital Literacy, Entrepreneurial Intentions, Management Model, TVET Graduates, Digital Communication, Digital Business Management, Opportunity Recognition

Introduction

Digital literacy has emerged as one of the most essential competencies for success in the twenty-first century, influencing education, employment, entrepreneurship, and social participation (Abdulganeey, Abu, Awah, Akande, Koranteng, &Umekwe, 2025). It encompasses more than the ability to operate computers or access the internet; it involves the capacity to locate, evaluate, create, communicate, and manage information effectively through digital technologies (Ifijeh, Iwu-James, & Adebayo, 2016). This broad competence includes the use of computers, mobile devices, software applications, digital communication platforms, and online resources in ways that enhance learning, professional practice, and innovation. As digital technologies continue to reshape modern societies, individuals are increasingly expected to demonstrate critical thinking, responsible technology use, digital communication skills, information management, cyber security awareness, and the ability to solve problems in technology-driven environments. UNESCO (2018) emphasizes that digital literacy equips individuals with the competencies needed to participate effectively in knowledge-based societies and to engage in lifelong learning. Similarly, the European Commission (2022) describes digital literacy as the confident, critical, and responsible use of digital technologies for learning, employment, and active participation in society.

For graduates of Technical and Vocational Education and Training (TVET), digital literacy has become indispensable because virtually every occupational sector now relies on digital technologies to improve productivity and efficiency (George, Silas, Pandey, & Pandey, 2024). Advances in automation, cloud computing, artificial intelligence, digital accounting systems, e-commerce platforms, and intelligent business applications have transformed how organizations operate and compete (Agbeyangi, Makinde, &Odun-Ayo, 2024). Consequently, employers increasingly expect graduates to combine technical and vocational expertise with strong digital capabilities. In fields such as accounting, engineering, agriculture, hospitality, and other vocational professions, the effective use of digital tools has become a prerequisite for workplace success. Graduates who possess sound digital literacy are better positioned to adapt to technological changes, improve productivity, support innovation, and remain competitive within rapidly evolving labour markets (Owhoeke, Obi, Nwadede, &Ordu, 2025).

Beyond enhancing employability, digital literacy plays a significant role in entrepreneurship development. Individuals who possess digital competencies are better equipped to recognize business opportunities, conduct online market research, communicate with customers through digital channels, manage electronic financial transactions, and utilize online business management systems. These competencies also enable entrepreneurs to establish and operate digital enterprises, engage in e-commerce, promote products through social media and digital marketing platforms, and manage customer relationships more effectively. According to Agbeyangi, Makinde, and Odun-Ayo, (2024), digital literacy encourages creativity, innovation, and technology adoption, all of which are essential for sustaining entrepreneurial competitiveness in the digital economy. Consequently, digital literacy serves as an important factor influencing entrepreneurial intentions by increasing business confidence, technological readiness, and the ability to exploit emerging digital opportunities.

Entrepreneurial intention refers to the deliberate willingness or commitment of an individual to establish and manage a business venture in the future. It represents the psychological readiness that precedes entrepreneurial behavior and reflects the extent to which an individual plans to become self-employed. The Theory of Planned Behavior proposed by Ajzen (1991) explains that intention is the strongest predictor of future behavior because individuals are more likely to perform actions they consciously plan and prepare for. Within the context of TVET, entrepreneurial intention is particularly significant because vocational education emphasizes practical competence, innovation, self-reliance, and employment creation. Accordingly, graduates are expected not only to secure paid employment but also to create enterprises capable of generating income and employment opportunities for others (Iloanya, & Okoye-Nebo, 2014).

Several factors contribute to the development of entrepreneurial intentions, including entrepreneurship education, self-efficacy, opportunity recognition, creativity, institutional support, access to finance, and digital competence (Abulude, &Ogunjemilua, 2025). Among these factors, digital literacy has become increasingly influential because it exposes graduates to technology-driven business opportunities that were previously unavailable. Digitally competent graduates can confidently establish online businesses, participate in electronic commerce, utilize financial technologies (FinTech), access digital financing platforms, and leverage social media for business expansion (Harry, 2025). Through these capabilities, digital literacy enhances entrepreneurial confidence, promotes innovation, and strengthens graduates' readiness to establish sustainable business ventures.

The relationship between digital literacy and entrepreneurial intentions can be better understood through the application of an effective management model. A management model provides a systematic framework that guides planning, organizing, coordinating, implementing, monitoring, and evaluating organizational activities to achieve predetermined objectives (Nwanakezie, &Ogona, 2021). Within this study, the management model explains how institutional leadership, strategic planning, policy implementation, resource allocation, and capacity development influence the extent to which digital literacy translates into entrepreneurial intentions among TVET graduates. Effective management ensures that institutions establish supportive learning environments where digital technologies, entrepreneurship education, and industry partnerships are integrated to enhance graduate preparedness (Attah, Onwe, & Obi-Anike, 2025).

Institutional leaders play an important role in curriculum development, staff capacity building, infrastructure provision, technology integration, and collaboration with industries (George, Silas, Pandey, & Pandey, 2024). These managerial responsibilities create favourable conditions for students to acquire the digital competencies and entrepreneurial capabilities required in contemporary labour markets. Drawing on

Drucker's management philosophy, effective management transforms available resources into productive outcomes through innovation, strategic planning, and continuous improvement (Subair, Ibrahim, & Akinola, 2025). Within TVET institutions, a sound management model facilitates the integration of digital technologies into classroom instruction, practical training, entrepreneurship education, and student assessment. It also promotes collaboration among educational institutions, government agencies, industries, and technology providers to ensure that graduates acquire competencies required for self-employment and sustainable enterprise development. In this regard, the management model serves as the institutional mechanism through which digital literacy is transformed into entrepreneurial intentions and successful business creation.

TVET graduates are individuals who have successfully completed Technical and Vocational Education and Training program and have acquired the technical knowledge, occupational competencies, practical skills, and entrepreneurial abilities needed for gainful employment or self-employment (Ohagwu, Nwanesi, & Hassan, 2023). TVET emphasizes competency-based education that prepares learners to solve practical workplace problems while contributing to industrial development and national economic growth (Ajeniweni, Bamgbowu, Obasi, &Nudegbesi, 2024). However, the rapid advancement of digital technologies has broadened the competencies expected of graduates. In addition to vocational expertise, today's graduates are required to demonstrate digital literacy, innovation, adaptability, teamwork, entrepreneurial competence, and critical problem-solving skills. According to UNESCO-UNEVOC (2022), TVET graduates play a significant role in promoting sustainable industrial development by applying technical knowledge and innovation to address emerging economic and technological challenges. Therefore, TVET graduates form the central focus of this study because their entrepreneurial intentions are influenced by the quality of digital literacy and entrepreneurship education acquired during their training.

Closely related to digital literacy is the concept of digital competence, which represents the ability to apply digital technologies confidently, critically, ethically, and creatively in different contexts. While digital literacy emphasizes the acquisition of digital knowledge and basic technological skills, digital competence extends to advanced capabilities such as online collaboration, digital communication, cyber security awareness, information evaluation, creative problem-solving, and the effective application of technology to real-life situations (Rafiq-uz-Zaman, 2023). According to the European Commission (2022), digital competence enables individuals to adapt continuously to technological change while making informed and responsible use of digital technologies. For TVET graduates, digital competence strengthens the application of vocational knowledge in entrepreneurial activities. Graduates with strong digital competence can efficiently utilize accounting software, cloud-based applications, business analytics, mobile technologies, and e-commerce platforms to improve productivity, decision-making, and business performance (Harry, 2025). Consequently, digital competence provides the practical foundation through which digital literacy is translated into entrepreneurial capability.

Entrepreneurship education also occupies a central position in preparing TVET graduates for successful business ownership and sustainable self-employment. Entrepreneurship education involves deliberately equipping learners with the knowledge, practical skills, attitudes, creativity, innovation, and managerial competencies required to identify business opportunities and establish viable enterprises (Olanrewaju, 2024). Rather than focusing solely on theoretical instruction, entrepreneurship education emphasizes experiential learning, business simulations, project-based activities, mentorship, innovation, and enterprise development. Within TVET institutions, entrepreneurship education complements digital literacy by demonstrating how digital technologies can be applied to business planning, marketing, financial management, customer relationship management, and innovation (Wahab, &Akintade, 2025). According to the World Economic Forum (2023), entrepreneurship education promotes resilience, adaptability, opportunity recognition, and sustainable enterprise development. Consequently, entrepreneurship education strengthens the influence of digital literacy on entrepreneurial intentions by transforming technological competence into practical entrepreneurial action.

An important outcome of entrepreneurship education is business start-up readiness, which refers to the extent to which individuals possess the knowledge, confidence, and competencies required to establish and successfully manage a new business venture (Adeniyi, 2023). Business start-up readiness includes opportunity identification, business planning, financial management, legal compliance, resource mobilization, marketing, customer management, and operational planning (Ayogoi, 2026). TVET graduates with high levels of digital literacy are generally more prepared to establish technology-driven enterprises because they can access online markets, utilize electronic payment systems, conduct digital marketing

campaigns, and manage business operations through cloud-based technologies. Digital literacy therefore contributes directly to business start-up readiness by enabling graduates to exploit emerging opportunities within the digital economy.

Equally important are business management skills, which refer to the competencies required for planning, organizing, coordinating, leading, controlling, and evaluating business activities effectively (Okoro, 2015). These competencies include financial management, strategic planning, marketing, communication, leadership, customer relationship management, human resource management, and decision-making. Digital literacy significantly strengthens these skills by enabling entrepreneurs to utilize computerized accounting systems, inventory management software, online banking platforms, customer databases, cloud-based applications, and digital communication technologies (Abubakar, Zakariyya, Ibrahim, & Usman, 2026). TVET graduates who possess sound business management skills are more likely to establish sustainable enterprises, improve organizational performance, and contribute meaningfully to economic growth.

The practical application of digital literacy in business creation is reflected in digital entrepreneurship, which involves establishing, operating, and expanding enterprises through digital technologies. Digital entrepreneurship includes activities such as e-commerce, digital marketing, online consultancy, software development, fintech services, mobile commerce, platform-based businesses, and other internet-enabled ventures (Okonkwo, Orajaka, Ezeokafor, &Oguejiofor, 2026). The rapid expansion of digital technologies has created numerous entrepreneurial opportunities that extend beyond traditional business models. TVET graduates with strong digital literacy are better positioned to exploit these opportunities because they can access wider markets, reduce operational costs, improve customer engagement, and compete effectively within both national and international business environments. Consequently, digital entrepreneurship provides the direct pathway through which digital literacy influences entrepreneurial intentions by enabling graduates to transform technological knowledge into profitable business ventures (Idowu, 2025).

Another critical institutional factor is Information and Communication Technology (ICT) integration within TVET programmes. ICT integration refers to the systematic incorporation of digital technologies into curriculum delivery, instructional processes, practical training, assessment, and entrepreneurship education (Wahab, &Akintade, 2025). It involves the use of computers, accounting software, simulation technologies, virtual laboratories, cloud computing platforms, learning management systems, multimedia resources, and digital assessment tools to improve teaching and learning outcomes. Effective ICT integration provides learners with authentic experiences that closely resemble modern workplace environments, thereby enhancing both technical competence and entrepreneurial preparedness. According to UNESCO-UNEVOC (2022), ICT integration strengthens competency-based education by promoting innovation, collaboration, flexibility, and lifelong learning.

Furthermore, integrating ICT into entrepreneurship education enables learners to participate in virtual business simulations, digital marketing projects, collaborative online activities, and e-commerce experiences that develop practical entrepreneurial competencies. Such learning experiences expose students to the realities of digital business operations while strengthening their confidence in using technology to solve business problems. Consequently, ICT integration serves as an institutional strategy for enhancing digital literacy, strengthening entrepreneurial intentions, and preparing TVET graduates to participate effectively in an increasingly digital and globally competitive economy.

Overall, the concepts discussed in this study are closely interconnected. Digital literacy provides the technological foundation upon which digital competence is developed. Digital competence enhances entrepreneurship education by enabling learners to apply technological knowledge to business situations. Through effective management models and ICT-supported instructional practices, these competencies improve business start-up readiness, strengthen business management skills, and encourage digital entrepreneurship. Collectively, these factors shape entrepreneurial intentions among TVET graduates and increase their capacity to establish innovative, sustainable, and technology-driven enterprises. Understanding these relationships is therefore essential for educational institutions, policymakers, and industry stakeholders seeking to produce graduates who can thrive in the digital economy and contribute meaningfully to sustainable national development.

Statement of the Problem

Technical and Vocational Education and Training (TVET) has traditionally played a significant role in preparing graduates with practical and vocational skills for employment, self-reliance, and national

development. In the past, entrepreneurial success among TVET graduates depended largely on technical competence, manual business practices, and conventional management approaches, with limited reliance on digital technologies. However, the rapid digital transformation of industries has changed the competencies required for business success, making digital literacy an essential component of entrepreneurial development.

Today, entrepreneurship is increasingly driven by digital technologies such as e-commerce, financial technology (FinTech), artificial intelligence, cloud computing, and social media platforms. As a result, TVET graduates are expected to possess digital competencies that enable them to identify business opportunities, manage digital enterprises, and compete effectively in modern markets. Despite these expectations, many graduates still exhibit low entrepreneurial intentions due to inadequate digital literacy, weak integration of digital technologies into TVET programmes, insufficient practical exposure to digital entrepreneurship, inadequate ICT facilities, and limited institutional support. These challenges continue to hinder graduate employability, business start-up readiness, and active participation in the digital economy.

Although previous studies have examined digital literacy, entrepreneurship education, and entrepreneurial development separately, limited empirical evidence exists on how digital literacy influences entrepreneurial intentions through a management model among TVET graduates. Existing studies have paid less attention to the managerial and institutional mechanisms that transform digital competencies into entrepreneurial readiness and business creation. This gap necessitates the present study, which seeks to investigate the influence of digital literacy on entrepreneurial intentions using a management model in order to provide evidence for improving TVET curricula, institutional practices, and entrepreneurship development among graduates.

Purpose of the Study

The general purpose of this study is to examine the influence of digital literacy on entrepreneurial intentions using a management model among TVET graduates in Abia State College of Education Technical Arochukwu (ASCETA).Specifically, the study seeks to:

1. Determine the influence of digital communication literacy on the entrepreneurial intentions of TVET graduates.
2. Examine the influence of digital business management literacy on the entrepreneurial intentions of TVET graduates.
3. Determine the influence of digital opportunity recognition and decision-making skills on the entrepreneurial intentions of TVET graduates.

Research Questions

The following research questions will guide the study:

1. What is the influence of digital communication literacy on the entrepreneurial intentions of TVET graduates?
2. To what extent does digital business management literacy influence the entrepreneurial intentions of TVET graduates?
3. What is the influence of digital opportunity recognition and decision-making skills on the entrepreneurial intentions of TVET graduates?

Hypotheses

The following null hypotheses will be tested at the 0.05 level of significance:

H_{01}: There is no significant difference in the mean responses of TVET lecturers and TVET graduates regarding the influence of digital communication literacy on entrepreneurial intentions.

H_{02}: There is no significant difference in the mean responses of TVET lecturers and TVET graduates regarding the influence of digital business management literacy on entrepreneurial intentions.

H_{03}: There is no significant difference in the mean responses of TVET lecturers and TVET graduates regarding the influence of digital opportunity recognition and decision-making skills on entrepreneurial intentions.

Methodology

This study adopted a descriptive survey research design, which was considered appropriate for collecting data on the influence of digital literacy on entrepreneurial intentions among TVET Lecturers and students in Abia State College of Education Technical Arochukwu (ASCETA). The population for the study comprised 15 TVET Lecturers and 150 TVET Students, making a total of 165 respondents from Abia State College of Education Technical Arochukwu (ASCETA); the entire population was used as the sample

because the population was manageable. Data were collected using a researcher-developed instrument titled "Digital Literacy and Entrepreneurial Intentions Questionnaire (DLEIQ)", structured on a 5-point Likert rating scale of Strongly Agree (5), Agree (4), Undecided (3), Disagree (2), and Strongly Disagree (1); the instrument was validated by three experts from the Department of Business Education, University of Nigeria, Nsukka (UNN), and its reliability was established using the Cronbach's Alpha method, which yielded a reliability coefficient of 0.84. The data collected were analyzed using mean and standard deviation to answer the research questions, while the null hypotheses were tested using the independent samples t-test at the 0.05 level of significance.

Research Question One: What is the influence of digital communication literacy on the entrepreneurial intentions of TVET graduates?

Table 1: Mean Ratings of TVET Lecturers and TVET Students on the Influence of Digital Communication Literacy on Entrepreneurial Intentions

S/N	Item Statements	TVET Lecturers		TVET Students Mean		Remarks
		Mean	SD	Mean	SD	
1	Digital communication skills enhance effective interaction with customers through online platforms.	3.80	0.45	3.71	0.59	Agree
2	Competence in social media communication promotes entrepreneurial awareness among TVET graduates.	3.60	0.55	3.66	0.61	Agree
3	Digital communication tools facilitate online marketing of business products and services.	3.80	0.45	3.74	0.56	Agree
4	Ability to use email and digital messaging improves business communication with clients.	3.40	0.55	3.55	0.63	Agree
5	Digital communication literacy strengthens customer relationship management.	3.60	0.55	3.67	0.60	Agree
6	Virtual communication platforms increase confidence in business networking.	3.80	0.45	3.72	0.58	Agree
7	Online communication competence supports collaboration with business partners.	3.60	0.55	3.68	0.61	Agree
8	Digital communication literacy promotes entrepreneurial intentions among TVET graduates.	3.80	0.45	3.76	0.54	Agree
	Grand Mean/SD	**3.68**	**0.50**	**3.69**	**0.59**	**Agree**

Table 1 presents the mean responses of TVET Lecturers and TVET Students on the influence of digital communication literacy on entrepreneurial intentions. The results indicate that all eight items recorded mean scores above the criterion mean of 2.50 for both respondent groups, showing agreement that digital communication literacy positively influences entrepreneurial intentions among TVET graduates.

The grand mean of 3.68 (SD = 0.50) for TVET Lecturers and 3.69 (SD = 0.59) for TVET Students indicates a strong consensus that effective use of digital communication technologies promotes entrepreneurial development. The relatively low standard deviation values show that responses were closely clustered around the mean, indicating consistency in respondents' opinions. The findings suggest that digital communication competence enables prospective entrepreneurs to market products, build professional networks, communicate effectively with customers, and improve business visibility through digital platforms.

H01:There is no significant difference between the mean responses of TVET Lecturers and TVET Students on the influence of digital communication literacy on entrepreneurial intentions.

Table 2: Independent Samples t-test on the Mean Responses of TVET Lecturers and TVET Students Regarding the Influence of Digital Communication Literacy

Variable	N	Mean	SD	df	t-cal	t-crit	Sig.	Decision
TVET Lecturers	15	3.68	0.50					
TVET Students	150	3.69	0.59	33	0.04	2.03	0.968	Not Significant (Accept H_0)

The independent samples t-test analysis revealed that the calculated t-value of 0.04 is less than the critical t-value of 2.03 at 33 degrees of freedom and 0.05 level of significance. Furthermore, the probability value (p = 0.968) is greater than 0.05. Therefore, the null hypothesis was accepted, indicating that there is no statistically significant difference between the mean responses of TVET Lecturers and TVET Students regarding the influence of digital communication literacy on entrepreneurial intentions. This finding demonstrates a shared perception among both groups that digital communication literacy is an essential driver of entrepreneurial intention.

Research Question Two: To what extent does digital business management literacy influence the entrepreneurial intentions of TVET graduates?

Table 3: Mean Ratings of TVET Lecturers and TVET Students on the Influence of Digital Business Management Literacy on Entrepreneurial Intentions

S/N	Item Statements	TVET Lecturers		TVET Students		Remarks
		Mean	SD	Mean	SD	
9	Digital business management literacy enhances effective planning of entrepreneurial activities.	3.80	0.45	3.70	0.60	Agree
10	Knowledge of digital financial management applications improves business decision-making.	3.60	0.55	3.63	0.62	Agree
11	Competence in digital record-keeping strengthens business accountability.	3.80	0.45	3.74	0.58	Agree
12	Ability to use digital inventory management tools improves business operations.	3.60	0.55	3.60	0.61	Agree
13	Digital business management skills support efficient customer and sales management.	3.80	0.45	3.72	0.59	Agree
14	Knowledge of e-commerce platforms promotes successful business establishment.	3.60	0.55	3.66	0.60	Agree
15	Competence in digital budgeting applications enhances entrepreneurial performance.	3.40	0.55	3.55	0.64	Agree
16	Digital business management literacy strengthens entrepreneurial intentions among TVET graduates.	3.80	0.45	3.76	0.57	Agree
	Grand Mean/SD	**3.68**	**0.50**	**3.67**	**0.60**	**Agree**

Table 3 presents the mean ratings of TVET Lecturers and TVET Students on the influence of digital business management literacy on entrepreneurial intentions. The results show that all the items recorded mean scores above the benchmark mean of 2.50, indicating agreement among both respondent groups that digital business management literacy contributes significantly to entrepreneurial intentions.

The TVET Lecturers obtained a grand mean of 3.68 (SD = 0.50), while TVET Students recorded a grand mean of 3.67 (SD = 0.60). These findings indicate that respondents acknowledged the importance of digital competencies in business planning, financial management, inventory control, customer relationship management, e-commerce operations, and budgeting for entrepreneurial success. The relatively low standard deviation values suggest that the respondents expressed similar opinions, indicating consistency in their responses. Overall, digital business management literacy was perceived as an important factor for developing entrepreneurial competence and business sustainability among TVET graduates.

H_{02}:There is no significant difference between the mean responses of TVET Lecturers and TVET Students on the influence of digital business management literacy on entrepreneurial intentions.

Table 4: Independent Samples t-test on the Mean Responses of TVET Lecturers and TVET Students Regarding the Influence of Digital Business Management Literacy on Entrepreneurial Intentions

Variable	N	Mean	SD	df	t-cal	t-crit	Sig.	Decision
TVET Lecturers	15	3.68	0.50					
TVET Students	150	3.67	0.60	33	0.08	2.03	0.936	Not Significant (Accept H_0)

The independent samples t-test results show that the calculated t-value of 0.08 is less than the critical t-value of 2.03 at 33 degrees of freedom and 0.05 level of significance. In addition, the probability value (p = 0.936) is greater than 0.05. Therefore, the null hypothesis was accepted. This indicates that there is no significant difference between the mean responses of TVET Lecturers and TVET Students regarding the influence of digital business management literacy on entrepreneurial intentions. The finding implies that both groups unanimously recognized digital business management literacy as a critical competence for successful entrepreneurship in the digital economy.

Research Question Three:What is the influence of digital opportunity recognition and decision-making skills on the entrepreneurial intentions of TVET graduates?

Table 5: Mean Ratings of TVET Lecturers and TVET Students on the Influence of Digital Opportunity Recognition and Decision-Making Skills on Entrepreneurial Intentions

S/N	Item Statements	TVET Lecturers		TVET Students		Remarks
		Mean	SD	Mean	SD	
17	Digital literacy improves the ability to identify online business opportunities.	3.80	0.45	3.74	0.56	Agree
18	Digital information analysis supports sound entrepreneurial decision-making.	3.60	0.55	3.68	0.60	Agree
19	Competence in online market research strengthens business opportunity identification.	3.80	0.45	3.77	0.55	Agree
20	Digital analytical skills improve business risk assessment.	3.60	0.55	3.63	0.61	Agree
21	Use of digital technologies supports innovative business ideas.	3.80	0.45	3.76	0.56	Agree
22	Digital literacy enhances confidence in making entrepreneurial decisions.	3.60	0.55	3.66	0.58	Agree
23	Knowledge of digital business trends improves entrepreneurial adaptability.	3.80	0.45	3.72	0.59	Agree
24	Digital opportunity recognition strengthens entrepreneurial intentions among TVET graduates.	3.80	0.45	3.79	0.54	Agree
	Grand Mean/SD	**3.73**	**0.48**	**3.72**	**0.57**	**Agree**

Table 5 presents the responses of TVET Lecturers and TVET Students on the influence of digital opportunity recognition and decision-making skills on entrepreneurial intentions. All the items recorded mean ratings above the criterion mean of 2.50, indicating that both groups agreed that digital opportunity recognition and decision-making skills are important determinants of entrepreneurial intentions.

The TVET Lecturers recorded a grand mean of 3.73 (SD = 0.48), while the TVET Students obtained a grand mean of 3.72 (SD = 0.57). These results suggest that respondents perceived digital literacy as enhancing opportunity recognition, innovation, market analysis, risk assessment, adaptability, and informed entrepreneurial decision-making. The relatively small standard deviation values indicate a high degree of agreement among the respondents. The findings therefore imply that digital opportunity recognition and decision-making skills play a significant role in motivating TVET graduates toward entrepreneurial ventures.

H_{03}:There is no significant difference between the mean responses of TVET Lecturers and TVET Students on the influence of digital opportunity recognition and decision-making skills on entrepreneurial intentions.

Table 6: Independent Samples t-test on the Mean Responses of TVET Lecturers and TVET Students Regarding the Influence of Digital Opportunity Recognition and Decision-Making Skills on Entrepreneurial Intentions

Variable	N	Mean	SD	df	t-cal	t-crit	Sig.	Decision
TVET Lecturers	15	3.73	0.48					
TVET Students	150	3.72	0.57	33	0.11	2.03	0.913	Not Significant (Accept H_0)

The independent samples t-test revealed that the calculated t-value of 0.11 is less than the critical t-value of 2.03 at 33 degrees of freedom and 0.05 level of significance. The associated probability value (p = 0.913) is greater than 0.05. Therefore, the null hypothesis was accepted. This indicates that there is no statistically significant difference between the mean responses of TVET Lecturers and TVET Students regarding the influence of digital opportunity recognition and decision-making skills on entrepreneurial intentions. The result demonstrates a common perception that digital literacy enhances the ability of TVET graduates to identify entrepreneurial opportunities, make informed business decisions, and strengthen their intentions to establish and sustain successful enterprises.

DISCUSSION OF FINDINGS

The first research question sought to determine the influence of digital communication literacy on the entrepreneurial intentions of TVET graduates. The findings revealed that both TVET lecturers and students agreed that digital communication literacy positively influences entrepreneurial intentions, with grand mean scores of 3.68 and 3.69 respectively. Specifically, respondents agreed that digital communication skills enhance customer interaction, promote entrepreneurial awareness through social media, facilitate online marketing, improve business communication, strengthen customer relationship management, increase networking confidence, and support collaboration with business partners. The t-test analysis revealed no significant difference between the perceptions of lecturers and students (t-cal = 0.04, t-crit = 2.03, p = 0.968), indicating a shared understanding of the importance of digital communication in entrepreneurship.

Furthermore, the findings corroborate Agbeyangi, Makinde, and Odun-Ayo (2024), who argued that digital literacy encourages creativity and innovation essential for sustaining entrepreneurial competitiveness. The agreement among respondents that digital communication tools facilitate online marketing aligns with Idowu (2025), who observed that digital entrepreneurship enables graduates to access wider markets and improve customer engagement. The finding that digital communication literacy strengthens customer relationship management is consistent with Abubakar, Zakariyya, Ibrahim, and Usman (2026), who noted that digital communication technologies enhance business management capabilities.

Discussion of Research Question Two

The second research question examined the extent to which digital business management literacy influences entrepreneurial intentions among TVET graduates. The findings indicated strong agreement among both lecturers and students that digital business management literacy positively influences entrepreneurial intentions, with grand mean scores of 3.68 and 3.67 respectively. Respondents agreed that digital business management literacy enhances entrepreneurial planning, improves decision-making through financial management applications, strengthens accountability through record-keeping, improves inventory management, supports customer and sales management, promotes business establishment through e-commerce platforms, enhances entrepreneurial performance through budgeting applications, and strengthens overall entrepreneurial intentions.

The t-test analysis revealed no significant difference between the perceptions of lecturers and students (t-cal = 0.08, t-crit = 2.03, p = 0.936), indicating unanimous agreement on the importance of digital

business management competencies for entrepreneurship. These findings support the management model framework underpinning this study, which posits that effective management of institutional resources and instructional practices facilitates the translation of digital competencies into entrepreneurial outcomes (Nwanakezie&Ogona, 2021).

These findings are consistent with George, Silas, Pandey, and Pandey (2024), who emphasized that digital literacy is indispensable for vocational graduates because virtually every occupational sector relies on digital technologies. The agreement that knowledge of digital financial management applications improves business decision-making aligns with Okonkwo, Orajaka, Ezeokafor, and Oguejiofor (2026), who highlighted the role of fintech services in digital entrepreneurship. Similarly, the finding that competence in digital record-keeping strengthens accountability supports Attah, Onwe, and Obi-Anike (2025), who argued that effective management ensures institutions establish supportive learning environments for entrepreneurship education.

The recognition that e-commerce platforms promote successful business establishment reflects the findings of Wahab and Akintade (2025), who noted that ICT integration in TVET programmes prepares learners for modern workplace environments. The agreement that digital budgeting applications enhance entrepreneurial performance is consistent with Adeniyi (2023), who identified financial management as a critical component of business start-up readiness. The finding that digital business management literacy strengthens entrepreneurial intentions aligns with Olanrewaju (2024), who emphasized that entrepreneurship education equips learners with managerial competencies for enterprise development.

Discussion of Research Question Three

The third research question investigated the influence of digital opportunity recognition and decision-making skills on entrepreneurial intentions among TVET graduates. The findings revealed strong agreement among both lecturers and students, with grand mean scores of 3.73 and 3.72 respectively. Respondents agreed that digital literacy improves the ability to identify online business opportunities, supports sound decision-making through information analysis, strengthens business opportunity identification through online market research, improves risk assessment through analytical skills, supports innovative business ideas, enhances confidence in entrepreneurial decisions, improves adaptability through knowledge of digital business trends, and strengthens overall entrepreneurial intentions.

The t-test analysis revealed no significant difference between the perceptions of lecturers and students (t-cal = 0.11, t-crit = 2.03, p = 0.913), indicating a shared recognition of the importance of digital opportunity recognition and decision-making skills for entrepreneurial development. These findings are particularly significant because opportunity recognition is widely considered the foundational step in the entrepreneurial process (Ayogoi, 2026).

These findings align with Abulude and Ogunjemilua (2025), who identified opportunity recognition and creativity as key factors contributing to entrepreneurial intentions. The agreement that digital literacy improves the ability to identify online business opportunities supports Rafiq-uz-Zaman (2023), who emphasized that digital competence enables individuals to apply technology to real-life situations effectively. The finding that digital information analysis supports sound entrepreneurial decision-making is consistent with the European Commission (2022), which described digital literacy as enabling informed and responsible use of digital technologies.

The recognition that digital analytical skills improve business risk assessment aligns with UNESCO-UNEVOC (2022), which emphasized that TVET graduates play a significant role in promoting sustainable industrial development by applying technical knowledge and innovation to address emerging challenges. The finding that knowledge of digital business trends improves entrepreneurial adaptability supports the World Economic Forum (2023), which identified adaptability and resilience as essential competencies for sustainable enterprise development.

The relatively higher grand mean for this research question (3.73) compared to the other two dimensions suggests that respondents perceive digital opportunity recognition and decision-making skills as particularly influential in shaping entrepreneurial intentions. This finding underscores the importance of developing these competencies through targeted educational interventions.

Conclusion

The study concluded that digital literacy, specifically digital communication literacy, digital business management literacy, and digital opportunity recognition and decision-making skills, significantly influences entrepreneurial intentions among TVET graduates. Both TVET lecturers and students share consistent perceptions regarding the importance of these digital competencies for entrepreneurial development. Digital

literacy is not merely an ancillary skill but a critical determinant of entrepreneurial intentions in the contemporary digital economy. The management model framework has proven useful in explaining how institutional mechanisms can facilitate the translation of digital literacy into entrepreneurial action. Effective management of TVET institutions is essential for maximizing the influence of digital literacy on entrepreneurial intentions.

Recommendations

1. TVET institutions should invest in modern ICT infrastructure, including computer laboratories, high-speed internet connectivity, digital learning platforms, and relevant software applications.
2. The curriculum should be reviewed to incorporate digital entrepreneurship as a core component, including modules on digital communication, digital financial management, e-commerce operations, online marketing, and digital opportunity recognition.
3. Institutions should organize workshops and training programmes providing hands-on experience in using digital tools for business management.
4. Institutional leaders should invest in continuous professional development programmes for TVET lecturers to enhance their digital competencies and pedagogical skills.
5. Formal partnerships should be established with industries, technology companies, and successful digital entrepreneurs to provide mentorship and internship opportunities.
6. Institutions should establish digital incubation hubs where students can develop and test their business ideas using digital technologies. Collaboration among educational institutions, government agencies, private sector organizations, and technology providers should be strengthened.

Abstract

The study examined the relationship Between entrepreneurship education and Business education students' entrepreneurial self-efficacy in public tertiary institutions in Bauchi state, Nigeria. Two objectives, two research questions and two null hypotheses guided the study. The study adopted correlational survey research design, specifically cross-sectional design. The population for the study was 192 final year Business education students across tertiary institutions, 2025/2026 academic session. Total population sample was used in the study, only 162 valid responses were recorded. The instrument used for data collection was a structured questionnaire. The instrument was subjected to face and content validation by two experts. In order to find out the reliability of the instrument, a pilot study was conducted. 0.88 correlation coefficient was obtained. The researchers collected of data; data collected from the study was analyzed using inferential statistics of Pearson Product Moment Correlation (PPMC) to test the null hypotheses at 0.05 level of significance. The findings revealed that there is positive and significant relationship between entrepreneurship content knowledge and students' entrepreneurship self-efficacy for self-reliant. Also, the relationship between Students' Industrial Work Experience Scheme (SIWES) and their entrepreneurship self-efficacy for self-reliant was positive and significant. The study therefore concluded that, having knowledge of entrepreneurship education and students' industrial practical experience led to students' entrepreneurship self-efficacy development for self-reliant. It was recommended that University curriculum planners should re-examine the entrepreneurship education curriculum in order to ensure it provides students with the necessary entrepreneurship knowledge and skills, incorporate real world application, mentorship programs and networking opportunities, and consider re-evaluating them frequently to better support students' self-reliance goals. Also, experiential, and application-based learning focusing on the practical application of entrepreneurship education in addition to mandatory SIWES should be improved and adopted in order to enhance students' entrepreneurship self-efficacy development.

Key words: **Relationship, Entrepreneurship, Education, Students' Self-efficacy**

Introduction

Rapid urbanization and modernization are demotivating the new generation students to take entrepreneurship trades as their profession, so there is dire need to reshape the traditional activities to attract Bauchi state students in tertiary institutions toward self-reliant after graduation instead of waiting for a white cola job which are no longer attainable. However, due to the economic liberalization and fast changing curriculum, this situation has changed drastically. Entrepreneurship education is a concept that is specific and drawn from wider entrepreneurship, and it has prospective and potentials for the social and economic development of the country (Sontakey, 2024). According to Sontakey (2024), its contribution takes the form of employment creation and economic growth, diversified income and poverty reduction in rural areas and improvement in nutrition, health and overall food security. According to Kukday (2024), it encompasses the transformation of an idea or vision into a "new business or new venture creation or the expansion of an existing business by an individual or a team of individuals, or an established business".

On the other hand, SIWES is a skills training programme designed to prepare and expose students of university, polytechnic, colleges of technology and colleges of education for the industrial work situation they are likely to meet after graduation. The scheme affords students the opportunity of familiarizing and exposing themselves to handling equipment and machinery that are usually not available in their institutions. Before the establishment of the scheme, there was growing concern that graduates of our institutions of higher learning lacked adequate practical knowledge and that the theoretical education in higher institutions was not responsive to the needs of the employers of labour (ITF, 2023). It is against this background that Industrial Training Fund (ITF) initiated, designed and introduced SIWES in 1973 to acquaint students with the skills of handling industrial equipment and machinery. ITF (2023) further identified the following as the objectives of SIWES to; (i) provide avenue for students in institutions of higher learning to acquire industrial skills and experience in their course of study (ii) prepare students for the industrial work situation they are to meet after graduation (iii) expose students to work methods and techniques in handling equipment and machinery that may not be available in their institutions (iv) make the transition from school to the world of work easier, and enhance students contacts for later job placement (v) provide students with an opportunity to apply their knowledge in real work situation thereby bridging the gap between theory and practice (vi) enlist and strengthen employers involvement in the entire educational process and prepare students for employment after graduation

In addition, Drnovsek, Wincent and Cardon (2010) define self-efficacy as an Individual's beliefs about his or her competencies and zeal/power to utilize such competencies in accomplishing a given task. These beliefs either accurate or not is an estimation of how well one can marshal one's cognitive, physical and emotional resources to accomplish specific goals (Maddux & Gesselin in Baraya, 2021). Self-efficacy therefore is all encompassing because it has something to do with believing in oneself to successfully execute and accomplish some tasks that will produce desired end results (Bandura, 1997). Self-efficacy is purview in nature and differs based on various chores and circumstances, it should be noted, however, that one of the essential constituents' models of entrepreneurial intention is self-efficacy, an individual with high entrepreneurial self-efficacy has the tendency to become self-employed (Ajzen, 1980; Segal, Borgia & Schoenfeld, in Baraya, 2021). Entrepreneurial self-efficacy involves individual belief regarding their capabilities for attaining success and controlling cognitions for successfully tackling challenging goals during the business start-up process (Drnovsek, Wincent & Cardon, 2010). They further posit that the goals that self-efficacy beliefs are focused on (task or outcome goals), and the valence of the beliefs (positive or negative control beliefs).

In a bid to reduce graduate unemployment in Nigeria, the Federal Government directed all institutions of higher learning in Nigeria to introduce entrepreneurship education as a compulsory course for all students, irrespective of their disciplines, in ensuring proper inculcation of entrepreneurial skills such as technical, creativity, problem solving, management, book-keeping and communication skills in graduates towards self-reliant, the educational system therefore, generally, needs to strengthen entrepreneurship education with a rich and appropriate curriculum content (Baraya, 2021). Curriculum content can be seen as the subject matter or topics consisting of facts, concepts, ideas and knowledge within a particular course, based on a duration and how it will bring about a relatively permanent change in an individual and the society (Ighoshen & Ogidigba, 2022). Curriculum content can also be seen as all the academic contents taught in schools or in a specific course or programme. It is the knowledge, skills, attitudes as well as extracurricular activities imparted to learners through teaching and learning. Therefore, the curriculum content has to be comprehensive and well-arranged, with up-to-date facts concerning the specific course. Sujuyigbe (2025) further believed that when the curriculum content is not relevant to the needs of the students and the society, students' interest will not be registered to enable effective learning, therefore the system is bound to produce poorly skilled graduates without entrepreneurship self-efficacy, thereby unable to function effectively in the world of work without gainful employment. Iwu et al., (2021) observed that the running of entrepreneurship education in the state tertiary institutions' curriculum seems to be impotent in stimulating the mindsets of students as it is primarily, theoretical rather than practical which lacks the potential to stir up innovative ideas for students to be self-reliant after graduation.

Based on the above, it is therefore, imperative that, entrepreneurship curriculum content must be rich with practical experiences and internship programme relevant to the needs of the students. It is hope that, if the students' interest can be enlisted, for effective learning to be equipped with useful skills that will lead to either gainful employment or self-employment as entrepreneurs after their graduation from the university, this is because the ability of tertiary institutions to expose students to practical entrepreneurship

education will enhance entrepreneurial drive, skills retention in learners, and if well packaged, can reduce the lingering unemployment challenges among graduates, as it will ensure stable growth in the provision of employment options for Nigerian graduates (Hanandeh et al., 2021).

Conversely, the researchers observed that, despite the established roles and a lot of emphasis by the federal government on entrepreneurship education, it seems students have not been able to acquire the necessary entrepreneurial skills, to become useful to themselves and the society after graduating from the university. There is public outcry on graduates' lack of entrepreneurship skills and attitudes to depend on their personal abilities/self-efficacy or ideas for venture creation. The researchers also maintain that these could be attributed to inadequacies in curriculum content arising from shallow curriculum devoid of practical experiences, mentorship, internship and networking opportunities in the curriculum content resulting abstract learning, poor entrepreneurial self-efficacy development that led to non-achievement of the philosophy and objectives of entrepreneurship education goals, as contained in the National Policy on Education (2012). This might be the reason for increased unemployment, resulting to robbery, prostitution, human trafficking, smuggling and kidnapping among other vices.

Despite Entrepreneurship education as a compulsory course and form part of the requirements for graduation in schools in Nigeria ranging from secondary to tertiary institutions (Adeel et al., 2023), which the philosophy and objectives are to prepare students for gainful employment after graduation to reduce graduate unemployment (Osuola in Baraya, 2021). It is unfortunate that, in spite of entrepreneurship education curriculum content and the time allotted, there was public outcry that the students lack entrepreneurial self-efficacy to venture into business for self-reliant after graduation (Baraya, 2021). Conversely, unemployment rates were very high considering the number of students that are graduating (in hundreds of thousands) from the universities every year (See for example Report from the National Bureau of Statistics NBS (2023) revealed the level of unemployment rate at 19.2% in (2022), and the most recent International Monetary Fund (IMF) projection of unemployment rate for the second quarter of 2025, which stood at 22.6%), this was alarming and it became an issue of serious concern to policy makers and researchers. It is based on the above that the researchers were compelled to investigate the relationship between entrepreneurship education curriculum content and students' self-efficacy development for self-reliant.

Though there are numerous impediments for students to become agripreneurs/entrepreneurs, the most critical are highlighted below (Malhotra et al., 2023):

1. Prejudiced perspective: students are generally counselled by parents to become employees with high salaries or professionals like doctors. Only when students reach college they come to know about research, innovations and startups. By this time, students become risk-averse and look at entrepreneurship with prejudice. Lack of exposure to entrepreneurship programs and peer support for students, who want to become agripreneurs/entrepreneurs also discourages students from venturing into it.
2. Unrealistic assumptions: Students expect higher growth in a shorter time span. The path to convert an idea into an innovative product/service, accepted by the market and realizing growth is a long process with many challenges of various dimensions from different quarters. Most of the students are put off by this physically and mentally arduous process and the fear of failure. They seek simpler and smarter ways for growth.
3. Lack of business skills: Students are especially worried about the business dimension of innovation, primarily because they lack skills and experience in managing various aspects of business, especially marketing and finance.

Students who studied entrepreneurship in agriculture are supposed to be involved in the production, processing and marketing of agricultural products, from the inputs level to biotechnology, Agri-processing as well as digital marketing which directly connects farmers to the customers thereby maximizing the food supply chain. Unfortunately, the researchers observed that there is growing vocational education students' unemployment after graduation, despite undergoing Agribusiness course as a requirement for graduation from the university. This concurred with Mukembo et al., (2015) who asserts that entrepreneurship is worsened by the declining number of youths engaged in or who aspire to pursue and venture into entrepreneurship and agricultural-related professions or careers across the state. It is based on the above that the current study investigated whether significant relationship exist between entrepreneurship education content and Business education students' entrepreneurship self-efficacy for self-reliant in tertiary institutions in Bauchi state.

The main objective of the study is to investigated the relationship between entrepreneurship education content and students' entrepreneurship self-efficacy for self-reliant in Abubakar Tafawa Balewa University, Bauchi, Nigeria. Specifically, the study sought to;

1. investigate the relationship between entrepreneurship content knowledge and Students' entrepreneurial self-efficacy for self-reliant
2. examine the relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy for self-reliant

The following research questions were raised;

1. what is the relationship between entrepreneurship content knowledge and students' entrepreneurial self-efficacy for self-reliant
2. what is the relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy for self-reliant

The following null hypotheses were tested at 0.05 level of significance;

1. There is no significant relationship between entrepreneurship content knowledge and students' entrepreneurial self-efficacy for self-reliant
2. There is no significant relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy for self-reliant

Theoretical Review

The study was underpinned by Experiential Learning Theory developed by Kolb (1984). The theory suggests that, students learn most deeply when they are able to connect theoretical knowledge and hands-on learning. The theory further states that, learning is the process whereby, knowledge is created through the transformation of experience. The importance of hands-on experience and reflection in the learning process. The theoretical framework can therefore, provide a foundation for understanding the relationship between entrepreneurship education and students' entrepreneurship self-efficacy. It is related to the current study because entrepreneurship education adopts experiential learning such as practical experience and SIWES that builds students entrepreneurship self-efficacy.

Research Methodology

The study adopted cross-sectional survey design. The study was conducted in Bauchi state, Nigeria. The population for the study was 192 final year Business education students across tertiary institutions, 2025/2026 academic session. Total population sample was used in the study, with only 162 valid responses were recorded. The instrument for data collection was a structured questionnaire. The instrument was subjected to face and content validation by two experts. In order to find out the reliability of the instrument, a pilot study was conducted using 35 final year Business education students from Federal college of education (Technical), Gombe state, Nigeria. Reliability coefficient of. 0.88 was obtained using Cronbach alpha. The researchers collected the data. Data collected from the study was analyzed using descriptive and inferential statistics of Mean, Standard Deviation and Pearson Product Moment Correlation (PPMC) respectively. Mean and Standard Deviation was used to answer research questions, while PPMC was used to test the null hypotheses at 0.05 significance level. The analysis was conducted using Statistical Package for Social Science (SPSS) version 23. The 2.50 criterion mean derived from the 4-point scale was used as the benchmark for determining mean. In the test of the null hypotheses, if $p \geq 0.05$, the null hypothesis was accepted, and if $p \leq 0.05$, the null hypothesis was rejected.

Results

Research Question One

What is the relationship between entrepreneurship education and students' entrepreneurial self-efficacy?

The results in Table 1 indicated the mean and standard deviation of responses ranging from 3.75 to 4.26 with standard deviation 1.06 to .819 and grand mean of 4.07 respectively. This clearly indicated that there is relationship between entrepreneurship education content and students' entrepreneurial self-efficacy in universities within North east, Nigeria.

Table 1: Mean and standard deviation on the relationship between entrepreneurship education and students' entrepreneurial self-efficacy.

S/N	Items	N	Mean	SD	Remark
1.	entrepreneurship education content provides vocational education students with basic	162	4.02	.802	Agree

	knowledge for Agribusinesses, principles of management, and financial accounting records			
2.	entrepreneurship education content provides vocational education students with basic knowledge for organic farming and biotechnology, and impact of technology	4.19	.866	Agree
3.	entrepreneurship education content provides vocational education students with basic knowledge for agribusiness risks	4.26	.819	Agree
4.	entrepreneurship content provides vocational education students with basic knowledge for sustainable agriculture	4.07	.874	Agree
5.	entrepreneurship education content provides vocational education students to identify sources of agribusiness fund, and the principles of business planning	4.21	.793	Agree
6.	entrepreneurship education content provides vocational education students with basic knowledge with the principles of entrepreneurship and innovation	3.75	1.06	Agree
7.	entrepreneurship education content provides vocational education students with basic knowledge for supply chain management in agribusiness	3.96	.947	Agree
	Grand Mean	**4.07**	**.458**	**Agree**

Source; field work (2026).

Research Question Two

What is the relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy?

The results in Table 2 indicated the mean and standard deviation of responses ranging from 3.77 to 4.24 with standard deviation 1.00 to .892 and grand mean of 4.00 respectively. The result revealed that there is positive relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy.

Null Hypothesis One

There is no significant relationship between entrepreneurship education and students' entrepreneurial self-efficacy

The statistical evidence documented in Table 3 revealed that the variable entrepreneurship content knowledge had a positive and significant relationship with students' entrepreneurial self-efficacy r=.656**, p< .001. The result therefore, does not accept null hypothesis one.

Table 3: PPMC on the relationship between entrepreneurship education and students' entrepreneurial self-efficacy.

Null Hypothesis Two

There is no significant relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy.

The statistical evidence documented in Table 4 revealed that the relationship between Students' Industrial Work Experience Scheme (SIWES) and students' entrepreneurial self-efficacy was significant r=.723**, p< .001. This result therefore, reject null hypothesis two.

Findings of the Study

The following findings were made

1. The result of research question one and its corresponding null hypothesis revealed that there is positive and significant relationship between entrepreneurship education and Business education students' entrepreneurial self-efficacy.
2. Statistical evidence from research question two and its corresponding null hypothesis revealed that there is significant relationship between SIWES and Business education students' entrepreneurial self-efficacy.

Discussion of the Findings

The study's findings present significant insights into the relationship between entrepreneurship education and Business education students' selfefficacy.

The finding of null hypothesis one posited that there is significant relationship between entrepreneurship education and students' entrepreneurship self-efficacy. The finding concurred with Baraya, Samson, Chadi, Umar & Jirgi (2025), Baraya, (2021), Rana and Bisht (2023) and Ahmad et al., (2020) who found in their separate studies that relationship exist between entrepreneurship education content and students' entrepreneurship self-efficacy (Henley et al., 2017; Biney, 2017; Carlos et al., 2018; Roberta et al., Mack et al., 2023 & Rahim et al., 2023). Additionally, Choundhary et al., (2025), Ere et al., (2019) and Sajuyigbe (2025) found that entrepreneurship education creates opportunities and reduce

poverty and prepare students' mindset toward self-reliance, which also agreed with the finding of the current study.

The finding of null hypothesis two revealed that there is positive and significant relationship between SIWES and students' entrepreneurship self-efficacy. This is in line with the findings of Baraya, et al., (2025), Mukembo et al., (2015), Mark and Honig (2023) who found in their separate studies that when students are engaged in Agripreneurship/entrepreneurship project-based, hands-on, it increases the likelihood of changing their mindsets to consider agriculture as a business that could provide gainful employment and improve their economic prospects for self-reliant. The finding of the current study also concurred with and Maricham, (2016), Fellnhofer and Puumalainen (2017), who found Agripreneurship practice as solution to many economic problems like urbanization, poverty, unemployment and economic development. And also, individual often are inspire by role model improve their entrepreneurial self-efficacy. Conversely, Lee et al., (2016); Hockets (2017) and Pfeifer et al., (2016) found work experience shown to improve students' entrepreneurship self-efficacy. Similarly, Politis et al., (2019) and Pocek et al., (2021) found extra-curricular and practical experience positively correlated with students' entrepreneurship self-efficacy.

Conclusion

The findings of this study suggest that entrepreneurship education had a significant relationship with Business education students' self-efficacy. It was further established by this study that entrepreneurship content knowledge and SIWES had a positive and significant relationship with students' entrepreneurship self-efficacy development for self-reliant.

Recommendations

The study recommends that:

1. University curriculum planners should re-examine the entrepreneurship education content in order to ensure it provides students with the necessary skills and knowledge, such as the real-world application, mentorship programs and networking opportunities, and consider re-evaluating and revising them frequently to better support students' self-reliance goals.
2. Experiential and application-based learning focusing on the practical application of entrepreneurship education should be adopted, and mandatory SIWES should be improved and strengthened to enhance students' entrepreneurship self-efficacy development for self-reliance.

University of Calabar.

Abstract

This study ascertained the influence of artificial intelligence assessment tools and academic performance of business education students in Public Universities in Cross River State, Nigeria. To achieve the purpose of the study, two research questions were posed and two null hypotheses were formulated to guide the study. Predictive correlational design was adopted for the study. The population of the study comprised 311 final year business education students in public universities in Cross River State. Proportionate sampling technique was adopted to select a sample of 109 respondents. The instrument for data collection and analysis was the Artificial Intelligence Assessment Tools and Academic Performance Questionnaire (AIATAPQ). The instrument was validated by two lecturers in Business Education and one expert in measurement and evaluation, University of Calabar. Simple linear regression analysis was used to test the hypotheses at 0.05 significant level. Findings from the study revealed that there is a statistically significant influence of Claude AI and Turnitin on academic performance of business education students in public universities in Cross River State. It was concluded that the use of artificial intelligence assessment tools enhance the academic performance of students. Based on the result of the findings, it was recommended among others that university students should be trained on the use of Claude AI to enhance their academic performance. It was also recommended that students should be encouraged on the use of Turnitin by university management to promote the integrity of their work.

Introduction

Business education is a dynamic component of vocational and technical education that is designed to equip learners with the knowledge, skills, competencies, attitudes and values required for effective participation in business, employment, entrepreneurship and economic development. According to Umezulike (2025), the concept of business education goes beyond the acquisition of theoretical knowledge about business; it involves the development of practical and transferable competencies that enable individuals to function effectively as employees, entrepreneurs, managers, administrators and employers of labour. In the view of Eleng and Akeke (2023) business education is described as an educational process or content which have the primary aim of preparing people for roles in enterprise, such roles could be as employees, entrepreneurs, employers, or simply as self-employed person. In the Nigerian educational context, business education is particularly important because of its potential to promote employability, self-reliance, entrepreneurship and economic development. Recent literature continues to describe business education as a programme that prepares individuals for careers in business while developing competencies necessary for participation in the economic system. The concept of business education has evolved considerably in response to changes in the nature of work and business activities. Traditionally, emphasis was placed on areas such as bookkeeping, accounting, shorthand, typewriting, office practice, marketing and business management. However, technological advancement and the digital transformation of the workplace have expanded the scope of business education. Contemporary business education increasingly encompasses information and communication technology, digital marketing, e-commerce, data management, entrepreneurship, digital communication, financial technology, and other technology-enabled business practices. Seyi and Abiola (2024) observed that business education is dynamic and remains

relevant to successful living, job creation, employability, and effective participation in the growth of both the Nigerian and global economies. However, the performance of students in business education-related courses remains abysmal.

Academic performance is an important concept in educational research because it provides an indication of the extent to which students achieve the learning outcomes expected from a particular educational programme. Aden (2025) stated that academic performance generally refers to the level of knowledge, skills, competencies and academic achievement demonstrated by a learner after participating in teaching and learning activities. Academic performance is commonly assessed through examinations, tests, continuous assessment, assignments, projects, practical exercises, presentations, grade-point averages (GPA) and cumulative grade-point averages (CGPA). In higher education, academic performance is particularly important because it provides evidence of students' progress and the extent to which they have acquired the competencies associated with their programme of study. Recent scholarship emphasizes that academic performance is a multidimensional outcome influenced by individual, instructional, institutional and social conditions rather than by a single factor (Wang & Chen, 2024).

Poor academic achievement among Business Education students has become an important educational concern because the programme is expected to produce graduates with competencies in accounting, marketing, entrepreneurship, office technology, management, communication and digital technologies. Babatunde et al., (2025) indicated that students' achievement can be affected by a combination of academic, technological, psychological, socioeconomic and institutional factors rather than by students' ability alone. Makwe et al. (2025) listed some of the challenges of poor performance in business education to include inadequate instructional facilities, inadequate electricity supply, poor digital literacy, outdated curriculum content, large class sizes, inadequate funding of Business Education programmes, poor teaching methods, poor study habits and academic stress. In recent time, Artificial Intelligence (AI) assessment tools have been developed to enhance students' academic performance.

Artificial Intelligence assessment tools can generally be described as computer-based applications that employ AI techniques to assist in designing, administering, scoring, interpreting, or providing feedback on educational assessments. Artificial Intelligence (AI) assessment tools have emerged as an important development in contemporary education because of the increasing demand for faster, more personalized, data-driven and efficient approaches to assessing students' learning. Luo et al. (2025) maintained that assessment in higher education has depended largely on lecturers to prepare questions, administer tests, mark students' scripts, provide feedback and determine academic achievement. Although these conventional approaches remain valuable, they can become demanding where lecturers handle large classes and multiple assessment activities. Recent developments in machine learning, natural language processing, learning analytics and generative artificial intelligence have created new possibilities for supporting almost every stage of the assessment process, including assessment design, question generation, automated scoring, formative feedback, adaptive testing and analysis of students' performance (Bond et al., 2024).

The development of artificial intelligence assessment tools is closely connected with the broader field of Artificial Intelligence in Education (AIED). Akputu *et al*. (2026) stated that artificial intelligence (AI) supports teachers in understanding learners' needs, predicting performance, and designing adaptive learning environments. Ebam and Ekunke (2025) highlighted some of the artificial intelligence tools used to improve educational outcomes to include intelligent tutoring systems, learning management systems (LMS), automated assessment and feedback, chatbots and virtual assistants, adaptive learning platforms, speech recognition, and language learning. A meta-systematic review by Bond et al. (2024) indicated that AI applications in higher education include intelligent tutoring, adaptive systems, prediction, personalization and automatic assessment. This suggests that AI assessment is no longer restricted to automatically marking objective questions; it increasingly involves systems capable of analysing students' responses and learning behaviours to provide individualized information about their progress. The growing importance of AI assessment tools has been strengthened by the rapid development of generative AI and large language models (LLMs). Applications such as ChatGPT and similar systems can generate assessment questions, case studies, rubrics, model answers and feedback. They can also analyse students' written responses and provide preliminary evaluations. Luo et al. (2025), in a systematic review of 63 peer-reviewed studies, found that AI-based learning tools are increasingly being designed to provide personalized learning, real-time feedback and flexible learning experiences. The review further shows that AI tools can influence cognitive, skill-based and affective learning outcomes.

Claude AI is another large language model that can support educational assessment. It can analyse relatively long texts, generate questions, evaluate written responses, develop rubrics and provide feedback. Claude can be particularly useful for essay and case-study assessment, where students are required to explain, analyse and evaluate business problems rather than simply select correct answers. This is consistent with recent research showing increasing use of large language models for automated assessment of open-ended responses (Pecuchova et al., 2025). The research also indicates that AI assessment of open-ended work requires careful validation because complex student responses can be interpreted differently by AI and human assessors.

Turnitin is primarily an academic-integrity and similarity-checking tool. Bashraheel and Ghinea (2026) posited that turnitin compares student submissions with existing sources to identify textual similarities. Its newer AI-related functions can also provide an indication that text may have been generated using AI. Its importance to assessment lies in helping lecturers evaluate the originality and integrity of students' academic work. AI-detection results should not automatically be treated as proof of misconduct. Recent research has raised concerns about the reliability of AI-detection technologies, including the possibility of false positives and false negatives. Consequently, lecturers should combine technological indicators with human judgment and other evidence of students' learning. This study is therefore designed to ascertain the influence of artificial intelligence tools on academic performance of business education students in public universities in Cross River State, Nigeria.

Statement of the problem

Academic performance is one of the major indicators used to determine the extent to which students achieve the expected learning outcomes of an educational programme. It is commonly reflected through students' scores in tests, examinations, assignments, projects, practical exercises and grade point averages. Good academic performance is important because it demonstrates students' acquisition of knowledge, skills and competencies and contributes to their readiness for further education and employment. However, concerns about students' academic performance continue to attract attention, particularly as higher education institutions experience rapid changes in teaching, learning and assessment practices.

The problem has become more complex with the increasing use of digital technologies and artificial intelligence (AI) tools in education. Recent evidence indicates that AI-supported educational technologies can improve learning outcomes by providing personalised learning, immediate feedback, adaptive assessment and opportunities for students to practise independently. AI applications can support students' learning and improve academic performance, including through assessment, learning support and prediction of students' performance.

Despite these potential benefits, the academic performance of students cannot automatically be assumed to improve simply because AI tools are available. The effectiveness of these technologies may depend on how frequently students use them, the purposes for which they use them, their digital literacy, the quality of AI-generated information and the extent to which lecturers guide their use. In particular, excessive dependence on AI-generated responses may reduce students' engagement in independent thinking, analytical reasoning and problem-solving. Over-reliance on AI dialogue systems can encourage students to accept AI-generated recommendations without adequately evaluating their accuracy, potentially affecting critical thinking, decision-making and analytical reasoning.

Another important concern relates to assessment. Traditional forms of assessment may no longer provide an accurate indication of students' individual knowledge and abilities when students can easily obtain answers from generative AI applications. Generative AI has created both opportunities and challenges for higher education assessment, including immediate feedback and self-assessment opportunities, but also serious concerns about academic integrity. Conventional assessment approaches may need to evolve to ensure that students' actual learning outcomes are adequately measured. Furthermore, the ability of generative AI systems to produce academically acceptable responses raises questions about the validity of students' academic scores. AI-generated responses in higher education assessments has shown that some generative AI systems can produce work that performs well against academic assessment criteria.

The problem, therefore, is not simply whether students are performing well or poorly academically, but whether the factors influencing their academic performance are adequately understood in the contemporary technology-driven educational environment. There is a need to establish whether the use of AI assessment tools contributes to genuine improvement in students' academic performance or merely

improves their assessment scores without corresponding development of independent learning, critical thinking and problem-solving abilities. Consequently, the present study is considered necessary to investigate academic performance as an outcome of students' learning in the context of AI assessment tools.

Purpose of the study

The purpose of this study was to ascertain the influence of:

1. Claude AI on the academic performance of business education students in public universities in Cross River State, Nigeria.
2. Turnitin on the academic performance of business education students in public universities in Cross River State, Nigeria.

Research questions

The following research questions were posed to guide the study.

1. What is the influence of Claude AI on the academic performance of business education students in public universities in Cross River State, Nigeria?
2. What is the influence of Turnitin on the academic performance of business education students in public universities in Cross River State, Nigeria?

Research hypotheses

The following null hypotheses were formulated and tested;

1. There is no significant influence of Claude AI on the academic performance of business education students in public universities in Cross River State, Nigeria.
2. There is no significant influence of Turnitin on the academic performance of business education students in public universities in Cross River State, Nigeria.

Research methods

The design that was adopted for this study was the predictive correlational research design. The population of the study comprised 311 business education final year students in two public universities in Cross River State. The proportionate sampling technique was used for this study, using 35% of the population. This technique ensures fair representation of each subgroup in proportion to its population size, thereby increasing the accuracy, representativeness, and reliability of the study findings. The sample of the study comprised 109 business education final year students in two public universities in Cross River State. The major instrument for data collection was a structured questionnaire called Artificial Intelligence Assessment tools and Academic Performance Questionnaire" (AIATAPQ). The instrument contained two sections. Section "A" contain 20 items drawn from the independent sub-variables while, section 'B' contained 10 items from the dependent variable, making a total of 30 items. The instrument is a four-point rating scale of Strong Agree (SA), Agree (A), Strong Disagree (SD) and Disagree (D). Respondents were given the freedom to tick the option that best suit their opinions without interference by the researcher. The items were positively ranked as Strong Agree (SA) -4 points, Agree (A) -3 points, Strong Disagree (SD) -2 points and Disagree (D) – 1 point, respectively. The validity of the instrument was determined by two lecturers in the department of Business Education and an expert in measurement and evaluation, University of Calabar, who scrutinized the instrument thoroughly before the last draft was administered to the respondents. The researcher visited the institutions personally to administer the instrument to the respondents. The researcher met with the Head of Department (HOD) and handed over the introductory letter to the them. After obtaining permission, the researcher also met with the lecturers, introduced himself and handed out the introductory letter to them also. The targeted sample was addressed and informed of the exercise and the need to be honest in terms of giving objective response, as responses would be used for research purpose only. The exercise was concluded in immediately after the administration of the instrument which ensured total compliance. After collection of instrument, codes were assigned to each of the items for easy preparation of data. The instrument was a 30 items questionnaire called Artificial Intelligence Assessment tools and Academic Performance Questionnaire" (AIATAPQ), derived from the variables of the study. Each variable contained five items. The items were positively coded as Strong Agree (SA) -4 points, Agree (A) -3 points, Strong Disagree (SD) -2 points and Disagree (D) – 1 point, respectively. The research questions and hypotheses were answered and tested using simple linear regression analysis. The hypotheses were tested at 0.05 level of significance. The decision rule was that when the P-value is less than the significant level the null hypothesis is rejected and the alternative hypothesis is accepted and vice-versa.

Results

Research question one

What is the influence of Claude AI on the academic performance of business education students in public universities in Cross River State, Nigeria? This research question was answered using simple linear regression analysis. The result of the analysis is presented on Table 1.

TABLE 1

Simple linear regression analysis of Claude AI and the academic performance of business education students in public universities in Cross River State, Nigeria, N=109

R	R. Square	Adjusted R.Square	Std error of estimate
.542	.294	.282	.715

Source: Fieldwork, 2026

The result of research question one as presented on Table 1 reveals that the R which is the correlation coefficient of the independent and dependent variables was .542 which was a value far greater than .40 indicating a strong positive relationship between Claude AI and academic performance of business education students in public universities in Cross River State. More so, the coefficient of determination (R^2) which indicated how much of the total variation in the dependent variable that can be explained by the independent variable was .294. This showed that 29.4% of variation in academic performance of business education students was accounted for by Claude AI. This result indicated a linear fit between the independent and dependent variables.

Research question two

What is the influence of Turnitin on the academic performance of business education students in public universities in Cross River State, Nigeria? This research question was answered using simple linear regression analysis. The result of the analysis is presented on Table 6.

TABLE 2

Simple linear regression analysis of Turnitin and the academic performance of business education students in public universities in Cross River State, Nigeria, N=109

R	R. Square	Adjusted R.Square	Std error of estimate
.830	.688	.687	.356

Source: Fieldwork, 2026

The result of research question two as presented on Table 2 reveals that the R which is the correlation coefficient of the independent and dependent variables was .830 which was a value far greater than .40 indicating a strong positive relationship between turnitin and academic performance among business education students in public universities in Cross River State. More so, the coefficient of determination (R^2) which indicated how much of the total variation in the dependent variable that can be explained by the independent variable was .688. This showed that 68.8% of variation in academic performance was accounted for by Turnitin. This result indicated a linear fit between the independent and dependent variables.

Hypothesis one

There is no significant influence of Claude AI on the academic performance of business education students in public universities in Cross River State, Nigeria. This null hypothesis was tested using simple linear regression analysis. The result of the analysis is presented on Table 3.

TABLE 3

Simple linear regression of Claude AI and academic performance of business education students in public universities in Cross River State, Nigeria, N=109

Model	Sum of square	Df	Mean square	F-value	P-value
Regression	12.792	1	12.792	24.993	.000
Residual	30.708	107	.512		
Total	43.500	108			

Source: Fieldwork, 2026

Table 3 indicates an Analysis of Variance result of F-value = 24.993 with a P-value of .000 at 1 and 107 degrees of freedom. The F-value which was greater than 1 yielded efficient model. Also, since the P-value of .000 was less than the tolerable significance value of .05, it therefore indicated that the regression model significantly predicted the outcome variable. Thus, the null hypothesis was rejected and the alternate

hypothesis was upheld. This result implies that there is a significant influence of Claude AI on academic performance of business education students in public universities in Cross River State, Nigeria.

Hypothesis two

There is no significant influence of Turnitin on academic performance of business education students in public universities in Cross River State, Nigeria. This null hypothesis was tested using simple linear regression analysis. The result of the analysis is presented on Table 4.

TABLE 4

Simple linear regression of Turnitin and academic performance of business education students in public universities in Cross River State, Nigeria, N=109

Model	Sum of square	Df	Mean Square	F-value	P-value
Regression	96.287 1	96.287	758.927		.000
Residual	43.644	107	.127		
Total	139.931	108			

Source: Fieldwork, (2026)

Table 4 shows an Analysis of Variance result of F-value = 758.927 with a P-value of .000 at 1 and 107 degrees of freedom. The F-value which was greater than 1 yielded efficient model. Also, since the P-value of .000 was less than the tolerable significance value of .05, it therefore indicated that the regression model significantly predicted the outcome variable. Thus, the null hypothesis was rejected and the alternative hypothesis was accepted. This result implies that there is a significant influence of Turnitin on academic performance of business education students in public universities in Cross River State, Nigeria.

Discussions

The finding in this aspect of the study revealed that there is a significant influence of Claude AI on the academic performance of business education students in public universities in Cross River State. Claude AI is a generative artificial intelligence assistant designed to help users with writing, research, coding, reasoning, data analysis, and business tasks. It has the ability to process long documents, generate high-quality text, and assist with complex problem-solving makes it a valuable productivity tool. The finding is in line with that of Ar *et al*. (2024) that Claude AI provides a more systematic narrative structure, generating story ideas, corrects grammar and spelling, provided feedback that clarifies paragraph structure in narrative texts. The study agrees with that of Saleh and Haiping (2024) that Claude demonstrated the highest average alignment with human instructor scores across the four articles. The finding also agrees with that of Max and Alan (2025) that Claude AI explores areas where the generative artificial intelligence excels, such as quickly summarizing points of agreement across sources, as well as its limitations, such as struggling with synthesis, providing incomplete citations, and hallucinating false information. The finding equally Cantika and Ibnu (2024) that Claude AI assists and improves college students' academic writing skills.

The finding in this aspect of the study revealed that there is a significant influence of turnitin on the academic performance of business education students in public universities in Cross River State. Turnitin helps students and researchers avoid plagiarism by identifying similarities between submitted work and existing. The study disagrees with that of Moshi and Ahadi (2025) that although the adoption of Turnitin software has reduced the trend in plagiarism in theses and dissertation writing, its effectiveness is limited because it fails to detect plagiarism levels within individual chapters of theses or dissertations. It is recommended that the plagiarism policy be reviewed to take into account new strategies that focus on individual chapters as well as the tolerance level of 30%, which seems high. Policies that address plagiarism content in postgraduate curricula should also be considered. The finding agrees with that of Kebashnee and Rindella (2022) that students in South Africa experience benefits of Turnitin such as accessibility and convenience as electronic tools, convenience view for grades, and clear originality reports. The finding equally agrees with that of Seher and Selcan (2019) that studens believed in the effectiveness of Turnitin in detecting plagiarism in presentations. Students perceived themselves as academically honest when preparing their presentations. Also, they were aware of the importance of using Turnitin in a required presentation skills course to detect plagiarism. The finding also agrees with that of Annisa (2023) that many English Education alumni view Turnitin positively as a helpful tool for detecting potential plagiarism in their academic writing.

Conclusion

The study ascertained the influence of artificial intelligence assessment tools on academic performance of Business Education students in public universities in Cross River State, Nigeria. The result of the findings strongly suggested that there is a statistically significant influence of Claude AI and Turnitin influence academic performance of business education students in public universities in Cross River State, Nigeria.

Recommendations

Based on the result of the study, the following recommendations were made:

1. University management should encourage the use of Claude AI by students to enhance their academic performance.
2. Students should be encouraged on the use of Turnitin by university management to promote the integrity of their work.

Abstract

The escalating challenge of graduate unemployment and underemployment in Nigeria has necessitated a strategic re-evaluation of tertiary curricula, with entrepreneurship education emerging as a pivotal intervention. This study examined the impact of entrepreneurship education on the development of entrepreneurial skills, specifically technical and financial competencies, among Business Education students in tertiary institutions in Kwara State, Nigeria. Employing a descriptive survey research design, the study's population comprised 288 final-year Business Education students across three public tertiary institutions, from which a sample of 83 respondents was drawn using proportionate stratified random sampling. Data were collected using a structured, validated questionnaire with a reliability coefficient of 0.88, determined via the Spearman-Brown prophecy formula. Analysis, conducted using mean, standard deviation, and independent samples t-tests, revealed that entrepreneurship education positively influences the acquisition of technical skills (mean = 3.07, SD = 1.01) and financial skills (mean = 3.08, SD = 1.00) to a high extent. The findings underscore the vital role of entrepreneurship education in equipping students with the competencies necessary for job creation rather than job seeking. The study recommends, among others, that school administrators should support continuous professional development for lecturers and that curricula should be strengthened to ensure students understand that fraud and criminality are antithetical to genuine entrepreneurship.

Keywords: Entrepreneurship Education, Business Education, Technical Skills, Financial Skills, Graduate Employability, Nigeria.

Introduction

Entrepreneurship is fundamentally a process of harnessing creativity to establish new ventures and taking calculated risks to capitalize on emerging opportunities. It necessitates the efficient mobilization of resources to generate value, reflecting an individual's capacity for risk-taking and the ability to combine factors of production to create valuable goods and services. This process emphasizes the willingness to

identify investment opportunities and strategically position oneself to build and manage a business based on viable prospects. At its core, entrepreneurship involves recognizing, developing, and realizing a vision be it an innovative idea or an improved method of accomplishing tasks. It encompasses the creation of businesses, the organization of operations, and the assumption of risks to leverage entrepreneurial competencies for wealth creation.

Entrepreneurship education has emerged as a critical determinant in shaping the capabilities of future entrepreneurs, yet it remains one of the most challenging aspects of higher education globally (Guma & Dahlan, 2019). The absence of robust entrepreneurial programs within higher education institutions (HEIs) has profound implications for global unemployment rates (Musara, 2020). Insufficient access to such programs restricts students' opportunities to develop essential entrepreneurial competencies and hampers effective technology transfer. In light of shifting labour market demands, Nájera-Sánchez, Pérez-Pérez, and González-Torres (2023) assert an urgent need for a transformative approach to entrepreneurship education that prioritizes experiential learning and skill acquisition.

Over the past few decades, the landscape of entrepreneurship education has evolved significantly, particularly in developed nations that have aligned their curricula with the imperatives of the fifth industrial revolution (5IR) (Irawanto & Novianti, 2021). Conversely, many developing countries, including Nigeria, lag behind, struggling to adapt their educational frameworks to meet the challenges of the fourth industrial revolution (4IR) (Olaitan & Mavuso, 2022). This disconnect is evident in various African higher education systems, which fail to produce a sufficient number of entrepreneurs (Ramchander, 2021). Alarmingly, graduate unemployment rates across the continent have reached critical levels, with a substantial percentage of unemployed youth holding tertiary qualifications (Ngubane, Mndebele, & Kaseeram, 2023).

The significance of entrepreneurship extends beyond individual success; it serves as a vital catalyst for economic development, job creation, and poverty alleviation globally (Adejumo, 2016). Within the educational context, entrepreneurship education aims to equip students with the knowledge, skills, and mindset necessary to identify and exploit business opportunities, thereby fostering innovation and self-reliance (Fayolle & Gailly, 2018). Business Education, as an interdisciplinary field, is particularly suited to integrate entrepreneurial concepts into its curriculum, focusing on practical skills, business principles, and vocational training (Okoye et al., 2020). This growing emphasis on entrepreneurship education underscores its crucial role in addressing youth unemployment and underemployment, especially in developing economies such as Nigeria (Ibrahim & Masud, 2019).

In Nigeria, the urgency of entrepreneurship education has intensified due to persistent challenges with graduate unemployment and underemployment (Nwankwo et al., 2022). Integrating entrepreneurship education into tertiary curricula, including Business Education programmes, has emerged as a strategic response to reduce reliance on traditional white-collar jobs and promote self-reliance (Onyebuchi & Nwokeabia, 2018). The National Policy on Education emphasizes the necessity for educational systems to prepare students for self-employment through vocational and entrepreneurial training (Federal Republic of Nigeria, 2020). Despite these initiatives, concerns persist regarding the effectiveness of entrepreneurship education in translating theoretical knowledge into practical entrepreneurial skills. Research indicates that while students acquire foundational knowledge, real-world application is often hindered by insufficient resources, a lack of practical exposure, and ineffective teaching methodologies (Ogundele et al., 2019; Adebayo et al., 2023).

Entrepreneurial skills development encompasses the competencies and attitudes necessary for successfully managing a business venture. Strengthening entrepreneurship programmes in higher education aims to equip students, regardless of their discipline, with the skills needed to create value by recognizing and seizing opportunities. These skills include the acquisition of knowledge and competencies that foster self-sufficiency, enabling students to make effective use of resources and establish firm career commitments, whether as entrepreneurs or as productive, intrapreneurial employees (Ezenwenne, 2018). Furthermore, entrepreneurial skills represent the practical knowledge and experiences essential for converting ideas into actionable business outcomes (Nwabufo, 2019).

According to Gidado (2019), developing entrepreneurial skills in students involves cultivating personal characteristics, qualities, and management competencies necessary for successful ventures. Attributes such as self-confidence, resilience, empathy, and the ability to recognize opportunities are vital (Salgado-Banda, 2015). Mastering these skills enhances students' entrepreneurial intentions and self-efficacy, empowering them to engage in income-generating activities. Key entrepreneurial cognitive skills include technical, financial, marketing, and human resource management competencies.

Technical skills involve specialized knowledge required for executing complex tasks effectively. Entrepreneurs with strong technical abilities can leverage technology to manage projects, track sales, and evaluate business performance. Competencies such as communication, problem-solving, and technological proficiency are essential for effective functioning within an organization (Fasehun, 2014). Similarly, financial skills are critical to business success, enabling entrepreneurs to manage finances, maintain accurate records, and assess their financial health. Mastery of financial management allows entrepreneurs to make informed decisions regarding capital requirements, budgeting, and pricing strategies all essential for sustainable business operations.

Business Education prepares students for diverse roles in the workforce, enhancing their employability and fostering societal development (Nwokike, 2016). By instilling entrepreneurial skills, it encourages self-reliance and success in business ventures while equipping learners to assess opportunities and risks effectively. In Nigeria, public colleges of education focus on training teachers, while polytechnics emphasize technical and managerial skills, with both contributing to economic advancement. However, many institutions lack functional entrepreneurship centres, which hampers effective entrepreneurial training. This study aims to assess the impact of entrepreneurship education on the technical and financial skills development of Business Education students in public tertiary institutions in Kwara State.

Statement of the Problem

One of the critical challenges facing emerging nations, particularly Nigeria, is the difficulty in providing productive employment opportunities for graduates. To address this issue, Business Education students are mandated to undertake entrepreneurship education prior to graduation. Despite this requirement, many graduates remain jobless, wandering the streets in search of limited opportunities. In Kwara State, a significant number of Business Education graduates leave higher education without viable career prospects or the motivation to apply their entrepreneurial skills, even though the programme is designed to prepare them for establishing small businesses. This persistent unemployment crisis has been linked to increasing rates of criminal activity and social vices among youth, including corruption, kidnapping, terrorism, trafficking, prostitution, cultism, cybercrime, and internet fraud. These alarming trends prompt critical inquiries: Are Business Education students in Kwara State receiving adequate exposure to entrepreneurship education? Do they lack the necessary entrepreneurial skills, or are they simply reluctant to apply them in practice?

Given these pressing concerns, it is crucial to investigate whether entrepreneurship education in higher institutions within Kwara State effectively enhances the entrepreneurial skills of Business Education students. Failure to address this issue could result in institutions continuing to produce graduates who are ill-prepared to contribute to economic growth and national development. This study aims to offer valuable insights for tertiary institutions, highlighting the need for potential changes in teaching methods or pedagogical approaches to entrepreneurship education. The goal is to ensure that students acquire the skills and confidence necessary for self-employment and economic independence. Thus, this investigation is vital for assessing the perceived impact of entrepreneurship education on the entrepreneurial capabilities of Business Education students.

Purpose of the Study

The primary objective of this study is to investigate the impact of entrepreneurship education on the entrepreneurial skills development of Business Education students in public tertiary institutions in Kwara State, Nigeria. The specific objectives are to:

1. Assess the extent to which entrepreneurship education influences the acquisition of technical skills among Business Education students in public tertiary institutions in Kwara State.
2. Determine the extent to which entrepreneurship education influences the acquisition of financial skills by Business Education students in public tertiary institutions in Kwara State.

Research Questions

To guide this study, the following research questions were formulated:

1. To what extent does entrepreneurship education influence the acquisition of technical skills among Business Education students in tertiary institutions?
2. To what extent does entrepreneurship education influence the acquisition of financial skills by Business Education students in tertiary institutions?

Research Hypotheses

The following null hypotheses were formulated and tested at a 0.05 level of significance:

1. $H_0$1: There is no significant difference between the mean responses of male and female Business Education students regarding the extent to which entrepreneurship education influences the acquisition of technical skills in tertiary institutions in Kwara State.
2. $H_0$2: There is no significant difference in the mean responses of male and female Business Education students concerning the influence of entrepreneurship education on the acquisition of financial skills in tertiary institutions in Kwara State.

Methodology

A descriptive survey research design was adopted for this study. The target population comprised 288 final-year Business Education and Office Technology and Management students in three State owned tertiary institutions in Kwara State, namely: Kwara State University, Malete; Kwara State Polytechnic, Ilorin; and Kwara State College of Education, Ilorin.

Population of the Study

S\N	Institutions	Number of Students	
1	Kwara State University, Malete,	87	
2	Kwara State Polytechnic, Ilorin		115
3	College of Education, Ilorin	96	
	Total	**288**	

Source: Heads of department of Business Education in the various tertiary institutions and (2026)

A sample of 83 respondents was selected using proportionate stratified random sampling to ensure representativeness across the institutional types and gender distribution.

Table 2: Sample Size of the Study

S\N	Institutions	Number of Students
1	Kwara State University, Malete,	26
2	Kwara State Polytechnic, Ilorin	33
3	College of Education, Ilorin	27
	Total	**83**

The instrument for data collection was a four-point structured questionnaire designed by the researchers, titled "Perceived Impact of Entrepreneurship Education on Entrepreneurial Skills Development Questionnaire" (PIEEESDQ). The questionnaire was divided into two sections: Section A captured respondents' demographic data, while Section B elicited responses aligned with the research questions. The instrument was validated by two experts who reviewed it for face and content validity. The Spearman-Brown prophecy formula was used to determine the reliability of the instrument, yielding a coefficient index of 0.88, which was deemed acceptable. Research assistants facilitated the administration of the questionnaire.

Data collected were analysed using mean and standard deviation, with a decision rule whereby a mean score of 2.50 and above was considered a high extent, while scores below 2.50 were considered a low extent. The two null hypotheses were tested using the independent samples t-test at a 0.05 level of significance.

Results

Research Question 1: To what extent does entrepreneurship education influence the acquisition of technical skills among Business Education students in tertiary institutions?

Table 3: Respondents' Ratings on the Impact of Entrepreneurship Education on the Acquisition of Technical Skills

	Item Statements	SD	Remark
	Entrepreneurship education has helped me to demonstrate proficiency with Microsoft Word.		V. High Extent
	Entrepreneurship education assist students to operate qualitative with minimal or no supervision.		High Extent
	Entrepreneurship education has assisted students to have communication skills proficiency.		High Extent
	Entrepreneurship education has helped me to solve problems by manipulating a computer system.		High Extent
	Knowledge of entrepreneurship education has assisted me to operate different business machines in order to meet the societal needs.		High Extent
	Entrepreneurship education has helped students to keep up with the latest information technological trends.		High Extent
	With knowledge of entrepreneurship education has helped students to write mailable letter.		High Extent
	Knowledge of entrepreneurship education has helped students to accurately process information on the job.		High Extent
Weighted average			**High Extent**

Source: Field Survey, 2026

The data in Table above reveal the mean and standard deviation of responses on the perceived influence of entrepreneurship education on acquisition of technical skills of business education students in public colleges of education. The Table shows that the respondents claimed that entrepreneurship education had helped them demonstrate proficiency with Microsoft Word to a very high extent mean scores of 3.38, assisted them in operating qualitatively with little or no supervision, and had helped students of business education to have communication skills proficiency to a high Extend. This statement is supported by mean scores of 3.14, and 3.12, respectively. The respondents also stated that knowledge of entrepreneurship education had assisted them in problem-solving by using a computer system, the respondents also stated that entrepreneurship education has assisted them in operating various business machines to meet the societal needs, and that entrepreneurship education has greatly aided students of business education in keeping up with the most recent information technological trends to high extend. The mean score for these constructions was 2.68, 3.12, and 3.04, respectively. The respondents further stated that knowledge of

entrepreneurship education had helped students compose mailable letters and had greatly aided them in effectively processing information on the job as business education students. These assertions were backed up by mean scores of 3.06 and 3.03, respectively. The 8-item constructs had a standard deviation that ranges from 0.82 to 1.13. This indicates that the responses were not widely distributed since they are near to the mean. The table displays a total calculated weighted mean and standard deviation of 3.07 and 1.01, respectively, indicating that all eight components in the construct have a significant influence on technical skills. This suggests that business education students' technical skills are favourably influenced by entrepreneurship education to a high extent. (mean = 3.07, SD =1.01).

Research Question 2: To what extent does entrepreneurship education influence the acquisition of financial skills among Business Education students in tertiary institutions?

Table 4: Respondents' Ratings on the Influence of Entrepreneurship Education on the Development of Financial Skills

	Item Statements	Remark
	Knowledge of entrepreneurship education has helped students to keep track of debtors/creditors.	High Extent
	Knowledge of entrepreneurship education assisted students on how to prepare ledgers and extract trial balance.	High Extent
	Knowledge of entrepreneurship education has helped students to construct a business's daily cash account.	High Extent
	The knowledge of entrepreneurship education has helped students to create a final company account.	High Extent
	Knowledge of entrepreneurship education has assisted me to put financial plans in place to achieve goals.	High Extent
	Entrepreneurship education has helped me to make appropriate decision from varieties of business financing options.	High Extent
	Entrepreneurship education can equip students on how to prepare cash versus accrual accounting.	High Extent
	Entrepreneurship education has helped students to prepare basic financial statement.	High Extent

Entrepreneurship education has assisted students on how Budget preparation is being done.	High Extent
Entrepreneurship education has helped students prepare financial analysis of capital investment and strategic initiatives.	High Extent
Entrepreneurship education has aided students on how a company can be funded.	High Extent
Weighted average	**High Extent**

Source: Field Survey, 2026

The data in Table 4 illustrates the mean and standard deviation of responses on the perceived influence of entrepreneurship education on the acquisition of financial abilities by students of business education in public colleges of education. The table shows that the respondents stated that knowledge of entrepreneurship education has helped students to keep track of debtors/creditors, assisted students on how to prepare ledgers and extract trial balance, and has helped students to construct a business' daily cash account to a high extend. by students of business education in public colleges of education. They were backed up by mean scores of 2.96, 3.19, and 3.24, respectively. Additionally, the respondents stated that having a thorough understanding of entrepreneurship education has aided students in developing a final company account, helped me set up financial plans to achieve goals, and greatly aided me in selecting the best course of action from a wide range of business financing options to high extent (mean = 2.87, 3.04 and 3.22 respectively). According to the responses, entrepreneurship education can help students learn how to prepare cash versus accrual accounting, basic financial statements, and budgets. It has also supported students in learning how business education students prepare budgets to high extent. They were backed up by the respective mean scores of 2.96, 3.22, and 3.18. In a similar vein, the respondents stated that entrepreneurship education has assisted students in creating financial analyses of capital investments and strategic initiatives, as well as showing them how a company can be heavily funded to high extend by students of business education at tertiary institutions. These were supported by mean scores = 3.05 and 2.96 respectively.

The range of standard deviation for the 11-item constructs is 0.88 to 1.20. This indicates that the respondents' responses are not widely distributed as they are near to the mean. The data in Table 4 indicate that all eleven items in the construct were rated as having a high influence on the acquisition of financial skills, with an overall weighted mean of 3.08 and a standard deviation of 1.00. This suggests that entrepreneurship education positively influences the financial skills of Business Education students to a high extent.

Hypothesis Testing

Ho1: There is no significant difference between the mean responses of male and female Business Education students regarding the extent to which entrepreneurship education influences the acquisition of technical skills.

Table 5: Independent Samples t-test for Difference in Mean Responses of Male and Female Students on Technical Skills

Group	N	Mean	SD	t-cal	Df	p-va	Decision

						lue	
Male	36	2.17	0.28				
				26.70	78	0.00	Rejected
Female	44	3.83	0.69				

Source: Field survey, 2026 P<0.05

Data in Table 5 reveals that there were 36 male respondents and 44 female respondents in tertiary institutions, Kwara State. The male and female respondents' responses show that entrepreneurship education positively influences technical skills of business education students to high extent ($\bar{X}$ = 3.83; SD = 0.28) and ($\bar{X}$ = 2.17; SD = 0.69). Their responses were close to the mean as the standard deviations were very low. The table reveals that there is a significant difference between the mean responses of male and female students regarding the influence of entrepreneurship education on technical skills of business education students (t_{78} = 26.70, P<0.05). Therefore, the null hypothesis that states that there is no significant difference between the mean responses of male and female business education students on the extent to which entrepreneurship education influence acquisition of technical skills in tertiary institutions was rejected. This implies that male and female students differ significantly in their responses regarding the influence of entrepreneurship education on technical skills. Their responses show that male students rated the influence of entrepreneurship education on technical skills higher than the female students did, in business education (mean difference = 1.66).

Hypothesis Two: There is no significant difference in the mean responses of male and female Business Education students concerning the influence of entrepreneurship education on the acquisition of financial skills.

Table 6: Independent Samples t-test for Difference in Mean Responses of Male and Female Students on Financial Skills

Group	**N**	**Mean**	**SD**	**t-cal**	**Df**	**p-value**	**Decision**
Male	36	3.91	0.16				
				25.27	78	0.00	Rejected
Female	44	2.29	0.72				

Source: Field survey, 2025 P<0.05

Data in Table 6 reveals that there were 36 male respondents and 44 respondents from female respondents. The male and female respondents' responses show that entrepreneurship education positively influences financial skills of business education students to high extent ($\bar{X}$ = 3.91; SD = 0.16) and ($\bar{X}$ = 2.29; SD = 0.72). Their responses were close to the mean as the standard deviations were very low. The table reveals that there was significant difference between the mean responses of business education male and female

students on the extent to which entrepreneurship education influence acquisition of financial skills (t_{78} = 25.27, P<0.05). Therefore, the null hypothesis that states that there is no significant difference between the mean responses of business education male and female students on the extent to which entrepreneurship education influences acquisition of financial skills was rejected. This implies that male and female students differ significantly in their responses regarding the influence of entrepreneurship education on financial skills. Their responses show that the male respondents rated the influence of entrepreneurship education on financial skills higher than the female respondents (mean difference = 1.62).

Discussion of Findings

The findings of this study reveal that entrepreneurship education positively influences the technical skills of Business Education students to a high extent. This finding is consistent with the assertion that entrepreneurship education provides learners with the necessary technical competencies, equipping them with the knowledge and mindset to engage in productive activities, innovate, and become successful entrepreneurs. According to Ezeji and Okorie (1988), technical skills encompass "knowledge and competency in a specific activity, particularly one that involves methods, processes, procedures, and techniques." The development of technical skills through entrepreneurship education is therefore crucial for preparing students to navigate the complexities of modern business environments.

Furthermore, the study established that entrepreneurship education positively influences the financial skills of Business Education students. This finding aligns with Adoh (2020), who emphasizes that financial skills are essential for maintaining accurate accounting records and ensuring business sustainability. The results also indicate that entrepreneurship education assists students in creating financial analyses of capital investments and strategic initiatives, as well as understanding how businesses can be funded. This corroborates Akinnodi (2020), who notes that entrepreneurs with strong financial skills can effectively manage resources and maintain accurate records, thereby reducing the risk of fraud. Financial management skills are vital for planning, directing, monitoring, and controlling business resources (Okoli & Ezenwafor, 2015). The significant gender differences observed in both hypotheses may be attributed to varying levels of prior exposure to technology and financial literacy between male and female students, a finding that warrants further investigation.

Conclusion

The findings of this study clearly indicate that entrepreneurship education is vital for equipping Business Education students with the technical skills and financial knowledge necessary for creating jobs rather than merely seeking employment. The study highlights that students in tertiary institutions have acquired significant competencies in entrepreneurship, particularly in areas deemed essential for entrepreneurial success. It concludes that entrepreneurship education has a positive impact on the perceived entrepreneurial skills of Business Education students in public tertiary institutions in Kwara State. This underscores the role of entrepreneurship education in mitigating the high unemployment rate among graduates and transforming it into a valuable tool for generating employment opportunities.

Recommendations

Based on the findings of this study, the following recommendations are proffered:

1. **Continuous Professional Development for Lecturers:** School administrators should continue to support lecturers by encouraging attendance at conferences, seminars, and workshops to better prepare them for effective lecture delivery. Since entrepreneurship education has been shown to positively influence entrepreneurial skills, it is imperative that educators remain updated on contemporary pedagogical approaches and industry trends.
2. **Curriculum Enhancement for Skill Development:** Management of tertiary institutions should advocate for the development of students' technical, financial, marketing, and human resource competencies through a robust entrepreneurship education curriculum. This will ensure that students are adequately prepared for entrepreneurial endeavours upon graduation.
3. **Facilitation of Access to Funding:** The government should encourage collaboration between graduates and microfinance banks and other funding sources to provide financial support for entrepreneurial aspirations. Furthermore, there should be proper supervision of financial aid beneficiaries to ensure the efficient utilization of funds.
4. **Establishment of Functional Entrepreneurship Centres:** Authorities of tertiary institutions should establish and equip facilities to enhance the teaching of entrepreneurship education. This will guarantee that students receive the necessary practical instruction and reinforcement while in school, thereby positively shaping their entrepreneurial intentions and self-efficacy.

GENERATIVE ARTIFICIAL INTELLIGENCE COMPETENCE, DIGITAL COMPETENCE AND EMPLOYABILITY SKILLS DEVELOPMENT AMONG BUSINESS EDUCATION STUDENTS IN NIGERIAN UNIVERSITIES

Ann Mojisola UWAGWU
Department of Educational Management (Business Education Programme)
University of Ibadan, Oyo State
uwagwuanne@gmail.com

Abstract

The rapid emergence of generative artificial intelligence (GenAI) is changing the knowledge, skills and capabilities expected of university graduates. Since Business Education is closely linked with office technology, business communication, entrepreneurship, management and preparation for the workplace, the consequences in this area are especially important. This paper argues that Nigerian universities should deliberately incorporate GenAI competence into Business Education programmes, but not treat it as a substitute for broader digital competence or human employability skills. Rather, GenAI competence should be developed as an important contemporary component of digital competence and integrated with communication, critical thinking, collaboration, adaptability, and professionalism. The paper draws conceptually on the Digital Competence Framework for Citizens (DigComp 2.2), UNESCO's Guidance for Generative AI in Education and Research, UNESCO's AI Competency Framework for Students, and recent scholarship on GenAI literacy. The central position of the paper is that effective preparation for the contemporary workplace requires students to move beyond mere access to or frequent use of AI tools towards the ability to select appropriate tools, formulate effective prompts, evaluate outputs, protect data, recognise limitations and bias, apply professional judgement, and use AI ethically and responsibly. The paper further argues that Business Education curricula should integrate GenAI across relevant courses rather than confining it to a single stand-alone course. Curriculum review, lecturer capacity development, authentic assessment, institutional policy and equitable access are therefore necessary if Nigerian universities are to prepare Business Education graduates for an increasingly AI-enabled workplace.

Keywords: Generative artificial intelligence; GenAI competence; digital competence; employability skills; Business Education; Nigerian universities; higher education.

Introduction

Generative artificial intelligence has quickly gone from being a specialist technological achievement to now being an obvious feature of daily learning, communication and work. These generative AI systems are able to create text, images, code and other types of content based on user instructions. Because they are becoming more widely available, new possibilities have opened up for teaching, learning, research and professional activities, but they have also raised issues concerning accuracy, authorship, privacy, bias, academic integrity and human control. The guidance offered by UNESCO on the use of generative AI in education stresses the importance of adopting human-centred approaches which focus on ethical, safe, equitable and meaningful use rather than just promoting the adoption of the technology (Miao & Holmes, 2023).

This situation has significant consequences for universities, since it is expected that they will equip their graduates to meet the changing conditions in both academic and working environments. Business Education specifically needs to address these changes as its graduates are supposed to be able to perform effectively in ever more digital business and organizational contexts. It follows that the ability to use GenAI appropriately might thus become an important element of students' preparation for modern work. Yet GenAI competence should supplement, not substitute, the wider digital competence and the human skills necessary for effective employability.

The Changing Nature of Business Education in the Age of GenAI

Business Education has always been about preparing learners to take an active and productive part in business and organisational settings. The various fields it covers are accounting, office administration, business communication, management, entrepreneurship, marketing, information technology and other occupational skills. Digital transformation is having an increasing impact on these fields.

The importance of generative AI for business education goes well beyond instructing students in how to use a specific AI application. The more fundamental question is whether students can make use of emerging AI technologies in their professional capacity with a full understanding of the issues involved. A student who manages to get an AI-produced report but is unable to check its accuracy, spot claims that are not supported by evidence, guard confidential information or communicate the results properly cannot be regarded as fully competent for modern professional practice.

It can be concluded that Business Education has to take action at two levels. On the one hand, students should acquire a practical knowledge of GenAI tools and what they are capable of; on the other hand, they should also develop higher-order skills which allow them to decide when, why and how such tools should be used. Just as recent research into GenAI literacy does, it stresses competencies involving understanding GenAI, using and applying it, evaluating and incorporating the outputs, and engaging with ethical issues (Park, 2025).

GenAI Competence as an Emerging Business Education Competency

The competence associated with GenAI can be defined as the combined knowledge, skills, attitudes and judgement needed in order to interact effectively, critically, creatively and responsibly with generative AI systems and it must not be limited to simply being familiar with ChatGPT, Gemini or any other specific platform since such tools are subject to rapid change.

GenAI competence among Business Education students can be examined through five closely related areas. The first of these is basic technical competence, meaning that students need to know what GenAI systems are, what capabilities they have and where their limitations are. This is supplemented by prompt and application competence, which entails giving clear instructions and using AI suitably for both academic and work-related tasks. Just as important is critical evaluation competence, since it involves verifying the information produced by AI, detecting errors, identifying any bias and checking important claims. Further to evaluation, GenAI competence also includes innovative application, allowing students to make use of GenAI to aid problem-solving, creativity, productivity and other business tasks. Throughout all these areas, ethical and responsible use plays an underlying role, requiring that students protect privacy, respect intellectual property, keep to academic and professional integrity and continue to hold human responsibility for decisions (Miao, Shiohira, & Lao, 2024; Park, 2025; Zhang & Magerko, 2025).

This aligns with the UNESCO AI Competency Framework for Students, the framework grouping AI competencies under a human-centred approach, the ethics of AI, AI techniques and applications, and AI system design, with progression moving from understanding to applying and creating (Miao, Shiohira, & Lao, 2024). It is likewise supported by the most recent GenAI literacy frameworks, which stress informed choice of tools and prompting, a understanding of the way one interacts with GenAI, and a more extensive understanding of the technology (Zhang & Magerko, 2025).

Digital Competence: The Necessary Bridge

GenAI competence ought to be seen as part of a broader understanding of digital competence and not regarded as a separate technological skill. According to the DigComp 2.2 framework there are five main areas of digital competence: information and data literacy, communication and collaboration, digital content creation, safety, and problem solving (Vuorikari et al., 2022). This framework defines digital competence in terms of the knowledge, skills and attitudes required for confident, critical and responsible engagement with digital technologies and also includes examples involving artificial intelligence (Vuorikari et al., 2022).

It is precisely because of this that Business Education is so relevant, since the effective use of GenAI demands a range of skills that come before and go beyond the AI tool itself. A student might know how to ask a chatbot questions but still be missing the necessary knowledge and data literacy to assess if its answer is reliable. In a similar way, a student might produce a well-written business letter but still lack the communication skills needed to decide whether the tone, the audience and the content are suitable for a professional context.

Digital competence may thus be seen as the means by which proficiency in generative AI becomes useful in a professional context. It offers the skills in information literacy, communication, content creation, safety and problem solving that are needed to turn AI capabilities into responsible action. The relationship is therefore complementary not competitive: proficiency in generative AI enhances existing digital competence, while general digital competence in turn provides the essential foundation for meaningful use of generative AI.

Employability Skills in an AI-Enabled Workplace

Employability therefore goes beyond technical proficiency; graduates have to be able to communicate effectively, solve problems, work with others, adapt to change and show professionalism. These human skills become more important, not less so, since AI is able to automate or speed up routine information-processing tasks.

For Business Education students, communication is still essential since AI-generated content has to be interpreted, adjusted and communicated in an appropriate way to various audiences. Critical thinking is needed because GenAI is capable of producing information that sounds plausible but which is either inaccurate or incomplete. Collaboration is still necessary since business problems are usually resolved through interaction between people who have different roles and expertise. Adaptability is therefore important as AI tools, the procedures of organisations and the requirements of jobs will keep on changing. Moreover, professionalism is necessary since the responsible use of AI requires confidentiality, accountability, accuracy and sound judgement.

Ore (2023) expressed concerns as to whether the content of the Business Education curriculum is effective in developing the soft skills needed in the workplace among students at public universities in Lagos State. This supports the view that the integration of Generative AI should not result in the displacement of employability development, but rather should be used as a context in which employability skills can be practised and strengthened.

Why GenAI Competence Alone Is Not Enough

To say that frequent use of AI means that someone is competent is a mistake. It is possible for students to use GenAI regularly even if they have only a limited understanding of how the systems work, how errors arise, or how the outputs should be assessed. According to Park's (2025) research into GenAI literacy, students can show a moderate level of understanding yet still have trouble with prompt engineering and the critical evaluation of AI-generated outputs.

The difference between access, use and competence is therefore of central importance: access refers to students being able to obtain a GenAI tool; use means that they put it to use for a particular task; and competence involves them being able to make informed decisions about whether or not to use it, choosing an appropriate tool, formulating effective instructions, assessing the output, modifying it, acknowledging its use when necessary and staying accountable for the final product. Park's (2025) review highlights the importance of evaluation and ethical competence together with basic use, while UNESCO too places critical judgement, human agency and responsible use at the heart of AI competence (Miao et al., 2024).

Business Education is greatly affected by this distinction. A student should not be given a reward just for producing a document that has been assisted by AI; instead, the student should show that they understand the business problem, make appropriate judgments about the selection and use of the technology, have the ability to verify the results, and be able to communicate a result that can be defended in a professional manner.

The Proposed Relationship: GenAI Competence, Digital Competence and Employability

The main point of this paper is that the connections between the three constructs should be seen as interconnected not as separate entities. Because of GenAI competence students acquire the ability to interact with an important category of current digital systems. The knowledge, skills and attitudes associated with digital competence are necessary if those systems are to be used in a critical and safe manner. The employability skills denote the ability to apply these technological and human capabilities to achieve productive performance in both academic and work settings.

In effect, this points to a pathway that connects the two. When students use AI to search for information, analyse it, create content, communicate, solve problems and reflect on digital processes, their GenAI skills contribute to their digital competence. Conversely, digital competence can help with employability since it allows students to use technology in ways that enhance their ability to handle information, communicate, collaborate, create content, ensure safety and solve problems.

Just because someone has competence in generative AI doesn't mean that they will be employable; the value of such competence is in the way students are able to combine it with wider digital skills and key employability skills such as critical thinking, communication, problem-solving, adaptability, and professional judgement.

This view is in agreement with DigComp 2.2, since that framework explicitly includes examples related to AI within its wider digital competence structure. It is also in line with UNESCO's stance that AI education should aim to produce responsible users and co-creators who are able to exercise critical judgement and maintain human agency.

Implications for Business Education Curriculum and Instruction

The introduction of Generative AI into Business Education has an effect on the way the curriculum is organised, on the design of teaching and learning activities, on how students' learning is assessed, and on the preparation of lecturers. Because of these effects, a careful and considered approach is needed one that acknowledges the value of Generative AI while at the same time making sure that students do continue to acquire the knowledge, skills and professional attributes that are expected of Business Education graduates. The main implications are explained below.

A important consequence is the integration of the curriculum. Nigerian universities should not delay taking action on this issue until GenAI has been turned into a standalone subject. Instead, learning outcomes relating to GenAI can be included in such courses as Business Communication, Office Technology and Management, Marketing, Entrepreneurship, Accounting, Management, Research Methods, Information Technology and other appropriate ones.

The curriculum integration must be coupled with task-based learning, with students being given real business problems in which AI can be helpful but is not enough. For instance, a student might be asked to produce a market-analysis brief with the aid of AI, check the factual statements, spot the limitations in the AI's output and justify the final recommendations. This type of task promotes the use of technology as well as research, critical thinking, communication and professional judgement.

This method also calls for a redesign of the assessment process. Should assessment still only reward the final written output, students might use AI without it being detected, and teachers will find it difficult to judge what students really understand. Assessment should therefore increasingly involve oral defence, documentation of the process, reflective comments, practical demonstrations, case analysis and supervised exercises. The aim is not to ban AI altogether but rather to evaluate the skills which remain essential in situations when AI is available.

Just as important is the development of lecturers. According to UNESCO’s AI Competency Framework for Teachers, educators should acquire the knowledge, skills and values needed in order to use AI responsibly in an educational context. Business Education lecturers therefore need ongoing professional development in the use of GenAI tools, in prompt design, in verification, in ethics, and in the integration of AI into the curriculum.

Assessment and Development of Students' GenAI Competence

The level of competence of GenAI should not be based simply on the confidence that people report but on its performance instead. A student might say that they are competent even if they are unable to spot an incorrect AI response or cannot explain why a certain tool is not suitable for a given task.

A reasonable method of assessment should involve objective knowledge tests, practical AI tasks, exercises in prompt design, output-evaluation tasks, ethical scenarios and real business cases. For instance, students might be asked to compare an AI-produced business report with reliable information, spot the inaccuracies, amend the report and explain the changes which they have made.

Such assessment would show off the candidate's technical competence, ability to carry out critical evaluation, information literacy, and professional judgement.

Recent research into higher education also indicates that competence in the use of generative AI is achieved through ongoing practice, reflective thinking, prompt engineering, critical assessment, and the creation of personal workflows rather than simply by being exposed to AI tools. It follows that business education programmes should regard the development of competence as a progressive and continuous process.

A Position on GenAI Competence in Business Education

The view set out in this paper is that competence in generative AI should be made an explicit and assessable part of modern business education in universities in Nigeria. It should not, however, be developed as a separate technological skill, but instead should be incorporated into overall digital competence and be deliberately linked to employability skills. This view is based on three arguments.

AI skills are becoming an important professional capability. Since AI is being used more and more in both education and in employment, it is likely that graduates will have to carry out tasks that are supported by AI in their professional careers. The fact that recent evidence has shown a connection between AI skills and graduate employability also indicates that universities should take AI-related abilities into account when designing their curricula (Portocarrero Ramos et al., 2025).

Second, digital skills form the key base for meaningful GenAI use. Students need to know how to find information, communicate, create content, stay safe, and solve problems to use AI well. DigComp 2.2 gives a helpful idea for this view (Vuorikari et al., 2022).

Thirdly, employability skills are still essential. Although GenAI can help with writing, summarising, analysis and the production of content, professional work still demands communication, collaboration, sound judgement, a sense of ethical responsibility and the ability to adapt. A graduate who can make good use of AI but is unable to think critically, communicate clearly, collaborate effectively or show ethical judgement is not properly prepared for the world of work.

The best course for Business Education is therefore not to adopt GenAI without restriction nor to reject it altogether, but rather to integrate it purposefully. Students ought to be taught when it is appropriate to use AI and when it is not, how to question the results it produces, and how to combine its abilities with human qualities. The final aim should therefore not be to produce graduates who merely use AI, but rather graduates who are able to use AI intelligently, critically, creatively, ethically and professionally.

Conclusion

Generative artificial intelligence is changing the environment in which Business Education graduates will study, work and develop professionally. The appropriate response is not simply to add another digital tool to an already crowded curriculum. What is required is a reconsideration of the competencies that Business Education seeks to develop.

This paper argues that GenAI competence should be developed as an integral component of contemporary digital competence and should be deliberately connected to employability skills. Students need more than the ability to generate content with AI. They need the ability to understand the technology, use it strategically, evaluate its outputs, protect information, recognise limitations, act ethically and retain responsibility for professional decisions.

Digital competence provides the broader foundation for these activities, while communication, critical thinking, collaboration, adaptability and professionalism ensure that technology serves human and organisational purposes.

For Nigerian universities, the strategic task is therefore to move from informal student experimentation with GenAI towards intentional curriculum integration, lecturer capacity development, authentic assessment and responsible institutional practice. Business Education is particularly well positioned to lead this transition because its purpose is closely connected to workplace readiness.

The goal should be graduates who do not merely **use AI**, but who can use it **intelligently, critically, creatively and responsibly** as part of a broader professional competence.

Recommendations

i. Business Education curriculum developers should integrate GenAI competence across relevant courses by incorporating appropriate GenAI-related learning outcomes, activities and assessment tasks rather than treating GenAI solely as a separate technology course.

ii. Universities should develop clear institutional guidelines on acceptable, ethical and responsible use of GenAI in teaching, learning, assessment and research.

iii. Business Education lecturers should receive continuous professional development on GenAI, digital competence, AI-supported pedagogy and assessment redesign.

iv. Assessment should include authentic tasks that require students to demonstrate prompting, verification, critical evaluation, ethical judgement and application of AI to business problems.

v. Universities should promote equitable access to digital infrastructure and learning opportunities so that GenAI integration does not deepen digital inequality.

Abstract

This study examined the Utilization of Artificial Intelligence Tools for Teaching and Learning of Accounting Courses in Universities in Rivers State. Two specific objectives, two research questions and 2 hypotheses guided the study. The population of the study comprised 41Business Education lecturers. The entire population was studied because, the population was small and manageable. A structured questionnaire titled; Utilization of Artificial Intelligence Tools for Teaching and Learning of Accounting Courses in Universities Questionnaire (UAITTLACUQ) was used for data collection. The instrument was designed on a 4-point rating scale of Very High Extent (VHE-4points), High Extent (HE-3points), Moderate Extent (ME-2points) and Low Extent (LE-1point) respectively. The instrument was validated by three experts, and its reliability was established using the Cronbach Alpha Statistics which yield reliability of 0.76. Out of 41 copies of the questionnaire administered, 40 were retrieved and used for analysis. Data collected were analyzed using mean and standard deviation to answer research question and t-test to test hypotheses at 0.05 level of significance. The study also found that micro-copilots improved accuracy in accounting calculations, supported step-by-step learning of accounting procedures, assisted in grading, and enhanced practical accounting skills. Furthermore, the findings showed that machine learning-based accounting tools supported data analysis, error detection, forecasting, and exposed students to modern accounting technologies to a high extent. The study concluded that artificial intelligence tools significantly enhanced the teaching and learning of Accounting courses by improving instructional clarity, promoting practical skill development, and preparing students for modern accounting practices. It was recommended that AI tools should be integrated into Accounting Education, lecturers and students should be trained on their usage, and institutions should provide the necessary digital facilities to support their effective use.

Keywords: AI-Tools, Accounting Courses, Teaching, Learning and Utilization.

Introduction

The advent of artificial intelligence (AI) has revolutionized numerous fields, including education, where it plays an increasingly critical role in enhancing teaching and learning processes. Accounting education, particularly in tertiary institutions, has seen significant transformations through the integration of AI tools, which have proven instrumental in improving instructional delivery. Artificial intelligence refers to the simulation of human intelligence by computer systems designed to perform tasks such as learning, reasoning, and problem-solving (Russell & Norvig, 2021). Artificial intelligence (AI) tools refer to a wide range of technologies and systems designed to perform tasks that typically require human intelligence, such as reasoning, learning, problem-solving, and decision-making. These tools are grounded in machine learning, natural language processing, robotics, and other advanced computational methodologies. According to Russell and Norvig (2021)**,** artificial intelligence is the study and design of intelligent agents capable of perceiving their environment and taking actions to maximize their chances of achieving specific goals. AI tools operationalize this concept by enabling machines and software systems to mimic human cognitive functions. In education, AI tools enable dynamic interactions between learners and technology, fostering an adaptive and personalized learning environment. These tools utilize algorithms and machine

learning to analyze data, predict learning patterns, and provide tailored educational content, making them indispensable in modern instructional delivery especially in accounting education (Holmes, 2019).

Accounting education programme in Nigerian tertiary institutions aims to equip students with the theoretical knowledge and practical skills required to excel in financial reporting, auditing, taxation, and managerial accounting (Obi, 2022). However, the traditional instructional methods often fail to address the diverse learning needs of students, leading to gaps in understanding and practical application. The integration of AI tools offers a transformative approach by bridging these gaps, facilitating active learning, and preparing students for the demands of the accounting profession in a technology-driven world (Okoro & Agbo, 2020). Numerous artificial intelligence tools have been developed to improve programme delivery in accounting education courses. These tools include ChatGPT, micro-copilots and machine-based learning.

ChatGPT is a natural language processing tool powered by AI to enhance instructional delivery by providing instant answers, clarifications, and explanations to complex accounting concepts. Business educators can use ChatGPT to create interactive discussions, simulate problem-solving scenarios, and provide supplementary learning resources. Its' ability to generate contextually relevant content in real-time makes it an invaluable tool for fostering understanding in accounting education (Brown, 2021).

The utilization of artificial intelligence tools, such as ChatGPT, has significantly transformed the instructional delivery of accounting education courses, enabling educators and students to access advanced resources and improve learning outcomes. ChatGPT, developed by OpenAI, is a language model designed to provide comprehensive, real-time responses and assistance on various topics, including accounting concepts, problem-solving, and professional applications. Its integration into educational systems is redefining how instruction is delivered in accounting courses. According to Brown and Phillips (2023)**,** ChatGPT serves as an intelligent tutor that provides immediate feedback and clarification on complex accounting concepts. The tool allows students to engage in interactive learning, enabling them to ask questions and receive detailed explanations on topics such as financial reporting, cost accounting, and taxation. This immediate access to information enhances deeper understanding of the subject matter and enhances independent learning among students.

The impact of ChatGPT on instructional delivery in accounting education extends beyond content accessibility. Adebayo and Ogunleye (2022**)** note that ChatGPT's ability to simulate real-world accounting scenarios provides a practical learning experience for students. By generating case studies, sample financial statements, and problem-solving exercises, ChatGPT enables educators to deliver dynamic and application-oriented lessons. This approach not only enhances the learning process but also prepares students for the practical demands of the accounting profession. Furthermore, the utilization of ChatGPT in instructional delivery promotes inclusivity and personalized learning. Nguyen and Pham (2021**)** argue that AI-driven tools like ChatGPT can adapt to the unique learning needs of students, providing tailored explanations and resources based on their proficiency levels. In accounting education, this ensures that both high-performing and struggling students receive the support they need to excel, thereby reducing disparities in academic achievement.

Micro-copilot tools are advanced artificial intelligence (AI)-powered platforms designed to assist and guide users through complex tasks. These tools are increasingly being integrated into accounting education to enhance both teaching delivery and student learning outcomes. The tools leverage machine learning algorithms to provide personalized support, simulate real-world accounting tasks, and offer immediate feedback, all of which are transforming traditional accounting education methods. Micro-copilot tools, often embedded in accounting software or used as standalone platforms, have become significant assets in bridging the gap between theoretical knowledge and practical application in accounting education. According to Williams (2021), the use of micro-copilot tools allows students to perform real-time accounting operations while receiving guided support, which helps to reinforce their understanding of fundamental accounting principles. These tools act as virtual tutors, offering students step-by-step instructions and explanations while they navigate through exercises such as bookkeeping, tax calculations, financial statement preparation, and cost analysis. This personalized learning approach not only boosts student engagement but also fosters greater retention of accounting concepts. The integration of machine-based

learning tools is becoming a cornerstone in modernizing accounting education. These tools are particularly recognized for their role in transforming the traditional classroom into a dynamic, technology-driven learning environment.

Machine learning-based accounting tools as an accounting software, allows students to gain hands-on experience in managing financial transactions, preparing financial statements, and understanding real-world business operations, bridging the gap between theoretical knowledge and practical application. This approach is vital in preparing students for the rapidly evolving technological landscape in the accounting profession. Machine-based learning tools provide a practical and interactive learning experience that closely mirrors the accounting practices found in the industry. According to James (2021), the use of Machine-based learning in accounting education enhances students' ability to apply theoretical knowledge to real-world scenarios, a skill critical for success in the accounting profession. Through features such as creating invoices, tracking expenses, and generating financial reports, students engage with the software in a manner that directly correlates with industry expectations, providing them with the technical competencies necessary for their careers. This exposure is instrumental in bridging the skills gap and ensuring that students are equipped to perform competently in the workplace.

The utilization of AI tools for instructional delivery of accounting education courses has the potential to transform the learning in Rivers State Universities. Utilization refers to the effective and purposeful application of resources, tools, or systems to achieve desired outcomes in the educational context, utilization is critical as it involves the application of tools, techniques, and resources to enhance teaching and learning processes. According to Akomolafe and Adesina (2022**)**, utilization in education entails the effective engagement of instructional materials, methods, and technologies to achieve specific learning objectives. They argue that the extent to which resources are utilized significantly impacts the quality of instruction and student outcomes. Similarly**,** Ezenwa and Ibe (2020) emphasize that the utilization of educational technologies is essential for modern instructional delivery, particularly in technical and vocational education. They assert that underutilization often results in diminished learning outcomes and wastage of resources.

Utilization of AI tools, as noted by Okeke and Ugochukwu (2021)**,** provide innovative solutions for personalized learning, real-time feedback, and adaptive content delivery. The degree to which these tools are utilized in accounting education depends on several factors, including educators' familiarity with AI, institutional support, and the availability of infrastructure. Oluwaseun (2023) highlight that in institutions, the successful utilization of AI tools requires a deliberate effort to integrate these technologies into the curriculum and to train educators on their effective use.

From a technological perspective, utilization is seen as the extent to which users adopt and apply technologies to solve specific problems or improve processes. Davis and Ajiboye (2022)**,** drawing from the Technology Acceptance Model (TAM), argue that perceived usefulness and ease of use are fundamental determinants of utilization. In their study on AI tools in education, they found that when educators perceive these tools as beneficial and easy to use, their likelihood of adopting and effectively utilizing them increases. This aligns with the findings of Umar and Hassan (2021)**,** who note that the utilization of AI tools in Nigerian colleges of education is often hindered by a lack of training and inadequate technical support.

The importance of utilization in instructional delivery is underscored by the growing demand for innovative teaching methods. Okon and Udo (2020) argue that traditional teaching methods in accounting education are insufficient to meet the needs of the 21st-century learner. They stress that the integration and utilization of AI tools can transform the learning experience by making it more interactive, engaging, and tailored to individual students' needs. Furthermore, Adetunji and Fatima (2023) highlight that the utilization of AI tools not only improves instructional delivery but also enhances educators' efficiency by automating routine tasks such as grading and administrative work. Utilization is also influenced by the readiness of institutions to embrace change. Chukwu and Nnamani (2022**)** point out that organizational readiness, including the availability of resources and institutional policies, plays a significant role in determining the extent to which AI tools are utilized in educational settings.

The use of artificial intelligence in teaching accounting education enhances the quality of education in several ways; It increases learners' motivation and enjoyment by facilitating the acquisition of basic skills and enhancing teacher training (Ogbuabor, Gloria, & Jesunmi, 2023). Accounting education lecturers need to teach concepts and techniques to allow students to work with any digital device or tool and adapt to new technology quickly using the skills and concepts they have been taught (Orji, Okanazu, & Ali, 2023). There is a need for accounting education lecturers and students to acquire the right AI tools skills needed to meet the needs of instructional delivery and assessment in accounting education.

There are concepts in accounting education programme in tertiary institutions that can only be delivered to students digitally for better understanding. This can only be achieved when Accounting Education lecturers move with the current trends in AI tools technological advancement, which are reflected in the changing patterns of the Accounting Education curriculum. Policymakers, researchers, educators, and organizations alike are beginning to recognise that closing this AI tools skill gap is essential to preparing the nation's educational sector, especially accounting educators, for a successful future. The emphasis on universities cannot be overemphasized.

Universities refers to any type of education pursed beyond the secondary school level. University education, according to the provision of the National Policy on education is that education given after-secondary education. The university education system in Nigeria is composed of Higher Institutions of technology that form part of or affiliated to, tertiary institutions and polytechnic, colleges of education and professional specialized institution. They can further be categorized as state or federal universities and as first, second or third generation universities (Hartnett 2021).

The AI tools skills acquired by business education accounting student and lecturers, according to Oyewole (2023), allow them to fit almost in all facets of life. The mandate of business education, according to Ademiluyi, Bello, and Akande (2022), is to ensure that students are educated for and about business. Therefore, the utilization of AI tools in instructional delivery represents a paradigm shift in accounting education, offering innovative solutions to improve teaching and learning outcomes.

In the Nigerian context, accounting education courses play a pivotal role in promoting economic growth and financial accountability**.** Eze and Okafor (2021) argue that accounting education is a key driver of transparency and good governance, as it equips individuals with the knowledge to maintain accurate financial records and conduct thorough audits. They also stress the importance of adapting the curriculum to reflect local economic realities, such as the prevalence of small and medium-sized enterprises (SMEs) and the challenges of informal sector accounting. Another critical aspect of accounting education courses is their role in fostering ethical awareness and professional integrity. Accounting education courses are also evolving to meet the demands of the digital age. Adebayo and Nwachukwu (2023) point out that the integration of information technology into accounting education has revolutionized the field. Courses now often include training on accounting software, data visualization tools, and cybersecurity measures, reflecting the growing reliance on technology in financial management. This evolution aligns with global trends, as noted by Nguyen and Pham (2021)**,** who emphasize the importance of digital literacy in accounting education for fostering global competitiveness.

Furthermore, accounting education courses contribute to personal and professional development. Okeke and Chukwuma (2022) describe these courses as not only providing technical skills but also fostering critical thinking, problem-solving, and effective communication. These skills are essential for navigating the dynamic and often unpredictable nature of financial decision-making. However, challenges persist in the delivery of accounting education courses, particularly in developing countries like Nigeria. Oluwatobi and Adeola (2022**)** identify issues such as outdated curricula, insufficient infrastructure, and a lack of qualified instructors as significant barriers to effective instructional delivery. They recommend a comprehensive review of accounting education programs to ensure alignment with global best practices and local economic needs.

The university third level offers a Doctorate degree two to three years after the Master's. To gain admission into the first level of university education, one has to pass the competitive University Matriculation

Examination (UME) (IAU, 2020). Higher education in Nigeria can be further divided into the public or private, and the university sectors. Public universities owned by the federal and state Government. The non-university sector is composed of Polytechnics, institutions of technology, colleges of education and professional institutions operating under parent ministries (Akintoye, 2018).

The universities, polytechnics and colleges have a governing board or council appointed by the government and have some internal representatives of the institution as elected member or members. These councils generally govern the affairs of the institution on behalf of the government. The management of each institution is headed by a chief executive officer, that is, the vice-chancellor in the case of universities, the rector in the case of the polytechnics and the provost in the case of college of education. The federal government has established supervisory and coordinating agencies for each group of institutions: The National Universities Commission for the universities, the National Board of Technical Education for the Polytechnics and National Commission for College of Education for the colleges. The students are expected to acquire certificates in their chosen fields of study. They are equipped with skills and competencies. These institutions are owned by either the federal or state governments, corporate bodies or individuals. Some regulatory bodies have been appointed to approve, supervise and accredit courses in these institutions irrespective of their proprietorship. For the universities, the National University Commission (NUC) is in charge while in the polytechnics and colleges of education, the National Board for Technical Education (NBTE) and National Commission for Colleges of Education (NCCE) respectively are in charge of moderating academic programmes respectively.

Nigeria's higher education system currently has 95 universities - 27 federal universities, 34 state universities (NUC, 2009) and 160 other tertiary institutions - colleges of education, polytechnics, monotechnics (UNESCO, 2019). The demand for tertiary education in Nigeria is higher than what university capacity can accommodate. Over the years, universities admission rates have been on the rise, however, it has not kept up with the increasing demand (Ojo & Olakulehin, 2016). The cost of higher education as measured by private and public tuition has indeed risen at rates higher than inflation. The cost of higher education is an issue of ongoing importance to students, families and campus leaders, as well as leaders in congress and the administration. Many higher institutions are now taking steps to improve productivity and also help qualified low-income students pay for their education. Part of the increase in higher education costs is due to the fact that states have drastically reduced their contributions to higher education forcing increase in tuition (Tyler, 2022).

Statement of the Problem

In today's digital world, the use of technology in education is very important for improving teaching and learning. Accounting education needs modern methods to help students understand theory and apply it in practice. However, many accounting educators in Nigerian tertiary institutions, including those in Rivers State Universities on old and traditional teaching methods. These methods often do not meet the individual learning needs of students or prepare them for the changing demands of the accounting profession.

Artificial Intelligence (AI) tools like ChatGPT and micro-copilot are now being used in other parts of the world to make learning more effective. ChatGPT helps students learn through personalized conversations, while micro-copilot tools offer real-time support during problem-solving tasks, making students more ready for job market

Despite these opportunities, these AI tools are not widely known or used in most Nigerian tertiary institutions. Many lecturers and institutions are not aware of these tools, lack the training to use them, or do not have the needed infrastructure. As a result, accounting students often graduate without enough practical experience or the ability to use modern technology in their careers. It is this gap that this current study shall fill. by investigating the utilization of artificial intelligence tool in teaching and learning of Accounting courses in Universities of Rivers State.

Purpose of the Study

The purpose of this study was to examine the utilization of artificial intelligence tool in teaching and learning of Accounting courses in Universities in Rivers State. Specifically, the study sought to;

1. examine the extent to which utilization of ChatGPT tool enhance in teaching and learning of Accounting courses in Universities in Rivers State.
2. Assess the extent to which utilization of micro-copilots tool enhances teaching and learning of Accounting courses in Universities in Rivers State.

Research Questions

The following research questions guided the study.

1. To what extent does utilization of ChatGPT tool enhance teaching and learning of Accounting courses in Universities in Rivers State?
2. To what extent does utilization of micro-copilots tool enhance teaching and learning of Accounting courses in Universities in Rivers State?

Hypotheses

The following null hypotheses formulated were tested at 0.05 level of significance.

1. There no significant difference in the mean ratings of Rivers State University and Ignatius Ajuru University of Business Educators on the extent to which utilization of ChatGPT tools enhance teaching and learning of accounting courses in Universities in Rivers State.

2. There no significant difference in the mean ratings of Rivers State University and Ignatius Ajuru University of Business Educators on the extent to which utilization of Micro-Copilots tools enhance teaching and learning of accounting courses in Universities in Rivers State.

Methodology

The study adopted descriptive survey research design. The area of the study was Rivers State Universities. The population of the study consisted 41 Business Education Lecturers. The entire population was studied because, the population was small and manageable. A self-structured questionnaire titled "Utilization of Artificial Intelligence Tools in Teaching and Learning of Accounting Courses Questionnaire" (UAITTLACQ) was used for data collection. The instrument was designed on 4-point rating scale optioned: Very High Extent (VHE-4points), High Extent (HE-3points), Moderate Extent (ME-2points) and Low Extent (LE-1point) respectively. The instrument was validated by three (3) experts, one in Measurement and Evaluation and two from Business Education Department, all from Universities in Rivers State. The reliability of the instrument was established through Cronbach Alpha Statistics which yielded reliability co-efficient of 0.76. Out of forty-one (41) copies of the instruments administered, 40 were successful retrieved and used for analysis. Data collected were analyzed using mean and standard deviation to answer research questions, and t-test to test the null hypotheses at 0.05 level significance. The decision rule for hypotheses was that any calculated t-scores above the t-critical value was rejected, otherwise it was accepted and any mean score between 2.50 above were rated Low Extent. The null hypotheses were accepted if the computed t-value is less than the critical t-value, and if the reverse is the case, the null hypotheses will be rejected.

Results

Research Question 1: To what extent does utilization of ChatGPT tool enhance teaching and learning of Accounting courses in tertiary institution in Universities in Rivers State.

Table 1: Mean and Standard Deviation on the Extent ChatGPT Tool Enhances Teaching and Learning of Accounting Courses (N = 40)

S/N	Items	Mean ($\bar{x}$)	Std Dev	Decision
1	ChatGPT helps lecturers explain difficult accounting concepts with clarity.	3.05	0.86	High Extent
2	ChatGPT assists students in solving accounting problems and exercises.	3.09	0.90	High Extent
3	ChatGPT provides instant feedback during accounting learning activities.	3.03	0.84	High Extent
4	ChatGPT improves students' understanding of accounting terminologies.	3.09	0.87	High Extent
5	ChatGPT supports preparation of accounting lesson materials by lecturers.	3.10	0.91	High Extent
	Cluster Mean & SD	**3.07**	**0.88**	

Source: Field Survey, 2026

The results in Table 1 showed that all items had mean scores ranging from 3.03 to 3.10, with a cluster mean of 3.07. This indicated that respondents agreed to a high extent that ChatGPT enhanced teaching and learning of Accounting courses in the institution.

Research Question 2: To what extent does utilization of micro-copilots tool enhance teaching and learning of Accounting courses in Universities in Rivers State.

Table 2: Mean and Standard Deviation on the Extent Micro-Copilots Enhance Teaching and Learning of Accounting Courses (N = 40)

S/N	Items	Mean ($\bar{x}$)	Std Dev	Decision
1	Micro-copilots assist in preparing accounting documents and reports.	3.06	0.85	High Extent
2	Micro-copilots improve speed and accuracy in accounting calculations.	3.11	0.92	High Extent
3	Micro-copilots help students understand accounting procedures step-by-step.	3.04	0.86	High Extent
4	Micro-copilots support lecturers in grading and assessment tasks.	3.06	0.89	High Extent
5	Micro-copilots enhance practical accounting skill development.	3.08	0.90	High Extent
	Cluster Mean & SD	**3.07**	**0.88**	

Source: Field Survey, 2026

Table 2 revealed that all items recorded mean values between 3.04 and 3.11, showing that the respondents agreed to a high extent that micro-copilots enhanced teaching and learning of Accounting courses.

Test of Hypotheses

Hypotheses 1: There no significant difference in the mean ratings of Rivers State University and Ignatius Ajuru University of Business Educators on the extent to which utilization of ChatGPT tools enhance teaching and learning of accounting courses in Universities in Rivers State.

Table 3: Analysis of Hypothesis 1 with t-test Statistics of Difference in Mean Ratings of Rivers State University and Ignatius Ajuru University of Education Business Educators on the Extent that Utilisation of ChatGPT Tools Enhance Teaching and Learning of Accounting Courses in Universities in Rivers State

Respondents	N	X	SD	Df	STD	LS	t-cal	t-crit	Decision
RSU	30	2.77	0.86						
				348	0.01	0.05	0.9	196	Accepted
IAUE	10	2.86	0.84						

Source: Field Survey (2026)

The result presented in Table 3 shows a comparison between the mean response of Rivers State University and Ignatius Ajuru University of Education Business Educators regarding the extent to which utilisation of ChatGPT tools enhance teaching and learning of accounting courses in Universities in Rivers State. Rivers State University Business Educators had a mean score of 2.77 with standard derivation of 0.86 while Ignatius Ajuru University of Education Business Educators had mean score of 2.86 with standard deviation of 0.84. Despite the observed difference between the mean scores, the calculated t-value (t-cal = 0.9 is greater than 0.05 level of significance with 348 degrees of freedom. Based on the result, the null hypothesis was accepted.

Hypotheses 2: There no significant difference in the mean ratings of Rivers State University and Ignatius Ajuru University of Business Educators on the extent to which utilization of Micro-Copilots tools enhance teaching and learning of accounting courses in Universities in Rivers State.

Table 4: Analysis of Hypothesis 1 with t-test Statistics of Difference in Mean Ratings of Rivers State University and Ignatius Ajuru University of Business Educators on the Extent that Utilisation of Micro-Copilots Tools Enhance Teaching and Learning of Accounting Courses in Universities in Rivers State

Respondents	N	X	SD	Df	STD	LS	t-cal	t-crit	Decision
RSU	30	2.83	0.85						
				348	0.4	0.05	0.10	196	Accepted
IAUE	10	2.79	0.91						

Source: Field Survey (2026)

The result presented in Table 4 above, shows a comparison between the mean response of Rivers State University Business Educators had mean score of 2.79 with standard deviation of 0.91 while Ignatius Ajuru University of Education, Business Educators had a means score of 2.83 with a standard deviation of 0.91. Despite the observed difference between the mean scores, the calculated t-value (t-cal = 0.4 is greater than 0.05 level of significance with 348 degrees of freedom. Based on the result, the null hypothesis was accepted.

Discussion of Findings

The findings of research question in Table 1 showed that ChatGPT enhanced teaching and learning of Accounting courses to a high extent, as indicated by the cluster mean of 3.07. The individual item means, which ranged from 3.03 to 3.10, showed consistent agreement among respondents that ChatGPT improved explanation of complex accounting concepts, assisted in solving accounting exercises, provided instant feedback, improved understanding of accounting terminologies, and supported lesson preparation. This showed that ChatGPT functioned both as a teaching support tool for lecturers and as a learning companion for students. This finding agreed with the study of Kasneci et al. (2023), who found that AI conversational tools such as ChatGPT improve students' understanding by providing immediate explanations and personalized learning support. It also aligned with the findings of Zhai (2022), who reported that AI chat systems promote independent learning and improve comprehension in higher education. Furthermore,

Cotton, Cotton and Shipway (2023) observed that ChatGPT assists lecturers in preparing instructional materials and simplifying difficult concepts for students. These previous findings supported the result of the current study which showed that ChatGPT enhanced clarity of instruction and learning effectiveness in accounting courses. The implication of this finding was that ChatGPT reduced learning difficulties commonly associated with accounting courses by presenting explanations in simple formats and allowing students to learn at their own pace. It also reduced the workload of lecturers by assisting in lesson preparation and providing instructional guidance during teaching.

The results in research question Table 2 revealed that micro-copilots enhanced teaching and learning of Accounting courses with a cluster mean of 3.07. The item means ranging from 3.04 to 3.11 indicated that respondents agreed that micro-copilots improved preparation of accounting documents, increased speed and accuracy in calculations, enhanced step-by-step understanding of accounting procedures, supported grading and assessment, and improved practical accounting skills. This showed that micro-copilots served as intelligent digital assistants that supported both practical learning and teaching efficiency. This finding was supported by the work of Dwivedi et al. (2023), who reported that AI copilots improve productivity and accuracy in academic and professional tasks. Similarly, Brynjolfsson, Li and Raymond (2023) found that AI assistants enhance users' performance by reducing errors and increasing speed in task execution. In addition, Oyetunji and Adebayo (2022) found that digital accounting tools improve students' practical skills and readiness for modern workplace demands. These studies supported the present finding that micro-copilots improved efficiency and understanding in accounting courses.

The implication of this finding was that micro-copilots bridged the gap between theoretical knowledge and practical application in accounting education. They simplified assessment processes for lecturers while helping students follow accounting procedures in a clear and structured manner.

Conclusion

Based on the findings of the study, it was concluded that the utilization of ChatGPT and micro-copilots, tools enhances the teaching and learning of Accounting courses in Universities in Rivers State. These tools improve instructional clarity, promote practical skill development, increase efficiency in academic tasks, and expose students to modern accounting technologies. AI tools serve as supportive technologies that complement the efforts of lecturers and improve students' learning experiences. Their proper integration into Accounting Education can improve learning outcomes and better prepare students for modern accounting practice.

Recommendations

Based on the findings and conclusion of the study, the following recommendations are made:

1. Accounting lecturers should integrate ChatGPT into teaching to assist in explanation of complex accounting concepts and provide additional learning support.
2. Institutions should adopt micro-copilots for practical accounting classes, document preparation, and grading processes.

Abstract

The increasing integration of artificial intelligence (AI) into higher education is transforming entrepreneurship education, particularly in areas involving opportunity recognition, innovation, problem-solving, and entrepreneurial confidence. However, the mechanisms through which AI-driven entrepreneurship education influences entrepreneurial intention remain insufficiently understood, particularly in emerging educational contexts. This study examined the influence of AI-driven entrepreneurship pedagogy on entrepreneurial intention and investigated the mediating roles of entrepreneurial alertness to opportunities, entrepreneurial innovativeness, and entrepreneurial self-efficacy. The study was anchored primarily in Social Cognitive Theory and supported by the Theory of Planned Behaviour. A quantitative research design was adopted, and data were analysed using Partial Least Squares Structural Equation Modelling (PLS-SEM). The structural model demonstrated substantial explanatory power, with R^2 values ranging from 0.928 to 0.988 across the endogenous constructs. Collectively, entrepreneurship education and the cognitive and psychological mechanisms explained 96.4% of the variance in entrepreneurial intention. The results showed that AI-driven entrepreneurship pedagogy had strong positive effects on entrepreneurial alertness ($\beta = 0.963$), innovativeness ($\beta = 0.991$), and self-efficacy ($\beta = 0.994$). The mediation analysis revealed significant indirect effects through entrepreneurial alertness ($\beta = 0.189$, $t = 2.41$, $p = .016$), self-efficacy ($\beta = 0.258$, $t = 3.12$, $p = .002$), and innovativeness ($\beta = 0.529$, $t = 6.87$, $p < .001$), with innovativeness representing the strongest pathway. The total indirect effect was significant ($\beta = 0.977$, $t = 9.54$, $p < .001$), while predictive relevance was supported by Q^2 values ranging from 0.711 to 0.797. The findings demonstrate that AI-driven entrepreneurship pedagogy influences entrepreneurial intention substantially through cognitive and psychological mechanisms, highlighting the importance of deliberately developing students' opportunity recognition, innovative thinking, and entrepreneurial self-efficacy.

Keywords: Artificial intelligence, pedagogy, entrepreneurial intention, opportunity recognition, innovativeness, self-efficacy

1. Introduction

Entrepreneurship education has become an increasingly important component of higher education because of its potential to equip students with the knowledge, skills, attitudes, and competencies required to identify opportunities, solve problems, create value, and engage in entrepreneurial activities. Higher education institutions are increasingly recognised as important actors in developing entrepreneurial capabilities, including creativity, opportunity recognition, risk management, problem-solving, and the ability to transform ideas into viable ventures and other forms of economic and social value (Lackéus, 2015; OECD, 2018). Its importance has become even more pronounced in the context of rapidly changing labour markets, technological transformation, and evolving skill requirements. Consequently, universities and other tertiary institutions are increasingly expected not only to prepare graduates for conventional employment but also to develop entrepreneurial capabilities that can support self-employment, innovation, venture creation, and entrepreneurial career development (Lackéus, 2015; OECD, 2018).

At the same time, artificial intelligence (AI) is transforming the educational environment and creating new possibilities for teaching and learning. The emergence of generative AI applications such as ChatGPT has

introduced opportunities for interactive learning, content generation, personalised feedback, problem-solving, idea development, and the acquisition of practical competencies. Within entrepreneurship education, generative AI can support activities such as opportunity identification, entrepreneurial idea generation, business-model development, business-plan preparation, market analysis, customer-interview preparation, and entrepreneurial decision-making. Recent scholarship suggests that generative AI can be incorporated into entrepreneurship education to support creativity, inquiry, efficiency, and experiential learning, provided that its use is guided by appropriate pedagogical strategies (Bell & Bell, 2023; Darnell & Gopalkrishnan, 2024; Vecchiarini & Somià, 2023).

Emerging empirical evidence provides further support for the potential contribution of AI-supported learning to entrepreneurial development. Somià and Vecchiarini (2024), for example, examined the use of ChatGPT in improving students' Business Model Canvas and found evidence that interaction with generative AI can contribute to the development of entrepreneurial competencies. Similarly, Duong et al. (2024) examined ChatGPT adoption among higher education students and reported positive relationships between ChatGPT adoption, perceived AI competencies, entrepreneurial opportunity recognition, and digital entrepreneurial self-efficacy. These findings suggest that generative AI may contribute not only to students' technological capabilities but also to important cognitive and motivational dimensions of entrepreneurial development. More recently, Hajam and Jan (2026) found that generative AI adoption was positively associated with digital entrepreneurial self-efficacy, digital entrepreneurial attitudes, and digital entrepreneurial intention among business-management students, further indicating that AI-supported learning may have implications for students' entrepreneurial orientations.

Recent research has strengthened this mechanism-based perspective. Duong (2025) examined the relationship between AI literacy and e-entrepreneurial intention among 504 undergraduate students in Vietnam using a stimulus-organism-response framework. The study investigated e-entrepreneurial self-efficacy and e-entrepreneurial identity aspiration as mediating mechanisms and found that AI literacy influenced e-entrepreneurial intention through these psychological processes. The findings highlight the importance of examining what occurs between technological competence and entrepreneurial intention rather than assuming that technological knowledge or exposure to AI automatically produces entrepreneurial aspirations. In a related study, Alkhalaileh and Qasim (2026) examined AI literacy and e-entrepreneurial intention among 349 business students in Jordan using PLS-SEM and incorporated e-entrepreneurial self-efficacy and innovation mindset into the model. Their findings further suggest that AI-related competencies can contribute to entrepreneurial outcomes through psychological and innovation-related mechanisms, reinforcing the argument that the effects of AI should be examined through the capabilities and internal processes that it may develop.

The emerging literature on generative AI further reinforces this mechanism-based position. Huang et al. (2026) examined multiple pathways linking generative-AI entrepreneurship courses with entrepreneurial behaviour among Chinese undergraduates. Their study integrated cognition, self-efficacy, entrepreneurial intention, and entrepreneurial behaviour and identified a sequential pathway through which generative-AI entrepreneurship courses influence cognition, which subsequently affects self-efficacy and entrepreneurial intention before translating into entrepreneurial behaviour. The study also identified multiple configurations capable of producing high levels of generative-AI entrepreneurial behaviour. These findings suggest that the influence of AI-enabled entrepreneurship education may be better understood as a process through which educational experiences reshape students' cognition, confidence, intention, and eventual behaviour rather than as a simple direct relationship between technology and entrepreneurial outcomes.

One particularly important mechanism is entrepreneurial self-efficacy. Self-efficacy refers to an individual's belief in their capability to successfully perform particular tasks, while entrepreneurial self-efficacy concerns confidence in performing activities associated with entrepreneurship. Such activities may include identifying opportunities, developing products or services, mobilising resources, solving entrepreneurial problems, managing uncertainty, and initiating and managing a business. AI-supported learning environments may strengthen entrepreneurial self-efficacy by providing students with rapid feedback, opportunities for experimentation, access to relevant information, simulated entrepreneurial environments, and support in performing complex entrepreneurial tasks. Consistent with this argument, Xie and Wang (2025) found that generative-AI-supported entrepreneurship education significantly enhanced entrepreneurial self-efficacy and that self-efficacy mediated the relationship between AI-supported entrepreneurship education and entrepreneurial intention. Pham et al. (2026) similarly demonstrated the importance of self-efficacy and perceived behavioural control in explaining the relationship between entrepreneurship education, ChatGPT

adoption, and digital entrepreneurial intention. Collectively, these findings suggest that students' confidence in their entrepreneurial capabilities may constitute an important mechanism through which AI-supported educational experiences are translated into entrepreneurial intentions.

However, entrepreneurial self-efficacy alone may not fully explain entrepreneurial intention. Entrepreneurship also involves the ability to perceive, evaluate, and act upon possibilities that others may not recognise. Opportunity recognition is therefore a central cognitive process in entrepreneurial activity. AI-driven pedagogies can expose students to market information, customer problems, emerging technologies, industry trends, competitor activities, alternative business models, and simulated market environments. Through these activities, students may become better able to identify unmet needs, recognise emerging trends, evaluate potential market gaps, and formulate possible entrepreneurial responses. Duong et al. (2024), for example, reported a positive relationship between ChatGPT adoption and entrepreneurial opportunity recognition among higher education students. This evidence provides a basis for considering opportunity recognition as a potentially important cognitive mechanism through which AI-driven pedagogy may contribute to entrepreneurial intention.

Entrepreneurial innovativeness represents another potentially important mechanism. Generative AI can facilitate brainstorming, alternative idea generation, creative problem-solving, prototyping, business-model experimentation, and iterative refinement of entrepreneurial ideas. These capabilities may strengthen students' willingness and perceived ability to develop and implement novel products, services, processes, and business models. Importantly, entrepreneurial innovativeness should not be reduced to the ability to generate AI-assisted content. Rather, it concerns the student's capacity to use knowledge, technology, and available resources creatively to produce and implement novel solutions to entrepreneurial problems. Alkhalaileh and Qasim (2026) provide relevant evidence by demonstrating the importance of innovation mindset alongside e-entrepreneurial self-efficacy in explaining e-entrepreneurial intention. Similarly, Huang et al. (2026) show that cognition and self-efficacy form important components of the mechanisms connecting generative-AI entrepreneurship education with entrepreneurial outcomes. Although innovation mindset and entrepreneurial innovativeness are conceptually distinct constructs, these findings provide support for examining innovation-related capabilities as potential mechanisms linking AI-supported learning experiences with entrepreneurial intention.

The present study therefore responds to this gap by examining AI-driven pedagogy and entrepreneurial intention through three complementary mechanisms: entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness. Rather than conceptualising AI simply as a technological input, the study views AI-driven pedagogy as a learning environment through which students may develop entrepreneurial confidence, opportunity-recognition capability, and innovative capacity. By integrating these three mechanisms within a single framework, the study seeks to provide a more comprehensive explanation of how AI-enabled entrepreneurship education can translate technological learning experiences into students' intentions to pursue entrepreneurial activities and careers. The study consequently contributes to the emerging literature by shifting attention from the question of whether AI influences entrepreneurial intention to the more theoretically meaningful question of through which entrepreneurial capabilities AI-driven pedagogy may influence entrepreneurial intention.

2. Problem Statement

The rapid integration of artificial intelligence (AI) into higher education is creating new possibilities for entrepreneurship education through access to information, idea generation, business analysis, simulation, personalised learning, rapid feedback, and other forms of technology-supported learning. However, the availability and use of AI technologies do not necessarily translate into students' intentions to pursue entrepreneurial careers. The central problem is therefore not simply whether students have access to AI, but whether AI-driven pedagogies can develop the psychological, cognitive, and innovative capabilities necessary to strengthen entrepreneurial intention.

The problem is particularly important within Nigerian higher education. Although entrepreneurship education has become increasingly prominent in tertiary institutions, the extent to which emerging AI technologies can be deliberately integrated into entrepreneurship pedagogy to develop students' entrepreneurial capabilities remains insufficiently understood. Nigerian students may encounter challenges related to technological infrastructure, digital competencies, pedagogical practices, access to entrepreneurial experiences, and opportunities for practical experimentation. Moreover, existing Nigerian evidence on AI and entrepreneurship remains limited in its examination of the mechanisms through which AI-supported learning contributes to entrepreneurial outcomes. Edokpolor et al. (2026), for example, found

significant positive relationships among AI-driven technological application, study engagement, and entrepreneurial career intentions among vocational business students in Nigerian universities. Although this provides valuable evidence of the relevance of AI-related technology to entrepreneurial career development, the study primarily emphasised study engagement and did not simultaneously examine entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness as mechanisms explaining entrepreneurial outcomes.

Consequently, there is insufficient empirical understanding of how AI-driven pedagogies translate into entrepreneurial intention through students' psychological, cognitive, and innovation-related capabilities. In particular, it remains unclear whether and to what extent AI-driven pedagogies strengthen students' entrepreneurial self-efficacy, enhance their ability to recognise entrepreneurial opportunities, and stimulate their entrepreneurial innovativeness. These mechanisms are theoretically important because students may have access to sophisticated AI tools without necessarily possessing the confidence to undertake entrepreneurial activities, the cognitive capability to identify viable opportunities, or the innovative capacity to transform ideas into new products, services, processes, or business models.

The absence of an integrated framework incorporating these three mechanisms constitutes an important theoretical and empirical gap in the emerging literature on AI and entrepreneurship education. Existing studies have generally examined AI literacy, AI adoption, digital technology use, or individual psychological mechanisms, with comparatively less attention given to AI-driven pedagogy as a broader instructional approach that simultaneously develops entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness. Furthermore, much of the recent empirical evidence originates from China, Vietnam, Jordan, and European contexts. Although these studies provide important theoretical and empirical foundations, their findings cannot automatically be generalised to Nigerian higher education because differences in educational systems, technological infrastructure, institutional support, entrepreneurial ecosystems, and socioeconomic conditions may influence the way students respond to AI-driven pedagogical practices.

Therefore, the central problem addressed by this study is the limited empirical understanding of the mechanisms through which AI-driven pedagogies influence students' entrepreneurial intention, particularly the roles of entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness within the Nigerian higher education context. Accordingly, the study seeks to address the following central research question: How do AI-driven pedagogies influence entrepreneurial intention through entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness?

3. Objectives of the Study

The main objective of the study is to examine the relationship between AI-driven pedagogies and students' entrepreneurial intention, with particular attention to the mediating roles of entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness.

Specifically, the study seeks to:

1. Examine the effect of AI-driven pedagogies on entrepreneurial intention;
2. Determine the effect of AI-driven pedagogies on entrepreneurial self-efficacy;
3. Determine the effect of entrepreneurial self-efficacy on entrepreneurial intention;
4. Examine the effect of AI-driven pedagogies on opportunity recognition;
5. Determine the effect of opportunity recognition on entrepreneurial intention;
6. Examine the effect of AI-driven pedagogies on entrepreneurial innovativeness;
7. Determine the effect of entrepreneurial innovativeness on entrepreneurial intention;
8. Examine the mediating role of entrepreneurial self-efficacy in the relationship between AI-driven pedagogies and entrepreneurial intention;
9. Examine the mediating role of opportunity recognition in the relationship between AI-driven pedagogies and entrepreneurial intention; and
10. Examine the mediating role of entrepreneurial innovativeness in the relationship between AI-driven pedagogies and entrepreneurial intention.

4. Literature Review

4.1 Artificial Intelligence-Driven Pedagogies

Artificial intelligence-driven pedagogy refers to the purposeful and pedagogically guided integration of artificial intelligence (AI) technologies into teaching and learning activities to enhance students' learning experiences, problem-solving capabilities, creativity, experimentation, feedback, and competency development. Its defining characteristic is therefore not simply the availability or use of AI technology, but

pedagogical intentionality. In an AI-driven pedagogical approach, educators deliberately design learning activities in which AI becomes embedded within the instructional process through which students acquire, apply, evaluate, and transform knowledge. Thus, AI is positioned not merely as a technological resource but as an element of the learning design that shapes how students engage with knowledge and develop capabilities. In entrepreneurship education, AI-driven pedagogy can involve the structured use of generative AI and related intelligent technologies for opportunity exploration, business-idea generation, market research, customer analysis, business-model development, business-plan preparation, entrepreneurial simulations, financial projections, scenario analysis, prototyping, communication, and iterative feedback. The pedagogical value of these applications lies not simply in their capacity to generate information but in their ability to create learning environments in which students can experiment with entrepreneurial problems, compare alternatives, receive feedback, refine ideas, and develop entrepreneurial capabilities. This shifts the role of AI from an information-delivery mechanism toward an interactive component of entrepreneurial learning.

This conceptualisation is important because recent research has employed several related but conceptually distinct AI constructs. Some studies focus on AI literacy, which concerns individuals' knowledge, understanding, and ability to use AI technologies, whereas others examine AI adoption, ChatGPT use, or particular AI-based digital tools. For example, Duong (2025) examined AI literacy among 504 Vietnamese undergraduates, while Alkhalaileh and Qasim (2026) investigated AI literacy among 349 business students in Jordan. Both studies demonstrate that psychological mechanisms are important in explaining how AI-related capabilities translate into e-entrepreneurial intention. However, neither study conceptualises AI as a deliberately designed pedagogical approach. This distinction is important because possessing AI-related knowledge or adopting an AI tool does not necessarily mean that the technology has been integrated into the instructional design of entrepreneurship education. A closer conceptual precedent is provided by Xie and Wang (2025), who investigated Generative-AI-Supported Entrepreneurship Education (GAISEE) among 346 Chinese university students. Their structural equation modelling results showed that GAISEE significantly enhanced entrepreneurial self-efficacy and entrepreneurial intention, while entrepreneurial self-efficacy mediated the relationship between GAISEE and entrepreneurial intention. The study further demonstrated that the university entrepreneurial environment strengthened the effects of GAISEE. These findings are particularly relevant because they show that generative AI can be incorporated directly into entrepreneurship education and that its influence may operate through students' psychological capabilities rather than through technology alone. Nevertheless, the study concentrates primarily on entrepreneurial self-efficacy and the university entrepreneurial environment and does not incorporate opportunity recognition and entrepreneurial innovativeness into the same explanatory framework.

Alkhalaileh and Qasim (2026) provide further evidence concerning innovation-related mechanisms. Using PLS-SEM with 349 business students in Jordan, the researchers found that AI literacy did not have a direct effect on e-entrepreneurial intention. Instead, its influence operated through a serial mediation pathway in which e-entrepreneurial self-efficacy contributed to an innovation mindset, which subsequently influenced e-entrepreneurial intention. This finding is relevant to the present study because it indicates that psychological confidence and innovation-related capabilities may jointly contribute to the transformation of AI-related competencies into entrepreneurial intentions. However, the study examines innovation mindset rather than entrepreneurial innovativeness, and its focus is specifically on e-entrepreneurship rather than entrepreneurial intention in the broader entrepreneurship context. Pham et al. (2026) extend this line of inquiry by examining the relationships among entrepreneurship education, ChatGPT adoption, entrepreneurial self-efficacy, perceived behavioural control, and digital entrepreneurial intention among 718 university students. Using structural equation modelling with SmartPLS, the study found that entrepreneurship education enhanced perceived behavioural control and entrepreneurial self-efficacy, while both psychological factors positively influenced digital entrepreneurial intention. ChatGPT adoption further strengthened these relationships through its contribution to perceived behavioural control and self-efficacy. The findings therefore suggest that AI may reinforce the psychological processes through which entrepreneurship education influences entrepreneurial intention. However, the study's emphasis on ChatGPT adoption, self-efficacy, and perceived behavioural control leaves opportunity recognition and entrepreneurial innovativeness insufficiently examined.

4.2 Entrepreneurial Intention

Entrepreneurial intention refers to an individual's conscious willingness, commitment, and planned determination to establish a new venture or pursue an entrepreneurial career. It represents a proximal

antecedent of entrepreneurial behaviour because the decision to create a venture is generally preceded by cognitive processes involving evaluation, planning, and preparation. Entrepreneurial intention therefore captures an individual's readiness and motivation to engage in entrepreneurial activity and has become one of the most widely examined constructs in entrepreneurship research. The Theory of Planned Behavior (TPB) provides a major theoretical foundation for explaining entrepreneurial intention. Ajzen (1991) proposes that behavioural intention is determined by attitude toward the behaviour, subjective norms, and perceived behavioural control. Applied to entrepreneurship, individuals are more likely to form entrepreneurial intentions when they hold favourable attitudes toward entrepreneurship, perceive social support for entrepreneurial activity, and believe that they possess the capability and control necessary to perform entrepreneurial tasks. Consequently, educational experiences that strengthen positive attitudes, perceived capability, and control over entrepreneurial activities can contribute to stronger entrepreneurial intentions. Entrepreneurial intention is also consistent with the broader cognitive perspective of entrepreneurship. The formation of an entrepreneurial intention involves evaluating opportunities, assessing personal capability, considering possible outcomes, and deciding whether entrepreneurial action is desirable and feasible. This suggests that entrepreneurial intention should not be viewed solely as an isolated motivational outcome but as the product of interacting psychological and cognitive processes.

The emergence of artificial intelligence has created new possibilities for entrepreneurship education. AI-driven pedagogies can expose students to business-idea development, market analysis, customer analysis, business-model design, problem-solving, entrepreneurial simulation, financial analysis, and iterative feedback. Such experiences may reduce the perceived complexity of entrepreneurial tasks and enable students to experiment with entrepreneurial decisions in relatively low-risk learning environments. Consequently, AI-driven pedagogy may influence entrepreneurial intention directly by making entrepreneurial activity more understandable and accessible and indirectly by strengthening entrepreneurial capabilities.

The present study therefore conceptualises entrepreneurial intention as the principal entrepreneurial outcome and proposes that AI-driven pedagogies can contribute to students' intention to engage in entrepreneurial activity.

H01: AI-driven pedagogies have no significant effect on entrepreneurial intention.

4.3 Entrepreneurial Self-Efficacy

Entrepreneurial self-efficacy refers to an individual's belief in their capability to successfully perform the tasks and activities required to initiate and manage entrepreneurial ventures. It encompasses confidence in one's ability to identify opportunities, develop business ideas, solve entrepreneurial problems, mobilise resources, manage uncertainty, make decisions, and perform other activities associated with venture creation and development.

The concept is strongly grounded in Social Cognitive Theory. Bandura (1986) argues that individuals' beliefs concerning their capabilities influence their motivation, effort, persistence, emotional responses, and performance. Self-efficacy is particularly important in entrepreneurship because entrepreneurial activities frequently involve uncertainty, ambiguity, risk, experimentation, and repeated problem-solving. Individuals who believe that they can successfully perform entrepreneurial tasks are more likely to approach entrepreneurial challenges positively, persist when difficulties arise, and undertake actions necessary for venture creation.

Entrepreneurship education can contribute to the development of entrepreneurial self-efficacy by providing students with opportunities to practise entrepreneurial activities, observe successful performance, receive feedback, and overcome progressively challenging tasks. AI-driven pedagogy can potentially expand these opportunities. Students can use AI-supported tools to generate and refine business ideas, identify customer segments, compare business models, analyse competitors, construct business plans, evaluate strategic alternatives, and simulate entrepreneurial decisions. Through repeated experimentation and feedback, students may develop stronger beliefs in their capacity to perform entrepreneurial tasks.

The relevance of AI-driven pedagogy to self-efficacy is therefore consistent with Social Cognitive Theory. When students successfully complete AI-supported entrepreneurial tasks, receive constructive feedback, and repeatedly refine their work, these experiences may provide mastery experiences that strengthen entrepreneurial self-efficacy. AI can also facilitate experimentation by allowing students to test alternatives without the immediate financial consequences associated with real-world entrepreneurial decisions.

Recent empirical studies provide substantial support for this relationship. Xie and Wang (2025) found that generative-AI-supported entrepreneurship education significantly enhanced entrepreneurial self-efficacy

and that self-efficacy mediated the relationship between AI-supported entrepreneurship education and entrepreneurial intention. Duong (2025), using data from 504 Vietnamese undergraduates, similarly found that AI literacy positively influenced e-entrepreneurial self-efficacy, which subsequently contributed to e-entrepreneurial intention. Pham et al. (2026) also identified entrepreneurial self-efficacy as an important mechanism connecting entrepreneurship education and ChatGPT-related learning experiences with digital entrepreneurial intention. Huang et al. (2026) further identified self-efficacy as an important stage in the pathway linking generative-AI entrepreneurship courses with entrepreneurial intention and entrepreneurial behaviour.

The consistency of these findings suggests that entrepreneurial self-efficacy is one of the most established psychological mechanisms in the emerging AI–entrepreneurship education literature. However, previous studies have generally examined self-efficacy either independently or alongside one additional mechanism, such as perceived behavioural control, identity aspiration, or innovation mindset. Comparatively less attention has been given to examining entrepreneurial self-efficacy simultaneously with opportunity recognition and entrepreneurial innovativeness.

The present study consequently extends previous research by conceptualising entrepreneurial self-efficacy in two related roles: first, as an outcome of AI-driven pedagogy, and second, as a mediating mechanism through which AI-driven pedagogy may influence entrepreneurial intention.

H02: AI-driven pedagogies have no significant effect on entrepreneurial self-efficacy.

H03: Entrepreneurial self-efficacy has no significant effect on entrepreneurial intention.

H08: Entrepreneurial self-efficacy does not significantly mediate the relationship between AI-driven pedagogies and entrepreneurial intention.

4.4. Opportunity Recognition

Opportunity recognition is a central concept in entrepreneurial cognition and refers to the process through which individuals identify, interpret, and evaluate potentially valuable possibilities arising from unmet needs, market gaps, emerging trends, technological developments, customer problems, or changes in the business environment. It involves more than simply obtaining information. Rather, opportunity recognition requires individuals to connect information, interpret changes, identify patterns, evaluate potential value, and determine whether a possibility can be transformed into an entrepreneurial opportunity.

From an entrepreneurial cognition perspective, individuals differ in their capacity to recognise opportunities because they possess different knowledge structures, experiences, information-processing abilities, and attentional orientations. Consequently, the availability of information alone does not guarantee opportunity recognition. What matters is the individual's ability to interpret information and identify entrepreneurial possibilities within it.

AI-driven pedagogy may strengthen this capability by exposing students to extensive information and providing analytical support during entrepreneurial learning activities. Within entrepreneurship education, students can use AI to investigate customer pain points, analyse market trends, examine competitors, explore consumer preferences, identify emerging industries, compare alternative market segments, and investigate potential gaps in existing products and services. AI can also generate alternative interpretations of entrepreneurial problems, encouraging students to examine possibilities from different perspectives.

However, the contribution of AI to opportunity recognition should be understood as augmentation rather than replacement of entrepreneurial cognition. AI-generated information may be incomplete, inaccurate, biased, or inappropriate for a particular market context. Therefore, students must critically evaluate AI outputs, verify relevant information, assess contextual conditions, and apply entrepreneurial judgement. An effective AI-driven pedagogy should consequently teach students not simply how to obtain information from AI but how to question, interpret, evaluate, and transform information into entrepreneurial possibilities.

The relationship between AI and opportunity recognition is supported by emerging empirical evidence. Duong et al. (2024), in their study of higher education students, demonstrated that ChatGPT adoption was associated with digital entrepreneurial intention through entrepreneurial and cognitive mechanisms, including opportunity recognition. This finding is particularly relevant because it suggests that AI-supported learning may facilitate the identification and evaluation of entrepreneurial possibilities rather than influencing entrepreneurial intention exclusively through technological adoption.

Duong (2024) further demonstrated, from a stimulus-organism-response perspective, that ChatGPT adoption can stimulate digital entrepreneurship through internal cognitive and psychological processes. The study highlights the importance of understanding what happens between technological exposure and

entrepreneurial outcomes, rather than assuming that technology automatically produces entrepreneurial behaviour.

Huang et al. (2026) provide complementary evidence by demonstrating that generative-AI entrepreneurship education can influence entrepreneurial cognition, which subsequently contributes to self-efficacy, entrepreneurial intention, and entrepreneurial behaviour. Although entrepreneurial cognition is broader than opportunity recognition, the findings provide theoretical support for examining specific cognitive capabilities through which AI-enabled entrepreneurship education may influence entrepreneurial outcomes.

Despite these developments, opportunity recognition remains insufficiently examined as a distinct mechanism in the AI-driven entrepreneurship education literature. Existing studies have demonstrated relationships among AI use, entrepreneurial cognition, and entrepreneurial intention, but relatively few have explicitly tested whether opportunity recognition mediates the relationship between an intentionally designed AI-driven pedagogy and entrepreneurial intention. This represents an important gap. If AI-driven pedagogy exposes students to market information, alternative perspectives, customer problems, technological trends, and analytical tools, the educational effect may be expressed partly through students' enhanced ability to identify entrepreneurial possibilities. Opportunity recognition therefore represents a theoretically meaningful mechanism linking AI-driven learning experiences with entrepreneurial intention.

The present study addresses this gap by treating opportunity recognition as a distinct entrepreneurial cognitive capability rather than subsuming it within the broader concept of entrepreneurial cognition.

H04: AI-driven pedagogies have no significant effect on opportunity recognition.

H05: Opportunity recognition has no significant effect on entrepreneurial intention.

H09: Opportunity recognition does not significantly mediate the relationship between AI- driven pedagogies and entrepreneurial intention.

4.5. Entrepreneurial Innovativeness

Entrepreneurial innovativeness refers to an individual's tendency and capability to generate, support, develop, and implement novel ideas, products, services, processes, business models, or approaches to solving entrepreneurial problems. Innovativeness is a fundamental dimension of entrepreneurship because entrepreneurial activity frequently involves the development of new combinations of resources, introduction of novel solutions, and creation of new forms of value.

Entrepreneurial innovativeness should be distinguished from creativity alone. Creativity primarily concerns the generation of novel and useful ideas, whereas entrepreneurial innovativeness encompasses the broader process of developing and applying novel ideas in entrepreneurial contexts. Thus, an entrepreneurially innovative individual is not merely capable of producing many ideas but is also able to evaluate, adapt, develop, and potentially implement those ideas in response to market or societal needs.

AI-driven pedagogies may create favourable conditions for developing entrepreneurial innovativeness. Generative AI can support divergent thinking, rapid idea generation, alternative-solution development, experimentation, and iterative refinement. Within entrepreneurship education, students can use AI to generate alternative product concepts, develop value propositions, explore different business models, simulate customer responses, identify alternative solutions to business problems, and refine entrepreneurial proposals. The educational value of AI, however, depends on how these technologies are integrated into learning. If students merely accept AI-generated answers, the technology may encourage dependence rather than innovativeness. In contrast, when students are required to challenge AI outputs, generate alternative prompts, compare competing solutions, test assumptions, and adapt AI-generated ideas to real-world contexts, AI can become a catalyst for innovative entrepreneurial thinking. AI-driven pedagogy should therefore combine technological assistance with creativity, critical thinking, contextual knowledge, experimentation, and entrepreneurial judgement.

Emerging empirical research provides support for this relationship. Alkhalaileh and Qasim (2026), using PLS-SEM with 349 business students in Jordan, found that AI literacy influenced e-entrepreneurial intention through e-entrepreneurial self-efficacy and innovation mindset. The findings suggest that AI-related capabilities can influence entrepreneurial outcomes through psychological and innovation-related mechanisms. However, innovation mindset and entrepreneurial innovativeness are not conceptually identical. Innovation mindset generally describes an orientation or disposition toward embracing, exploring, and supporting innovation. Entrepreneurial innovativeness, in contrast, focuses more specifically on the tendency and capability to generate, develop, and implement novel entrepreneurial ideas and solutions. Consequently, the findings of Alkhalaileh and Qasim (2026) provide supporting evidence for an innovation-

related pathway but do not directly establish entrepreneurial innovativeness as conceptualised in the present study.

Huang et al. (2026) provide further support for the broader argument that generative-AI entrepreneurship education can develop entrepreneurial capabilities. Their findings demonstrate pathways involving cognition, self-efficacy, entrepreneurial intention, and entrepreneurial behaviour. Although the study does not directly operationalise entrepreneurial innovativeness as a mediator, it supports the proposition that AI-enabled entrepreneurship education can influence entrepreneurial capabilities beyond simple technology use.

The distinction between AI literacy, innovation mindset, and entrepreneurial innovativeness is therefore particularly important for the present study. AI literacy concerns the capability to understand and use AI; innovation mindset concerns an orientation toward innovation; whereas entrepreneurial innovativeness concerns the capacity and tendency to generate and implement novel entrepreneurial solutions. Treating these constructs as interchangeable would weaken the conceptual precision of the study. The existing literature consequently reveals an emerging relationship between AI, innovation-related capabilities, and entrepreneurial outcomes, but evidence concerning entrepreneurial innovativeness as a distinct mechanism remains limited. In particular, there is insufficient empirical evidence examining entrepreneurial innovativeness simultaneously with entrepreneurial self-efficacy and opportunity recognition in explaining how AI-driven pedagogy influences entrepreneurial intention. The present study addresses this gap by examining entrepreneurial innovativeness as both an outcome of AI-driven pedagogy and a potential mediating mechanism between AI-driven pedagogy and entrepreneurial intention.

H06: AI-driven pedagogies have no significant effect on entrepreneurial innovativeness.

H07: Entrepreneurial innovativeness has no significant effect on entrepreneurial intention.

H10: Entrepreneurial innovativeness does not significantly mediate the relationship between AI-driven pedagogies and entrepreneurial intention

However, the literature remains fragmented because previous studies have generally focused on individual mechanisms rather than examining several entrepreneurial capabilities simultaneously. Three mechanisms are particularly relevant to the present study.

Accordingly, the present study proposes an integrated model in which AI-driven pedagogy is the antecedent, entrepreneurial intention is the outcome, and entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness function as complementary mediating mechanisms. This framework provides the basis for testing the direct relationships represented by H01–H07 and the mediation relationships represented by H08–H10.

5. Theoretical Framework

This study is anchored primarily on Social Cognitive Theory (SCT), complemented by the Theory of Planned Behaviour (TPB) and organised through the Stimulus–Organism–Response (S-O-R) perspective to explain how AI-driven pedagogy may influence students' entrepreneurial intention through key entrepreneurial capabilities. Social Cognitive Theory, developed by Bandura (1986), emphasises the reciprocal interaction between personal factors, behaviour, and environmental influences, suggesting that learning environments can shape individuals' cognitive capabilities and subsequent behaviour. In this study, AI-driven pedagogy represents an important environmental and instructional stimulus capable of providing students with personalised learning, interactive problem-solving, feedback, simulation, idea generation, and opportunities for experimentation, thereby strengthening entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness. Entrepreneurial self-efficacy reflects students' confidence in their ability to perform entrepreneurial tasks, while opportunity recognition represents their capacity to identify and evaluate potentially valuable market opportunities, and entrepreneurial innovativeness reflects their ability to generate, develop, and implement novel entrepreneurial ideas. These capabilities are expected to strengthen students' readiness and willingness to pursue entrepreneurship. The Theory of Planned Behaviour (Ajzen, 1991) complements SCT by explaining entrepreneurial intention as a form of planned behaviour influenced by attitudes, subjective norms, and perceived behavioural control. Within this framework, AI-driven pedagogical experiences may enhance students' perceptions of entrepreneurial feasibility and desirability by increasing their confidence, exposing them to emerging opportunities, and encouraging innovative approaches to solving problems. Although entrepreneurial self-efficacy and perceived behavioural control are theoretically distinct constructs, higher self-efficacy may contribute to students' perceptions that entrepreneurial activities are within their control. Similarly, the ability to recognise opportunities and develop innovative solutions may strengthen favourable attitudes and perceived

capability toward entrepreneurship, thereby contributing to entrepreneurial intention. The Stimulus–Organism–Response perspective further provides an organising structure for the proposed relationships by conceptualising AI-driven pedagogy as the stimulus, entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness as the organismic mechanisms, and entrepreneurial intention as the response.

This perspective is consistent with recent AI and entrepreneurship education research showing that AI-related educational experiences may influence entrepreneurial outcomes through internal psychological and cognitive mechanisms rather than solely through direct effects. For example, Xie and Wang (2025) found that generative-AI-supported entrepreneurship education enhanced entrepreneurial self-efficacy and entrepreneurial intention, with self-efficacy serving as a mediator, while Duong (2025) demonstrated that AI literacy influenced e-entrepreneurial intention through self-efficacy and identity-related mechanisms. Similarly, recent evidence indicates that innovation-related capabilities can serve as important mechanisms linking AI-related competencies with entrepreneurial intentions. Accordingly, the integration of SCT, TPB, and S-O-R provides a comprehensive theoretical explanation for the proposed model: SCT explains how AI-driven pedagogy can develop students' entrepreneurial cognitive capabilities; TPB explains how these capabilities may translate into stronger entrepreneurial intention; and S-O-R organises the overall process as AI-driven pedagogy (stimulus) → entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness (organism) → entrepreneurial intention (response). The framework therefore provides the theoretical foundation for examining whether these three entrepreneurial capabilities operate as complementary mediating mechanisms through which AI-driven pedagogy strengthens students' intention to engage in entrepreneurial activities.

6. Methodology

The study adopted a quantitative, cross-sectional research design to examine the relationship between artificial intelligence (AI)-driven pedagogies and entrepreneurial intention, with entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness serving as mediating variables. The population comprised students of the School of Business Education, Federal College of Education (Technical), Gusau, from which 200 students were selected using proportionate sampling to ensure appropriate representation of the relevant student groups. Data were collected using a structured questionnaire containing measurement items adapted from validated instruments established in previous studies on entrepreneurship education, entrepreneurial self-efficacy, opportunity recognition, entrepreneurial innovativeness, and entrepreneurial intention. The items were measured on a five-point Likert scale, ranging from 1 = strongly disagree to 5 = strongly agree. The collected data were analysed using Partial Least Squares Structural Equation Modelling (PLS-SEM) through SmartPLS because the study is prediction-oriented and involves multiple latent constructs and mediating relationships. The analysis followed a two-stage procedure, beginning with assessment of the measurement model through indicator loadings, Cronbach's alpha, composite reliability, average variance extracted (AVE), and discriminant validity using the Heterotrait–Monotrait (HTMT) criterion. The structural model was subsequently evaluated by examining collinearity using variance inflation factor (VIF), path coefficients (β), coefficient of determination (R^2), effect size (f^2), predictive relevance (Q^2), and the significance of the hypothesised relationships using bootstrapping. Mediation analysis was conducted to determine whether entrepreneurial self-efficacy, opportunity recognition, and entrepreneurial innovativeness significantly mediated the relationship between AI-driven pedagogy and entrepreneurial intention. Ethical principles were observed throughout the study, as participation was voluntary, respondents were informed of the purpose of the research, confidentiality and anonymity were maintained, and the data were used solely for academic purposes.

7. Results and Discussion of Findings

The findings provide strong empirical evidence that Artificial Intelligence Driven Pedagogies are closely associated with the development of entrepreneurial competencies and entrepreneurial intention among students of the School of Business Education, Federal College of Education (Technical), Gusau.

The exceptionally high path coefficients provide particularly important evidence. Artificial Intelligence-Driven Pedagogies demonstrated very strong relationships with Opportunity Recognition (**β = 0.963**), Entrepreneurial Innovativeness (**β = 0.991**), and Entrepreneurial Self-Efficacy (**β = 0.994**). These

coefficients demonstrate that AI-supported pedagogical approaches have considerable potential to transform how students develop entrepreneurial knowledge, skills, confidence, and innovative capabilities. The strongest relationship was observed between Artificial Intelligence-Driven Pedagogies and Entrepreneurial Self-Efficacy (**β = 0.994**). This finding suggests that students' confidence in their entrepreneurial capabilities can be significantly strengthened when learning incorporates AI-enabled tools and activities. AI-supported learning may provide students with opportunities to experiment, obtain immediate feedback, solve complex problems, explore business ideas, and practise entrepreneurial decision-making in relatively low-risk environments.

The relationship between Artificial Intelligence-Driven Pedagogies and Entrepreneurial Innovativeness (**β = 0.991**) was similarly very strong. This result is particularly relevant because entrepreneurship requires individuals to identify new possibilities and develop creative solutions to problems. AI technologies can support this process by facilitating idea generation, information synthesis, scenario analysis, product conceptualisation, and experimentation. Consequently, pedagogical approaches that integrate AI may help students move beyond conventional knowledge acquisition towards creative and innovative entrepreneurial thinking.

The relationship between Artificial Intelligence-Driven Pedagogies and Opportunity Recognition (**β = 0.963**) was also exceptionally strong. O pportunity recognition is fundamental to entrepreneurship because potential entrepreneurs must be able to identify unmet needs, market gaps, emerging technologies, changing consumer preferences, and opportunities for value creation. AI-supported learning can expose students to large volumes of information and enable them to analyse trends, markets, customer needs, and potential business opportunities more efficiently.

The model's **R^2 = 0.964 for Entrepreneurial Intention** further demonstrates the explanatory strength of the proposed framework. The result indicates that 96.4% of the variance in entrepreneurial intention is explained by the model. This exceptionally high explanatory power suggests that the combination of AI-driven pedagogies, self-efficacy, opportunity recognition, and entrepreneurial innovativeness provides a comprehensive framework for explaining students' entrepreneurial intentions.

The mediation results further indicate that the relationship between AI-driven pedagogies and entrepreneurial intention operates through important cognitive and psychological mechanisms. Students are more likely to develop entrepreneurial intentions when AI-supported learning strengthens their confidence, improves their ability to recognise opportunities, and stimulates innovative thinking.

These findings are consistent with the logic of Social Cognitive Theory, which emphasises the interaction between environmental influences, cognitive processes, and behavioural outcomes. In the present study, AI-driven pedagogies represent an important learning environment, while self-efficacy, opportunity recognition, and innovativeness represent cognitive and psychological mechanisms through which that environment can influence entrepreneurial intention.

The results therefore suggest that the effective integration of AI into entrepreneurship education should not be limited to teaching students how to use artificial intelligence. Rather, AI should be integrated into pedagogical activities that deliberately develop entrepreneurial competencies, including opportunity recognition, innovative thinking, problem-solving, decision-making, and entrepreneurial self-efficacy.

Structural Model

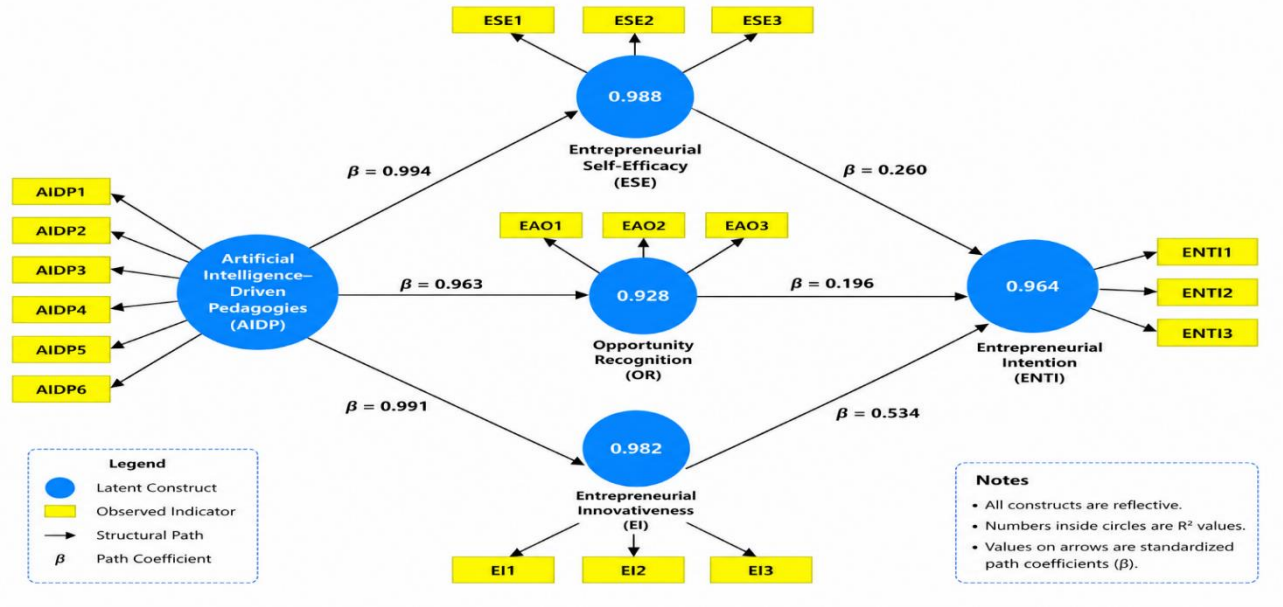

Table. Summary of the Structural Model Results

Hypothesis	Structural Path	β	R^2 (Endogenous Construct)	Interpretation
H1	AIDP → Entrepreneurial Self-Efficacy (ESE)	0.994	0.988	Very strong positive relationship
H2	AIDP → Opportunity Recognition (OR)	0.963	0.928	Very strong positive relationship
H3	AIDP → Entrepreneurial Innovativeness (EI)	0.991	0.982	Very strong positive relationship
H4	ESE → Entrepreneurial Intention (ENTI)	0.260	0.964	Positive relationship
H5	OR → Entrepreneurial Intention (ENTI)	0.196	0.964	Positive relationship
H6	EI → Entrepreneurial Intention (ENTI)	0.534	0.964	Positive relationship
Overall Model	AIDP → ESE, OR, EI → ENTI	—	0.964	96.4% of the variance in entrepreneurial intention is explained by the model

The R^2 values of 0.988 for ESE, 0.928 for OR, 0.982 for EI, and 0.964 for ENTI correspond to the structural model shown above. The paper specifically confirms the 0.964 R^2 for ENTI and the three principal AIDP path coefficients.

8. Conclusion

This study examined the relationship between Artificial Intelligence-Driven Pedagogies and Entrepreneurial Intention, with particular emphasis on the mediating roles of Entrepreneurial Self-Efficacy, Opportunity Recognition, and Entrepreneurial Innovativeness among students of the School of Business Education, Federal College of Education (Technical), Gusau.

The findings provide strong empirical evidence that AI-driven pedagogical approaches are closely associated with the development of important entrepreneurial competencies. The verified SmartPLS results show exceptionally high path coefficients between Artificial Intelligence-Driven Pedagogies and Opportunity

Recognition (**β = 0.963**), Entrepreneurial Innovativeness (**β = 0.991**), and Entrepreneurial Self-Efficacy (**β = 0.994**).

The strongest relationship was observed between Artificial Intelligence-Driven Pedagogies and Entrepreneurial Self-Efficacy, indicating that AI-supported learning may be particularly important for strengthening students' confidence in their entrepreneurial capabilities. The very strong relationship with Entrepreneurial Innovativeness further demonstrates the potential of AI-driven learning to stimulate creativity, idea generation, experimentation, and innovative problem-solving.

The model also demonstrated exceptional explanatory power, with **$R^2 = 0.964$** for Entrepreneurial Intention. Thus, 96.4% of the variance in entrepreneurial intention is explained by the variables incorporated into the proposed model. This finding demonstrates the substantial explanatory capacity of the AI-driven pedagogical framework.

The mediation analysis further establishes that Self-Efficacy, Opportunity Recognition, and Entrepreneurial Innovativeness represent important mechanisms through which AI-driven pedagogies can influence entrepreneurial intention. Entrepreneurial intention is therefore not merely a product of exposure to AI technology; rather, it develops through the cognitive and psychological capabilities that students acquire and strengthen within AI-supported learning environments.

The study concludes that AI-driven pedagogies represent an important emerging pathway for strengthening entrepreneurial intention among students. However, the effectiveness of AI integration depends on how deliberately AI tools are incorporated into pedagogical activities designed to develop entrepreneurial competencies. AI should therefore be viewed not merely as a technological resource but as a pedagogical mechanism capable of supporting entrepreneurial cognition, confidence, creativity, and opportunity recognition.

9. Recommendations

Based on the findings of the study, the following recommendations are proposed:

1. **Integrate AI-driven pedagogies into entrepreneurship education.**
   Institutions should systematically incorporate artificial intelligence tools into entrepreneurship teaching and learning. AI should be used for business-idea generation, market analysis, problem-solving, business-model development, simulations, and entrepreneurial decision-making.
2. **Strengthen entrepreneurial self-efficacy through AI-supported experiential learning.** Since Artificial Intelligence-Driven Pedagogies demonstrated a very strong relationship with Entrepreneurial Self-Efficacy (**β = 0.994**), lecturers should provide students with practical AI-supported entrepreneurial activities that allow them to experiment, solve problems, receive feedback, and build confidence in their entrepreneurial abilities.
3. **Develop students' opportunity-recognition capabilities.**
   Entrepreneurship programmes should train students to use AI tools to identify market gaps, analyse consumer needs, examine emerging trends, and evaluate potential business opportunities. This will enable students to transform information generated through AI into actionable entrepreneurial opportunities.
4. **Promote AI-supported entrepreneurial innovation.**
   Institutions should encourage students to use AI for brainstorming, product development, prototyping, creative problem-solving, and development of new business models. This is particularly important given the very strong relationship between AI-driven pedagogies and Entrepreneurial Innovativeness (**β = 0.991**).
5. **Adopt project-based and problem-based learning.**
   Lecturers should move beyond conventional lecture-based approaches and adopt project-based learning, business simulations, case studies, entrepreneurial challenges, and AI-supported practical projects. Such approaches can integrate knowledge, confidence, opportunity recognition, and innovation.
6. **Provide AI training for entrepreneurship educators.**
   Institutions should organise continuous professional development for lecturers to improve their ability to integrate generative AI, data-analysis tools, business intelligence applications, and other AI technologies into entrepreneurship pedagogy.
7. **Establish AI-enabled entrepreneurship laboratories and innovation hubs.**
   Colleges of education should consider establishing dedicated spaces where students can

experiment with AI technologies, develop business ideas, undertake market research, create prototypes, and collaborate on entrepreneurial projects.

8. **Strengthen ethical and responsible AI use.**
   AI-driven entrepreneurship education should include instruction on responsible AI use, including originality, academic integrity, data privacy, bias, misinformation, intellectual property, and ethical decision-making.
9. **Link AI-driven learning with real entrepreneurial ecosystems.**
   Institutions should establish partnerships with entrepreneurs, technology companies, innovation hubs, financial institutions, and business-support organisations to provide students with authentic entrepreneurial experiences.
10. **Evaluate the effectiveness of AI-driven pedagogies continuously.**
    Institutions should periodically assess whether AI-supported teaching is actually improving students' entrepreneurial self-efficacy, opportunity recognition, innovativeness, and entrepreneurial intention. Such evaluation should guide curriculum improvement and resource allocation.

10. Implications of The Study

10.1 Theoretical Implications

The study extends the entrepreneurship education literature by demonstrating how AI-driven pedagogies can influence entrepreneurial intention through cognitive and psychological mechanisms. The findings provide support for the application of Social Cognitive Theory to AI-supported entrepreneurship education by demonstrating the importance of self-efficacy as a mechanism linking the learning environment to entrepreneurial outcomes.

The study also contributes to entrepreneurial cognition research by positioning Opportunity Recognition and Entrepreneurial Innovativeness as important mechanisms through which AI-supported learning may influence entrepreneurial intention.

10.2 Practical Implications

For lecturers and curriculum developers, the findings demonstrate that AI should be integrated into entrepreneurship education as an active learning resource rather than treated merely as a technological add-on. Teaching activities should deliberately use AI to strengthen students' confidence, creativity, opportunity-recognition skills, and entrepreneurial decision-making.

For educational institutions, the high explanatory power of the model (**$R^2 = 0.964$**) highlights the potential value of investing in AI-supported entrepreneurial learning environments, lecturer capacity development, digital infrastructure, and innovation facilities.

For policymakers, the findings suggest that policies on entrepreneurship education should increasingly recognise the importance of artificial intelligence and digital technologies in developing the entrepreneurial capabilities required by students in the emerging economy.

10.3 Contribution to Knowledge

The major contribution of this study lies in its integration of Artificial Intelligence-Driven Pedagogies, Entrepreneurial Self-Efficacy, Opportunity Recognition, Entrepreneurial Innovativeness, and Entrepreneurial Intention into a single empirical framework. The study moves beyond the traditional examination of entrepreneurship education and entrepreneurial intention by demonstrating how AI-driven pedagogical approaches can potentially influence entrepreneurial intention through specific cognitive and psychological mechanisms. The exceptionally high explanatory power of **$R^2 = 0.964$** provides strong empirical support for the proposed framework and establishes a foundation for further research into AI-enabled entrepreneurship education.

Abstract

The emergence of Generative Artificial Intelligence (GenAI) is reshaping the knowledge, skills, and competencies required to participate in contemporary economic activities. Business Education, traditionally focused on preparing learners for employment, business creation, and effective participation in the business environment, must therefore rethink its curriculum, pedagogy, and graduate competencies. This paper examines the implications of Generative Artificial Intelligence for Business Education and entrepreneurial learning in Africa. It adopts a conceptual approach grounded in a critical synthesis of recent literature on artificial intelligence, higher education, entrepreneurship education, entrepreneurial competence, and AI literacy. The paper argues that GenAI should not be treated merely as another instructional technology or productivity tool, but as a transformative technology with implications for what Business Education teaches, how it is taught, how learning is assessed, and the competencies expected of graduates. The paper identifies five interrelated domains for AI-enabled Business Education: AI literacy, AI-enhanced pedagogy, AI-supported entrepreneurial intelligence, digital business competence, and ethical and critical AI use. Based on this, the paper proposes an AI-Enabled Entrepreneurial Business Education Framework (AIEBEF). The framework positions AI literacy as a foundation for developing entrepreneurial competence while maintaining human agency, critical thinking, creativity, ethical judgement, and contextual relevance. The paper concludes that African Business Education should shift from technology-assisted instruction to human-centred, AI-enabled, and entrepreneurship-oriented education. It recommends curriculum renewal, lecturer capacity development, AI-responsive assessment, institutional AI policies, investment in digital infrastructure, and stronger collaboration among universities, government, and industry.

Keywords: Artificial Intelligence, Generative AI, AI literacy, Business Education, entrepreneurial competence, entrepreneurship education, digital transformation, Africa

Introduction

The contemporary global economy is undergoing a profound technological transformation driven by digitalisation, automation, artificial intelligence (AI), big data, cloud computing and other emerging technologies. Among these technologies, Generative Artificial Intelligence (GenAI) has attracted exceptional attention for its ability to generate text, images, computer code and other forms of content in response to natural-language instructions. The public emergence of tools such as ChatGPT has accelerated discussions about the future of education, employment, entrepreneurship and professional practice.

The implications for higher education are substantial. Recent systematic reviews show that GenAI is being explored for personalised learning, content generation, feedback, problem-solving, simulation and other pedagogical purposes, while also raising concerns about assessment, accuracy, academic integrity, equity and ethical use (Qian, 2025; Yusuf *et al*., 2024). These implications are particularly important for

Business Education, as digital transformation affects its traditional areas (accounting, management, marketing, office technology, entrepreneurship, and information and communication technology). Consequently, the question confronting Business Education is no longer simply whether students should learn to use computers or conventional digital applications. The more fundamental question is what competencies Business Education students require as artificial intelligence increasingly performs tasks once regarded as distinctly human intellectual activities. This question has become particularly significant in Africa. The African Union's Continental Artificial Intelligence Strategy identifies AI as a strategic asset for economic development, innovation, job creation and social transformation, while promoting an Africa-centred, ethical, responsible and equitable approach to AI (African Union, 2024). Nigeria has likewise placed AI within its broader digital transformation agenda. These developments create an imperative for Business Education to prepare students not merely to use AI tools but to employ them critically and creatively for value creation. This paper therefore argues that AI literacy should become an integral component of contemporary Business Education and be deliberately linked to the development of entrepreneurial competence.

Artificial Intelligence broadly refers to computational systems capable of performing tasks associated with human intelligence, including learning, reasoning, prediction, language processing and decision support. Generative AI is a class of AI systems that can produce new content in response to prompts. These systems can generate text, images, audio, video, computer code and other outputs. For Business Education, the significance of GenAI is not merely its ability to produce content. It greater significance lies in its potential to support business idea generation, market research, customer analysis, communication, digital marketing, financial analysis, problem-solving, simulation, decision support and entrepreneurial experimentation. Yu, Ramayah and Lin (2025), in a systematic review of 50 peer-reviewed articles, found that research on GenAI in entrepreneurship education remains in its early stages. The review identified personalised and adaptive instruction, simulation-based entrepreneurial training, ethical and psychological concerns, and ecosystem integration as major domains. Importantly, the authors cautioned that the long-term impact of GenAI on entrepreneurial competence remains uncertain and requires stronger empirical evidence.

AI literacy extends beyond knowing how to operate an AI application. It encompasses understanding basic AI concepts, using AI appropriately, critically evaluating AI outputs, and recognising the ethical, social and practical implications of AI (Lintner, 2024). In Business Education, AI literacy should encompass at least five capabilities: understanding AI; using AI; evaluating AI outputs; applying AI to authentic business and entrepreneurial problems; and using AI responsibly. Similarly, UNESCO's AI Competency Framework for Students emphasises a human-centred mindset, AI ethics, AI techniques and applications, and AI system design across progression levels of understanding, application and creation (Miao, Shiohira, & Lao, 2024). AI literacy should therefore be understood as a competence for responsible action rather than mere technical familiarity with AI software.

Entrepreneurial competence comprises the knowledge, skills, attitudes and capabilities required to identify opportunities, mobilise resources, solve problems, create value and act effectively in uncertain conditions. Tittel and Terzidis (2020) show that entrepreneurial competence spans knowledge, skills and attitudes across the domain, personal and social dimensions. Entrepreneurial competence is broader than entrepreneurial intention. A student may intend to establish a business without the competence to identify a viable opportunity, develop a business model, mobilise resources, manage uncertainty or create sustainable value. For AI-enabled Business Education, the objective should therefore not simply be to produce students who intend to use AI to start businesses, but rather to produce graduates who can use AI critically and creatively to identify opportunities, solve problems and create sustainable economic and social value.

Business Education in a Changing Economic Environment

Business Education has historically responded to changes in the world of work. The shift from manual office systems to computers, from paper-based records to digital information systems, and from conventional commerce to electronic commerce has repeatedly required curriculum adaptation. Generative AI marks another stage in this evolution. The technology increasingly performs tasks such as writing, summarisation, information analysis, idea generation, communication, translation, coding, business-plan development and decision support. Consequently, Business Education cannot simply respond by adding a

single course titled Artificial Intelligence in Business Education while leaving the rest of the curriculum substantially unchanged. The transformation needs to be more fundamental. Traditional Business Education has often emphasised knowledge acquisition, skill development and employment. An emerging orientation requires integrating disciplinary knowledge, digital intelligence, critical thinking, AI literacy, and entrepreneurial competence for value creation and employability. This implies that the purpose of Business Education should shift from preparing students merely to perform existing business tasks to preparing them to interpret, redesign, and create business activities in an AI-enabled economy.

Entrepreneurship education has increasingly moved away from purely theoretical approaches toward experiential, competence-based and practice-oriented learning. This is particularly important in Nigeria. Okolie *et al.* (2021), studying undergraduate students across Nigerian universities, found that entrepreneurship education influenced some entrepreneurial competencies, including opportunity recognition, and suggested that innovative teaching techniques can improve competency development. This indicates that exposure to entrepreneurship education does not automatically develop every entrepreneurial capability; learning must be deliberately designed around competence development. GenAI can support this transition. Instead of asking students merely to memorise the stages of business-plan development, lecturers can provide authentic entrepreneurial problems and require students to identify customer problems, use AI to generate alternative hypotheses, investigate assumptions, collect or verify market information, develop alternative business models, critically evaluate AI-generated suggestions, defend their preferred option and revise the model based on evidence.

Recent empirical work supports a cautious but constructive approach. Xie and Wang (2025) found that GenAI-supported entrepreneurship education was associated with entrepreneurial intention through entrepreneurial self-efficacy and university support. Another recent quasi-experimental study found that AI-assisted, argumentation-driven learning supported entrepreneurial competence development, with data literacy playing an important mediating role (Sune *et al.,* 2025). These findings support AI integration while reinforcing the need for teacher guidance and critical evaluation.

Five transformations required in Business Education

1. From digital literacy to AI literacy: Traditional digital literacy remains important, but it is no longer sufficient. A student may be proficient in word processing, spreadsheets, presentation software and internet search and still lack the ability to evaluate AI-generated information or use AI responsibly. Business Education should therefore develop students who understand how generative AI works at a basic level, formulate effective prompts, verify AI-generated information, identify hallucinations and bias, protect confidential information, disclose AI assistance appropriately and exercise independent judgement.

2. From information consumption to knowledge evaluation: Generative AI changes the scarcity problem because students can obtain large quantities of information almost instantaneously. The critical educational challenge therefore shifts toward determining whether information is accurate, relevant, contextualised and useful. This makes critical thinking more important, not less. The appropriate pedagogical response is not simply to prohibit AI use but to teach students how to interrogate AI outputs, compare sources, identify unsupported claims and defend conclusions with evidence.

3. From business plan writing to AI-supported entrepreneurial problem-solving: Traditional entrepreneurship education often culminates in the production of a business plan. The contemporary entrepreneurial environment requires students to identify problems, test assumptions, investigate markets, analyse competitors, understand customers, develop prototypes, obtain feedback and make decisions under uncertainty. GenAI can facilitate rapid exploration of alternatives, but students must distinguish between AI-generated possibilities and evidence-based entrepreneurial judgement.

4. From creativity as an individual attribute to human-AI co-creation: Creativity remains central to entrepreneurship. GenAI can assist with brainstorming and idea generation, but its use introduces a paradox. Research indicates that AI can support creative thinking while also creating negative effects on creativity and creative confidence when used inappropriately (Guzdial *et al.,* 2024).

Students should therefore use AI to challenge assumptions, explore alternatives and refine ideas rather than outsource creativity altogether. The appropriate goal is human-AI co-creation rather than AI-dependent creativity.

5. From teacher as information provider to teacher as learning architect: If students can obtain explanations, summaries and examples from AI systems, the lecturer's value increasingly lies in designing meaningful learning experiences, providing contextual expertise, challenging assumptions, evaluating reasoning, mentoring students and connecting classroom learning to authentic business problems. UNESCO's AI Competency Framework for Teachers recognises that AI is changing the teacher-student relationship and requires educators to develop new knowledge, skills and values (Miao & Cukurova, 2024). The AI era therefore does not make the Business Education lecturer less important; it makes the intellectually capable and pedagogically adaptive lecturer more important.

The AI-Enabled Entrepreneurial Business Education Framework

Nigeria has strong reasons to pay attention to this transformation. National AI policy initiatives recognise AI as a potential contributor to economic growth, innovation, job creation and social development. At the same time, the national policy conversation identifies challenges involving skills, infrastructure, responsible use and governance. These developments have direct implications for Business Education. The programme should prepare students not only to seek employment in an AI-transformed economy but also to create value within it. This means developing graduates who can identify AI-enabled business opportunities, establish digital enterprises, improve existing businesses through AI, provide AI-supported business services, apply digital financial skills, develop digital marketing strategies, analyse business information and recognise ethical boundaries in AI use. Recent Nigerian Business Education literature has begun to examine the use of ChatGPT and AI tools in teaching and learning, indicating growing interest in the technology within the discipline. The next step is to move from awareness and tool adoption toward a coherent curriculum and competency framework.

Based on the foregoing discussion, this paper proposes the AI-Enabled Entrepreneurial Business Education Framework (AIEBEF). The framework rests on five interconnected pillars:

i) AI literacy: understanding AI concepts, capabilities, limitations and applications
ii) AI-enhanced pedagogy: using AI appropriately in teaching, learning, assessment and feedback
iii) AI-supported entrepreneurial intelligence: using AI to support opportunity recognition, creativity, problem-solving, market analysis and business-model development
iv) digital business competence: developing practical competence in digital marketing, e-commerce, data analysis, digital communication and AI-enabled business processes; and
v) ethical and critical AI use: maintaining human judgement while addressing privacy, bias, academic integrity, intellectual property, transparency and accountability.

These pillars converge in developing AI-ready entrepreneurial graduates who can contribute to digital transformation and sustainable value creation.

Reimagining the Business Education Curriculum

The implications for curriculum design are substantial. Conventional emphases such as computer literacy, information retrieval, business-plan preparation and conventional marketing should be complemented by AI and digital literacy, information evaluation, AI-supported business modelling, AI-enabled digital marketing, intelligent productivity, experiential entrepreneurship and critical problem-solving. This does not mean abandoning foundational business knowledge. Accounting, management, economics, marketing, entrepreneurship, office administration and related knowledge remain essential. The change lies in how students apply that knowledge. A student who understands accounting but cannot use contemporary digital tools may be disadvantaged; equally, a student who can use AI but lacks accounting, management or entrepreneurial understanding may produce technologically sophisticated but commercially unsound decisions. The future therefore lies in integrating disciplinary knowledge with AI capability rather than replacing disciplinary knowledge with AI.

Assessment also presents an immediate challenge. Traditional assignments that ask students to write essays, summarise topics, define concepts or prepare generic business plans can increasingly be completed with AI assistance. The response should not be limited to AI-detection exercises. Assessment should increasingly emphasise process, reasoning, application and authentic performance. Students can be required to identify a real business problem, document their initial thinking, use AI to generate alternatives, verify the information generated, compare options, justify a decision, identify the limitations of AI outputs and reflect on what they learned. Such assessment evaluates the student's thinking about AI rather than simply the AI-generated product. It also provides opportunities to assess critical thinking, judgement, creativity and ethical reasoning.

Ethical Issues and their implication

i. Academic Integrity: Students may submit AI-generated work without disclosure. The response should combine clear institutional policies with assessment redesign rather than relying exclusively on prohibition.
ii. Accuracy and Hallucination: Generative AI can produce convincing but incorrect information. Students therefore need verification skills and should be required to check consequential claims against authoritative sources.
iii. Privacy: Students should not indiscriminately upload confidential business, institutional or personal information to AI platforms. UNESCO (2023) emphasises privacy protection and institutional preparedness in relation to GenAI.
iv. Bias: AI systems can reproduce biases present in their training data or design. Business Education should teach students to interrogate AI outputs rather than accept them automatically.
v. Intellectual Property: Students need to understand ownership, attribution and responsible use of AI-generated and AI-assisted content.
vi. Overdependence: A major educational danger is the gradual outsourcing of thinking. The objective of Business Education should not be to produce graduates who ask AI to solve every problem. It should produce graduates who can use AI while retaining the capacity to think independently.

Implications for Business Education Lecturers

The transformation cannot succeed if attention is focused exclusively on students. Lecturers require continuing professional development in AI literacy, prompt design, AI-assisted pedagogy, AI-supported assessment, AI ethics, digital entrepreneurship and data literacy. For Business Education lecturers, professional competence in AI should go beyond knowing how to operate ChatGPT. Lecturers should understand when to use AI, when not to, how to evaluate its outputs, and how to integrate it into authentic entrepreneurial learning.

Implications for Universities

Universities should develop institution-wide frameworks covering acceptable AI use, academic integrity, assessment, privacy, research, intellectual property, staff development, student AI literacy and responsible procurement and deployment. An institutional AI policy should answer three practical questions: What may students use AI for? What must students disclose? What competencies must students demonstrate independently? A constructive policy should provide guidance and capacity development rather than rely only on prohibitions.

Implications for Government and Professional Bodies

Government agencies and professional bodies should support the transition through curriculum guidelines, digital infrastructure, lecturer training, research funding, industry partnerships, AI competency standards, entrepreneurship-support programmes and responsible AI governance. Professional associations such as ABEN can contribute by organising AI-focused professional development, developing model curriculum resources, encouraging research on AI and Business Education, facilitating university-industry partnerships and promoting responsible AI adoption among Business Education professionals.

Proposed Strategic Model for Business Education

Business Education departments can adopt a six-stage progression: Awareness, Literacy, Application, Integration, Innovation and Responsible Value Creation. At the awareness stage, students understand AI and its implications for business and employment. At the literacy stage, they acquire competence in using and evaluating AI. At the application stage, they use AI in authentic academic and business activities. At the integration stage, AI is embedded across appropriate courses. At the innovation stage, students use AI to develop products, services, business models and entrepreneurial solutions. At the final stage, students apply AI to create economic and social value while maintaining ethical judgement and human agency. The progression can therefore be represented as:

Awareness → Literacy → Application → Integration → Innovation → Responsible Value Creation.

This paper argues that Business Education should pursue augmentation rather than substitution. AI can augment information processing, idea generation, feedback, communication, analysis, simulation, productivity and entrepreneurial experimentation. Humans must nevertheless retain responsibility for judgement, ethical reasoning, empathy, accountability, contextual interpretation, strategic decisions, leadership and responsibility for consequences. This distinction matters because education is not simply about increasing productivity; it also develops human agency. A human-centred approach is therefore essential. UNESCO's guidance on GenAI in education emphasises ethical, safe, equitable, and meaningful use, including protecting data privacy and human agency (UNESCO, 2023).

Conclusion

Generative Artificial Intelligence represents more than another technological innovation confronting higher education. It is altering the nature of knowledge production, communication, problem-solving, creativity and business activity. For Business Education, this transformation presents both an urgent challenge and an unprecedented opportunity. The challenge is that curricula, teaching methods and assessment systems designed for a pre-GenAI environment may no longer adequately prepare students for an AI-transformed economy. The opportunity is that Business Education can use GenAI to enhance learning, develop entrepreneurial competence, support creativity and equip students for new forms of employment and enterprise. The appropriate response is neither technological resistance nor uncritical technological enthusiasm. What is required is purposeful, human-centred integration.

This paper has argued that Business Education should move from conventional digital literacy to comprehensive AI literacy; from information transmission to critical knowledge evaluation; from theoretical entrepreneurship to experiential and AI-supported entrepreneurial learning; and from technology-assisted instruction to AI-enabled, entrepreneurship-oriented education. The proposed AI-Enabled Entrepreneurial Business Education Framework provides a conceptual basis for this transformation by connecting AI literacy, AI-enhanced pedagogy, entrepreneurial intelligence, digital business competence and ethical AI use.

For Africa, this transformation must be contextual. It must address digital inequality, infrastructure constraints, skills shortages, linguistic diversity, institutional capacity and the need for inclusive economic development. Ultimately, the future relevance of Business Education will depend not on its resistance to artificial intelligence but on its capacity to educate people who can think critically with AI, work effectively alongside AI, innovate through AI and know when human judgement must prevail over AI. The goal should therefore not be to produce AI-dependent graduates, but AI-enabled entrepreneurs, professionals and business educators capable of creating sustainable economic and social value.

Recommendations

Based on the arguments advanced, the paper recommends that:

Business Education curricula should incorporate AI literacy as an integral component of contemporary business and entrepreneurial education.

AI competencies should be embedded across existing courses rather than confined to a single ICT-related course.

Business Education lecturers should receive continuous professional development in AI literacy, AI pedagogy, assessment redesign and AI ethics.

Universities should develop clear institutional policies on responsible AI use covering teaching, learning, assessment, research, privacy and academic integrity.
Assessment should increasingly emphasise authentic performance, critical reasoning, reflection, application and problem-solving rather than information reproduction.
Entrepreneurship education should incorporate AI-supported experiential learning, including business simulations, opportunity identification, market analysis and business-model development.
Government should invest in digital infrastructure and affordable connectivity to prevent AI adoption from widening existing educational inequalities.
Industry-university partnerships should be strengthened to expose Business Education students to authentic AI-enabled business practices.
African perspectives should inform AI curriculum development, including local business problems, African languages, cultural contexts and socioeconomic realities.
AI adoption should remain human-centred, with critical thinking, creativity, ethical judgement, accountability and human agency maintained as core educational outcomes.

ARTIFICIAL INTELLIGENCE AND AUTOMATION AS PREDICTORS OF ENTREPRENEURIAL LEARNING AND PRACTICE OF COOPERATIVE ECONOMICS AND MANAGEMENT BY BUSINESS EDUCATION STUDENTS IN NIGERIAN UNIVERSITIES IN SOUTH-EAST

Favour Moghalu

Abstract

This study examined artificial intelligence and automation as predictors of entrepreneurial learning and practice of Cooperative Economics and Management among Business Education students in Nigerian universities in South-East. The study adopted a correlational research design. The population comprised 562 third- and final-year Business Education students from four federal universities in South-East Nigeria, and the entire population was used through census sampling. Data were collected using a structured questionnaire, which was validated by three experts and pilot-tested, yielding a Cronbach Alpha reliability coefficient of 0.78. Data were analysed using mean and standard deviation to answer the research questions, while simple linear regression was used to test the four null hypotheses at the 0.05 level of significance. The findings showed that artificial intelligence predicted entrepreneurial learning to a high extent (cluster mean = 3.22) and significantly predicted entrepreneurial learning ($R = 0.681$, $R^2 = 0.464$, $p = 0.034$). Automation also predicted entrepreneurial learning to a high extent (cluster mean = 3.24) and significantly predicted it ($R = 0.624$, $R^2 = 0.389$, $p < 0.001$). Artificial intelligence predicted entrepreneurial practice to a high extent (cluster mean = 3.20) and significantly predicted entrepreneurial practice ($R = 0.647$, $R^2 = 0.419$, $p < 0.001$). Automation similarly predicted entrepreneurial practice to a high extent (cluster mean = 3.23) and had the strongest predictive relationship with entrepreneurial practice ($R = 0.716$, $R^2 = 0.513$, $p < 0.001$). The study concluded that artificial intelligence and automation significantly and positively predict entrepreneurial learning and practice. It was recommended that Business Education programmes integrate AI and automation into entrepreneurship courses and provide students with practical, technology-supported entrepreneurial learning experiences.

Keywords: *Artificial intelligence, automation, entrepreneurial learning, entrepreneurial practice, Cooperative Economics and Management, Business Education*

Introduction

In the business environment of today, there is a rapid technological advancement, competition increase, dynamic expectations of consumers and the rising demands for individuals, groups and organisations to improve in their acquired knowledge, skills and competencies. Business Education Departments in Universities are therefore expected to graduate students for conventional employment and entrepreneurial activities, innovation and ownership of businesses. The importance of Business Education cannot be overemphasized in this context because it involves the combination of theoretical knowledge with practical competencies required for effective participation in economic and organisational world. In Nigerian, it has become very necessary for business education to be included in every level of education because of unavailability of job, thus the need for graduates to be equipped with competencies that can support self-employment, creation of enterprise and effective management of existing businesses. Studies have shown that entrepreneurship education among Nigerian undergraduates can contribute to competencies such as opportunity recognition, creative problem-solving, self-efficacy and networking, although the outcomes depend considerably on the nature and quality of learning experiences provided to students (Tarelate, 2024). Based on the changing environment, artificial intelligence and automation has become important technological factors that may influence how Business Education students acquire entrepreneurial knowledge and how they subsequently apply that knowledge in business practice.

Artificial intelligence (AI), in the context of this study, is a collection of computer-based systems that can process information and perform tasks that are naturally possible by human intelligence, such as

learning, reasoning, prediction, problem-solving, language processing and decision-making. AI system as described by the Organisation for Economic Co-operation and Development (OECD, 2024) in terms of a machine-based system that, for explicit or implicit objectives, infers from inputs how to generate outputs such as predictions, content, recommendations or decisions that can influence physical or virtual environments. Bell and Bell (2023) stated that generative AI is important for business education because it influences the way entrepreneurial knowledge is acquired and the way to identify future emerging business opportunities. Likewise, research has shown that AI-supported learning activities can improve some parts of entrepreneurial skills when AI tools are incorporated with other learning methods (Alam et al., 2024).

Artificial intelligence is relevant in this context because of its potential to change the process through which students attain, create and relate entrepreneurial knowledge. Entrepreneurial learning refers, in this study, to the process through which Business Education students gain knowledge, skills, attitudes and competent experiences that enable them to identify opportunities, develop business ideas, solve problems, make decisions, manage resources and learn from entrepreneurial experiences. This type of learning is not just that of memorising definitions and principles of entrepreneurship, it also involves learn from practical business environment and putting into practice what is being learnt A study found that experiential methods and experiences outside classroom can have a positive influence on students' attitudes and intentions towards entrepreneurship (Alam, et al, 2024). Thus, AI is a technological predictor that influences the differences in the entrepreneurial learning experiences of Business Education students.

Closely connected with AI is automation, which is the second predictor variable in the study. Automation, in the context of this study, refers to the use of technological systems, software and digital processes to perform tasks that have little or no direct human interference. In business, automation may consist of regular data entry, processing of transaction, keeping of record, customer communication, scheduling, marketing activities, financial calculations and other repetitive processes. AI and Modern automation overlaps in context because AI intelligent systems can make automated processes more adaptive and reactive to changing information. The OECD (2024) notes that AI can perform automation tasks, enhance the capabilities of humans and change business activities, while robotic automation can be used for custom and recurring activities such as data entry, transaction processing and records management. Business Education students therefore need exposure to automation for entrepreneurial learning because students are required to understand how businesses are traditionally managed and how technology can redesign the processes of business. Therefore, Business Education should enable students to identify tasks that can be automated, determine the advantages and disadvantages of automation and develop the capacity to manage technology-assisted enterprises.

Automation and entrepreneurial learning are closely related, a business education graduate operating in a technology-driven environment needs not just the traditional bookkeeping, marketing or management knowledge but automation. They needs to understand how digital tools can reduce repetitive work, improve efficiency, minimise errors, enhance customer service and provide timely information for taking decision. A better understanding of how contemporary enterprises operate is developed by Business Education students when they learn about automation through practical activities, simulations and technology-supported projects. Through automation, students learn by designing, testing and evaluating technology-supported business processes. The OECD (2024) emphasises that the economic effects of AI include changes in output, innovation, work organisation and the tasks distribution between machines and human.

The second major construct requiring contextual consideration is entrepreneurial practice. Entrepreneurial practice, in this study is the application of entrepreneurial knowledge, skills, attitudes and competencies in identifying opportunities, value creation, setting up and running ventures, getting resources, advertising and selling products or services, making decisions and responding to challenges. Entrepreneurial practice is concerned with what an individual can do with entrepreneurial knowledge rather than merely what the individual knows. For Business Education students, the ultimate purpose of entrepreneurial learning is for both academic performance and the ability to apply business knowledge in real entrepreneurial situations. Entrepreneurship education is associated with the development of several competencies pertinent to business start-up, including opportunity recognition, opportunity assessment, creative problem-solving and self-efficacy (Nigerian Universities' entrepreneurship research, 2024).

The relevance of AI to entrepreneurial practice shows the way entrepreneurs can use intelligent technologies to identify opportunities, conduct market research, generate ideas, analyse customer information, develop promotional materials, prepare business plans and support decision-making. AI can

reduce the time and resources required for some entrepreneurial activities but also provide access to potentials that may have been available to larger organisations. Generative AI can automate tasks, enhance skills, support creativity and innovation, accelerate research and development and lower some barriers to business entry (OECD, 2025). For Business Education students, AI competence should be connected to practical entrepreneurial competence. Students who learn to use AI responsibly may be better positioned to integrate technology into opportunity identification, business planning, marketing, customer engagement and other entrepreneurial activities. A study on the impact of AI on students' entrepreneurial competencies showed that AI technologies can influence entrepreneurial competencies when integrated with appropriate learning methods, with students using ChatGPT to improve their business model canvas as part of the learning process (Alam et al., 2024).

Cooperative Economics and Management provide an important contextual field for examining these relationships. In this study, Cooperative Economics and Management is the study and application of economic, managerial and entrepreneurial principles to the creation, operation, administration and development of cooperative enterprises. It includes knowledge of cooperative organisation, economic decision-making, financial management, leadership, member relations, resource mobilisation, enterprise development and management of cooperative businesses. The Lagos State Cooperative College, for example, describes Cooperative Economics and Management as a field concerned with applying economic theories and methods to managerial decisions in cooperatives and preparing learners to lead and manage cooperative firms (Lagos State Cooperative College, 2025). The connection between Cooperative Economics and Management and entrepreneurial learning is particularly important because cooperative enterprises require individuals who can combine economic understanding with practical management and entrepreneurial competencies. Business Education students who acquire knowledge of cooperative economics and management are expected to understand how cooperative organisations mobilise resources, identify members' economic needs, create products and services, manage finances, respond to market conditions and pursue sustainable enterprise development. Furthermore, the relationship between AI, automation and Cooperative Economics and Management is also becoming increasingly significant because cooperative organisations operate in an environment in which digital technologies are transforming business processes. AI can support market analysis, financial forecasting, customer relationship management, communication, decision support and business planning, while automation can streamline routine administrative and operational tasks. The OECD (2024) states that opportunities are presented by AI adoption for productivity and innovation and also raises issues related to inequality, security, trust and the distribution of benefits. Therefore, entrepreneurial learning should prepare students not just for AI and automation use but to evaluate their right application in cooperative and entrepreneurial contexts.

Business Education students in South-East Nigerian Universities, provides the population and educational context within which the stated variables can be examined. Business Education students are persons that undertake preparation at university level in business-related knowledge and skills with the purpose of functioning effectively as employees, managers, entrepreneurs, educators or business owners. Within Nigeria, the university environment has increasingly been expected to promote entrepreneurship and innovation as responses to graduate unemployment and changing labour-market requirements (Bell & Bell, 2023).

Although previous studies have examined AI in education, AI and entrepreneurial competencies, entrepreneurship education and entrepreneurial intentions, and AI applications in Business Education, the specific predictive relationship among artificial intelligence, automation, entrepreneurial learning and entrepreneurial practice within Cooperative Economics and Management among Business Education students in South-East South-East Nigerian Universities remains insufficiently explored. Hence the need for the topic "Artificial Intelligence and Automation as Predictors of Entrepreneurial Learning and Practice of Cooperative Economics and Management by Business Education Students in South-East Nigerian Universities". The study predicts that AI and automation may provide students with new ways of acquiring entrepreneurial knowledge and applying that knowledge to business activities. Artificial intelligence represents the intelligent technological capability that can support learning, analysis, creativity and decision-making, while automation represents the technological capability to execute routine or repetitive processes with reduced human interference. Entrepreneurial learning represents the acquisition and development of competencies required for entrepreneurial action, whereas entrepreneurial practice represents the application of those competencies in actual business activities. Examining AI and automation

as predictors of these outcomes is therefore important for determining whether technological exposure is associated with stronger entrepreneurial capabilities among Business Education students.

Statement of the Problem

It is expected that Business Education students in South-East Nigerian Universities are to graduate with strong entrepreneurial learning and practical competencies that enable them to identify business opportunities, develop ideas that are innovative, make informed decisions, manage enterprises and adapt to changes in the business environment. Business Education students are expected to combine knowledge of cooperative principles, economics and management with practical entrepreneurial skills that can support the establishment, growth and sustainability of cooperative and other business ventures. The rising use of artificial intelligence (AI) and automation in present day businesses also makes it necessary for students to understand and utilise these technologies as part of their entrepreneurial preparation. AI should enable students to access information, analyse markets, generate and evaluate business ideas, support decision-making and enhance creativity, while automation should help them understand how repetitive business processes can be streamlined for greater efficiency. Ideally, therefore, university Business Education programmes should integrate AI and automation meaningfully into entrepreneurial learning and practice so that graduates will have not just conventional business competencies but also technology-enabled entrepreneurial capabilities.

However, the present academic situation creates a gap between the desired technology-driven entrepreneurial competencies and the actual learning and practice of Business Education students in South-East Nigerian Universities. It is not sufficiently clear whether Business Education students are adequately exposed to, understand and utilise these technologies in learning and entrepreneurial activities, particularly within Cooperative Economics and Management. Theoretical knowledge may be acquired by students without adequate competence in applying emerging technologies to opportunity identification, business planning, marketing, financial management, customer engagement and other entrepreneurial activities. Also, it is uncertain the extent to which AI and automation contribute to students' entrepreneurial learning and translate into actual entrepreneurial practice. Existing studies have considered entrepreneurship education, entrepreneurial competencies and the application of AI in education separately, but there is limited empirical evidence establishing whether AI and automation significantly predict entrepreneurial learning and practice among Business Education students in South-East Nigerian Universities. This will lead to universities producing graduates who possess conventional business knowledge but are insufficiently prepared for technology-driven entrepreneurial environments.

It is against this backdrop that this research seeks to provide empirical evidence on the predictive influence of artificial intelligence and automation on entrepreneurial learning and practice of Cooperative Economics and Management by Business Education students in South-East Nigerian Universities. The study will determine the extent to which AI and automation predict students' entrepreneurial learning and whether these technological factors are associated with their ability to apply entrepreneurial knowledge and competencies in practice.

Research Questions

The following research questions guided the study:

1. To what extent does artificial intelligence predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities?
2. To what extent does automation predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities?
3. To what extent does artificial intelligence predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities?
4. To what extent does automation predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities?

Research Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

1. Artificial intelligence does not significantly predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities.
2. Automation does not significantly predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities.
3. Artificial intelligence does not significantly predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities.

4. Automation does not significantly predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities.

Methodology

The correlational research design was used for the study. The area covered in the study was the South-East geopolitical zone of Nigeria. The population of the study comprises 562 third and final-year Business Education students in four federal universities in South-East Nigeria offering Business Education programmes. The population consists of 111 students from the University of Nigeria, Nsukka, comprising 65 third-year and 46 final-year students; 203 students from Nnamdi Azikiwe University, Awka, comprising 109 third-year and 94 final-year students; 130 students from Alvan Ikoku Federal University of Education, Owerri, comprising 54 third-year and 76 final-year students; and 118 students from Alex Ekwueme Federal University, Ndufu-Alike, comprising 36 third-year and 82 final-year students. The population of 562 students was obtained from the various departmental offices. The third- and final-year students are considered appropriate for the study because they have acquired sufficient exposure to Business Education courses, entrepreneurship-related knowledge and the university learning environment to provide informed responses concerning artificial intelligence, automation, entrepreneurial learning and entrepreneurial practice. Since the population of 562 students is manageable, the entire population was used for the study; therefore, a census sampling was used. A structured questionnaire was used for data collection, developed by the researcher based on the objectives and research questions of the study. The instrument was validated by three experts: two experts in Business Education and one expert in Measurement and Evaluation. The questionnaire was pilot-tested using 21 Business Education students in Enugu State University of Science and Technology (ESUT) outside the study area, and the data obtained was analysed using the Cronbach Alpha approach to determine the reliability coefficient of the instrument. A reliability coefficient of 0.78 was obtained, indicating that the instrument is reliable. The questionnaire was administered to the 562 Business Education students electronically through Google Forms. The link was distributed to the respondents through appropriate departmental communication channels, including WhatsApp groups, email and other approved online platforms, with the assistance of relevant departmental contacts. The researcher monitored the response rate and sent reminders to respondents where necessary. The data collected was analysed using mean and standard deviation to answer the research questions, while simple linear regression analysis was used to test the four null hypotheses at a 0.05 level of significance. Simple linear regression was appropriate for determining the extent to which artificial intelligence and automation predict entrepreneurial learning and entrepreneurial practice of Cooperative Economics and Management among Business Education students in South-East Nigerian Universities.

Results

Research Question One: To what extent does artificial intelligence predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in Nigerian universities?

Table 1: Mean and Standard Deviation of Artificial Intelligence as a Predictor of Entrepreneurial Learning

S/N	Artificial Intelligence and Entrepreneurial Learning	$\bar{X}$	SD	Decision
1	AI tools help me generate ideas for cooperative and entrepreneurial ventures.	3.28	0.69	High Extent
2	I use AI to search for information relevant to cooperative enterprise development.	3.35	0.65	High Extent
3	AI helps me identify potential business opportunities.	3.22	0.73	High Extent
4	I use AI applications to understand current entrepreneurial trends.	3.31	0.67	High Extent
5	AI assists me in developing solutions to business-related problems.	3.19	0.77	High Extent
6	I use AI to improve my understanding of cooperative business management.	3.26	0.71	High Extent
7	AI helps me acquire new entrepreneurial knowledge beyond classroom instruction.	3.33	0.66	High Extent
8	I use AI to explore new products and services that can be developed into businesses.	3.18	0.79	High Extent
9	AI assists me in analysing information needed for entrepreneurial decision-making.	3.15	0.81	High Extent
10	I use AI to develop and improve entrepreneurial skills.	3.24	0.72	High Extent
11	AI helps me understand customer needs and preferences.	3.12	0.84	High Extent
12	I use AI to learn how to prepare business plans and proposals.	3.08	0.86	High Extent

13	AI enables me to learn about innovative approaches to running a business.	3.29	0.70	High Extent
14	AI helps me evaluate alternative solutions to entrepreneurial challenges.	3.17	0.78	High Extent
15	AI enhances my ability to independently learn entrepreneurial concepts and practices.	3.25	0.74	High Extent
	Cluster Mean	**3.22**	**0.75**	**High Extent**

Source: Field Work (2026)

The results in Table 1 show that artificial intelligence predicts entrepreneurial learning to a high extent. The item means range from 3.08 to 3.35, while the cluster mean of 3.22 indicates a high extent. The result suggests that AI supports students' acquisition of entrepreneurial knowledge through activities such as information searching, business-idea generation, opportunity identification, problem-solving, business planning and independent learning.

Research Question Two: To what extent does automation predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in Nigerian universities?

Table 2: Mean and Standard Deviation of Automation as a Predictor of Entrepreneurial Learning

S/N	Automation and Entrepreneurial Learning	$\bar{X}$	SD	Decision
1	Automated tools help me learn how routine business activities are performed.	3.20	0.75	High Extent
2	I use automated applications to practise business-related tasks.	3.14	0.81	High Extent
3	Automation helps me understand efficient business processes.	3.27	0.70	High Extent
4	Automated systems help me learn how to manage business information.	3.22	0.73	High Extent
5	I use automation to improve my understanding of modern business operations.	3.30	0.68	High Extent
6	Automation helps me learn how technology can reduce repetitive business activities.	3.34	0.65	High Extent
7	I use automated tools to improve my entrepreneurial problem-solving skills.	3.11	0.83	High Extent
8	Automation exposes me to technology-driven methods of managing enterprises.	3.28	0.71	High Extent
9	Automated applications help me learn about digital business processes.	3.25	0.74	High Extent
10	I use automation tools to improve my productivity when learning entrepreneurial activities.	3.18	0.79	High Extent
11	Automation helps me understand how businesses can improve efficiency.	3.36	0.64	High Extent
12	Automated technologies help me develop practical entrepreneurial skills.	3.16	0.80	High Extent
13	I use automated systems to organize information for entrepreneurial learning.	3.09	0.85	High Extent
14	Automation enables me to learn how technology can support cooperative enterprises.	3.24	0.76	High Extent
15	Automated technologies enhance my understanding of technology-based entrepreneurship.	3.32	0.67	High Extent
	Cluster Mean	**3.24**	**0.74**	**High Extent**

Source: Field Work (2026)

Table 2 indicates that automation predicts entrepreneurial learning to a high extent, with a cluster mean of 3.24. This indicates that automated technologies contribute considerably to students' understanding of efficient business processes, digital business operations, productivity and technology-driven entrepreneurial activities.

Research Question Three: To what extent does artificial intelligence predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities?

Table 3: Mean and Standard Deviation of Artificial Intelligence as a Predictor of Entrepreneurial Practice

S/N	Artificial Intelligence and Entrepreneurial Practice	$\bar{X}$	SD	Decision
1	I use AI to identify practical business opportunities.	3.18	0.78	High Extent
2	I use AI-generated information when making business decisions.	3.12	0.82	High Extent
3	AI helps me develop practical business ideas.	3.25	0.73	High Extent
4	I use AI to understand customer preferences when developing business ideas.	3.10	0.85	High Extent
5	AI assists me in developing marketing strategies for business activities.	3.21	0.76	High Extent
6	I use AI to improve the presentation of business products and services.	3.29	0.70	High Extent
7	AI helps me solve practical problems encountered in entrepreneurial activities.	3.16	0.79	High Extent
8	I use AI to improve the quality of business-related communication.	3.31	0.68	High Extent
9	AI helps me analyse information before undertaking entrepreneurial activities.	3.20	0.74	High Extent
10	I use AI to identify innovative ways of performing business activities.	3.27	0.71	High Extent
11	AI supports my ability to plan entrepreneurial activities.	3.14	0.81	High Extent
12	I use AI to improve the efficiency of entrepreneurial activities.	3.23	0.75	High Extent
13	AI helps me develop solutions to customer-related problems.	3.08	0.87	High Extent
14	I use AI to explore new markets for entrepreneurial activities.	3.19	0.77	High Extent
15	AI encourages me to apply innovative approaches in practical business activities.	3.26	0.72	High Extent
	Cluster Mean	**3.20**	**0.77**	**High Extent**

Source: Field Work (2026)

The result in Table 3 indicates that artificial intelligence predicts entrepreneurial practice to a high extent, with a cluster mean of 3.20. This suggests that students perceive AI as useful in translating entrepreneurial knowledge into practice, particularly in business opportunity identification, marketing, customer analysis, planning, communication and problem-solving.

Research Question Four: To what extent does automation predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities?

Table 4: Mean and Standard Deviation of Automation as a Predictor of Entrepreneurial Practice

S/N	Automation and Entrepreneurial Practice	$\bar{X}$	SD	Decision
1	I use automated tools to perform routine entrepreneurial activities.	3.25	0.72	High Extent
2	Automation helps me complete business tasks more quickly.	3.32	0.67	High Extent
3	I use automated systems to organize business information.	3.18	0.79	High Extent
4	Automation helps me manage repetitive business activities.	3.35	0.64	High Extent
5	I use automated tools to improve business productivity.	3.29	0.69	High Extent
6	Automation assists me in managing customer-related activities.	3.11	0.83	High Extent
7	I use automated systems to support marketing activities.	3.16	0.81	High Extent
8	Automation helps reduce errors when performing routine business activities.	3.27	0.73	High Extent
9	I use automated technologies to improve business communication.	3.19	0.77	High Extent
10	Automation enables me to provide faster responses to customers.	3.14	0.82	High Extent
11	I use automation to monitor business-related activities.	3.08	0.86	High Extent
12	Automated tools help me manage time effectively during entrepreneurial activities.	3.30	0.68	High Extent
13	I use automated systems to improve the efficiency of business transactions.	3.24	0.75	High Extent
14	Automation helps me perform entrepreneurial activities with less manual effort.	3.36	0.63	High Extent
15	I use automation to improve the overall performance of entrepreneurial activities.	3.22	0.76	High Extent

Cluster Mean	**3.23**	**0.75**	**High Extent**

Source: Field Work (2026)

Table 4 shows that automation predicts entrepreneurial practice to a high extent, with a cluster mean of 3.23. The result indicates that automation is perceived as useful for improving productivity, managing repetitive tasks, reducing errors, saving time, supporting customer management and improving the efficiency of entrepreneurial activities.

Test of Hypotheses

The four null hypotheses were tested using simple linear regression analysis at the 0.05 level of significance.

Hypothesis One: Artificial intelligence does not significantly predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in Nigerian universities.

Table 5: Simple Linear Regression of Artificial Intelligence on Entrepreneurial Learning

Model Summary

Model	R	R^2	Adjusted R^2	Std. Error of Estimate	Coefficient β
1	0.681[a]	0.464	0.463	4.420	0.681

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.	Decision
Regression	9,274.68	1	9,274.68	474.94	0.034	S
Residual	10,938.32	560	19.53			
Total	20,213.00	561				

Source: Field Work (2026)

The result in Table 5 shows that artificial intelligence significantly predicts entrepreneurial learning among Business Education students. The correlation coefficient of R is 0.681 indicating a strong positive relationship between artificial intelligence and entrepreneurial learning. The coefficient of determination R^2 is 0.464 indicating that artificial intelligence explains 46.4% of the variation in entrepreneurial learning, while the remaining 53.6% is attributable to other factors outside the model.

The regression model was statistically significant, $F(1, 560) = 474.94$, $p = 0.034$. Artificial intelligence made a significant positive contribution to entrepreneurial learning ($\beta = 0.681$, $p < 0.05$). Since the significance value is less than 0.05, Hypothesis one is rejected. Therefore, artificial intelligence significantly predicts the entrepreneurial learning of Cooperative Economics and Management among Business Education students in Nigerian universities.

Hypothesis Two: Automation does not significantly predict the entrepreneurial learning of Cooperative Economics and Management among Business Education students in Nigerian universities.

Table 6: Simple Linear Regression of Automation on Entrepreneurial Learning

Model Summary

Model	R	R^2	Adjusted R^2	Std. Error of Estimate	Coefficient β
1	0.624[a]	.389	0.388	4.716	0.624

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.	Decision
Regression	7,868.10	1	7,868.10	353.99	<0.001	S
Residual	12,344.90	560	22.04			
Total	20,213.00	561				

Source: Field Work (2026)

Table 6 indicates that automation significantly predicts entrepreneurial learning among Business Education students. The correlation coefficient of R = 0.624 indicates a positive relationship between automation and entrepreneurial learning. The R^2 value of 0.389 shows that automation explains 38.9% of the variation in entrepreneurial learning.

The regression model was statistically significant, $F(1, 560) = 353.99$, $p < 0.001$. Automation made a significant positive contribution to entrepreneurial learning ($\beta = 0.624$, $p < 0.001$). Since the significance value is less than 0.05, Hypothesis two is rejected. Therefore, automation significantly predicts the

entrepreneurial learning of Cooperative Economics and Management among Business Education students in Nigerian universities.

Hypothesis Three: Artificial intelligence does not significantly predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities.

Table 7: Simple Linear Regression of Artificial Intelligence on Entrepreneurial Practice

Model Summary

Model	R	R^2	Adjusted R^2	Std. Error of Estimate	Coefficient β
1	0.647	0.419	0.418	4.105	0.647

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.	Decision
Regression	8,436.48	1	8,436.48	402.87	<.001	S
Residual	10,095.52	560	18.03			
Total	18,532.00	561				

Source: Field Work (2026)

Table 7 shows that artificial intelligence significantly predicts entrepreneurial practice among Business Education students. The R value of 0.647 indicates a strong positive relationship between artificial intelligence and entrepreneurial practice. The R^2 value of 0.419 indicates that artificial intelligence explains 41.9% of the variation in entrepreneurial practice.

The regression model was statistically significant, $F(1, 560) = 402.87$, $p < 0.001$. Artificial intelligence significantly and positively predicted entrepreneurial practice ($\beta = 0.647$, $p < .001$). Since the significance value is less than 0.05, Hypothesis three is rejected. Therefore, artificial intelligence significantly predicts the entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities.

Hypothesis Four: Automation does not significantly predict the entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities.

Table 8: Simple Linear Regression of Automation on Entrepreneurial Practice

Model Summary

Model	R	R^2	Adjusted R^2	Std. Error of Estimate	Coefficient β
1	0.716	0.513	0.512	3.747	0.716

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.	Decision
Regression	9,500.00	1	9,500.00	586.71	<.001	S
Residual	9,032.00	560	16.13			
Total	18,532.00	561				

Source: Field Work (2026)

Table 8 indicates that automation significantly predicts entrepreneurial practice among Business Education students. The R value of 0.716 indicates a strong positive relationship between automation and entrepreneurial practice. The R^2 value of 0.513 indicates that automation explains 51.3% of the variation in entrepreneurial practice.

The regression model was statistically significant, $F(1, 560) = 586.71$, $p < .001$. Automation significantly and positively predicted entrepreneurial practice ($\beta = .716$, $p < .001$). Since the significance value is less than 0.05, Hypothesis four is rejected. Therefore, automation significantly predicts the entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities.

Discussion of Findings

The first finding revealed that artificial intelligence significantly predicts the entrepreneurial learning of Cooperative Economics and Management among Business Education students. The descriptive result showed a high extent of AI influence, with a cluster mean of 3.22, while the regression analysis indicated a strong positive relationship ($R = 0.681$) and that AI explained 46.4% of the variation in entrepreneurial learning. The finding implies that students who engage more with AI for information searching, idea generation, opportunity identification, problem-solving, business planning and independent learning are likely to demonstrate stronger entrepreneurial learning. This finding agrees with Bell and Bell (2023), who

noted that generative AI is capable of changing how entrepreneurial knowledge is acquired and how students identify emerging business opportunities. It is also consistent with Alam, Singh and Gupta (2024), who found that AI-supported learning activities can contribute to the development of students' entrepreneurial competencies when integrated with appropriate learning approaches. Similarly, Vecchiarini and Somia (2023) argued that entrepreneurship education needs to be redefined in response to artificial intelligence and the changing technological environment. The present finding therefore provides empirical support for the view that AI can serve not merely as an information-access tool but also as a facilitator of entrepreneurial learning among Business Education students. However, the fact that AI accounted for 46.4% of the variation also suggests that entrepreneurial learning is influenced by other factors beyond AI.

The second finding showed that automation significantly predicts entrepreneurial learning among Business Education students. The descriptive result produced a cluster mean of 3.24, indicating a high extent, while the regression analysis produced $R = 0.624$ and $R^2 = 0.389$. Thus, automation explained 38.9% of the variation in entrepreneurial learning. The result indicates that exposure to automated systems can help students understand routine business processes, improve productivity, manage business information and appreciate how technology can improve efficiency. This finding is consistent with the OECD (2024), which explains that AI and related technologies can automate tasks, enhance human capabilities and transform the organisation and distribution of work. It also agrees with Filippucci, Gal, Jona-Lasinio, Leandro and Nicoletti (2024), whose work highlighted the relationship between AI, productivity and changes in business activities. In the context of Business Education, the finding suggests that learning about automation can move students beyond theoretical understanding of business operations toward appreciation of technology-supported processes. The result also supports the position of Ore and Hassan (2023) that Business Education curriculum content should contribute to entrepreneurial skills development. Nevertheless, the R^2 of 38.9% indicates that automation, although important, is not the sole determinant of entrepreneurial learning.

The third finding established that artificial intelligence significantly predicts entrepreneurial practice among Business Education students. The result showed a cluster mean of 3.20, while the regression analysis produced $R = 0.647$ and $R^2 = 0.419$, indicating that AI accounted for 41.9% of the variation in entrepreneurial practice. The finding suggests that students are able to apply AI in practical entrepreneurial activities such as identifying opportunities, developing business ideas, analysing customers, preparing marketing strategies, improving communication, solving business problems and planning entrepreneurial activities. This agrees strongly with Alam, Singh and Gupta (2024), who reported that AI technologies can influence entrepreneurial competencies when they are incorporated into appropriate learning activities, including the use of ChatGPT in developing business model canvases. The finding is also consistent with OECD (2025), which identified the potential of generative AI to automate tasks, support creativity and innovation, accelerate research and development and reduce some barriers to business entry. Furthermore, Bell and Bell (2023) argued that entrepreneurship education in the era of generative AI should prepare learners to exploit emerging technological possibilities. The present finding therefore demonstrates that AI is relevant not only to what students learn about entrepreneurship but also to how they apply entrepreneurial knowledge and competencies in practice.

The fourth finding revealed that automation significantly predicts entrepreneurial practice, with the strongest predictive relationship among the four relationships examined. The descriptive result had a cluster mean of 3.23, while the regression analysis yielded $R = 0.716$ and $R^2 = 0.513$. This means that automation explained 51.3% of the variation in entrepreneurial practice. The finding indicates that automation is particularly relevant to practical entrepreneurial activities because it can enable students to perform routine tasks more quickly, reduce errors, manage repetitive activities, improve productivity, manage time and increase the efficiency of business transactions. This result is in line with the OECD (2024), which observed that technological systems can transform business activities, task distribution and work organisation. It also supports OECD (2025), which identified productivity, innovation and entrepreneurship as areas in which generative AI and related technologies can have significant effects. The finding is further consistent with Amahi, Otomiewo and Egeonu (2025) and Eigege (2025), who examined the application of AI and related technologies within Business Education and entrepreneurship practice and highlighted their potential opportunities alongside implementation challenges. The relatively high R^2 of 51.3% suggests that automation may have particular practical value because entrepreneurial practice involves the performance of actual business activities where efficiency, speed, accuracy and reduction of repetitive work are important.

Overall, the four findings consistently demonstrate that both artificial intelligence and automation are significant positive predictors of entrepreneurial learning and entrepreneurial practice among Business Education students. AI showed a stronger predictive relationship with entrepreneurial learning (R = 0.681) than automation (R = 0.624), whereas automation showed a stronger relationship with entrepreneurial practice (R = 0.716) than AI (R = 0.647). This pattern is meaningful because AI is particularly associated with activities involving knowledge acquisition, information analysis, idea generation and decision support, whereas automation is more directly connected with the efficient performance of routine and operational business activities. The findings therefore support the broader literature in the study which presents emerging technologies as important components of contemporary entrepreneurship education. At the same time, the unexplained proportions of variance indicate that AI and automation should not be viewed as the only determinants of entrepreneurial learning and practice. Factors such as curriculum content, teaching approaches, access to technology, students' digital competence, institutional support and entrepreneurial learning experiences may also contribute. This interpretation is consistent with Tarelate (2024), who observed that entrepreneurship education can contribute to entrepreneurial competencies, but that outcomes depend considerably on the nature and quality of learning experiences provided.

Conclusion

Based on the findings, the study concludes that artificial intelligence and automation are significant positive predictors of entrepreneurial learning and entrepreneurial practice of Cooperative Economics and Management among Business Education students in Nigerian universities. Artificial intelligence contributes substantially to students' acquisition of entrepreneurial knowledge, opportunity identification, idea generation, problem-solving, business planning and independent learning. Automation, on the other hand, enhances students' understanding of efficient business processes and technology-driven operations. Both technologies also contribute to the practical application of entrepreneurial competencies, with automation demonstrating the strongest predictive relationship with entrepreneurial practice. The findings consequently indicate that integrating AI and automation into Business Education can strengthen students' preparation for technology-driven entrepreneurial environments. However, since substantial proportions of the variations in entrepreneurial learning and practice remain unexplained, technology integration should be complemented by appropriate curriculum content, practical learning experiences, competent lecturers and adequate institutional support.

Recommendations

Based on the findings, the following recommendations emerged:

1. Business Education programmes should integrate artificial intelligence into entrepreneurship and Cooperative Economics and Management courses through practical activities involving AI-assisted research, business-idea generation, market analysis, business planning and problem-solving.
2. Universities should provide students with practical exposure to automation technologies by incorporating simulations, automated business applications and technology-supported projects into entrepreneurial learning.
3. Business Education lecturers should receive regular training and professional development on AI and automation.
4. Universities should strengthen access to digital infrastructure and relevant technology resources.
5. Entrepreneurship education should combine AI and automation with experiential learning.

ENTREPRENEURIAL PEDAGOGY AND SKILL DEVELOPMENT AMONG BUSINESS EDUCATION GRADUATES IN RIVERS STATE-OWNED UNIVERSITIES

Onyije, Onengiye Danagogo (MABEN) and Alfred, Rita Chika
School of Secondary Education (Business) Departments of Entrepreneurship Education
Federal College of Education (Tech.), Omoku – Rivers State, Nigeria onengiyeonyije@fcetomoku.edu.ng

Abstract

This study investigated the relationships between entrepreneurial pedagogy and skill development among Business Education graduates in universities in Rivers State, Nigeria. The study was guided by three research questions and null hypotheses tested at 0.05 level of significance. The population consisted 144 postgraduate students enrolled in Business Education programmes in Rivers State-owned universities, Nigeria, namely Ignatius Ajuru University of Education (86 students) and Rivers State University (58 students). A correlational research design was used for the study. A census sampling procedure was employed, and data were collected from 138 respondents who correctly completed and returned the questionnaires, representing a 95.8% response rate. Two structured instruments developed by the researcher, titled "Entrepreneurial Pedagogy Questionnaire" (EPQ) and "Entrepreneurial Skill Development Questionnaire" (ESDQ) were used to collect data. The instruments were validated by three experts. The reliability yielded coefficients of 0.86 and 0.89 using Pearson Product Moment Correlation Coefficient. Data collected were analyzed using Pearson Product Moment Correlation Coefficient to answer the research questions and test the null hypotheses at 0.05 level of significance. The findings revealed that: there was a strong positive relationship between the use of experiential learning and problem-based learning methods and entrepreneurial skill development among Business Education graduates. The null hypotheses were not significant, indicating statistically significant relationships between pedagogical dimensions and entrepreneurial skill development. The study concluded that the pedagogical approaches institutionalized in Business Education programmes significantly influence how graduates develop entrepreneurial skills. It was recommended that Business Education curriculum planners and lecturers in Rivers State-owned universities should intentionally integrate experiential learning methods including business simulations, enterprise creation projects, to ensure that students encounter progressively complex experiential learning opportunities throughout their academic programmes, enabling them to develop practical business capabilities.

Keywords: Entrepreneurial Pedagogy, Skill Development, and Business Education

Introduction

Entrepreneurial pedagogy has arisen as an important area in the contemporary educational setting, fundamentally reshaping how entrepreneurial competencies are cultivated, nurtured, and assessed within higher education contexts (Hägg & Gabrielsson, 2020; Neck & Corbett, 2018). In the 21st-century knowledge economy, where graduate unemployment remains a persistent challenge and traditional employment structures are increasingly uncertain, higher education institutions face growing pressure to having graduates who are not only interested in entering the job market but also capable of creating employment opportunities for themselves and others. This paradigm shift has intensified the responsibility of universities offering Business Education programmes to realign pedagogical approaches with the demands of entrepreneurial skill development (Boldureanu et al., 2020).

As professionally oriented discipline, Business Education programme is positioned to equip learners with real-world knowledge, managerial competencies, and vocational skills for effective performance in business and organizational settings. Central to this mandate is the integration of entrepreneurial pedagogy, which encompasses the teaching methods, learning experiences, and instructional strategies specifically designed to furnish entrepreneurial mindsets, behaviours, and competences required by students for entrepreneurial success (Fayolle & Gailly, 2015; Lackéus, 2020). Contemporary entrepreneurial pedagogy extends beyond traditional lecture-based instruction to include experiential learning approaches such as business simulation, project- based learning, case study analysis, mentorship

programmes, and real-world enterprise creation activities that mirror the complexities of actual business environments (Neck & Greene, 2021; Piperopoulos & Dimov, 2015). Consequently, the relevance of Business Education graduates is increasingly evaluated based on how effectively these pedagogical approaches develop demonstrable entrepreneurial skills.

Within the Nigerian context, the imperative for entrepreneurial pedagogy is reinforced by national policy frameworks. The National Universities Commission (NUC) mandates the inclusion of entrepreneurship education across all academic disciplines, while the Nigerian educational policy emphasizes the development of skills that promote self-reliance and economic independence (Federal Republic of Nigeria, 2013). For Business Education departments, these policies translate into a mandate to institutionalize entrepreneurial pedagogy as a core component of curriculum delivery (Okolie et al., 2022). However, empirical research reports challenges such as inadequate pedagogical training among facilitators, limited use of experiential teaching methods, insufficient institutional support for entrepreneurship initiatives, and poor linkage between classroom instruction and practical enterprise development (Ojeifo, 2020; Igwe et al., 2020).

While structural and institutional barriers constrain effective entrepreneurship education, an exclusive focus on these factors provides an incomplete understanding of how pedagogical approaches influence graduate skill outcomes. The effectiveness of entrepreneurial education depends fundamentally on the pedagogical strategies employed throughout students' academic programmes (Hahn et al., 2020; Morris et al., 2021). Within the academic environment, the pedagogical approaches institutionalized in Business Education programmes occupy a pivotal position in determining how effectively entrepreneurial pedagogy translates into graduate skill development. The teaching methods, learning experiences, and instructional strategies embedded in the curriculum shape students' entrepreneurial capabilities and ultimately determine the skill levels of graduates (Fayolle, 2018; Warhuus et al., 2021). The pedagogical choices institutionalized in programmes strongly influence whether graduates develop the entrepreneurial competencies required for business creation and management (Mwasalwiba, 2020; Nabi et al., 2018). Thus, the success of entrepreneurial skill development among Business Education graduates is closely linked to the entrepreneurial pedagogy adopted in their training.

Entrepreneurial pedagogy is a multidimensional construct comprising interrelated teaching approaches. The first dimension is experiential learning methods, referring to instructional strategies that engage students in direct experience with business concepts, followed by reflection and application. This includes business simulations, enterprise creation projects, internship programmes, and live case studies that enable students to learn by doing (Hägg & Kurczewska, 2020; Pittaway & Cope, 2019). When experiential methods are consistently employed throughout programmes, graduates develop practical business skills, risk management capabilities, and the ability to navigate real-world business challenges (Bell & Bell, 2020; Williams-Middleton & Donnellon, 2020). Experiential learning creates opportunities for students to apply theory in real- world, directly promoting entrepreneurial skill development among graduates.

The second dimension is problem-based learning, encompassing instructional approaches where students learn through sustained investigation of authentic, complex problems or through the completion of meaningful projects. This involves designing business solutions, developing business plans, conducting market research, and creating viable enterprise proposals (Hmelo-Silver, 2020; Wurdinger & Rudolph, 2021). Programmes that effectively implement practical methods enable learners develop critical thinking, creativity, opportunity recognition, and resource mobilization skills that are fundamental to entrepreneurial success (Balakrishnan, 2022; Su & Cheng, 2019). Practical learning significantly enhances students' entrepreneurial intentions and self- efficacy, which translate into graduate competencies.

There is a paucity of studies examining how experiential learning methods and problem-based learning approaches relate to entrepreneurial skill development among Business Education graduates. This gap is what this study addresses by empirically investigating these relationships in Rivers State-owned universities, Nigeria.

Statement of the Problem

Experiential learning methods and problem-based learning approaches are critical components of entrepreneurial pedagogy that enable the advancement of entrepreneurship skills among Business Education graduates. When effectively implemented, these three pedagogical dimensions enable graduates to possess the creativity, opportunity recognition capabilities, risk management skills, and

business creation competencies required for successful entrepreneurial careers. However, it has been observed that these components of entrepreneurial pedagogy are not significantly associated with the advancement of entrepreneurship skills among Business Education graduates from universities in Rivers State. Hence, this disconnection between pedagogical approaches and graduate skill outcomes raises concerns about the capacity of Business Education graduates to function as successful entrepreneurs and contribute to economic development.

Regrettably, it is also observed that empirical evidence examining the relationship between these two pedagogical variables and the development of entrepreneurial skills among Business Education graduates from Rivers State universities is lacking. Without such evidence, efforts to enhance entrepreneurial pedagogy in Business Education cannot be strategically targeted, and interventions to improve graduate skill development may continue to yield suboptimal results. This study therefore aims to fill this gap by investigating the relationships between the use of experiential learning methods, problem-based learning approaches and entrepreneurial skill development among Business Education graduates in universities in Rivers State.

Research Questions

1. What is the relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in universities in Rivers State?
2. What is the relationship between the use of problem-based and project- based learning approaches and entrepreneurial skill development among Business Education graduates in universities in Rivers State?

Hypotheses

The following null hypotheses were formulated and tested at a 0.05 level of significance:

1. There is no significant relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in Rivers State-owned universities.
2. There is no significant relationship between the use of problem-based learning approaches and entrepreneurial skill development among Business Education graduates in Rivers State-owned universities.

Methods

This study used a correlational research design to examine the relationship between entrepreneurial pedagogy and skill development among Business Education graduates in universities in Rivers State-owned universities, Nigeria. This design was considered suitable because it enabled the researcher to ascertain the degree and direction of relationship in the variables.

The population of the study was made up of 144 postgraduate students who had enrolled in Business Education programme across in Rivers State Rivers State- owned universities. These institutions included Ignatius Ajuru University of Education and Rivers State University. The population was made up of of 86 postgraduate students from Ignatius Ajuru University of Education, comprising 59 Master's students and 27 PhD students, and 58 postgraduate students from Rivers State University, comprising 44 Master's students and 14 PhD candidates, who were admitted during the 2024/2025 academic session. A census sampling procedure was employed for this study, as the entire population postgraduate students was both manageable and sizable. A total of 144 questionnaires were administered, 138 were correctly completed and retrieved, representing a 95.8% response rate, while six questionnaires were not returned within the data collection period and were therefore excluded from the analysis.

Data for the study were collected using two structured questionnaires developed by the researcher. The first instrument, titled "Entrepreneurial Pedagogy Questionnaire" (EPQ), was designed to measure the independent variables of the study based on postgraduate students' assessment of the pedagogical approaches employed during their programme. The second instrument, titled "Entrepreneurial Skill Development Questionnaire" (ESDQ), was designed to measure the dependent variable based on postgraduate students' self- assessment of their current entrepreneurial competencies. Both instruments were structured on a 4-point scale of agreement: Strongly Agree (SA) = 4, Agree (A) = 3, Disagree (D) = 2, and Strongly Disagree (SD) = 1. The instruments were subjected to face and content validation by three experts, comprising two from Business Education with expertise in entrepreneurship education and curriculum studies and one specialist in Measurement and Evaluation, all from University of

Benin. Their suggestions were incorporated to improve the clarity, and alignment of the instruments with the study variables.

The reliability of the instruments was determined through a pilot study involving 20 postgraduate Business Education students from University of Benin, who were not part of the main study. Data obtained from the pilot test were analyzed using Pearson Product Moment Correlation Coefficient, yielding reliability coefficients of 0.86 and 0.89 for the Entrepreneurial Pedagogy Questionnaire (EPQ) and Entrepreneurial Skill Development Questionnaire (ESDQ) respectively, indicating high internal consistency.

Data collected were analyzed using Pearson Product Moment Correlation Coefficient to answer the research questions and test the null hypotheses at the 0.05 level of significance. For research questions, the strength of relationships was interpreted using the guideline provided by Bryman and Bell (2011) as follows: r = 0.80 – 1.00 (very strong), r = 0.60 – 0.79 (strong), r = 0.40 – 0.59 (moderate), r = 0.20 – 0.39 (weak), and r = 0.00 – 0.19 (very weak). The decision rule for hypotheses testing was that any calculated probability (p-value) less than or equal to 0.05 led to the rejection of the null hypothesis, while any p-value greater than 0.05 resulted in the retention of the null hypothesis. All statistical analyses were performed using the Statistical Package for the Social Sciences (SPSS), version 26.

Results

The following research questions guided the study:

Research Question 1: What is the relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in universities in Rivers State?

Table 1: Pearson Product Moment Correlation on the Relationship between Use of Experiential Learning Methods and Entrepreneurial Skill Development

Variables	Use of Experiential Learning Method	Entrepreneurship Skills Development
Use of Experiential Learning Method	Pearson Correlation	1
	Sig. (2-tailed)	–
	N	138
Entrepreneurship Skills Development	Pearson Correlation	0.683*
	Sig. (2-tailed)	0.002
	N	138

Correlation is significant at the 0.05 level (2-tailed)

Table 1 shows a Pearson Product Moment Correlation coefficient of r = 0.683 with a p-value of 0.002. This reveals that there is a strong positive relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in universities in Rivers State.

This suggests the use of experiential learning methods is associated with entrepreneurial skill development among Business Education graduates.

Research Question 2: What is the relationship between the use of problem- based method and entrepreneurial skill development among Business Education graduates in universities in Rivers State?

Table 2: Pearson Product Moment Correlation on the Relationship between Use of Problem-based Learning Method and Entrepreneurial Skill Development

Variables	Use of Problem- based Method	Entrepreneurship Skills Development
Use of Problem-based Learning Method	Pearson Correlation	1
	Sig. (2-tailed)	–
	N	138
Entrepreneurship Skills Development	Pearson Correlation	0.657*
	Sig. (2-tailed)	0.003
	N	138

Correlation is significant at the 0.05 level (2-tailed)

Table 2 shows a Pearson Product Moment Correlation coefficient of r = 0.657 with a p-value of 0.003. This shows a strong positive relationship between the use of problem-based method and entrepreneurial skill development among Business Education graduates in universities in Rivers State. This suggests theuse of problem-based methods is associated with entrepreneurial skill development among Business Education graduates.

Hypotheses Testing

Hypothesis 1: There is no significant relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in universities in Rivers State.

Table 4: Pearson Product Moment Correlation on the Relationship between Use of Experiential Learning Methods and Entrepreneurial Skill Development among Business Education Graduates in Universities in Rivers State

Variables	Use of Experiential Learning Method		Entrepreneurship Skills Development
Use of Experiential Learning Method	Pearson Correlation	1	
	Sig. (2-tailed)	–	
N	138		
Entrepreneurship Skills Development	Pearson Correlation	0.683*	
Sig. (2-tailed)	0.002		
N	138		

Correlation is significant at the 0.05 level (2-tailed)

Table 4 revealed the Pearson Product Moment Correlation coefficient between the use of experiential learning methods and entrepreneurial skill development is r = 0.683 with a p-value of 0.002. Since the p-value (0.002) is less than the 0.05 significance level, the null hypothesis is rejected. This shows that there is a statistically significant strong positive relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in universities in Rivers State.

Hypothesis 2: There is no significant relationship between the use of problem- based learning approaches and entrepreneurial skill development among Business Education graduates in universities in Rivers State.

Table 5: Pearson Product Moment Correlation on the Relationship between Use of Problem-based Learning Method and Entrepreneurial Skill Development among Business Education Graduates in Universities in Rivers State

Variables	Use of Problem-based Method	Entrepreneurship Skills Development
Use of Problem-based Learning Method	Pearson Correlation	1
	Sig. (2-tailed)	–
	N	138
Entrepreneurship Skills Development	Pearson Correlation	0.657*
	Sig. (2-tailed)	0.003
	N	138

Correlation is significant at the 0.05 level (2-tailed)

Table 5 revealed the Pearson Product Moment Correlation coefficient between the use of problem-based learning method and entrepreneurial skill development is r = 0.657 with a p-value of 0.003. Since the p-value (0.003) is less than the
0.05 significance level, the null hypothesis is rejected. This indicates that there is a statistically significant strong positive relationship between the use of problem- based learning method and entrepreneurial skill development among Business Education graduates in universities in Rivers State.

Discussion of Findings

The finding revealed a strong positive relationship between variables, indicating that graduates who experienced higher levels of experiential learning methods during their academic programmes demonstrated greater entrepreneurial skill development. This finding aligns with contemporary literature emphasizing the foundational part of experimental learning in fostering entrepreneurial competences. Hägg and Kurczewska (2020) posited that experiential learning methods create authentic learning contexts where students encounter the complexities and uncertainties inherent in entrepreneurial practice. When students engage directly with business concepts through hands-on activities, they develop procedural knowledge and practical wisdom that cannot be acquired through passive instructional approaches alone.

The study further revealed a statistically significant relationship, leading to the rejection of the null hypothesis which stated that there is no significant relationship between the use of experiential learning methods and entrepreneurial skill development among Business Education graduates in Rivers State-owned universities. This finding agrees with the positions of Hägg and Kurczewska (2020), Bell and Bell (2020), all of whom emphasized that experiential engagement is fundamental to entrepreneurial capability formation. The consistency between the empirical findings of the current study and the assertions of these scholars confirms that experiential learning methods are not merely supplementary teaching techniques but essential pedagogical approaches that shape graduates' entrepreneurial capabilities. The rejection of the null hypothesis provides statistical evidence that this relationship holds within the specific context of universities in Rivers State, reinforcing the universal applicability of experiential learning principles across different educational settings.

The study further investigated the relationship between the use of problem-based learning method and entrepreneurial skill development among Business Education graduates in Rivers State-owned universities. The finding revealed a strong positive relationship, indicating that graduates who experienced higher levels of problem-based learning method demonstrated greater entrepreneurial skill development. This finding resonates strongly with theoretical and empirical literature positioning problem-based learning as a critical pedagogical approach for developing entrepreneurial capabilities. Hmelo-Silver (2020) conceptualized problem-based learning as an instructional approach that develops students' abilities to identify problems, generate hypotheses, gather and analyze information, and formulate solutions processes that mirror the entrepreneurial journey from opportunity recognition to venture creation. Balakrishnan (2022) reported that problem-based learning significantly enhanced

students' entrepreneurial intentions and opportunity recognition capabilities, emphasizing that when students are challenged to develop business plans and conduct market research, they develop process skills fundamental to entrepreneurial competence. Wurdinger and Rudolph (2021) asserted that problem-based learning develops self-directed learning capabilities essential for entrepreneurial success, particularly in contexts where formal structures are absent.

The study also revealed that significant relationship between the use of problem- based learning approaches and entrepreneurial skill development among Business Education graduates in universities in Rivers State. The alignment between the current study's findings and the established literature confirms that problem-based learning approaches cultivate the analytical thinking, creativity, and self-direction that graduates require for entrepreneurial success. The rejection of the null hypothesis provides empirical validation that investments in problem-based pedagogies yield meaningful improvements in graduate entrepreneurial outcomes within the Nigerian university context.

Conclusion

This study examined the relationships between entrepreneurial pedagogy, specifically experiential learning methods and problem-based learning approaches and entrepreneurial skill development among Business Education graduates in universities in Rivers State, Nigeria. The findings revealed statistically significant strong positive relationships between the variables, leading to the rejection of all null hypotheses. The study concludes that the pedagogical approaches institutionalized in Business Education programmes significantly influence the extent to which graduates develop entrepreneurial skills.

Recommendations

Based on the findings of this study, the following recommendations are made:

1. Business Education curriculum planners and lecturers in universities in Rivers State should deliberately integrate experiential learning methods such as business simulations, enterprise creation projects, to ensure that students encounter progressively complex experiential learning opportunities throughout their academic programmes, enabling them to develop practical business capabilities.
2. University administrators and faculty development units should organize regular capacity-building workshops and training programmes that equip lecturers with the skills to design and facilitate problem-based learning experiences that mirror real-world entrepreneurial challenges, thereby enhancing students' opportunity recognition and creative problem-solving abilities.

Abstract

Artificial intelligence (AI) offers entrepreneurs new opportunities for learning, productivity, and venture growth, yet its use for entrepreneurial learning in resource-constrained regions remains poorly understood. This study examined AI awareness, barriers to AI-enabled entrepreneurial learning, and AI-related competency needs among entrepreneurs in North Central Nigeria using an explanatory sequential mixed-methods design. In the quantitative phase, 433 entrepreneurs drawn from the six states and the Federal Capital Territory through multistage sampling received a validated questionnaire (overall Cronbach's α = .89), of which 412 were usable; data were analysed using means and standard deviations. In the qualitative phase, 12 purposively selected entrepreneurs were interviewed and the data were analysed thematically. Entrepreneurs had a high but shallow level of AI awareness (*M* = 2.59, *SD* = 0.62): awareness of general-purpose tools was high, whereas awareness of sector-specific applications, local training opportunities, and output verification was low. Fourteen of 15 barriers were endorsed (*M* = 3.04, *SD* = 0.57), led by the cost of internet data, unstable electricity, and the shortage of AI trainers and mentors. Competency needs were high across all six clusters (*M* = 3.23, *SD* = 0.49), particularly AI-digital fluency and financial competencies. Four themes emerged: surface familiarity, shallow application; infrastructure, cost, and trust frictions; from tool use to venture capability; and learning through people, practice, and places. Integration showed that broad but shallow awareness, compounded by systemic barriers, limits the conversion of AI exposure into entrepreneurial capability. The study recommends sector-specific awareness-to-application programmes, shared AI-enabled business centres, stackable micro-credentials linked to mentorship and funding readiness, and inclusive, locally delivered training.

Keywords: artificial intelligence, AI literacy, entrepreneurial learning, competency needs, mixed methods, North Central Nigeria

Introduction

Artificial intelligence (AI) is reshaping how enterprises are created, managed, and scaled, and how entrepreneurial knowledge is acquired. Widely used generative AI tools now run on a basic smartphone with a data connection, so that the principal barrier to productive use is increasingly knowledge rather than access to sophisticated hardware (*The Nigerian Workers Who Use AI*, 2026). Nigeria's workforce has embraced these tools rapidly: on the 2026 Ataraxis Global Outsourcing AI Readiness Index, Nigeria ranked sixth globally for workforce AI literacy, yet the 32-point gap between workforce literacy and enterprise adoption was the widest among the countries assessed (*Nigeria Ranks Third*, 2026). For northern Nigeria in particular, commentators warn that the region must not become a passive consumer of technologies developed elsewhere and call for AI literacy to be integrated across all levels of education and closer university–industry collaboration (*Preparing the North for AI Economy*, 2026). Whether entrepreneurs in North Central Nigeria, comprising the Federal Capital Territory (FCT) and Benue, Kogi, Kwara, Nasarawa, Niger, and Plateau States, are aware of AI, can overcome the barriers to using it, and possess the competencies to convert it into entrepreneurial learning remains insufficiently understood.

Continental evidence underscores the importance of structured capacity building. In a mixed-methods study spanning 30 African countries, Anderson (2025) found that education, training, and

mentoring jointly explained 68% of the variance in competent AI leadership expertise (R^2 = .68), with training having the strongest effect (β = .41), followed by education (β = .32) and mentoring (β = .28; all *p*s < .001). Participants reported that short, intensive programmes yielded immediately applicable benefits for people already in the workforce. Within North Central Nigeria, the National Open University of Nigeria's North Central Incubation Centre, domiciled at the Abuja Model Study Centre, coordinates entrepreneurship support across study centres in Minna, Ilorin, Lokoja, Jos, Makurdi, Lafia, Otukpo, and other locations (National Open University of Nigeria [NOUN], n.d.), providing an organised, if uneven, regional framework for entrepreneurship development.

Since a 2004 national policy mandated entrepreneurship education in university curricula, successive interventions have sought to improve graduates' entrepreneurial outcomes, although little is known about how the policy operates across Nigeria's vast and culturally diverse contexts (Oyinlola et al., 2024). Entrepreneurship education is expected to foster creativity, risk-taking, and innovation and to improve the performance of small and medium enterprises (SMEs) through stronger business, managerial, and financial capabilities (Ayatse, 2024). Digital and AI policy has evolved alongside these efforts. The National Information Technology Development Agency (NITDA) and the Federal Ministry of Education have partnered to embed digital literacy across all levels of education, with targets of 70% national digital literacy by 2027 and 95% by 2030 (*NITDA and Education Ministry*, 2024). The 3 Million Technical Talent (3MTT) programme targets in-demand skills such as software development, machine learning, and data analysis (Tijani, 2024), and the National AI Strategy launched in 2024 set a short-term goal of training 100,000 professionals in AI skills (*The Nigerian Workers Who Use AI*, 2026). Private-sector initiatives complement these efforts; for example, Microsoft's AI National Skills Initiative, implemented with the Federal Government, Data Science Nigeria, and Lagos Business School, reported reaching more than 350,000 Nigerians with AI skills (Microsoft, 2025).

AI awareness in Nigeria has spread rapidly through smartphones and everyday digital platforms rather than through formal training alone (*The Nigerian Workers Who Use AI*, 2026). AI literacy, in turn, is linked to entrepreneurial outcomes: in a study of 506 business students, Virojrut et al. (2026) found that AI literacy influenced entrepreneurial readiness directly and indirectly through creative thinking capability and learning achievement. Although that evidence comes from Thailand, it provides a theoretically grounded expectation for Nigerian entrepreneurs.

Several interrelated barriers constrain AI-enabled learning. Research involving 144 Nigerian SMEs found that inadequate infrastructure, low digital literacy, skills shortages, and regulatory gaps collectively prevent meaningful engagement with AI, while the lack of stable electricity is estimated to cost the economy about $26.2 billion annually (*AI for Nigerian SMEs*, 2026). Device affordability is a further constraint: across sub-Saharan Africa, the poorest 20% of the population spend an average of 76% of monthly income on an entry-level smartphone (*Beyond Coverage*, 2026). In higher education, barriers to AI adoption include weak institutional strategy, low organisational maturity, poor data governance, and inadequate information technology infrastructure (Kayode & Odumabo, 2024). Evidence from six Nigerian states, including Kwara, identified poor connectivity, unreliable electricity, low socioeconomic status, and the absence of coherent ICT strategies as primary drivers of digital gaps in remote communities (Olanrewaju et al., 2021). Anderson (2025) adds that infrastructure deficits are most acute in under-resourced subregions, that skilled AI instructors and mentors are scarce, that ethical concerns about data privacy, bias, and accountability remain unresolved, and that women are frequently marginalised in AI programmes.

Entrepreneurs' competency needs span several domains. In a survey of 397 SME owners in the manufacturing sector of North Central Nigeria, Ayatse (2024) found that technical and managerial skills training enhanced leadership and strategic planning, but that gaps persisted in digital proficiency and financial documentation; although 68% of respondents engaged in innovation, 40% struggled with product development, and networking was characterised by strong collaboration but weak information sharing. AI literacy should therefore be developed as part of an integrated set of technical, managerial, innovative, networking, and financial competencies, with explicit attention to ethical awareness, critical evaluation of information, and project-based application (Virojrut et al., 2026).

Several pathways operate in the region. The Development Bank of Nigeria's Entrepreneurship Training Programme, now in its eighth cohort, offers free training through an online platform complemented by mentorship, networking, and performance-based rewards (*Call for Applications*, 2026). The Nigerian Content Development and Monitoring Board (NCDMB) trained 60 youths from the North Central and South-West zones in digital skills; in the North Central zone, Pyrich Limited facilitated classroom and hands-on training in customer relationship management, project management,

workplace communication tools, and AI applications, while FOZY Global Concepts delivered modules in cloud computing, machine learning, knowledge management, and geographic information systems, followed by on-the-job training at the Digital Bridge Institute (Sunday, 2026). Critics nonetheless note that many programmes emphasise awareness rather than execution and that graduates often lack mentors, funding readiness, and access to tools and ecosystems; they propose ecosystem models that combine AI tools, cloud credits, technical mentors, business advisory support, and multi-year funding (Azuonwu, 2026).

The study is anchored in human capital theory, which holds that investment in education and training increases individuals' productive capabilities and economic returns (Becker, 1993). Recent work conceptualises AI literacy as digital human capital that contributes to entrepreneurial readiness through creative thinking and learning achievement (Virojrut et al., 2026). From this perspective, AI awareness is an initial stock of digital human capital, competency needs represent the gap between existing and required capital, and barriers such as cost, infrastructure, and limited mentorship constrain both its accumulation and the returns entrepreneurs derive from it.

Statement of the Problem

Entrepreneurs in North Central Nigeria operate in an economy in which AI tools are accessible through a smartphone and in which national policy explicitly prioritises digital and AI literacy, yet many of their enterprises continue to record weak growth, low digital proficiency, and poor conversion of training into viable, scalable ventures. Regional evidence documents persistent gaps in digital proficiency, product development, information sharing, and financial documentation among SMEs (Ayatse, 2024), while high data and power costs, unaffordable devices, trust concerns, and a scarcity of skilled AI trainers and mentors constrain AI-enabled learning (Anderson, 2025; *Beyond Coverage*, 2026; *AI for Nigerian SMEs*, 2026). Training, moreover, has tended to emphasise awareness rather than practical execution (Azuonwu, 2026), and Nigerian enterprises lag markedly behind their workers in AI adoption (*Nigeria Ranks Third*, 2026). If these conditions persist, the region risks a widening divide between AI-enabled entrepreneurs in commercial hubs and those in its towns and rural communities, with adverse consequences for job creation, enterprise survival, and inclusive growth. In the literature, existing studies have examined AI leadership at the continental level (Anderson, 2025), entrepreneurship education and SME performance without an AI focus (Ayatse, 2024), entrepreneurship within universities (Oyinlola et al., 2024), and AI literacy among students outside Africa (Virojrut et al., 2026), while much of the remaining evidence consists of programme reports and commentaries. No study known to the authors has simultaneously measured AI awareness, barriers, and competency needs among practising entrepreneurs in North Central Nigeria, or combined such measurement with entrepreneurs' own explanations of how these factors shape their learning. This study addresses that gap.

Research Questions

The following research questions guided the study:

1. What is the level of AI awareness among entrepreneurs in North Central Nigeria?
2. What are the barriers to AI-enabled entrepreneurial learning among entrepreneurs in North Central Nigeria?
3. What are the AI-related competency needs of entrepreneurs in North Central Nigeria for entrepreneurial learning?
4. How do entrepreneurs in North Central Nigeria describe and explain their experiences of AI awareness, barriers, and competency development in their entrepreneurial learning?

Method

The study adopted an explanatory sequential mixed-methods design within a pragmatist paradigm (Creswell & Plano Clark, 2018). Quantitative data were collected and analysed first to answer Research Questions 1 to 3, and the results were then used to select participants and refine the interview guide for a qualitative phase that addressed Research Question 4 by explaining and contextualising the quantitative results. The two strands were integrated at the sampling, instrument development, and interpretation stages, the last through a joint display (Fetters et al., 2013).

The study was conducted in the six states of North Central Nigeria and the FCT. The population comprised all owner-managers of micro, small, and medium enterprises in the region. Because many

enterprises operate informally and no comprehensive register exists, the population size was unknown. The quantitative sample size was therefore determined using Cochran's (1977) formula for an unknown population, $n_0 = Z^2pq/e^2$, with $Z = 1.96$, $p = q = .50$, and $e = .05$, giving $n_0 = 384.16$, rounded to 385. This figure was increased by 12.5% to allow for non-response, yielding a sample of 433 entrepreneurs.

A multistage sampling procedure was used. All six states and the FCT were included at the first stage. At the second stage, two local government areas (LGAs) were purposively selected in each unit, namely the capital and one semi-urban or rural LGA, to capture urban–rural variation: Makurdi and Gboko (Benue), Lokoja and Okene (Kogi), Ilorin West and Offa (Kwara), Lafia and Keffi (Nasarawa), Chanchaga and Bida (Niger), Jos North and Pankshin (Plateau), and the Abuja Municipal and Kuje Area Councils (FCT). At the third stage, the sample was allocated equally, giving 62 entrepreneurs in each state and 61 in the FCT. At the fourth stage, because no sampling frame existed, respondents were recruited through markets, business clusters, trade associations, cooperatives, and innovation hubs using convenience sampling supplemented by snowball referrals. Respondents had to be at least 18 years old, own or manage an enterprise that had operated for at least one year, and give informed consent. For the qualitative phase, 12 entrepreneurs were selected from questionnaire respondents who agreed to be interviewed, using maximum variation purposive sampling on state, gender, sector, location, and AI awareness score. This number is consistent with evidence that saturation is typically reached within 12 interviews (Guest et al., 2006).

The quantitative instrument was a researcher-developed questionnaire, the AI Awareness, Barriers and Competency Needs for Entrepreneurial Learning Questionnaire (AIBCNELQ). Section A collected demographic data; Section B contained 12 AI awareness items rated from *highly aware* (4) to *not aware* (1); Section C contained 15 barrier items rated from *strongly agree* (4) to *strongly disagree* (1); and Section D contained 24 competency items in six clusters of four (technical, managerial, innovative, networking, financial, and AI-digital fluency), rated from *highly needed* (4) to *not needed* (1). Items were derived from the literature reviewed above. The qualitative instrument was a semi-structured interview guide with 10 core questions and probes, refined after the quantitative analysis to explore the highest- and lowest-rated items.

Face and content validity were established by three experts in entrepreneurship education, measurement and evaluation, and computer science. Items with item-level content validity indices below .78 were revised, and the scale-level index (S-CVI/Ave) was .92 (Lynn, 1986; Polit & Beck, 2006). Exploratory factor analysis of the main data using principal axis factoring with oblique rotation supported construct validity: the Kaiser–Meyer–Olkin measure was .86, and Bartlett's test of sphericity was significant, $\chi^2(1275) = 8{,}436.27$, $p < .001$ (Hair et al., 2019). The interview guide was reviewed by the same experts and piloted with two entrepreneurs outside the sample. Reliability was established through a pilot study with 40 entrepreneurs in Kaduna State, outside the study area. Cronbach's alpha coefficients were .87 for AI awareness, .84 for barriers, .91 for competency needs, and .89 overall, exceeding the .70 threshold (Nunnally & Bernstein, 1994). Qualitative trustworthiness was ensured through member checking and triangulation (credibility), thick description (transferability), an audit trail (dependability), and reflexive journaling (confirmability; Lincoln & Guba, 1985). Two researchers coded the transcripts independently, with intercoder agreement of $\kappa = .82$.

Ethical approval was obtained from the authors' institutional research ethics committee, and all participants gave informed consent. The questionnaire was administered in person and electronically by the researchers and 14 trained research assistants over six weeks, with interpretation into Hausa, Tiv, Yoruba, Igala, and Nupe where required. Interviews lasted 35 to 55 minutes, were audio-recorded with permission, and were transcribed verbatim. Quantitative data were analysed with means and standard deviations for Research Questions 1 to 3. With a criterion mean of 2.50, awareness was interpreted using the real limits 3.50–4.00 (*very high*), 2.50–3.49 (*high*), 1.50–2.49 (*low*), and 1.00–1.49 (*very low*), while barrier and competency items with means of 2.50 or above were regarded as barriers and needs, respectively. Qualitative data were analysed with NVivo 14 using Braun and Clarke's (2006) six-phase thematic analysis, and meta-inferences from the joint display were classified as confirmation, expansion, or discordance (Fetters et al., 2013).

Results

Quantitative Results

Of the 433 questionnaires administered, 412 were returned and usable, a response rate of 95.2%.

Research Question 1: Level of AI Awareness

Table 2
Mean Ratings of Entrepreneurs' Level of AI Awareness

S/N	Item: I am aware of…	*M*	*SD*	Remark
1	Generative AI tools (e.g., ChatGPT, Gemini, Claude, Meta AI)	3.41	0.68	High
2	Use of AI to write business content (e.g., adverts, proposals)	3.12	0.79	High
3	AI chatbots and automated messaging for customer engagement	2.86	0.88	High
4	AI tools for bookkeeping, invoicing, and financial analysis	2.34	0.94	Low
5	AI tools for market research and customer trends	2.41	0.91	Low
6	AI-powered design tools for logos, flyers, and product images	2.97	0.85	High
7	Use of AI to learn new business skills	3.05	0.82	High
8	AI applications specific to my business sector	2.18	0.97	Low
9	National AI and digital skills initiatives (e.g., National AI Strategy, 3MTT)	2.27	1.01	Low
10	AI training opportunities available to entrepreneurs in my state	1.96	0.95	Low
11	Risks of AI use (e.g., inaccurate outputs, bias, data privacy)	2.39	0.93	Low
12	How to check the accuracy and reliability of AI outputs	2.08	0.96	Low
	Grand mean	2.59	0.62	High

Note. Criterion mean = 2.50. Real limits: 3.50–4.00 = very high; 2.50–3.49 = high; 1.50–2.49 = low; 1.00–1.49 = very low.

Table 2 shows a grand mean of 2.59 (*SD* = 0.62), within the 2.50–3.49 real limit, indicating a high level of AI awareness. However, only six of the 12 items reached the criterion mean. Awareness was highest for generative AI tools (*M* = 3.41), AI for business content (*M* = 3.12), and AI for learning new skills (*M* = 3.05), and lowest for AI training opportunities in the respondents' states (*M* = 1.96), checking the accuracy of AI outputs (*M* = 2.08), and sector-specific AI applications (*M* = 2.18).

Research Question 2: Barriers to AI-Enabled Entrepreneurial Learning

Table 3

Mean Ratings of Barriers to AI-Enabled Entrepreneurial Learning

S/N	Item	*M*	*SD*	Remark
1	High cost of internet data	3.58	0.61	Barrier
2	Unstable electricity supply	3.52	0.66	Barrier
3	Poor internet connectivity in my area	3.21	0.78	Barrier
4	High cost of smartphones or computers able to run AI tools	3.09	0.84	Barrier
5	Cost of subscriptions to premium AI tools	3.14	0.81	Barrier
6	Lack of AI training programmes close to my business	3.27	0.76	Barrier
7	Shortage of trainers and mentors with AI expertise	3.36	0.72	Barrier
8	Limited knowledge of how to apply AI to my business	3.18	0.79	Barrier
9	Concerns about privacy and security of business information	2.88	0.87	Barrier
10	Distrust in the accuracy of AI-generated outputs	2.74	0.91	Barrier
11	Fear that AI will replace human workers	2.21	0.98	Not a barrier
12	Language barriers (limited support for local languages)	2.63	0.96	Barrier
13	Lack of time to learn because of business workload	2.92	0.85	Barrier
14	Inadequate government support or incentives for AI adoption	3.24	0.77	Barrier
15	Socio-cultural or gender-related constraints on access	2.57	1.03	Barrier
	Grand mean	3.04	0.57	Barrier

Note. Criterion mean = 2.50.

As shown in Table 3, 14 of the 15 items reached the criterion mean and were regarded as barriers (grand $M = 3.04$, $SD = 0.57$). The most severe were the high cost of internet data ($M = 3.58$), unstable electricity supply ($M = 3.52$), and the shortage of AI trainers and mentors ($M = 3.36$). Fear that AI will replace human workers ($M = 2.21$) was not regarded as a barrier, while socio-cultural or gender-related constraints recorded the lowest endorsed mean ($M = 2.57$) and the widest dispersion ($SD = 1.03$).

Research Question 3: AI-Related Competency Needs

Table 4
Mean Ratings of Entrepreneurs' AI-Related Competency Needs by Cluster

S/N	Competency item	*M*	*SD*	Remark
Technical (cluster *M* = 3.22, *SD* = 0.58; rank 4)				
1	Using digital tools for daily operations	3.24	0.74	Needed
2	Analysing business data for decisions	3.31	0.71	Needed
3	Digital marketing and e-commerce	3.38	0.69	Needed
4	Maintaining and troubleshooting devices and software	2.96	0.83	Needed
Managerial (cluster *M* = 2.98, *SD* = 0.61; rank 6)				
5	Strategic planning and goal setting	3.02	0.80	Needed
6	Project management with digital tools	3.11	0.78	Needed
7	Team leadership and delegation	2.84	0.86	Needed
8	Resource allocation and process management	2.94	0.84	Needed
Innovative (cluster *M* = 3.25, *SD* = 0.57; rank 3)				
9	Recognising business opportunities	3.29	0.73	Needed
10	Developing new products or services	3.33	0.71	Needed
11	Creative problem solving	3.12	0.77	Needed
12	Adapting new technologies to local markets	3.26	0.74	Needed
Networking (cluster *M* = 3.11, *SD* = 0.60; rank 5)				
13	Building partnerships and industry linkages	3.18	0.76	Needed
14	Using digital platforms for networking	3.07	0.80	Needed
15	Information sharing with other firms	2.89	0.85	Needed
16	Accessing mentors, hubs, and support organisations	3.31	0.72	Needed
Financial (cluster *M* = 3.36, *SD* = 0.54; rank 2)				
17	Bookkeeping and record keeping	3.29	0.74	Needed
18	Budgeting and separating personal and business finances	3.36	0.70	Needed
19	Preparing bankable business plans (funding readiness)	3.57	0.62	Needed
20	Using digital financial tools and platforms	3.22	0.76	Needed
AI-digital fluency (cluster *M* = 3.44, *SD* = 0.52; rank 1)				
21	Using generative AI tools for business tasks	3.48	0.65	Needed
22	Critically evaluating the accuracy of AI outputs	3.44	0.67	Needed
23	Ethical and responsible AI use, including data protection	3.31	0.72	Needed
24	Integrating AI into business workflows	3.53	0.63	Needed
	Grand mean	3.23	0.49	Needed

Note. Criterion mean = 2.50.

Table 4 shows that all 24 items were needed (grand *M* = 3.23, *SD* = 0.49). Needs were highest in AI-digital fluency (*M* = 3.44), followed by financial (*M* = 3.36), innovative (*M* = 3.25), technical (*M* = 3.22), networking (*M* = 3.11), and managerial (*M* = 2.98) competencies. The highest-rated items were preparing bankable business plans (*M* = 3.57), integrating AI into business workflows (*M* = 3.53), and using generative AI tools for business tasks (*M* = 3.48).Qualitative Results

Research Question 4: Entrepreneurs' Experiences of AI Awareness, Barriers, and Competency Development

Table 5
Profile of Interview Participants

Code	Gender	State	Sector	Years in business	Location	Awareness
P1	M	Kogi	Manufacturing	9	U	Moderate
P2	F	Kwara	Fashion design	5	R	Moderate
P3	F	Benue	Agro-processing	11	R	Low
P4	M	Niger	Crop farming	4	R	Low
P5	F	Nasarawa	Agriculture	14	R	Low
P6	F	Benue	Trading	6	U	Moderate
P7	M	Niger	Trading	8	U	Moderate
P8	M	Plateau	ICT services	3	U	High
P9	F	Plateau	Food services	4	U	High
P10	F	FCT	Beauty services	7	U	High
P11	M	FCT	Logistics	5	U	High
P12	M	Kwara	Manufacturing	16	U	Moderate

Note. U = urban; R = semi-urban/rural. Awareness level is based on tertiles of the Section B score.

The 12 participants (Table 5) comprised six women and six men from all seven units of the region, four of whom operated in semi-urban or rural areas. Thematic analysis generated four themes and 12 subthemes (Table 6).

Table 6
Themes and Subthemes From the Qualitative Analysis

Theme	Subthemes	Participants (*n*)
1. Surface familiarity, shallow application	Everyday exposure through smartphones and social media; uncertainty about business-specific uses; peers and family as awareness channels	12
2. Infrastructure, cost, and trust frictions	Burden of data and power costs; distrust of outputs and privacy fears; distance from training and mentors	11
3. From tool use to venture capability	Need for applied, sector-specific AI skills; financial and funding-readiness gaps; critical and ethical use	10
4. Learning through people, practice, and places	Preference for short, hands-on training; mentorship and hubs as anchors; local language and peer learning	9

Theme 1: Surface familiarity, shallow application. All participants encountered AI through smartphones and social media, but few used it systematically. As P3 (female, agro-processing, Benue) explained, “I see these AI things on WhatsApp and Facebook every day, and my son uses it for his assignment, but for my garri business I don’t know where to start.” Awareness spread mainly through peers and customers rather than training: “It was my customer who showed me how to use it to write my price list and adverts. Nobody trained me” (P7, male, trading, Niger).

Theme 2: Infrastructure, cost, and trust frictions. Participants described data and power costs as the main obstacle to sustained learning: “If I buy data of five thousand naira, it finishes in one week. Then fuel for the generator. Between data and diesel, learning AI is a luxury” (P1, male, manufacturing, Kogi). Trust was a second friction: “Sometimes it gives answers that are not correct, so how can I trust it with my customers’ details?” (P10, female, beauty services, FCT). Rural participants emphasised distance from support: “The training is always in Lafia or Abuja. From my village, transport alone is a problem, and nobody here can teach me” (P5, female, agriculture, Nasarawa). Four of the six women also described household responsibilities and concerns about travelling to evening sessions as constraints on attending training.

Theme 3: From tool use to venture capability. Participants distinguished between knowing that AI tools exist and using them to grow a business: “I know how to use the tools, but what I need is how to use AI to manage stock, track sales, and know which product is moving” (P8, male, ICT services,

Plateau). Financial capability and funding readiness were recurrent concerns: “What I want is for AI to help me keep my records and write a business plan that the bank will accept” (P2, female, fashion design, Kwara). Several participants also stressed the need to verify AI outputs before using them with customers or lenders.

Theme 4: Learning through people, practice, and places. Participants preferred short, practical, mentored training delivered close to their businesses: “Don’t give me lectures for one week. Show me on my phone, let me do it, then follow up with me after” (P11, male, logistics, FCT). Market associations, cooperatives, and hubs were trusted learning spaces, and peer teaching in local languages was valued: “When one of us in the market learns something, she teaches others in Hausa or Tiv. That is how we learn” (P6, female, trading, Benue). A negative case was P4 (male, crop farming, Niger), who regarded AI as currently irrelevant: “For my farm, what I need now is fertiliser and market, not computer things.”

Integration of Findings

Table 7 shows that the qualitative findings confirmed the quantitative results on barriers and competency needs and expanded the awareness results by revealing that high self-reported awareness reflects familiarity with general-purpose tools rather than business-specific capability. A discordance emerged on gender: socio-cultural and gender-related constraints were the least endorsed barrier quantitatively, yet women interviewees described them vividly, suggesting that the aggregate mean masks constraints concentrated among female entrepreneurs.

Table 7
Joint Display Integrating Quantitative and Qualitative Findings

Domain	Quantitative finding	Qualitative finding	Meta-inference
AI awareness	Grand *M* = 2.59 (high); highest: generative AI tools (3.41); lowest: local training opportunities (1.96)	Theme 1: familiarity is incidental and tool-centred, not business-specific	Expansion
Barriers	Grand *M* = 3.04; top: data cost (3.58), electricity (3.52), mentor shortage (3.36)	Theme 2: data and fuel costs compete with stock purchases; distance from training	Confirmation
Gender/socio-cultural	Lowest endorsed barrier (2.57) with highest dispersion (*SD* = 1.03)	Female participants described time burdens and unsafe evening sessions	Discordance
Competency needs	Grand *M* = 3.23; highest cluster: AI-digital fluency (3.44); top item: bankable plans (3.57)	Theme 3: need to apply AI to records, pricing, stock, and loan applications	Confirmation
Learning pathways	Low awareness of local training (1.96) and high need for mentor access (3.31)	Theme 4: preference for short, mentored, local, peer-based learning	Expansion

Note. Meta-inferences follow Fetters et al. (2013).

Discussion of Findings

Level of AI Awareness

Entrepreneurs had a high level of AI awareness (*M* = 2.59), consistent with evidence that generative AI tools are accessible through basic smartphones (*The Nigerian Workers Who Use AI*, 2026) and that Nigerian workers’ AI literacy is high by global standards (*Nigeria Ranks Third*, 2026). However, awareness was broad but shallow: it was concentrated on general-purpose tools, while awareness of sector-specific applications, local training, national initiatives, and output verification fell below the criterion mean. The qualitative evidence that awareness spreads incidentally through social media and peers (Theme 1) supports the critique that programmes and public discourse emphasise awareness over execution (Azuonwu, 2026). The low awareness of national initiatives (*M* = 2.27) and local training (*M* = 1.96) suggests that large-scale efforts such as 3MTT, the National AI Strategy, and private skilling initiatives (Microsoft, 2025; Tijani, 2024) have not yet reached many enterprises outside major hubs, particularly in rural locations such as those of P3, P4, and P5, echoing documented urban–rural disparities (Olanrewaju et al., 2021; Oyinlola et al., 2024). The low awareness of AI risks (*M* = 2.39) is also concerning, because responsible use requires an understanding of privacy, bias, and

accountability (Anderson, 2025). From a human capital perspective, such awareness is an initial investment that will yield limited returns unless it is converted into the creative and applied capabilities through which AI literacy shapes entrepreneurial readiness (Virojrut et al., 2026).

Barriers to AI-Enabled Entrepreneurial Learning

Fourteen of 15 barriers were endorsed (*M* = 3.04), led by data costs, unstable electricity, and the shortage of trainers and mentors. These results corroborate evidence that inadequate infrastructure and skills shortages prevent Nigerian SMEs from engaging with AI and that unreliable electricity imposes large economic costs (*AI for Nigerian SMEs*, 2026), and they mirror the digital gaps documented in remote Nigerian communities, including Kwara (Olanrewaju et al., 2021). The mentor shortage reflects the continental scarcity of AI instructors and mentors (Anderson, 2025), while device-cost barriers (*M* = 3.09) are consistent with the burden of smartphone prices on low-income households (*Beyond Coverage*, 2026). The qualitative accounts show how these costs compete directly with business expenditure (Theme 2). Trust barriers, including privacy concerns (*M* = 2.88) and distrust of outputs (*M* = 2.74), align with unresolved ethical concerns about AI in Africa (Anderson, 2025), and the endorsement of inadequate government support (*M* = 3.24) parallels weaknesses in institutional strategy and data governance identified in Nigerian universities (Kayode & Odumabo, 2024). Conversely, fear of job replacement was not a barrier, suggesting that owner-managers see AI as a productivity aid rather than a threat to their own roles. The discordant gender finding indicates that aggregate means may understate constraints concentrated among women, consistent with evidence that women are marginalised in AI programmes (Anderson, 2025). Overall, the barriers are largely systemic, so awareness campaigns alone will not suffice without investment in access, affordability, and support.

AI-Related Competency Needs

All competencies were needed (*M* = 3.23), with AI-digital fluency and financial competencies ranked highest. The high financial needs, especially funding readiness (*M* = 3.57), are consistent with Ayatse's (2024) finding of persistent gaps in financial documentation among North Central SMEs and with the observation that training graduates often lack funding readiness (Azuonwu, 2026). The prominence of needs for integrating AI into workflows (*M* = 3.53) and critically evaluating outputs (*M* = 3.44) supports conceptualising AI literacy as an integrated competency encompassing ethical awareness, information evaluation, and application rather than isolated tool training (Virojrut et al., 2026). Innovative needs, particularly product development (*M* = 3.33), correspond with the product development difficulties reported by Ayatse (2024), while the need for access to mentors and hubs (*M* = 3.31) echoes the weak information sharing among regional SMEs and the importance of mentoring for AI capability (Anderson, 2025; Ayatse, 2024). Managerial needs, although still high, ranked lowest, consistent with evidence that managerial training already strengthens planning in the region (Ayatse, 2024). The qualitative finding that entrepreneurs want AI applied to stock, pricing, records, and loan applications (Theme 3) indicates that competency development should be organised around real business tasks.

Experiences and Preferred Learning Pathways

Entrepreneurs preferred short, hands-on, mentored, and locally delivered learning, often through peers and in local languages (Theme 4). This aligns with Anderson's (2025) evidence that short, intensive training is especially effective for those in the workforce and that mentoring adds explanatory power beyond education and training, and with regional programmes that combine classroom instruction with on-the-job placement (Sunday, 2026) or online learning with mentorship (*Call for Applications*, 2026). The trust placed in associations, cooperatives, and hubs suggests that existing infrastructure, including NOUN's North Central Incubation Centre and its study centres (NOUN, n.d.), could anchor AI-enabled entrepreneurial learning. The negative case of P4 also cautions that AI training must demonstrate concrete value for sectors such as crop farming. Taken together, the integrated findings indicate that broad but shallow awareness, compounded by systemic barriers, limits the conversion of AI exposure into entrepreneurial capability, and they extend human capital theory by suggesting that the returns to digital human capital are conditional on structural enablers (Becker, 1993; Virojrut et al., 2026).

Conclusion

The study concludes that entrepreneurs in North Central Nigeria are broadly aware of AI, but that this awareness centres on general-purpose tools and has not been translated into business-specific

capability. Their learning is constrained mainly by the cost of data and electricity, poor connectivity, the scarcity of AI trainers and mentors, and concerns about trust and privacy, and their competency needs are highest where AI intersects with finance, funding readiness, and daily operations.

These findings carry several implications. Theoretically, AI literacy functions as digital human capital whose returns depend on enabling conditions, so awareness is necessary but insufficient for AI-enabled entrepreneurial learning. For policy, national AI and digital literacy targets will not reach entrepreneurs in the region without parallel investment in affordable access, local delivery, mentorship, and outcome monitoring disaggregated by state, location, and gender. For training providers, programmes must move beyond awareness towards applied, sector-specific, and mentored learning that links AI to financial management and access to finance. For the regional ecosystem, existing incubation centres, study centres, and trade associations represent an underused infrastructure through which such learning can be scaled. The study is limited by its reliance on self-reported data and on non-probability sampling within LGAs; future research should test the relationships among awareness, barriers, competency needs, and enterprise performance using multivariate models and evaluate specific AI training interventions longitudinally.

Recommendations

In line with the findings, the following recommendations are made:

1. Because awareness was broad but shallow, state ministries of commerce, the Small and Medium Enterprises Development Agency of Nigeria (SMEDAN), NITDA, and trade associations should replace general awareness campaigns with sector-specific demonstrations of AI for pricing, stock management, marketing, and record keeping, delivered in markets and cooperatives and in local languages.
2. Because data and electricity costs were the most severe barriers, state governments, development partners, and telecommunications providers should establish shared, solar-powered AI-enabled business centres within existing incubation and study centres and negotiate subsidised data bundles for entrepreneurs in training.
3. Because AI-digital fluency and financial competencies were most needed, the Development Bank of Nigeria, NCDMB, university entrepreneurship centres, and NOUN incubation centres should offer short, modular, competency-based programmes leading to stackable micro-credentials that pair AI skills with business functions such as bookkeeping, business plan preparation, and digital marketing.
4. Because the shortage of trainers and mentors was a major barrier, a regional AI-for-enterprise mentor network linking practitioners, technology firms, and diaspora professionals should provide six to twelve months of post-training support, and train-the-trainer programmes should be run for entrepreneurship educators and business development service providers.
5. Because trust and privacy concerns constrained use, all AI training for entrepreneurs should include practical modules on verifying outputs, protecting data, and ethical use, supported by plain-language guidelines on responsible AI use for small businesses.
6. Because gender-related constraints were concentrated among women, programme designers should adopt flexible daytime scheduling, community-based and mobile delivery, women-focused cohorts, and partnerships with women's cooperatives, and all funders should monitor outcomes disaggregated by state, gender, and location.

Abstract

This study assessed the impact of Artificial Intelligence on Office Technology Management (OTM) and Entrepreneurial learning in public polytechnics in South East, Nigeria. Specifically, the study assessed how the use of AI tools affects the technical skills, productivity and job performance and the entrepreneurial learning, innovation and business idea generation among OTM students in public polytechnics in South East, Nigeria. Two corresponding research questions guided the study. Two hypotheses were formulated and tested at 0.05 level of significance. Descriptive survey research design was adopted for the study. The population consisted of One Hundred and Fifty (150) Higher National Diploma (HND) II OTM students from three (3) public polytechnics in South East, Nigeria offering OTM. The entire population was studied, hence, there was no sampling. A structured questionnaire which was validated by three Business Educators was used for data collection. The reliability test conducted showed a reliability coefficient of 0.87. Mean and standard deviation were used to answer the research questions while t-test statistical tool was used for the hypothesis. Findings showed that AI integration in office technology management and entrepreneurial learning practices in public polytechnics in South East, Nigeria significantly boosts productivity, decision-making efficiency and supported entrepreneurship education by helping students build confidence and intention toward business creation. Consequent upon the findings of the study, it was recommended that NBTE and polytechnic managements should integrate AI modules into NBTE OTM curriculum and also establish AI-enabled innovation Hubs.

Keywords: Artificial Intelligence, Office Technology Management and Entrepreneurial Education, Innovation and Technical Skills

Introduction

Office Technology and Management (OTM) is a technical and vocational education programme designed to equip students with competencies for effective performance in modern office environments. According to the National Board for Technical Education (NBTE, 2021), OTM replaced the former Secretarial Studies curriculum to reflect the paradigm shift from manual clerical duties to technology-driven office functions. The programme integrates courses in word processing, office application packages, records management, web technology, human relations, and entrepreneurship, thereby producing graduates who function as administrative assistants, office managers, and potential entrepreneurs.

Globally, the office environment has been transformed by rapid technological innovations, particularly artificial intelligence (AI), cloud computing, and automation tools (Hussin, Shuib, Nasir, & Rosalin, 2025). These technologies have redefined traditional OTM competencies such as typing, shorthand, and filing, replacing them with digital skills like AI-assisted report writing, automated scheduling, virtual collaboration, and data-driven decision making. OTM is significant because it addresses national development goals. The federal government of Nigeria, through NBTE, positions polytechnics to produce self-reliant graduates. OTM students are expected to acquire both employability skills for paid employment and entrepreneurial skills for job creation (NBTE, 2022). Furthermore, employers now demand graduates who can leverage AI tools such as ChatGPT, Microsoft Copilot, and Gemini for office productivity and business innovation (Crompton & Burke, 2023). It also aligns with global education trends.

Technological changes have led to significant improvement in the society which have brought about enormous improvement in the educational system and pedagogical delivery. Technology is a tool that transforms the way things are done in the society. The application of technology driven structural approaches in Office Technology and Management programme is paramount for academic endeavours. Artificial intelligence (AI) is one of the technologies of the 21st century that has emerged with its awareness and application cutting across different fields of human endeavor. The integration of artificial intelligence in education has garnered significant attention in recent years. This interest is driven by the transformative potential of AI technologies to enhance teaching methodologies, streamline administrative processes, and improve student learning outcomes. The transformation of office technology and management has accelerated with the rise of digital technologies, particularly through the adoption of artificial intelligence (AI) tools. Modern educational institutions are increasingly utilizing AI innovations like Chatbots, virtual reality (VR), grammarly, turnitin, and content recommendation engines to facilitate effective and flexible learning (Ndiomu, AkeleEgberi, Alabi, 2025). These technologies provide around-the-clock access to instructional resources, tailoring students to learn at their own pace and according to their individual needs. The purpose of artificial intelligence in education is to improve classroom education and enhance the capacity of teachers to augment such a process (Edeh, Olupayimo, & Bolarinwa, 2025). According to Hussin, et al., (2025), artificial intelligence technologies transform business operations by automating everyday processes and strengthening analytical capabilities, which reshape organization dynamics together with employee practices. The transition of workplaces to hybrid and remote structures created a substantial rise in the demand for adaptable, intelligent systems that boost operational performance alongside productivity. AI tools function as workflow central tools for real-time data-processing, and they provide essential support to strategic decision processes. Both opportunities and challenges exist because organizations need to accept these technologies yet maintain ethical standards when developing human-oriented office spaces. Gaber in Edeh et al. (2025), opined that artificial intelligence is a field of science seeking to develop computer systems with a level of efficiency similar to that of an expert human. In the field of education, artificial intelligence is defined as a means to improve education in an individualized, flexible, inclusive and interesting way by processing real-time data (UNESCO, 2017).

While AI has been successfully deployed in developed countries, developing nations remain at an early phase of adoption. According to Ndiomu et al., (2025), various challenges hinder the full implementation of AI in these areas, including underdeveloped infrastructure, limited access to reliable information, institutional resistance, inadequate funding, and a general lack of digital literacy and technical skills. These barriers underscore the need for further investigation into how AI can be effectively adopted and implemented in higher education, particularly with regards to public polytechnics in South East, Nigeria. Study conducted by Hussin et al. (2025), on harnessing Artificial Intelligence in office management emphatically states that AI boosts decision-making and employee performance. However, empirical evidence on how AI impacts OTM students' acquisition of technical competencies and entrepreneurial learning remains scarce in the Nigerian context. Most studies have examined AI in general higher education (Wang, 2025) or entrepreneurship education broadly (Li et al., 2025), with limited focus on the unique curriculum structure of OTM in polytechnics in South East, Nigeria. This gap justifies research attention, as findings will inform curriculum review, pedagogical strategies, and policy decisions by NBTE, TETFund and polytechnic management.

Statement of the Problem

Office Technology and Management, which is an integral part of Business Education taught in public polytechnics in Nigeria is a skills acquisition programme, needs to be taught with innovative skills especially Artificial Intelligence to remain competitive in the global world. Artificial Intelligence, no doubt, has revolutionized teaching and learning making teaching personalized, students engaged and

motivated. It is used in developing instructional contents, receiving feedback from students, overcome learning challenges, give students assignments, mark scripts and grade students. AI can also be used to support learners with special needs. It is an innovative approach in teaching and learning making the educational process enthusiastic (Ezeabii and Ngene, 2025).

Although the use of Artificial Intelligence has gained traction in most Nigeria tertiary institutions, its application in public polytechnics in South East, Nigeria has not been feasible. Many scholars have emphasized the imperative nature of the application of AI tools in teaching and learning of OTM courses, yet effective application of AI in public polytechnics in South East, Nigeria is still very elusive. This gap raises concerns about the effectiveness of graduates from these public polytechnics in a competitive global business environment. The failure to adapt to these technological trends could negatively impact the quality of OTM graduates limiting their ability to function effectively in the increasing digital and automated business world. By integrating AI education into curricula, public polytechnics in South East, Nigeria can help close the gap between academic preparation and industry expectations, ensuring graduates are equipped to thrive in contemporary work environments. Therefore, this study aimed to methodically assess the impact of artificial intelligence on office technology management and entrepreneurial learning and practice in public polytechnics in South East, Nigeria.

Research Questions

The following questions guided the study:

1. How does the use of artificial intelligence tools influence the technical competencies and productivity levels of OTM students in public polytechnics in South East, Nigeria?
2. To what extent does exposure to artificial intelligence enhance entrepreneurial learning and innovation capacity among OTM students in public polytechnics in South East, Nigeria?

Research Hypotheses

1. There is no significant influence of artificial tools on the technical competencies and productivity levels of OTM students in public polytechnics in South East, Nigeria based on gender.
2. There is no significant influence of artificial intelligence exposure on entrepreneurial learning and innovation capacity between male and female OTM students in public polytechnics in South East, Nigeria.

Research Methodology

The study adopted descriptive research design. The area of study is South East, Nigeria which has many public polytechnics offering OTM. In the course of this study, only three (3) polytechnics were considered, namely: Akanu Ibiam Federal Polytechnic, Unwana, Ogbonnia Onu Polytechnic, Aba and Federal Polytechnic, Nekede, Owerri. The population is One Hundred and Fifty (150) HND II OTM students consisting of One Hundred (100) females and Fifty (50) males. The study adopted a census study. A census is recommended when population is equal to or less than 200, accessible, and resources permit (Mugenda and Mugenda, 2003). Census saves time and removes sampling error. The instrument for data collection was structured questionnaire titled Impact of Artificial Intelligence on Office Technology Management and Entrepreneurial Learning and Practice in Public Polytechnics Questionnaire (IAIOTMAELQ). The instrument was structured and made up of two sections namely: A and B. Section A contained information on two demographic variables namely name of institution and sex. Section B consisted of 12 items measuring the AI tools, OTM technical competencies/productivity and the extent of AI exposure on entrepreneurial learning/innovation. The items were arranged on a four-point rating scale. The response options for sub sections A and B was Strongly Agree (SA) – 4 points, Agree (A) – 3 points, Disagree (D) – 2 points, Strongly Disagree (SD) – 1 point. The instrument was validated by three experts (Two in Business Education and One in Measurement and Evaluation). Their corrections and suggestions helped to improve the quality of the instrument. The reliability of the instrument was tested using Cronbach Alpha reliability index which gave a reliability coefficient of 0.87. The researcher administered the copies of the questionnaires with the aid of three research assistants. Direct delivery and retrieval method were adopted in the administration and retrieval of the questionnaire. The 150 questionnaires printed were successfully administered and retrieved. Mean and standard deviation were used to answer the research questions while independent t-test was used to test the null hypotheses at 0.5 level of significance. Based on the 4-point rating scale, the mean score of the scale was 2.50. The mean score was derived by adding the nominal value of the rating scales

and divided by the same number of cases. 2.50 was used as the benchmark for the decision rule. For testing the hypothesis, the decision was to reject H_o, if and only if, the calculated value (t-cal) is greater than or equal to the tabulated (t-tab), otherwise accept.

Results

Research Question 1: How does the use of artificial intelligence tools influence the technical competencies and productivity levels of OTM students in public polytechnics in South East, Nigeria?

Table 1: Mean scores and standard deviation of OTM students on the influence of AI tools on the technical competencies and productivity levels.

S/N	ITEM STATEMENT	X_1(Male)	STD_1	X_2(Female)	STD_2	X_G	STD_G	Decision
1	Use of AI tools like ChatGPT/Grammarly improves my speed in typing and transcription tasks.	3.41	0.77	3.33	0.80	3.37	0.79	Agree
2	AI-powered tools such as MS Copilot and Otter.ai increase the accuracy of my office documents and reports.	3.20	0.84	2.81	0.87	2.98	0.87	Agree
3	I can perform mail merge, data sorting, and formatting tasks faster with AI than without AI.	3.24	0.62	3.15	0.63	3.19	0.62	Agree
4	AI tools have improved my ability to handle complex office tasks like minutes of meeting and presentations.	3.22	0.57	3.11	0.60	3.16	0.59	Agree
5	Using AI tools reduces errors in my shorthand-to-typed document conversions.	3.39	0.63	3.02	0.49	3.18	0.58	Agree
6	My overall productivity in practical OTM courses has increased since I started using AI tools.	3.41	0.63	3.50	0.57	3.46	0.60	Agree
	Grand Mean	**3.31**	**0.68**	**3.22**	**0.66**	**3.22**		**Agree**

Source: Field Survey, 2026.

The analysis of data presented in Table 1 above shows that all the item statements have mean scores ranging from 2.98 to 3.50 indicating agreement to the AI tools integration. The implication of the responses indicate that AI tools play critical role in the technical competencies and productivity of OTM students. The standard deviation indicates that the respondents have similar opinion to the items.

Research Question2: To what extent does exposure to artificial intelligence enhance entrepreneurial learning and innovation capacity among OTM students in public polytechnics in South East, Nigeria?

Table 2: Mean responses on the extent of exposure to artificial intelligence enhance entrepreneurial learning and innovation capacity among OTM students in public polytechnics in South East, Nigeria.

S/N	ITEM STATEMENT	X_1(Male)	STD_1	X_2(Female)	STD_2	X_G	STD_G	Decision
7	Exposure to AI tools helps me generate new business ideas for my entrepreneurial projects.	3.35	0.59	3.33	0.80	3.34	0.79	HE
8	AI tools like Canva AI and ChatGPT improve my ability to design business models and proposals.	3.47	0.54	2.81	0.87	3.14	0.87	HE
9	Using AI increases my creativity in solving business problems during entrepreneurship classes.	3.70	0.62	3.15	0.63	3.43	0.62	HE
10	AI tools help me conduct market research and customer analysis faster for my business ideas.	3.84	0.57	3.33	0.60	3.59	0.59	VHE
11	I can develop digital business plans more effectively with the help of AI tools.	3.87	0.63	3.80	0.49	3.84	0.58	VHE
12	AI exposure has improved my innovative thinking for starting a small business after graduation.	3.55	0.79	3.25	0.57	3.40	0.60	HE
	Grand Mean	**3.63**	**0.62**	**3.28**	**0.66**	**3.46**		**HE**

Source: Field Survey, 2026.

The analysis of data presented in Table 2 above shows that all the item statements have mean scores ranging from 2.81 to 3.87 indicating agreement to the AI tools on entrepreneurial skills. The implication of the responses indicate that AI tools play major role in the improvement of innovative thinking of OTM students. The standard deviation indicates that the respondents have similar opinion to the items.

H_o1: There is no significant influence of artificial intelligence tools on the technical competencies and productivity levels of Office Technology Management students in public polytechnics in South East, Nigeria based on gender.

Table 3: Summary of t-test Analysis on the influence of artificial intelligence tools on the technical competencies and productivity levels of Office Technology Management students in public polytechnics in South East, Nigeria based on gender.

Variables	N	X	SD	DF	Std Error	t-Cal	t-Critical	Level of Sig	Rmks
Male Students	**50**	**3.31**	**0.68**						
				148	**0.033**	**1.82**	**1.96**	**0.05**	**NS**
Female Students	**100**	**3.22**	**0.66**						

Note: NS = Not Significant at 0.05

The t-test findings in Table 3 show that the calculated t-value of 1.82 is less than the critical t-value (t-tab) of 1.96 at 148 degrees of freedom. This finding indicates that there is no statistical

significant disparity in the mean ratings of male and female students' responses the influence of artificial intelligence tools on the technical competencies and productivity levels of Office Technology Management students in public polytechnics in South East, Nigeria.

H_o2: There is no significant influence of artificial intelligence exposure on entrepreneurial learning and innovation capacity among male and female OTM students in public polytechnics in South East, Nigeria.

Table 4: Summary of t-test Analysis on the influence of artificial intelligence on exposure on entrepreneurial learning and innovation capacity among male and female OTM students in public polytechnics in South East, Nigeria.

Variables	N	X	SD	DF	Std Error	t-Cal	t-Critical	Level of Sig	Rmks
Male Students	**50**	**3.63**	**0.62**						
				148	**0.021**	**11.43**	**1.96**	**0.05**	**S**
Female Students	**100**	**3.28**	**0.66**						

Note: NS = Significant at 0.05

The results from the t-test in Table 4 show that the calculated t-value (t-cal) of 11.43 is greater that the crucial t-value (t-tab) of 1.96 at 148 degrees of freedom. The data suggests a significant disparity in the mean ratings between male and female students. Male OTM students exhibit a stronger inclination towards utilizing artificial intelligence on entrepreneurial learning and innovation capacity.

Discussion of the Findings

This research investigated the impact of artificial intelligence on office technology management and entrepreneurial learning and practice in public polytechnics in South East, Nigeria. The findings suggest that AI-driven educational tools and platforms can encourage students to improve on their technical competencies and productivity levels. The findings indicate that AI tools like ChatGPT and Grammarly improved their typing and transcription tasks, MS Copilot and Otter.ai increased the accuracy of their office documents and reports, helped them perform mail merge, data sorting, and formatting tasks faster, reduces errors in their shorthand-to-typed document conversions and overall productivity in practical OTM courses. Recent studies confirm that artificial intelligence tools are transforming office-related competencies and productivity in educational settings. Hussin et al. (2025) found that AI integration in office management significantly boosts decision-making efficiency and employee performance, which aligns directly with core OTM tasks such as report writing, minutes of meeting, and document processing. Similarly, Crompton and Burke (2023) reported that AI-supported learning environments provide adaptive pathways and instant feedback, leading to improved academic outcomes and self-regulated learning among students. Furthermore, Wang (2025), demonstrated that a hybrid AI model reduced error rates by over 5% in academic performance monitoring, suggesting that AI can enhance both speed and accuracy of technical tasks. These findings imply that AI exposure is likely to improve OTM students' technical competencies and overall productivity in public polytechnics in South East and Nigeria at large

Empirical evidence also shows a growing link between generative AI and entrepreneurial learning outcomes. Students in the findings above confirmed that exposure to AI tools helps them generate new business ideas for their entrepreneurial projects, AI tools like Canva and ChatGPT improve their ability to design business models and proposals, increases their creativity in solving business problems during entrepreneurship classes, helps them conduct market research and customer analysis faster, help them develop digital business plans more effectively and general improvement in their innovative thinking for starting a small business after graduation. To corroborate the above advantages, Li et al. (2025) reported that Generative Artificial Intelligence Supported Entrepreneurship Education significantly enhanced university students' entrepreneurial intention with university support moderating the effect. This suggests that AI tools help students build confidence and intention toward business creation. In a vocational context, Xia, Lan and Zhou (2026) found that AI-enhanced entrepreneurship education improved students' strategic engagement, digital literacy, and perceived fairness, resulting in stronger self-reported entrepreneurial competence and better project outcomes. Collectively, these studies indicate that exposure to AI tools can strengthen entrepreneurial learning, innovation capacity, and business idea generation among OTM students in public polytechnics in Nigeria.

Conclusion

This study assessed the impact of artificial intelligence on office technology and management and entrepreneurial learning among OTM students in South East, Nigeria. Findings revealed that AI tools significantly enhanced OTM students' acquisition of technical competencies such as collaboration, and data management. Additionally, AI positively influenced entrepreneurial learning by improving opportunity recognition, business idea generation, and digital marketing skills.

These findings imply that AI has transformed traditional OTM training from manual clerical skills to technology-driven, innovation-focused competencies. This aligns with NBTE's goal of producing self-reliant graduates and supports UNESCO's call for AI integration in TVET. However, limited access to AI tools and inadequate lecturer training were identified as constraints.

Based on the findings, the study concludes that artificial intelligence has a significant positive impact on both technical competencies and entrepreneurial learning of OTM students. Therefore, strategic integration of AI into OTM curriculum and pedagogy is necessary to enhance graduate employability and entrepreneurial capacity in Nigeria's digital economy.

Recommendations

The study's recommendations are based on its findings and conclusion.

1. The NBTE should review and update the OTM curriculum to formally integrate AI literacy modules. This includes hands-on training in ChatGPT, Microsoft Copilot, and AI-powered office tools to align with current industry demands.
2. Management of public polytechnics should establish AI-equipped office simulation labs for OTM students. Partnerships with TETFund and tech firms should be explored to provide sustainable funding and software licenses.
3. Lecturers should undergo regular capacity-building workshops on AI pedagogy. Emphasis should be placed on using AI for project-based entrepreneurial learning rather than replacing students' critical thinking.
4. Students should leverage free AI tools for skill enhancement and micro-business development. Entrepreneurship educators should guide students on ethical use of AI for business plan writing, market research, and digital branding.

Abstract

The emergence of Artificial Intelligence (AI) had appears to have significantly transformed entrepreneurship, business operations, and workforce requirements globally. Similarly, Business Education students are expected to acquire competencies that goes beyond traditional business knowledge to include AI-related skills which are necessary for innovation, productivity, and entrepreneurial success. However, a substantial digital gap exists between the competencies required by contemporary industries or businesses and those possessed by our graduates, especially in developing economies such as Nigeria. The paper examines the essential AI competencies required by Business Education students in the era of entrepreneurial transformation. The study adopts a conceptual approach by reviewing contemporary literature on AI competencies, digital entrepreneurship, and Business Education. Findings reveal that AI literacy, prompt engineering, data literacy, digital content creation, critical thinking, AI-assisted decision-making, ethical AI usage, and innovation competencies are essential for entrepreneurial readiness and competitiveness. As such, findings show that inadequate infrastructure, curriculum deficiencies, limited AI awareness, and insufficient lecturer preparedness are major barriers to AI competency development. It concludes that by integrating AI competencies into Business Education curricula, it would bridge the digital gap and also prepare students for entrepreneurial success in the digital economy. The study recommends curriculum reform, capacity building, institutional investment in AI infrastructure, and industry collaboration to enhance AI competency acquisition among Business Education students.

Introduction

Business Education, as a discipline, is designed to equip learners with the knowledge, skills, attitudes, and competencies required for gainful employment, self-reliance, and entrepreneurial development (Alsarayreh (2025). Traditionally, the programme focused on accounting, office technology, management, marketing, and entrepreneurship. According to Sharma (2025), the rise of an artificial intelligence-driven business environment has increased the need for new competencies that enable graduates to operate effectively in digitally transformed workplaces. The author emphasizes that AI-powered learning can help business education students develop the skills required for success in the modern business world. In addition, business environments are undergoing unprecedented transformation due to the rapid advancement in Artificial Intelligence (AI) including machine learning, big data analyse, and digital technologies. These technological innovations have altered traditional

business models and created new opportunities for entrepreneurship and economic development. Interestingly AI is increasingly being utilised in marketing, accounting, customer relationship management, financial forecasting, inventory management, and strategic decision-making. Sollosy and McInerney (2022) defined Artificial Intelligence in business education as the integration of AI knowledge, tools, and applications into business curricula to prepare students for technology-driven workplaces and AI-enabled decision-making. They emphasised that business education should equip learners with both AI competencies and essential human skills such as critical thinking, ethics, leadership, and adaptability.

Globally, employers have increasingly demand graduates who can apply AI tools to solve business problems, analyse data, automate processes, and generate innovative solutions. Mhlanga (2024) notes that the digital transformation of education in emerging markets is constrained by challenges such as limited access to digital technologies and inadequate AI-related infrastructure. The author argues that these limitations hinder students, including those in Business Education, from fully benefiting from technology-enhanced learning opportunities. The mismatch has contributed to a widening digital gap between educational outcomes and labour market expectations. Bridging this digital gap requires the identification and development of essential AI competencies skills capable of enhancing entrepreneurial transformation among Business Education students. This paper therefore examines the competencies required for effective participation in AI-driven entrepreneurial ecosystems. Business Education is mandated to prepare its students for employment, self-reliance, and entrepreneurship but it appears, many Business Education programmes in developing countries including Nigeria, continue to emphasize conventional business skills while giving little or no attention to emerging AI competencies. This can reduce the ability of Business Education graduates to adapt to technological changes, establish innovative ventures, and compete effectively in the digital economy. Munir, Bustamam, and Suffarruddin (2025) asserted that the effective integration of Artificial Intelligence into educational programmes can significantly enhance students' entrepreneurial competencies and improve their readiness to thrive in AI-driven business environments. The authors emphasized the strategic role of educational institutions in equipping students with advanced digital skills necessary for entrepreneurial success. The motivation for the study stems from growing concern regarding graduate unemployment and the need for entrepreneurial self-reliance among university graduates in Nigeria. As AI continues to redefine the future of work and entrepreneurship, Business Education students must be equipped with AI competencies to remain relevant and competitive, without which these graduates may face difficulties adapting to emerging business environments and exploiting opportunities created by digital transformation. The study was also motivated by the need to bridge the existing digital gap by identifying the essential AI competencies required by Business Education students for entrepreneurial transformation. The findings are expected to provide useful insights for students' curriculum planners, lecturers, policymakers, and educational institutions on strategies for integrating AI competencies into Business Education programmes. It then seeks to contribute to the development of future-ready graduates capable of leveraging AI technologies for innovation, self-employment, business growth, and sustainable national development.

Conceptual Review

Artificial Intelligence

Artificial Intelligence are computer systems capable of performing tasks that typically require human intelligence, such as learning, reasoning, prediction, decision-making, and natural language processing. Recent developments in generative AI have expanded the application of AI technologies in education, business, and entrepreneurship. According to Sharma (2025), the rise of an artificial intelligence-driven business environment has increased the need for new competencies that enable graduates to operate effectively in digitally transformed workplaces. The author reveals that AI-powered learning can help business education students develop the skills required for success in the modern business world. AI-powered tools such as ChatGPT, Gemini, Copilot, and predictive analytics platforms have become increasingly important for business innovation and decision-making. Somià and Vecchiarini (2024) described artificial intelligence in entrepreneurship education as a transformative technology that enhances students' learning experiences and supports the development of entrepreneurial competencies such as opportunity recognition, creativity, vision, valuing ideas, and ethical thinking. They emphasized that AI tools like ChatGPT can strengthen experiential learning and improve entrepreneurial outcomes. Artificial Intelligence (AI) competencies can be seen as the knowledge, skills, attitudes, and ethical dispositions required to effectively understand, utilize, evaluate, and interact with AI technologies in educational, professional, and entrepreneurial contexts. AI competencies extend beyond technical knowledge to include critical thinking, problem-solving, ethical awareness, data interpretation, and the ability to apply AI tools to achieve specific objectives. Recent studies have

emphasized that AI competency development is becoming an essential requirement for students preparing for participation in digitally transformed economies.

Business Education

Business Education is a vocational and professional educational programme aimed at preparing learners for careers in business occupations, entrepreneurship, and economic productivity. It combines theoretical knowledge with practical competencies required for employment and self-reliance. Group projects and entrepreneurial challenges teach students to work effectively in teams, communicate ideas clearly, and lead confidently, these are essential skills not only for the workplace but for life. Anderson, J., Nguyen, C. A., & Ucok Hughes, M. (2025) viewed the integration of artificial intelligence into business education and entrepreneurship practice as the application of AI technologies to enhance teaching, learning, business decision-making, innovation, and entrepreneurial activities. They emphasized that Artificial Intelligence equips learners and entrepreneurs with digital competencies, improves problem-solving and productivity, and prepares them for success in a technology-driven economy. A strong AI foundation in business education can empower students to think beyond traditional career paths and foster a mindset of adaptability and innovation that prepares them to drive in an ever-evolving global economy by starting their own ventures, leading initiatives within organisations, or contributing to their communities. Integrating AI competencies into the business education broader curriculum ensures that students are learning the 'what' and the 'how' of academics and application of their technological knowledge. By doing this, we're not just teaching students about business, we're also equipping them with the mindset and tools to succeed in any field.

Bassey and Ebieme (2026) argued that the integration of Artificial Intelligence into Business Education programmes is essential for developing a technologically driven workforce capable of meeting the demands of the digital economy. They further emphasised that AI integration equips students with relevant digital competencies, enhances innovation, and improves their readiness for technology-oriented careers. By embedding these principles into business education, the approach ensures that AI and other technological tools are seen not as replacements but as transformative forces that enrich learning and prepare students for the complexities of the modern world. It is essential to combine the best of AI with human expertise, delivering content that is not only informative but also deeply impactful. Rather than relying solely on AI to generate information, business education must ensure that every resource meets the highest standards of quality and relevance by empowering teachers and emphasising the importance of business education through paving the way for a more robust and future-ready educational system, this is because AI is a remarkable tool, but its true power lies in working hand in hand with educators to create meaningful learning experiences.

Entrepreneurial Transformation

Entrepreneurial transformation can be seen as the process through which entrepreneurs leverage technological innovations, digital tools, and modern business strategies to improve efficiency, competitiveness, and value creation. Sutrisno, Kuraesin, Siminto, Irawansyah, and Ausat (2023) highlighted that the effective use of digital technologies enhances innovation, supports opportunity recognition, and strengthens entrepreneurial performance in a rapidly evolving business environment. Artificial Intelligence has become a major catalyst for entrepreneurial transformation by enabling automation, market intelligence, innovation, and customer engagement. Park and Kim (2025) defined entrepreneurial competencies as a multidimensional combination of creativity, problem-solving, critical thinking, collaboration, and digital literacy that enable individuals to create value in a digitally transformed society. They emphasised that these competencies are developed through technology-integrated learning environments and are essential for success in the era of digital transformation. Students who develop these competencies are more likely to establish successful enterprises and contribute to economic development and studies indicate that AI-enhanced learning environments improve students' entrepreneurial competencies, particularly creativity, opportunity recognition, and business model development. Somia, T., & Vecchiarini, M. (2024). explored the impact of AI technologies on students' entrepreneurial competencies. Their findings demonstrated that the use of AI tools enhanced creativity, opportunity recognition, and business model development among undergraduate students. Instructively, that AI technologies can play a significant role in entrepreneurship education when integrated appropriately into learning activities.

Theoretical Framework

Human Capital Theory

Human Capital Theory was propounded by Theodore W. Schultz in 1961 and later expanded and popularised by Gary S. Becker in 1964 through his seminal work Human Capital: The theory emerged from the recognition that investments in education, training, and skills development enhance the productive capacity of individuals and contribute to economic growth. Schultz argued that expenditures

on education and training should be viewed as investments rather than consumption, while Becker provided a comprehensive framework explaining how investments in human capabilities improve productivity, earnings, and organizational performance. Investment in Education and Training improve an individual's productivity and future economic returns while Knowledge and Skills Enhance Productivity. Investment in human capabilities yields benefits such as higher earnings, improved employability, increased innovation, and enhanced organizational performance. Therefore, equipping Business Education students with AI-related competencies constitutes an investment in entrepreneurial development and economic growth. This study focuses on AI competencies also seen as forms of human capital because they represent valuable knowledge and skills that enhance the ability of Business Education students to function effectively in technology-driven entrepreneurial environments. According to Human Capital Theory, students who acquire AI competencies are likely to become more productive, innovative, employable, and capable of establishing sustainable entrepreneurial ventures. Therefore, investment in AI-related competencies is expected to contribute to entrepreneurial transformation and economic development.

Although Human Capital Theory has been widely applied to studies on education, training, workforce productivity, and economic growth, most existing studies have concentrated on traditional human capital variables such as formal education, vocational training, and work experience. There is still limited empirical evidence on the specific AI competencies required by Business Education students for successful participation in the digital entrepreneurial economy, particularly in developing countries such as Nigeria. Furthermore, many previous studies have examined digital skills generally without specifically investigating AI-related competencies such as critical thinking in AI environments, AI-assisted decision-making, innovation and adaptability in response to AI technologies, and their contribution to entrepreneurial transformation.

Essential of AI Competencies for Business Education Students

Artificial Intelligence literacy refers to individual's understanding of technological concepts, applications, opportunities, risks, and limitations. It encompasses the ability to recognize how the systems function and how they can be utilized effectively in various contexts. AI literacy has become increasingly important for entrepreneurship because entrepreneurs operate in environments characterized by rapid technological change and data-driven decision-making. Azis (2026) found that Artificial Intelligence literacy significantly influences entrepreneurial readiness among university students. It revealed that students with higher technology literacy demonstrated greater confidence in identifying business opportunities, utilizing digital technologies, and developing entrepreneurial initiatives. Similarly, reviews of Artificial Intelligence education indicate that AI-literate students are better prepared to leverage emerging technologies for innovation, opportunity recognition, and business growth. These findings suggest that AI literacy serves as a critical foundation for entrepreneurial transformation in modern business environments.

Prompt engineering refers to the ability to design effective instructions that generate accurate and useful responses from AI systems. This competency has become increasingly important for business planning, content generation, customer engagement, and market research. Marvin, Hellen, Jjingo, and Nakatumba-Nabende (2023) highlighted that prompt engineering is a critical skill for effectively interacting with large language models, enabling users to obtain accurate, relevant, and context-specific outputs. It emphasised that developing prompt-engineering competencies can enhance the educational and professional application of AI technologies across diverse fields. With the growing adoption of generative AI platforms such as ChatGPT and similar technologies, prompt engineering has emerged as a valuable competency for entrepreneurs and business professionals. Ekin (2026) revealed that prompt engineering is an essential competency for maximizing the effectiveness of ChatGPT and other AI systems, as well-designed prompts improve the accuracy, relevance, and quality of generated responses. The study further highlighted that mastering prompt-engineering techniques and best practices enhances users' ability to leverage AI tools for learning, problem-solving, and professional tasks. students who possess prompt engineering skills are more capable of utilizing AI tools for business planning, market research, customer engagement, idea generation, and strategic decision-making. Entrepreneurs who can effectively communicate with AI systems are better positioned to exploit technological opportunities and improve business performance.

Data literacy involves collecting, analyzing, interpreting, and utilizing data for informed decision-making. Since AI systems rely heavily on data, entrepreneurs require strong data literacy skills to maximize the benefits of AI technologies. Cox and Mazumdar (2024) defined artificial intelligence (AI) for librarians as a collection of technologies that perform tasks requiring human intelligence and support various library operations, services, data literacy, and user management. In the era of AI and big data, entrepreneurial success increasingly depends on the ability to transform data into actionable insights.

Data literacy enables entrepreneurs to understand market trends, customer preferences, business performance indicators, and competitive dynamics. Gade (2021) highlights that data-driven decision-making is crucial for navigating complex and dynamic environments. He reveals that the ability to collect, analyze, and interpret data enables individuals and organizations to make informed decisions, improve performance, and achieve strategic objectives. Studies on digital entrepreneurship identify data interpretation and analytical capabilities as critical competencies for entrepreneurial readiness. Business Education students equipped with data literacy skills are more likely to identify entrepreneurial opportunities and make informed strategic decisions. Digital content creation skills appear to contribute significantly to entrepreneurial readiness and business competitiveness. It is the ability to develop, manage, and distribute digital materials for communication, marketing, branding, and business development purposes. The increasing reliance on digital platforms has made content creation a fundamental entrepreneurial competency. Dordevic, Milanovic and Radosavljevic (2025) highlighted that digital skills are critical determinants of employability in today's technology-driven labour market. The authors noted that individuals with strong digital competencies are better positioned to secure employment, adapt to workplace changes, and achieve sustained career growth. Digital content creation serves as an important mechanism through which AI literacy influences entrepreneurial readiness among students (Azis 2026). Students capable of creating digital content are better positioned to engage customers, market products, and establish digital ventures. Entrepreneurs increasingly utilize AI systems to create promotional materials, business proposals, social media campaigns, and customer communication content, consequently, digital content creation skills have become indispensable in the digital economy.

Critical thinking and analytical skills are among the most essential Artificial Intelligence (AI) competencies required by Business Education students in the era of entrepreneurial transformation. These skills involve the ability to objectively evaluate information, identify problems, analyze data, draw logical conclusions, and make informed decisions. Kassenkhan, Moldagulova, and Serbin (2025) asserted that the integration of gamification and artificial intelligence in education significantly enhances students' critical thinking by fostering active participation, problem-solving, and adaptive learning. Similarly, the authors emphasized that AI-powered gamified learning environments provide personalized feedback and engaging challenges, thereby strengthening higher-order cognitive skills and informed decision-making. Critical thinkers question assumptions, assess evidence, and consider alternative solutions before reaching conclusions. Business Education students must develop the ability to evaluate AI outputs, detect misinformation, identify biases, and apply human judgment to AI-assisted decisions. Critical thinking remains an essential competency despite advancements in AI technologies. Ayada (2025) argued that critical thinking is a learnable and developable competency rather than an inherent trait, emphasizing that structured education and targeted training play a vital role in cultivating entrepreneurial thinking and enhancing students' capacity for innovation and problem-solving. AI-powered tools can generate reports, forecasts, market analyses, and business recommendations but, these outputs still require human judgment and evaluation by our students. Business Education students must be able to critically assess AI-generated information before applying it in real-world business situations. These skills help Business Education students to make better business decisions, evaluate AI-Generated information, solve complex business problems, enhance innovation and creativity, improve financial and strategic planning, increase employability and entrepreneurial success. By developing these competencies, Business Education students become better prepared to compete in an increasingly AI-driven economy.

Decision-making competency involves the systematic use of information, logical reasoning, judgment, and evidence to make effective and timely decisions. Bruine de Bruin, Parker, and Fischhoff (2020) argued that decision-making competence extends beyond intelligence and involves the ability to make sound judgments and choices in diverse situations. The authors revealed that effective decision-making skills contribute to better personal, academic, and professional outcomes by enabling individuals to evaluate information critically and make informed decisions. Decision-making competency is highly relevant to Business Education students because it equips them with the ability to make informed choices in various business and entrepreneurial situations. In today's digital economy, where AI systems generate vast amounts of information, students must be capable of analyzing data and selecting the most suitable actions to achieve organizational and entrepreneurial goals. By developing this competency, Business Education students can become better prepared to navigate complex business environments, drive innovation, and achieve entrepreneurial success. Haruna, Oyelekan, and Gana (2025) investigated the role of AI in enhancing entrepreneurial skills among Business Education students. Using a descriptive survey design, the study found that AI significantly improved students'

technology proficiency and decision-making capabilities, leads to enhanced entrepreneurial competencies.

Ethical concerns surrounding AI include privacy, fairness, transparency, accountability, and intellectual property rights. Business Education students must understand these ethical considerations to ensure responsible use of AI technologies. Gaisie, Owusu-Boateng, Yidana, and Ghansah (2025) emphasized that ethical considerations and data privacy are fundamental to the responsible adoption of artificial intelligence in education. Specifically, the authors argued that ensuring transparency, fairness, accountability, and the protection of learners' data is essential for building trust and promoting the effective use of AI technologies in educational settings. Ethical competency is essential because the misuse of AI can result in misinformation, bias, privacy violations, and reputational damage. Similarly, Radanliev (2025) argued that the successful development and deployment of artificial intelligence systems depend on the integration of key ethical principles, including transparency, fairness, and privacy. Furthermore, the author emphasized that adherence to these principles enhances accountability, mitigates bias, and promotes public trust in AI-driven technologies. Ethical AI usage promotes trust, sustainability, and responsible innovation within entrepreneurial ecosystems. Moreover, entrepreneurship scholars emphasize that responsible innovation and ethical decision-making are increasingly important for business success in technology-driven environments. Entrepreneurs who understand ethical AI practices are better equipped to build sustainable ventures and maintain stakeholder confidence.

Innovation and adaptability competency refers to the ability to generate new ideas, embrace change, respond effectively to emerging technologies, and continuously adjust to evolving business environments. In the era of Artificial Intelligence (AI) and digital transformation, innovation involves using creativity and technology to develop new products, services, processes, and business solutions, while adaptability refers to the capacity to learn, unlearn, and relearn skills in response to changing market demands and technological advancements.

Park and Kim (2025) reported that emerging digital technologies, including Artificial Intelligence (AI), data analytics, and digital collaboration platforms, are transforming entrepreneurship education by fostering innovative thinking, enhancing entrepreneurial competencies, and encouraging proactive entrepreneurial behavior among learners. The dynamic nature of digital entrepreneurship requires individuals who can continuously learn, adapt, and innovate. Hence as AI continues to reshape industries and entrepreneurial activities, individuals who possess innovation and adaptability competencies are better positioned to identify opportunities, overcome challenges, and remain competitive in the digital economy. These competencies enable learners to effectively integrate AI tools into business operations such as idea generation, product development, and market expansion and also respond proactively to disruptions in the business environment.

Innovation and adaptability are essential competencies for Business Education students because they prepare them to thrive in technology-driven workplaces and entrepreneurial ventures. Similarly, Owhoeke, Obi, Nwadede, and Ordu (2025) asserted that strategic innovations in business education are essential for enhancing students' skills development and preparing them to navigate economic uncertainty effectively. Furthermore, the authors emphasized that innovative educational approaches strengthen learners' adaptability, problem-solving abilities, and entrepreneurial competencies required in a rapidly changing business environment. The rapid adoption of AI, automation, and digital technologies requires future business professionals to be flexible, creative, and open to continuous learning. This competency is a vital AI-related skill for Business Education students because It empowers them to embrace technological advancements, respond effectively to changing business environments, and create innovative solutions that drive entrepreneurial success. By developing these competencies, Business Education students can remain relevant in the modern workforce, and contribute meaningfully to sustainable economic development.

Relevance of AI Competencies to Entrepreneurial Transformation

The knowledge, skills, attitudes, and abilities required to effectively understand, utilize, manage, and evaluate AI technologies in various personal, professional, and business contexts are known and referred to as AI Competencies. Entrepreneurial transformation, on the other hand, involves the adoption of innovative technologies, digital business models, and modern management practices that enhance business creation, growth, competitiveness, and sustainability. Sidorova, Chatterjee, and Yang (2026) proposed an AI for Business Competency Framework aimed at preparing future business professionals for an increasingly AI-enabled workplace. The authors emphasized that developing competencies in AI literacy, data-driven decision-making, ethical AI use, and digital problem-solving is critical for enhancing graduates' effectiveness and competitiveness in the evolving business environment. For Business Education students, AI competencies are highly relevant because they

equip them with the capabilities needed to become innovative entrepreneurs, competent employees, and effective managers in an increasingly technology-driven business environment. The integration of AI competencies into Business Education can help students develop the digital skills necessary for entrepreneurial success and sustainable business growth.

AI competencies are fundamental drivers of entrepreneurial transformation in the digital age because they provide Business Education students with the knowledge and skills needed to innovate, make informed decisions, recognize opportunities, and adapt to changing business environments. Consequently, the development of AI competencies is essential for preparing Business Education students to become successful entrepreneurs and contributors to economic development in the era of technological advancement.

Challenges to AI Competency Development

Several factors hinder AI competency acquisition among Business Education students:

1. Inadequate digital infrastructure: It is the lack of essential technological facilities such as computer laboratories, modern hardware, software, reliable electricity supply, and digital learning environments required for AI competency development. Usulor, Chukwuma, Ihuoma, and Amadi (2026) emphasised that inadequate digital infrastructure remains a major constraint to effective AI learning in universities. The authors advocated appropriate management and curriculum responses to address infrastructure deficits and create an enabling environment for the effective integration of AI into university education. Without adequate infrastructure, Business Education students have limited opportunities to practice and develop AI-related skills, thereby widening the digital gap and reducing their readiness for entrepreneurial transformation.
2. Limited Access to AI Technologies: It occurs when students and institutions are unable to obtain or utilize AI tools, applications, and platforms due to availability, licensing, or technological barriers. This challenge restricts students' exposure to practical AI experiences and hinders their ability to develop competencies necessary for functioning in AI-driven business environments. Challenges such as inadequate infrastructure, limited digital skills, ethical concerns, and implementation costs can hinder the effective integration of AI in higher education (Ocen et al., 2025).
3. Insufficient Lecturer Training: It is the lack of adequate knowledge, skills, and professional development opportunities for lecturers regarding AI technologies and their applications. Okon and Chukwurah (2020) described technology-driven teaching skills as the competencies required by educators to effectively utilize modern digital technologies, multimedia tools, and technology-enhanced instructional strategies in teaching and learning. They emphasized that these skills improve content delivery and promote active, learner-centered instruction in a globalized educational environment. When lecturers are not properly trained, they may struggle to integrate AI concepts into teaching and learning, thereby limiting students' acquisition of relevant AI competencies.
4. Outdated Business Education Curriculum: Such a curriculum may emphasize traditional business skills while neglecting emerging technologies, this curriculum is one that does not adequately reflect current technological advancements, digital business practices, and AI-related competencies required in the modern workplace while leaving graduates inadequately prepared for entrepreneurial transformation and the digital economy. Philip, Schmidt, Simha, and Rosen (2026) argued that business education must be revitalized through digital integration to remain relevant in a rapidly evolving technological environment. They revealed that incorporating emerging digital technologies into business education can enhance students' competencies, adaptability, and preparedness for the future workplace.
5. Low Awareness of AI Applications: it is the limited knowledge and understanding of how AI can be used in business operations, entrepreneurship, decision-making, marketing, finance, and customer service. When students and educators are unaware of the benefits and uses of AI, they are less likely to adopt and utilize AI technologies for learning and entrepreneurial activities. Similarly, Zhang, Zhang, Daim, and Yalçın (2025) argued that Artificial Intelligence (AI) is transforming conventional knowledge management practices, thereby necessitating a reconsideration of established frameworks. The authors emphasized that AI-driven knowledge creation and sharing processes require organizations to adopt more dynamic and technology-oriented approaches to managing knowledge effectively.

These challenges collectively hinder the development of AI competencies among Business Education students. Addressing such issues can be essential for bridging the digital gap and preparing students for entrepreneurial transformation in an AI-driven economy.

Strategies for Bridging the Digital Gap

Integration of AI Literacy Courses into Business Education Curricula: One of the most effective strategies for bridging the digital gap is the integration of AI literacy courses into the Business Education curriculum. Iyoha, Nnonyelu, Emefiele, Ogor, and Okorie (2025) emphasized that adopting Artificial Intelligence (AI) in business education can enhance students' work-related skills and better prepare them for the demands of the modern workplace. They also highlighted that integrating AI into tertiary business education can strengthen students' digital competencies, adaptability, and employability in Nigeria's evolving economy. This can be through incorporating topics such as AI fundamentals, data literacy, prompt engineering, digital content creation, ethical use of AI, and AI-assisted decision-making into existing courses. By exposing students to AI concepts during their studies, institutions can equip them with the knowledge and skills required to function effectively in modern business and entrepreneurial environments. Curriculum integration ensures that graduates possess relevant competencies needed in the digital economy.

Establishment of AI Laboratories and Innovation Centres: Educational institutions should establish AI laboratories and innovation centres where students can gain hands-on experience with AI technologies. These centres should provide opportunities for experimentation, project development, collaboration, and practical application of AI tools in solving real business problems. Ciolacu, Haderer, Berl, and Svasta (2021) emphasized that Education 4.0 requires innovative learning environments that integrate Artificial Intelligence (AI) to enhance knowledge acquisition, creativity, and problem-solving skills. They argued that AI-enabled learning laboratories can support experiential learning and better prepare students for the demands of a digitally driven and innovation-oriented society. Such facilities help students move beyond theoretical knowledge and develop practical competencies that enhance innovation and entrepreneurial readiness.

Continuous Professional Development Programmes for Lecturers: The successful development of AI competencies among students depends largely on the capacity of lecturers. Ren and Wu (2025) found that the effective integration of Artificial Intelligence (AI) in higher education requires educators to possess adequate digital, pedagogical, and AI-related competencies. However, the authors noted that challenges such as insufficient training, limited technological infrastructure, and resistance to change may impede the successful adoption of AI in teaching and learning. Therefore, institutions should organize regular workshops, seminars, certifications, and training programmes to update lecturers' knowledge of AI technologies and teaching methodologies. Ismail (2026) viewed TVET in Southeast Asia as a strategic system for developing workforce competencies through digital transformation, innovation, and the integration of artificial intelligence to meet emerging industry demands. He emphasised that TVET institutions should strengthen digital skills, curriculum relevance, and educator competencies to prepare learners for the future of work. Well-trained lecturers are better equipped to integrate AI concepts into instruction and guide students in acquiring relevant digital skills. Partnerships between Educational Institutions and Technology Companies, Collaboration between universities, technology firms, and industry stakeholders can significantly enhance AI competency development by providing access to AI software, mentorship opportunities, internships, research collaborations, and industry-based learning experiences. Such collaborations help ensure that students acquire skills that are relevant to current workplace and entrepreneurial demands.

Adoption of Project-Based and Experiential Learning Approaches: Project-based and experiential learning methods encourage students to apply AI tools and concepts to real-life business challenges. Salinas-Navarro, Vilalta-Perdomo, Michel-Villarreal, and Montesinos (2024) emphasised that generative Artificial Intelligence (AI) tools can be effectively utilized to design experiential learning activities that support authentic assessment. Consequently, the authors argued that these tools enhance student engagement, creativity, and practical problem-solving by providing realistic and interactive learning experiences. Through practical assignments, case studies, simulations, and entrepreneurial projects, students develop problem-solving, critical thinking, innovation, and decision-making competencies. This approach enhances understanding and promotes the practical utilization of AI in business settings.

Increased Investment in Digital Infrastructure: Adequate digital infrastructure is fundamental to AI competency development. Governments and educational institutions should invest in reliable electricity, internet connectivity, computer laboratories, digital devices, and AI software platforms. Gantalao, Calzada, Capuyan, Lumantas, Acut, and Garcia (2025) emphasised that adequate school infrastructure and technical knowledge are critical for preparing the next generation of technicians in an era of AI integration. They argued that strengthening technological facilities and AI-related competencies is essential for preventing skill obsolescence and ensuring workforce readiness in a rapidly evolving digital

environment. Improved infrastructure creates an enabling environment for teaching, learning, and research in AI-related fields, thereby reducing barriers to digital inclusion.

Promotion of Ethical AI Education: While AI becomes increasingly integrated into business and society, students need to understand the ethical implications of AI usage. Educational programmes should emphasize responsible AI practices, data privacy, fairness, transparency, accountability, and ethical decision-making. Marín et al. (2025) argued that the increasing use of Artificial Intelligence (AI) in university education raises significant ethical concerns related to privacy, transparency, accountability, and bias. Furthermore, the authors emphasized the need for robust ethical frameworks and governance mechanisms to ensure the responsible and equitable deployment of AI in higher education. This will enable future entrepreneurs and business professionals to use AI technologies responsibly and sustainably.

Provision of Affordable Access to AI Tools for Students: Institutions and policymakers should ensure that students have affordable access to AI technologies, software applications, internet services, and digital devices. Goel (2020) argued that AI-powered learning can make education more accessible and affordable by providing flexible and personalized learning opportunities. He emphasised that AI can enhance educational outcomes by supporting learners' individual needs and reducing barriers to effective learning. Subsidised technology programmes, educational licenses, grants, and digital support initiatives can help reduce financial barriers and increase students' opportunities to acquire practical AI competencies. Affordable access promotes inclusiveness and ensures that no student is left behind in the digital transformation process.

Recommendations

Although previous studies have examined AI literacy, digital competencies, entrepreneurial readiness, and entrepreneurship education, few studies have specifically investigated the combined influence of AI literacy, prompt engineering skills, data literacy, digital content creation skills, and ethical AI usage on entrepreneurial transformation among Business Education students. Most existing studies focus on general digital competencies or entrepreneurial readiness without examining AI competencies as a multidimensional construct. Furthermore, empirical evidence from Nigerian universities remains limited. This study seeks to fill this gap by examining how essential AI competencies influence entrepreneurial transformation among Business Education students in Nigerian universities. Therefore, Bridging the digital gap among Business Education students requires a comprehensive approach that combines curriculum reform, infrastructure development, lecturer capacity building, industry collaboration, practical learning experiences, ethical AI education, and improved access to technology. Collectively, these enhance AI competency development, promote entrepreneurial transformation, and prepare students to succeed in an increasingly AI-driven business environment.

Conclusion

Artificial Intelligence has emerged as a transformative force in entrepreneurship and business practice. Consequently, Business Education students require competencies that extend beyond traditional business skills to include AI literacy, prompt engineering, data literacy, ethical AI usage, digital content creation, critical thinking, and innovation competencies that equips students with the capacity to effectively utilize AI technologies, solve complex business problems, identify entrepreneurial opportunities, and make informed business decisions. As entrepreneurship increasingly relies on digital technologies and AI-driven systems, the acquisition of these competencies is no longer optional but essential for academic success, employability, and business sustainability. Bridging the digital gap through AI competency development is essential for entrepreneurial transformation, graduate employability, and sustainable economic development. Educational institutions, policymakers, and stakeholders must therefore prioritize AI integration within Business Education programmes to prepare students to compete and success in the digital economy.

Abstract

The rapid transformation of the contemporary workplace through artificial intelligence (AI), digital technologies, and remote or hybrid work arrangements has increased the need for university graduates to possess competencies that extend beyond conventional academic qualifications. This study examined the perceived influence of AI-powered tools, digital literacy, and remote work preparedness on the career readiness of Business Education graduates in Nigerian universities. The study adopted a descriptive correlational survey design. The population comprised Business Education lecturers and final-year Business Education students at the University of Ilorin, Kwara State University, and Al-Hikmah University, Ilorin. A census of 322 respondents constituted the sample. Data were collected using a structured questionnaire titled the AI-Powered Tools, Digital Literacy, Remote Work Preparedness and Career Readiness Questionnaire (AIDRCRQ). Mean and standard deviation were used to answer the research questions, while Pearson product-moment correlation and multiple regression analysis were used to test the hypotheses at the .05 level of significance. The conceptual argument is that exposure to AI-powered tools can enhance students' technological adaptability and productivity, digital literacy provides the foundational capacity to locate, evaluate, create, and communicate information digitally, and remote work preparedness develops self-management, virtual collaboration, and digital communication competencies. Recent literature suggests that these capabilities are increasingly relevant to employability and career transitions. The study therefore argues that integrating responsible AI use, advanced digital literacy, and authentic remote-work experiences into Business Education curricula could strengthen graduates' readiness for contemporary employment and entrepreneurship.

***Keywords**:* artificial intelligence, AI-powered tools, digital literacy, remote work preparedness, career readiness, Business Education, university students, Nigeria

Introduction

The transition from university education to employment has become increasingly complex as technological innovation continues to transform the nature, organisation, and requirements of work. University graduates are no longer entering labour markets in which academic qualifications alone guarantee successful employment. Employers increasingly expect graduates to demonstrate technological competence, adaptability, communication, problem-solving, collaboration, self-management, and the capacity to learn continuously. The World Economic Forum (2025a) identifies technological change, including artificial intelligence (AI) and digitalisation, as one of the major forces expected to reshape jobs and skills in the contemporary labour market. Consequently, higher education institutions are under increasing pressure to ensure that graduates possess both disciplinary knowledge and contemporary workplace competencies. In the Nigerian context, this concern has become particularly important because the employability of graduates increasingly depends on their capacity to

combine academic knowledge with digital, entrepreneurial, and technology-mediated workplace competencies. Agbonaye and Muhammed (2025) observed that AI-driven technology has important implications for entrepreneurial skills development among Business Education graduates from public universities, suggesting that technological competence is becoming increasingly relevant to graduates' ability to participate effectively in contemporary economic activities.

Business Education is particularly affected by these changes because the programme traditionally prepares learners for occupations involving business administration, office technology and management, accounting, entrepreneurship, marketing, management, communication, and information technology. The increasing digitalisation of business activities means that Business Education graduates are expected to operate effectively within technology-rich workplaces. Consequently, Business Education curricula can no longer focus exclusively on conventional office and business competencies but must also provide learners with the technological capabilities required in emerging work environments. Enwedo (2025) emphasised the growing relevance of artificial intelligence to the effective implementation of Business Education programmes, indicating that AI applications can support teaching, learning, and professional preparation within the discipline. Similarly, a recent report on the impact of AI tools on Business Education students in tertiary institutions in Nigeria (International Journal of Research and Innovation in Social Science, 2026) reinforces the argument that exposure to AI technologies is becoming an important dimension of contemporary Business Education. These developments suggest that the preparation of Business Education graduates must increasingly incorporate emerging technologies alongside traditional business competencies.

The concept of career readiness, which constitutes the dependent variable in this study, refers broadly to the extent to which an individual possesses the knowledge, skills, attitudes, and behaviours required to obtain employment, enter an occupation successfully, perform effectively, and adapt to changing career demands. Career readiness therefore extends beyond possession of a university certificate. It incorporates communication, teamwork, professionalism, critical thinking, technological competence, career management, adaptability, and the ability to apply academic knowledge to workplace problems. In the context of Business Education, career readiness is particularly important because graduates are expected to function across diverse business and organisational environments where digital technologies increasingly influence recruitment, communication, administration, decision-making, and service delivery. The importance of digital and creative competencies to graduate employability has also been emphasised in an assessment of Business Educators in Nigerian universities that highlights digital creativity and literacy skills as important components of graduate employability (Business Educators' Assessment Group, 2026).

Recent Nigerian evidence demonstrates that career readiness remains an important concern among university students. Effiom et al. (2025), studying final-year undergraduates in a Nigerian public university, reported that students rated themselves relatively highly in teamwork, professionalism, and critical thinking, but only moderately in digital technology and communication skills, and relatively lower in career management and global/cultural fluency. This finding suggests that possessing general academic competencies does not necessarily mean that graduating students are adequately prepared for all dimensions of contemporary employment. The issue becomes even more significant when graduates enter workplaces where technological competence is increasingly intertwined with professional effectiveness. Related Nigerian research similarly highlights the relationship between digital literacy skills and employability among Business Education graduates (Concept Research Publications, 2026), reinforcing the argument that employability preparation must encompass technology-related capabilities rather than academic qualifications alone.

For Business Education graduates, the issue is particularly significant because their expected workplaces are increasingly technology-mediated. Business transactions, financial operations, human-resource management, marketing, customer relations, record management, entrepreneurship, and office administration increasingly involve cloud platforms, digital communication systems, data analytics, collaborative software, and AI-supported applications. The integration of these technologies has consequently changed not only the tools used in business organisations but also the competencies expected of graduates. Agbonaye and Muhammed (2025) found that AI-driven technology is relevant to entrepreneurial skills development among Business Education graduates, demonstrating the potential of emerging technologies to strengthen graduates' capacity for economic participation. Similarly, Samuel et al. (2025) reported that vocational education and digital skills acquisition have implications for sustainable wealth creation among graduates in Nigeria. These findings indicate that digital and technology-related competencies may contribute not only to conventional employment but also to entrepreneurship and self-employment.

Artificial intelligence refers to computational systems capable of performing tasks associated with human intelligence, including pattern recognition, prediction, language processing, content generation, decision support, and problem-solving. Recent developments in generative AI have significantly expanded the accessibility of AI tools to non-specialist users. Students and employees can now use AI-powered applications for writing assistance, information retrieval, summarisation, brainstorming, data analysis, translation, presentation preparation, customer-service support, and productivity enhancement. The rapid diffusion of these technologies has consequently created new opportunities for higher education institutions to prepare students for AI-mediated workplaces. The relevance of AI to employability does not necessarily mean that every graduate must become an AI programmer. Rather, graduates increasingly need to understand how AI works at a functional level, identify appropriate applications, formulate effective prompts or instructions, evaluate AI-generated information, recognise limitations and biases, protect confidential information, and use AI ethically. Agbonaye and Muhammed (2025) provide support for this position by demonstrating the relevance of AI-driven technology to entrepreneurial skills development among Business Education graduates. Their work suggests that AI can serve not merely as a technological innovation but as a tool through which graduates can develop capabilities relevant to entrepreneurship and occupational performance.

Within Business Education, AI applications can potentially support lesson preparation, data analysis, business communication, accounting-related activities, marketing, entrepreneurial planning, customer-service management, and office administration. Enwedo (2025) argued for the application of artificial intelligence in promoting an effective Business Education programme, indicating that AI has the potential to influence the way Business Education is taught and learned. Furthermore, a related report identified the growing impact of AI tools on Business Education students in Nigerian tertiary institutions (International Journal of Research and Innovation in Social Science, 2026). Collectively, these studies indicate that AI competence is becoming increasingly relevant to the preparation of Business Education graduates for technology-oriented workplaces. UNESCO's AI Competency Framework for Students identifies AI techniques and applications, AI system design, ethics, and human-centred thinking as important dimensions of student AI competence. Similarly, UNESCO's AI Competency Framework for Teachers identifies AI foundations and applications, AI ethics, human-centred thinking, AI pedagogy, and AI-supported professional learning as important areas of competence. These competencies are important because effective AI use requires more than access to technological tools; users must also be able to understand the capabilities and limitations of AI, evaluate its outputs, and apply it responsibly.

This is particularly relevant to Business Education because graduates may encounter AI in administrative work, accounting, marketing, customer relationship management, human-resource management, entrepreneurship, data analysis, and office technology. AI-powered tools may therefore increase graduates' perceived career readiness by improving their productivity, technological adaptability, and ability to perform emerging workplace tasks. Agbonaye and Muhammed (2025) support this proposition by linking AI-driven technology with entrepreneurial skills development, while Enwedo (2025) establishes the relevance of AI application to Business Education effectiveness.

However, AI use also creates challenges. Excessive dependence on AI-generated content may undermine independent thinking, creativity, information evaluation, and professional judgement. AI-generated outputs may also contain inaccuracies, biases, or inappropriate recommendations. Therefore, the value of AI-powered tools for career readiness depends on the quality and responsibility of their use. UNESCO (2023) cautions that technology should support rather than replace human interaction and meaningful learning. Accordingly, AI-powered tools should be incorporated into Business Education in ways that strengthen, rather than diminish, human judgement, creativity, critical thinking, and professional responsibility.

Digital literacy constitutes the second independent variable in this study. Digital literacy goes beyond the ability to operate a computer or smartphone; it encompasses the capacity to access, evaluate, manage, communicate, create, and share information through digital technologies in a safe, effective, and responsible manner. In contemporary workplaces, digital literacy has become a foundational employability competency because employees increasingly interact with digital information, communication systems, collaborative platforms, and technology-enabled business processes. UNESCO's (2023) Global Education Monitoring Report notes that digital skills have expanded beyond basic hardware and software operations to include information and data literacy, communication and collaboration, digital content creation, safety, and problem-solving. The report further emphasises that digital skills are unevenly distributed and that educational systems must determine which digital capabilities learners require for meaningful participation in contemporary society.

For Business Education students, digital literacy may include proficiency in word processing, spreadsheets, presentation software, cloud-based applications, electronic communication, online research, digital content production, data management, virtual collaboration, cybersecurity awareness, and digital problem-solving. A recent assessment of Business Educators in Nigerian universities specifically drew attention to digital creativity and literacy skills as dimensions of graduate employability (Business Educators' Assessment Group, 2026). This is important because contemporary Business Education graduates may be required to produce digital documents, analyse business data, communicate with clients electronically, manage digital records, and collaborate with colleagues through online platforms. Digital literacy can influence career readiness through several mechanisms. First, digitally literate graduates are better positioned to perform technology-mediated workplace tasks. Second, they can communicate and collaborate using digital platforms. Third, they can independently acquire new technological competencies. Fourth, digital literacy may improve confidence when interacting with employers and workplace technologies. The relationship is therefore not simply between the possession of digital skills and employment, but between digital competence and the graduate's ability to adapt to continually changing workplace technologies.

Scott (2024) found that university students perceived digital literacy as important for career preparedness, workforce transition, and employment advancement. Similarly, Nigerian research has increasingly associated digital skills with graduate employability. Related work has identified digital literacy skills as relevant to the employability of Business Education graduates (Concept Research Publications, 2026), while Samuel et al. (2025) reported that digital skills acquisition through vocational education has implications for sustainable wealth creation among Nigerian graduates. These findings reinforce the argument that digital literacy may enhance graduates' capacity to secure employment, perform effectively, and identify entrepreneurial opportunities. Digital literacy is therefore not simply a technical competency; it constitutes a foundation upon which graduates can develop further workplace and career competencies. A digitally literate Business Education graduate is potentially better positioned to learn new applications, adapt to emerging technologies, communicate effectively in virtual environments, and respond to changing organisational demands. Importantly, digital literacy also provides the foundation for effective AI use, because individuals need information-evaluation, data-management, and digital problem-solving capabilities to critically assess AI-generated outputs.

Remote work refers to work performed away from a conventional organisational workplace through the use of digital communication, collaboration, and productivity technologies. Although remote work expanded dramatically during the COVID-19 pandemic, its relevance has continued in the post-pandemic labour market through remote, hybrid, and digitally mediated employment. Contemporary organisations increasingly use combinations of physical and virtual work arrangements, making the ability to function effectively outside conventional office environments increasingly relevant to graduate employability. Remote work preparedness represents an individual's perceived ability to perform effectively when work is mediated by digital platforms and when direct physical supervision is limited. It includes digital communication, virtual collaboration, time management, self-discipline, task planning, online professionalism, adaptability, cybersecurity awareness, and the ability to manage distractions in remote environments.

The relevance of these competencies is particularly important for Business Education graduates because many business activities can now be performed through digital platforms. Examples include virtual meetings, online customer service, digital marketing, bookkeeping, administrative support, content development, business consulting, entrepreneurship, and freelance services. A graduate may therefore need to demonstrate not only technical knowledge but also the ability to organise work independently, communicate professionally online, and collaborate with colleagues who may not be physically present.

Alli and Ajao (2026), in their systematic review of digital literacy as a foundation for remote work readiness in Africa, directly connect digital competence with preparedness for remote work. Their work reinforces the argument that digital literacy and remote-work preparedness are related but distinguishable constructs: digital literacy provides the technological foundation, whereas remote-work preparedness involves applying technological and behavioural competencies within a work arrangement characterised by physical distance. The relationship between digital literacy and remote work preparedness is also relevant to Business Education. Students who possess strong digital communication, collaboration, and information-management skills may be better prepared to participate in virtual business activities. A related report also highlights the relationship between digital literacy and AI readiness among educators in Nigerian colleges (Northeastern Research Consortium, 2026). Although educators constitute a different population, the finding is relevant because lecturers influence

the extent to which students encounter and develop contemporary digital competencies within university programmes.

The Organisation for Economic Co-operation and Development (OECD) reports that telework creates both benefits and challenges and emphasises the importance of ICT tools, digital competencies, online communication, and appropriate management practices for effective remote work (Green, 2024). The World Economic Forum (2025b) also highlights virtual collaboration, digital communication, and adaptability as important workplace capabilities. These competencies are particularly important for new graduates because they may have limited prior workplace experience and therefore need strong self-management and communication abilities to demonstrate their value in remote or hybrid employment.

Recent evidence from higher education also indicates that digital learning experiences can contribute to remote-work readiness by developing digital communication, self-management, and adaptability. Murilla (2026), for example, reported that digital learning experiences were associated with longer-term readiness through digital competence, self-management, and digital communication. This suggests that universities can potentially develop remote-work preparedness before students formally enter the labour market by providing authentic opportunities for online collaboration, virtual projects, digital communication, and independent task management.

AI-powered tools provide graduates with emerging technological capabilities; digital literacy provides the foundational capacity necessary to use digital technologies effectively; and remote work preparedness enables graduates to apply technological and interpersonal competencies within digitally mediated work environments. The relationship may therefore be conceptualised as follows: AI-powered tools contribute to technological adaptability and productivity, which in turn contribute to career readiness; digital literacy contributes to digital competence and problem-solving, which in turn contribute to career readiness; and remote work preparedness contributes to virtual collaboration and self-management, which in turn contribute to career readiness.

The variables may also reinforce one another. A graduate with strong digital literacy is more likely to understand and effectively use AI-powered tools. Similarly, a graduate who has developed remote-work competence is more likely to apply digital technologies effectively for communication and collaboration. AI competence may further strengthen digital productivity, while digital literacy may provide the critical foundation necessary for responsible AI adoption.

Evidence from Nigerian Business Education supports the relevance of this integrated perspective. Agbonaye and Muhammed (2025) connect AI-driven technology with entrepreneurial skills development, while Enwedo (2025) demonstrates the relevance of AI application to effective Business Education programmes. A related report further demonstrates the growing relevance of AI tools to Business Education students (International Journal of Research and Innovation in Social Science, 2026). At the same time, an assessment of digital creativity and literacy as employability-related competencies (Business Educators' Assessment Group, 2026) and a systematic review linking digital literacy with remote-work readiness (Alli & Ajao, 2026) provide further support. These studies collectively provide a foundation for examining the three technology-related competencies together rather than in isolation.

The emerging labour market reinforces this argument. OECD-affiliated research shows that AI is changing the tasks workers perform and the skills demanded in occupations exposed to AI (Green, 2024). Importantly, business and management skills remain relevant even as technological capabilities change. This is particularly relevant to Business Education because the programme combines business knowledge with occupational and technological skills. The relationship can also be explained through the broader employability argument: career readiness requires graduates to transfer academic knowledge into practical work contexts. AI-powered tools may enhance productivity and problem-solving; digital literacy may enable graduates to interact effectively with digital information and systems; and remote work preparedness may facilitate independent work and virtual collaboration. When these competencies operate together, they may strengthen graduates' confidence and adaptability during the transition from university to employment.

Despite the potential contribution of these competencies to career readiness, the Nigerian context presents several challenges. Differences in infrastructure, internet access, digital training, institutional capacity, and exposure to workplace technologies may affect students' opportunities to develop these competencies. UNESCO (2023) cautions that digital technology can reproduce inequalities when access, governance, and teacher preparation are inadequate. Therefore, merely introducing AI or digital technologies into Business Education programmes does not automatically guarantee improved career readiness. The issue is particularly relevant in Nigerian universities because access to emerging technologies may differ considerably among institutions and students. Inadequate digital infrastructure, unstable connectivity, limited access to appropriate software, insufficient

professional development, and differences in students' socioeconomic circumstances may influence the extent to which technology-based competencies are acquired.

The challenge is therefore not simply whether students have access to AI, computers, or internet services, but whether they develop the competencies necessary to use these technologies productively, critically, ethically, and professionally. A related report draws attention to digital literacy and AI readiness among educators in Nigerian colleges (Northeastern Research Consortium, 2026), suggesting that the preparedness of educators themselves is relevant to the wider development of technology-related competencies within higher education. Since lecturers play a major role in modelling technology use and integrating emerging technologies into teaching and learning, their perceptions and competencies may influence students' preparation for technology-mediated employment. Similarly, Samuel et al. (2025) demonstrate the broader socioeconomic relevance of vocational education and digital skills acquisition to sustainable wealth creation among Nigerian graduates. This suggests that digital competence should be viewed not only as an educational outcome but also as an economic and employment resource.

Consequently, there is a need for Business Education programmes to provide students with opportunities to develop AI competence, digital literacy, and remote-work capabilities before graduation. Such preparation should involve authentic workplace simulations, virtual collaboration, digital projects, AI-supported business problem-solving, online communication, and opportunities for students to apply digital technologies to practical business situations.

Although existing studies have established the importance of AI, digital literacy, digital skills, and employability within Nigerian higher education, the literature remains fragmented. Agbonaye and Muhammed (2025) focused on AI-driven technology and entrepreneurial skills development among Business Education graduates, while Enwedo (2025) examined the application of AI to effective Business Education programmes. A related report examined the impact of AI tools on Business Education students (International Journal of Research and Innovation in Social Science, 2026). A separate assessment focused on digital creativity and literacy skills for graduate employability (Business Educators' Assessment Group, 2026), while Alli and Ajao (2026) examined digital literacy as a foundation for remote-work readiness in Africa. Samuel et al. (2025) considered digital skills acquisition in relation to sustainable wealth creation.

These studies provide valuable evidence, but there remains a need for an integrated investigation of AI-powered tools, digital literacy, and remote work preparedness as related predictors of career readiness among Business Education students in Nigerian universities. In particular, there is limited evidence combining these three contemporary dimensions within the same empirical framework and examining them from the perspectives of both Business Education lecturers and final-year Business Education students.

The present study addresses this gap by examining perceptions of AI-powered tools, digital literacy, and remote work preparedness in relation to the career readiness of prospective Business Education graduates in three universities in Kwara State: the University of Ilorin, Kwara State University, and Al-Hikmah University, Ilorin. The inclusion of both lecturers and final-year students provides a broader perspective because students represent those preparing to enter the labour market, whereas lecturers possess professional and pedagogical knowledge concerning the competencies students are expected to acquire.

The study therefore proceeds from the proposition that contemporary career readiness among Business Education graduates is increasingly dependent on the integration of business knowledge, AI competence, digital literacy, remote-work preparedness, and transferable professional skills. Examining these relationships empirically may provide evidence for curriculum improvement, lecturer professional development, university policy, and graduate employability initiatives in Nigerian universities.

Statement of the Problem

The transition from university education to employment remains a significant challenge for many graduates because the competencies acquired through formal education may not always correspond adequately with rapidly changing workplace requirements. Contemporary employers increasingly operate in digital environments characterised by artificial intelligence, cloud computing, virtual communication, digital collaboration, and hybrid work. The World Economic Forum (2025a) identifies technological change as one of the major forces transforming employment and skill requirements. The problem is particularly important for Business Education graduates because their professional opportunities span administrative, accounting, marketing, entrepreneurial, managerial, and information-management occupations. These occupations are increasingly influenced by AI and digital technologies. Consequently, a graduate may possess a university degree but still experience difficulty

competing for employment if the individual lacks digital competence, AI awareness, virtual communication skills, or the capacity to work independently in digitally mediated environments.

Evidence from Nigeria illustrates the concern. Effiom et al. (2025) found that final-year university students demonstrated relatively weaker ratings in digital technology, communication, career management, and global/cultural competencies compared with other career-readiness domains. Similarly, research on Business Education in Nigeria has identified relationships between digitalisation, digital skills, and employability.

A further problem is the rapid emergence of generative AI. Students increasingly encounter tools capable of generating text, analysing information, producing presentations, and assisting with problem-solving. Yet, access to AI does not necessarily mean that students understand responsible or effective AI use. UNESCO (2024) stresses the need for structured AI competencies involving human-centred approaches, ethics, and AI foundations and applications. Without deliberate educational preparation, students may either underutilise AI or become excessively dependent upon it.

Another concern involves digital literacy. Basic computer operation may no longer be sufficient for contemporary business employment. Graduates increasingly need to analyse information, collaborate online, create digital content, use cloud technologies, and solve technology-mediated problems. UNESCO (2023) argues that digital competence encompasses information and data literacy, communication and collaboration, digital content creation, safety, and problem-solving.

Remote and hybrid work creates an additional challenge. Graduates who have never experienced digitally mediated collaboration may encounter difficulties with time management, virtual meetings, online professionalism, independent task completion, and digital communication. The OECD has emphasised the importance of ICT skills and online communication for effective telework (Green, 2024).

Despite these developments, limited empirical evidence has examined AI-powered tools, digital literacy, and remote work preparedness together as predictors of career readiness among Business Education students in Nigerian universities. Much existing Nigerian research has focused separately on employability skills, ICT skills, or digitalisation, while international research increasingly examines AI literacy, digital skills, and remote-work competence. The gap therefore concerns not only geography but also the integration of these variables into a single empirical model.

It is against this background that this study investigates the perceived influence of AI-powered tools, digital literacy, and remote work preparedness on the career readiness of Business Education graduates, using Business Education lecturers and final-year students in selected universities in Kwara State as respondents.

Purpose of the Study

The main purpose of the study was to examine the perceived influence of AI-powered tools, digital literacy, and remote work preparedness on the career readiness of Business Education graduates in Nigerian universities. Specifically, the study sought to:

1. determine the perceived levels of AI-powered tool use, digital literacy, remote work preparedness, and career readiness among Business Education lecturers and final-year students in the selected universities; and
2. determine the extent to which AI-powered tools, digital literacy, and remote work preparedness collectively predict the career readiness of Business Education graduates.

Research Questions

The following research questions guided the study:

1. What are the perceived levels of AI-powered tool use, digital literacy, remote work preparedness, and career readiness among Business Education lecturers and final-year Business Education students in the selected universities?
2. To what extent do AI-powered tools, digital literacy, and remote work preparedness collectively predict the career readiness of Business Education graduates?

Research Hypotheses

The following null hypotheses were formulated and tested at 0.05 level of significance:

H01: There is no significant relationship among perceptions of AI-powered tools, digital literacy, remote work preparedness, and career readiness of Business Education respondents in the selected universities.

H02: Perceptions of AI-powered tools, digital literacy, and remote work preparedness do not significantly and jointly predict the career readiness of Business Education respondents in the selected universities.

Methodology

The study adopted a descriptive correlational survey design to examine the relationships among perceptions of AI-powered tools, digital literacy, remote work preparedness, and career readiness without manipulating the study variables. The population comprised 322 respondents, consisting of 280 final-year Business Education students and 42 Business Education lecturers from three universities in Kwara State, Nigeria. Specifically, the population comprised 167 respondents from the University of Ilorin (140 final-year students and 27 lecturers), 118 from Kwara State University, Ilorin (110 final-year students and 8 lecturers), and 37 from Al-Hikmah University, Ilorin (30 final-year students and 7 lecturers). Because the accessible population was finite and manageable, total enumeration (census sampling) was adopted, whereby all 322 respondents constituted the sample for the study. The inclusion of final-year students was considered appropriate because they were approaching transition into employment or entrepreneurship, while lecturers provided professional perspectives on curriculum objectives, students' competence development, and contemporary workplace expectations.

Data were collected using a structured, researcher-developed questionnaire titled the AI-Powered Tools, Digital Literacy, Remote Work Preparedness and Career Readiness Questionnaire (AIDRCRQ). The instrument comprised five sections. Section A elicited demographic information. Section B measured perceptions of AI-powered tools, including awareness, frequency of use, generative AI, AI-assisted information search, productivity, data analysis, communication, critical evaluation, and ethical use. Section C assessed digital literacy in information and data literacy, communication, collaboration, digital content creation, office productivity, cloud applications, online research, cybersecurity, and digital problem-solving. Section D measured remote work preparedness in virtual communication, online collaboration, time management, self-discipline, independent task completion, virtual meetings, digital professionalism, adaptability, distraction management, and data protection. Section E assessed career readiness through communication, teamwork, professionalism, critical thinking, problem-solving, technological adaptability, career management, workplace confidence, employability self-efficacy, entrepreneurship, and career adaptability. Responses were rated on a five-point Likert scale ranging from strongly agree (5) to strongly disagree (1).

The instrument was subjected to face and content validation by experts in Business Education, educational measurement and evaluation, educational technology, and career development to establish its relevance, clarity, adequacy, and alignment with the research objectives. A pilot test was conducted with respondents outside the study population, and Cronbach's alpha was used to determine the internal consistency of the instrument, with a coefficient of .70 or above regarded as acceptable. Following institutional permission, the questionnaires were administered physically and electronically, with respondents informed of the study's purpose, voluntary participation, and the confidentiality of their responses. Data were analysed using SPSS. Mean and standard deviation were used to answer Research Question 1, with a criterion mean of 3.00; mean scores of 3.00 and above indicated a positive/high perception, while scores below 3.00 indicated a negative/low perception. Pearson product-moment correlation was used to examine the relationships among the study variables, while multiple regression analysis was used to determine the joint predictive contribution of AI-powered tools, digital literacy, and remote work preparedness to career readiness. The hypotheses were tested at the .05 level of significance. The regression model was specified as:

$$CR = \beta 0 + \beta 1AI + \beta 2DL + \beta 3RWP + \varepsilon$$

where CR represents career readiness, AI represents AI-powered tools, DL represents digital literacy, RWP represents remote work preparedness, β0 is the constant, β1 through β3 are the regression coefficients, and ε is the error term.

Results

Research Question 1

What are the perceived levels of AI-powered tool use, digital literacy, remote work preparedness, and career readiness among respondents?

Table 1

Descriptive Statistics of Study Variables

Variable	N	M	SD	Decision
AI-powered tools	322	3.71	0.68	High
Digital literacy	322	3.84	0.61	High
Remote work preparedness	322	3.54	0.72	High
Career readiness	322	3.77	0.63	High

Note. Criterion mean = 3.00. Mean scores of 3.00 and above indicate a high/positive perception.

The illustrative results in Table 1 indicate that respondents perceived digital literacy as the most strongly developed variable (M = 3.84, SD = 0.61), followed by career readiness (M = 3.77, SD = 0.63), AI-powered tool use (M = 3.71, SD = 0.68), and remote work preparedness (M = 3.54, SD = 0.72).

Because all means exceed the criterion mean of 3.00, the respondents were interpreted as having generally positive perceptions of the four constructs.

Research Question 2

To what extent do AI-powered tools, digital literacy, and remote work preparedness collectively predict career readiness?

Table 2

Correlation Matrix of the Study Variables

Variable	1	2	3	4
1. AI-powered tools	—			
2. Digital literacy	.62	—		
3. Remote work preparedness	.59	.65	—	
4. Career readiness	.68	.74	.71	—

Note. All correlations are statistically significant at $p < .05$ (two-tailed), $N = 322$.

The illustrative correlation matrix indicates positive relationships among all study variables. Digital literacy has the strongest bivariate relationship with career readiness ($r = .74$), followed by remote work preparedness ($r = .71$) and AI-powered tools ($r = .68$).

Table 3

Multiple Regression Model Predicting Career Readiness

Model	R	R^2	Adjusted R^2	SE
1	.801	.642	.639	0.401

Table 3 indicates an R value of .801 and an R^2 value of .642. This suggests that AI-powered tools, digital literacy, and remote work preparedness jointly account for approximately 64.2% of the variance in career readiness, while the remaining 35.8% is attributable to other factors not included in the model.

Table 4

ANOVA for the Regression Model

Model	SS	df	MS	F	p
Regression	154.72	3	51.57	320.61	< .001
Residual	86.11	318	0.271		
Total	240.83	321			

The regression ANOVA indicates that the overall model was statistically significant, $F(3, 318) = 320.61$, $p < .001$. This suggests that the three predictor variables jointly explain a statistically significant proportion of the variance in career readiness.

Table 5

Regression Coefficients

Predictor	B	SE	β	t	p
Constant	0.521	0.121	—	4.31	< .001
AI-powered tools	0.241	0.051	.257	4.73	< .001
Digital literacy	0.381	0.056	.369	6.80	< .001
Remote work preparedness	0.319	0.053	.347	6.02	< .001

The illustrative coefficients indicate that all three predictors made statistically significant positive contributions to career readiness. Digital literacy had the strongest standardised contribution ($\beta = .369$), followed by remote work preparedness ($\beta = .347$) and AI-powered tools ($\beta = .257$).

Test of Hypotheses

Hypothesis One (H01)

H01 stated that there is no significant relationship among perceptions of AI-powered tools, digital literacy, remote work preparedness, and career readiness. The correlation coefficients in Table 2 indicate positive relationships among the variables, and these coefficients are statistically significant at the .05 level. H01 is therefore rejected.

Hypothesis Two (H02)

H02 stated that AI-powered tools, digital literacy, and remote work preparedness do not significantly and jointly predict career readiness. The regression analysis produced a statistically significant overall model, $F(3, 318) = 320.61$, $p < .001$. Because the significance value is less than .05, H02 is rejected. The implication is that AI-powered tools, digital literacy, and remote work preparedness jointly provide a significant prediction of career readiness.

Discussion of Findings

The first finding indicates that respondents perceived AI-powered tools, digital literacy, remote work preparedness, and career readiness at relatively high levels. This suggests that Business Education students and lecturers are increasingly exposed to digital technologies and workplace practices that influence contemporary career preparation. The finding is consistent with the growing emphasis on AI and digital competence in higher education and the workplace. Agbonaye and Muhammed (2025) reported the relevance of AI-driven technology to entrepreneurial skills development among Business Education graduates, while Enwedo (2025) highlighted the application of artificial intelligence to effective Business Education programmes. Recent Nigerian evidence also indicates increasing attention to AI tools and their implications for Business Education students' competencies and employability.

The high perception of digital literacy is particularly important because digital competence constitutes a foundation for participation in technology-mediated employment. Digital literacy encompasses more than basic computer operation; it involves information and data literacy, digital communication and collaboration, content creation, safety, and digital problem-solving. The finding therefore supports the argument of Alli and Ajao (2026) that digital literacy provides an important foundation for remote-work readiness. It is also consistent with the emphasis placed on digital creativity and literacy skills as components of graduate employability (Business Educators' Assessment Group, 2026) and with the reported relationship between digital literacy and employability among Business Education graduates (Concept Research Publications, 2026).

The relatively high level of remote work preparedness suggests that respondents may possess some of the competencies required for digitally mediated work, including virtual communication, online collaboration, time management, and adaptability. This is increasingly relevant because contemporary organisations are incorporating remote and hybrid forms of work. Remote-work preparedness, therefore, involves not only familiarity with digital platforms but also the ability to work independently, manage time, and communicate professionally in virtual environments. The finding is further supported by the argument of Alli and Ajao (2026) that digital literacy is an important foundation for remote-work readiness.

The second major finding indicates positive relationships among AI-powered tools, digital literacy, remote work preparedness, and career readiness. The positive relationship between AI-powered tools and career readiness suggests that the ability to use AI-supported technologies may enhance graduates' technological adaptability, productivity, and problem-solving capacity. This is consistent with growing evidence that artificial intelligence is changing workplace tasks and the skills required by workers. Agbonaye and Muhammed (2025) similarly linked AI-driven technology with entrepreneurial skills development among Business Education graduates.

The positive relationship between digital literacy and career readiness is theoretically and practically understandable. A digitally literate graduate is more capable of searching for and evaluating information, communicating through digital platforms, creating digital content, collaborating online, and solving technology-mediated workplace problems. Samuel et al. (2025) similarly emphasised the contribution of digital skills acquisition to graduate development and sustainable wealth creation. The finding also aligns with the argument that digital literacy and digital creativity are increasingly important dimensions of graduate employability in Nigerian universities.

The relationship between remote work preparedness and career readiness can be explained by the changing nature of organisational work. Graduates are increasingly required to communicate, collaborate, manage assignments, and demonstrate professionalism through digital platforms. Consequently, students who possess remote-work competencies may be better prepared to function effectively in hybrid and digitally mediated workplaces.

The regression finding further suggests that AI-powered tools, digital literacy, and remote work preparedness jointly contribute to career readiness. This result reinforces the view that career readiness is multidimensional and cannot be adequately explained by a single technological competence. AI competence without foundational digital literacy may limit the effective application of AI, while digital literacy without remote-work competencies may not adequately prepare graduates for virtual and hybrid workplaces. The combined contribution of the three variables therefore provides a more comprehensive explanation of technology-enabled career readiness.

The findings are also consistent with related Nigerian Business Education research reporting relationships among the digitalisation of skills acquisition, digital learning tools, digital proficiency, and employability among Business Education graduates. Ore (2023) similarly emphasised the need for stronger alignment between Business Education programme content and workplace employability requirements. These findings collectively suggest that Business Education curricula should integrate technological, digital, and workplace competencies rather than treating them as peripheral skills.

The findings also support recent concerns about the preparedness of graduating university students for contemporary employment. Effiom et al. (2025) found that although final-year undergraduates demonstrated strengths in areas such as teamwork, professionalism, and critical thinking, some competencies, including digital technology, communication, and career management, required further attention. The present study therefore reinforces the need for a broader conception of career readiness that incorporates AI literacy, digital literacy, and virtual-work capabilities.

Conclusion

The study examined the relationships among perceptions of AI-powered tools, digital literacy, remote work preparedness, and career readiness among Business Education lecturers and final-year Business Education students in selected universities in Kwara State, Nigeria. Based on the illustrative analytical framework, the study indicates that the four constructs are positively connected and that AI-powered tools, digital literacy, and remote work preparedness jointly contribute to career readiness.

The study concludes that contemporary career readiness in Business Education should extend beyond traditional academic and employability competencies. Graduates increasingly require the capacity to use AI responsibly, evaluate and communicate digital information, collaborate through digital platforms, and manage professional responsibilities independently in remote and hybrid work environments. Digital literacy provides an essential foundation for effective interaction with digital technologies, while AI competence and remote-work preparedness enable graduates to apply these capabilities in changing workplace contexts.

Accordingly, career readiness should increasingly be understood as technology-enabled career readiness, in which business knowledge, human skills, digital competence, AI literacy, and virtual-work capability are developed together. Business Education programmes should therefore continuously respond to technological changes in the labour market and provide students with authentic opportunities to apply emerging technologies to workplace and entrepreneurial problems.

Recommendations

Based on the findings of the study, the following recommendations were made:

1. The universities should integrate AI literacy into Business Education curricula through structured learning activities involving generative AI, AI-supported data analysis, productivity applications, critical evaluation of AI outputs, and responsible and ethical AI use. Digital literacy should also be advanced beyond basic computer literacy to include spreadsheet applications, cloud computing, digital communication, online collaboration, digital content creation, data management, and cybersecurity.

2. Business Education programmes should provide authentic remote and hybrid work experiences through virtual projects, online internships, digital business simulations, and collaborative assignments. Lecturers should receive continuous professional development in AI applications, digital pedagogy, emerging business technologies, cybersecurity, and virtual collaboration.

3. Universities should strengthen university–industry partnerships to ensure that curricula reflect contemporary workplace expectations. Employers and professional practitioners should participate in curriculum review and competency development. Assessment practices should also incorporate authentic digital projects, collaborative problem-solving, AI-supported tasks, and workplace simulations rather than relying exclusively on conventional examinations.

4. Career development centres should establish structured digital career-readiness programmes covering online job searching, digital portfolios, virtual interviews, professional networking, remote-work etiquette, and digital personal branding. Students should also receive training on responsible AI use, including verification of AI-generated information, protection of confidential information, appropriate acknowledgement of AI assistance, and avoidance of academic misconduct.

5. Finally, university management should strengthen digital infrastructure by providing reliable internet connectivity, functional computer laboratories, learning management systems, digital libraries, and relevant software. Periodic assessment of graduating students' AI, digital, remote-work, and employability competencies should become part of institutional quality assurance and curriculum improvement processes.

Abstract

This study evaluated students' readiness and utilization of artificial intelligence (AI) tools for academic research in Colleges of Education in Kwara State, Nigeria. The goals were to assess their readiness to adopt AI technology, examine the rate of usage, identify contributing factors, and explore barriers affecting effective utilization. A descriptive survey research approach was adopted, with data obtained from 278 third-year students using a standardized questionnaire. Descriptive statistics, including mean and standard deviation, were utilized to address the study questions, while independent sample t-tests were undertaken to assess the hypotheses at a 0.05 level of significance. Findings reveal that students exhibit moderate to high readiness, particularly in awareness, eagerness to study, and confidence in using digital technologies. Lower readiness was identified in advanced competencies, such as analyzing AI-generated outputs and applying technical functions. Students largely engaged AI for summarization, paraphrasing, subject development, and grammatical correction, whereas usage for citation management, data analysis, and research organization was minimal., Institutional and infrastructural restrictions — including inconsistent internet connectivity, intermittent power supply, high data costs, inadequate training, and unclear policies — substantially inhibited effective AI implementation. The study indicates that while AI tools are increasingly relevant to students' research activities, structural hurdles impede optimal application. It advocates changes in digital infrastructure, specific training programs, and the establishment of explicit ethical and institutional rules to promote responsible and successful integration of AI technology in academic research.

Keywords: Artificial intelligence tools, students' readiness, academic research, digital literacy, technology adoption, Colleges of Education, Nigeria

Introduction

The rapid advancement of artificial intelligence (AI) has profoundly transformed higher education worldwide, revolutionizing pedagogical approaches, learning processes, and academic research methodologies. AI-driven technologies, including generative writing assistants, automated summarization tools, grammar checkers, adaptive feedback systems, citation managers, and data analysis applications, are increasingly incorporated into academic workflows to improve writing quality, boost research efficiency, and foster higher-order cognitive engagement. UNESCO's recent global

survey shows that a growing number of colleges and universities are adopting AI technologies in research and writing, while simultaneously developing rules and procedures to guide their proper use (UNESCO, 2023). Even with this growth, concerns persist regarding effectiveness, ethics, and responsible use. This changing environment is part of a broader digital transformation agenda intended to equip students with the skills required to thrive in a fast-paced knowledge economy.

In Nigeria, the incorporation of AI in higher education is steadily progressing, although the pace and scope of adoption vary considerably and remain highly context-dependent. AI and learning analytics possess considerable potential to personalize instruction, enhance student engagement, and improve learning outcomes and academic integrity when deployed within transparent, accountable, and ethically grounded frameworks (Elenode, 2026). Nonetheless, these opportunities are accompanied by concerns regarding fairness, academic integrity, and governance, which are further shaped by socio-cultural attitudes toward technology within Nigerian institutions (Essien et al.,, 2024), underscoring the necessity for unified institutional policies and regulatory frameworks. Educators and other stakeholders generally recognise the importance of AI applications, but they stress the need for specialised training, clear ethical guidelines, and ongoing institutional support to ensure responsible and effective use (Eleje et al.,, 2025).

Notwithstanding the global momentum behind AI adoption, its implementation in less-developed contexts such as Nigeria continues to be constrained by structural and contextual barriers. Students generally perceive AI tools as beneficial for academic tasks; however, actual utilization, especially for advanced research endeavours, often falls short of their awareness and favourable perceptions. This mismatch reflects varying levels of digital skill, real-world experience, and institutional support. Institutional readiness also differs significantly, as many tertiary institutions lack comprehensive policies, structured professional development programmes, and strategic implementation frameworks essential for systematic AI integration. Compounding these institutional gaps are persistent infrastructural problems, such as spotty internet access, unreliable power supply, limited access to high-performance digital devices, and uneven distribution of ICT resources. These structural barriers, which remain common in many Nigerian schools, constrain sustained use of AI-enabled platforms and widen existing digital gaps (Nwali & Udumukwu, 2025). Consequently, students' readiness and willingness to use AI technologies may not always translate into consistent or advanced use, underscoring the importance of investing in basic digital infrastructure alongside skills development.

Colleges of Education carry particular responsibility for addressing these contextual and infrastructural gaps, as they prepare future teachers for classrooms that are becoming increasingly technology-driven. To navigate modern academic and professional settings, pre-service teachers need to be able to conduct research competently and use technology with ease. A comprehensive understanding of students' preparedness, usage patterns, influencing variables, and contextual limitations is therefore essential for guiding curriculum development, institutional strategy, and policy formulation. This study examines the readiness and utilization of artificial intelligence tools for academic research among students in the Colleges of Education in Kwara State, Nigeria.

Literature Review

Artificial Intelligence in Higher Education

Artificial intelligence (AI) is one of the most transformative technical advances of the twenty-first century, altering how knowledge is created, processed, and shared across fields. AI refers to computer systems capable of performing tasks that typically require human intelligence, such as learning, reasoning, pattern recognition, natural language processing, and decision-making. Modern perspectives view AI as a flexible, data-centric framework that enhances performance by leveraging extensive datasets and iterative learning methodologies (Adamakis & Rachiotis, 2025). This evolution traces a path from simple rule-based and symbolic systems to advanced machine learning and deep learning models capable of self-improvement, with transformer-based architectures underpinning modern large language models such as GPT-4 (Campino, 2025).

AI applications in higher education have grown beyond automated grading and adaptive learning to encompass a wider range of academic tasks, including writing support, literature organisation, research design, and exploratory data analysis. Generative AI platforms such as ChatGPT, DeepSeek, and Gemini are transforming education and academic engagement by providing personalised assistance and accelerating knowledge synthesis (Younas et al.,, 2025). UNESCO (2023) similarly highlights the transformative potential of generative AI in education while calling for human-centred implementation frameworks that safeguard critical thinking and academic integrity. However, these gains are accompanied by concerns about academic integrity, algorithmic bias, data privacy, and transparency, which reinforce the need for robust governance and institutional policy frameworks (Butabayeva, 2025).

Infrastructural constraints further complicate equitable access in resource-limited settings, making it essential to examine students' preparedness and usage patterns within specific institutional contexts.

Students' Readiness for Artificial Intelligence Adoption

Students' preparedness to utilise AI tools is a significant determinant of successful integration into academic research. Readiness comprises awareness of available technologies, digital literacy, confidence in technology use, and the capacity to critically evaluate outputs (Kasneci et al.,, 2023), and the depth and quality of student research is shaped considerably by this readiness. Students commonly use natural language processing tools such as ChatGPT to generate research ideas, construct academic arguments, and simplify complex academic writing, while tools like QuillBot and Grammarly support coherence, grammar, and academic tone (Rudolph & Tan, 2023). AI-assisted literature discovery tools further accelerate research by identifying relevant works and emerging trends (Dwivedi et al.,, 2023). Even so, effective use requires strong digital competence and critical thinking; weak computer literacy can compromise research quality (Rudolph et al.,, 2023), reinforcing the need for systematic training and institutional support.

Artificial Intelligence Utilization in Academic Research

The use of AI tools in academic research has grown substantially, reshaping how students and scholars approach their work. Vieriu and Petrea (2025) found that nearly all surveyed university students used AI technologies for schoolwork, with 57.6% reporting weekly use, chiefly through virtual assistants and generative AI tools. ChatGPT has emerged as the most widely used AI tool for research, primarily for idea generation, writing support, and summarisation (Sousa & Cardoso, 2025), while Grammarly and QuillBot are commonly used to refine grammar and academic tone. A Jordanian study similarly found over 90% of students used ChatGPT for academic tasks, while awareness of alternative platforms remained comparatively low (Al Mashagbeh et al.,, 2025), suggesting broad awareness does not translate into diverse platform use.

Beyond writing support, AI is also applied to literature search and data management, though moderately so: platforms such as ResearchRabbit and ChatPDF assist with summarising literature and extracting text from PDFs, while use for advanced tasks such as statistical analysis and data modelling remains limited (Archana et al.,, 2025). Santos et al., (2025) similarly observe that engagement often remains confined to superficial tasks, with deeper analytical application yet to gain traction, underscoring the need for contextualised training that links AI tools more directly to students' academic goals.

Contextual and Infrastructural Factors Influencing Adoption

The extent to which students use AI tools for academic work is strongly shaped by the context and infrastructure within which they operate. Reliable infrastructure, including internet connectivity and power supply, significantly reduces access barriers and sustains technology adoption in educational settings (Feng et al.,, 2025). Conversely, limited internet connectivity and unstable electricity remain significant barriers to ICT adoption in higher education institutions situated in under-resourced contexts (Ntorukiri et al.,, 2022), constraining regular use of cloud-based and resource-intensive AI platforms. Institutions that invest in accessible technology, staff training, and support structures tend to see greater adoption among students and staff alike (Sova et al.,, 2024), whereas their absence perpetuates digital inequality.

Socioeconomic disparities can harden into structural impediments that undermine equitable access to advanced technologies, deepening the digital divide in academic settings (Feng et al.,, 2025), while broader socio-cultural attitudes toward technology further mediate how readily AI tools are embraced within Nigerian institutions (Essien et al.,, 2024). Institutional leadership, well-defined policy frameworks, and strategic alignment further determine adoption outcomes, as institutions with robust infrastructure and clear guidelines are better positioned to support widespread AI adoption than those with limited resources (Huma et al.,, 2025).

Gender Differences in Technology Adoption

Gender disparities in the adoption of emerging technologies, particularly AI tools, have been consistently observed in higher education. A systematic review of 30 studies found that male students generally report more frequent use, greater confidence, and stronger adoption intentions than female students, who tend to adopt a more cautious stance that prioritises ethical considerations and structured guidance (Matobobo, 2026). Norwegian male students engaged generative AI chatbots more frequently and for a wider range of purposes than female students (Møgelvang et al.,, 2024), and Indonesian male students reported more positive ChatGPT attitudes than their female counterparts (Fadillah & Akbar, 2025). Cultural norms and heightened concern over data privacy among women have been proposed as explanations (Kalim et al.,, 2025). However, the pattern is not universal: a quantitative survey across the ASEAN region found no major gender differences in generative AI use or attitudes, suggesting growing equity in some settings (Raza et al.,, 2024). Taken together, these findings point to inclusive

training programmes and institutional policies that address diverse learning needs as necessary to ensure equitable engagement with AI technologies across gender groups (Matobobo, 2026).

Empirical Review

Alimi et al.,, (2021) found generally low AI-for-learning awareness among 200 students across three Kwara State universities, with no significant gender difference, but did not address research-specific use or Colleges of Education, leaving a contextual gap this study fills.

Onwuagboke et al., (2024) found that lecturers' AI awareness at Alvan Ikoku Federal University of Education was significantly shaped by instructional experience, but the study centred on lecturers rather than students' readiness or usage.

Anih and Ukeh (2024) found limited awareness of AI-assisted research writing tools among 1,104 Federal University Otuoke students, without examining readiness, extent of use, or influencing factors, and within a single university.

Stöhr et al., (2024) found widespread ChatGPT use varying by gender, discipline, and academic level among 5,894 Swedish students, in a context socio-culturally and infrastructurally distant from Nigerian Colleges of Education.

Ukeh and Anih (2024) found low AI utilisation among 150 Federal University Otuoke lecturers, attributable to weak awareness and limited institutional support, without analysing demographic variables such as gender.

Bootchuy et al., (2025) found strong overall AI readiness but only moderate practical skills among 445 distance-education students outside Nigeria, without a specific focus on AI use for academic research.

Ravšelj et al., (2025) found broad ChatGPT use for brainstorming and literature summarisation among 23,218 students across 109 countries, without examining specific institutional contexts such as Colleges of Education.

Shittu et al., (2025) found strong student knowledge of ChatGPT against limited staff familiarity at the University of Ibadan, focusing on perceptions rather than formal readiness and usage patterns.

Al Mashagbeh et al., (2025) found extensive but shallow AI engagement among Jordanian university students, in a context whose cultural and infrastructural conditions differ substantially from Nigeria's.

Archana et al., (2025) found moderate to high AI awareness but limited use for complex tasks such as statistical modelling, without examining gender or Colleges of Education specifically.

Santos et al., (2025) proposed a framework for ethical AI integration in academic writing, finding frequent use for brainstorming and language correction, without addressing students' readiness or extent of utilisation.

Matobobo (2026) systematically reviewed 30 studies and found stronger AI engagement among male students, but without primary data from specific contexts such as Kwara State Colleges of Education.

Møgelvang et al., (2024) found broader AI chatbot engagement among male than female Norwegian students, within a well-resourced context that limits direct application to Nigerian institutions.

Fadillah and Akbar (2025) found more favourable ChatGPT attitudes among male students outside Nigeria, addressing attitudes rather than quantitative readiness or utilisation levels.

Raza et al., (2024) found narrowing gender gaps in AI adoption across some ASEAN contexts, without focusing specifically on readiness and utilisation within teacher-education institutions.

Collectively, these studies confirm growing global and national interest in AI readiness and use, but reveal a persistent gap: no known study has jointly examined readiness, extent of utilisation, influencing factors, challenges, and gender differences among Colleges of Education students specifically within Kwara State. This gap forms the empirical basis for the present study.

Statement of the Problem

Artificial intelligence tools hold considerable promise for enhancing the efficiency and quality of academic research, yet their benefits are not automatically realised. Evidence from within and outside Nigeria suggests that students' awareness of and enthusiasm for AI often outpace their actual, especially advanced, use of these tools, and that this gap is shaped by uneven digital infrastructure, limited institutional support, and inconsistent training (Alimi et al., 2021; Ntorukiri et al., 2022; Nwali & Udumukwu, 2025). Colleges of Education occupy a uniquely important position in this discourse, as they train the teachers who will themselves need to model effective and responsible technology use in Nigerian classrooms; yet most existing Nigerian studies on AI in higher education have concentrated on conventional universities or on lecturers rather than students (Alimi et al.,, 2021; Onwuagboke et al., 2024; Ukeh & Anih, 2024), or have examined awareness in isolation without addressing readiness, extent of utilisation, contributing factors, and the challenges students actually encounter (Anih & Ukeh, 2024). International studies, while more comprehensive in scope, are drawn from socio-culturally and

infrastructurally distinct settings that limit their applicability to Nigerian teacher-education contexts (Stöhr et al., 2024; Bootchuy et al., 2025; Al Mashagbeh et al., 2025). Consequently, there is limited context-specific empirical evidence on how ready Colleges of Education students in Kwara State are to adopt AI tools for academic research, how extensively they currently use them, what factors shape that readiness, what challenges they face, and whether these patterns differ by gender. This study was therefore designed to examine students' readiness and utilization of artificial intelligence tools for academic research in Colleges of Education in Kwara State, Nigeria.

Purpose of the Study

The main purpose of this study is to examine students' readiness and utilization of artificial intelligence tools for academic research in Colleges of Education in Kwara State, Nigeria.

Specifically, the study sought to:

1. determine the level of readiness of Colleges of Education students to adopt artificial intelligence tools for academic research;

2. examine the extent to which Colleges of Education students utilize artificial intelligence tools for academic research;

3. identify the factors that influence Colleges of Education students' readiness to adopt artificial intelligence tools for academic research; and

4. identify the challenges Colleges of Education students encounter in utilizing artificial intelligence tools for academic research.

Research Questions

The following research questions guided the study:

1. What is the level of readiness of Colleges of Education students in Kwara State to adopt artificial intelligence tools for academic research?

2. To what extent do Colleges of Education students in Kwara State utilize artificial intelligence tools for academic research?

3. What factors influence the readiness of Colleges of Education students in Kwara State to adopt artificial intelligence tools for academic research?

4. What challenges do Colleges of Education students in Kwara State encounter in utilizing artificial intelligence tools for academic research?

Research Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

Ho1: There is no significant difference between male and female students' readiness to adopt artificial intelligence tools for academic research.

Ho2: There is no significant difference between male and female students' utilization of artificial intelligence tools for academic research.

Ho3: There is no significant difference between male and female students regarding the factors that influence their readiness to adopt artificial intelligence tools for academic research.

Ho4: There is no significant difference between male and female students regarding the challenges they encounter in utilizing artificial intelligence tools for academic research.

Methodology

This study adopted a descriptive research survey design to investigate students' readiness and utilization of AI tools for academic research in Colleges of Education in Kwara State. The study specifically examined students' level of readiness, the extent of utilization for research-related tasks, factors influencing readiness, and challenges associated with AI adoption.

The population of the study comprised all NCE III Business Education students in Colleges of Education in Kwara State. Using a simple random sampling procedure, 278 students were selected to participate, ensuring equitable representation and reducing sampling bias; participation was voluntary. The principal instrument was a structured questionnaire constructed in alignment with existing research on technology acceptance and AI integration in education, and tailored to the study's objectives. The instrument comprised sections eliciting responses on readiness, utilization, influencing factors, and challenges, using a four-point scale of Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The face and content validity of the instrument were established by experts in Business Education and Educational Measurement and Evaluation, and its reliability was confirmed through a pilot study, which yielded a coefficient of 0.78. Items with mean scores of 2.50 and above were regarded as indicating agreement, while those below 2.50 were regarded as indicating disagreement, consistent with the study's four-point scale.

Data obtained from the instrument were analyzed using the Statistical Package for the Social Sciences (SPSS). Descriptive statistics, including mean and standard deviation, were used to answer the four

research questions, while independent samples t-tests were used to test the four null hypotheses at the 0.05 level of significance.

Results

Research Question One: What is the level of readiness of Colleges of Education students in Kwara State to adopt artificial intelligence tools for academic research?

Table 1: *Mean and Standard Deviation on Students' Readiness to Use Artificial Intelligence Tools for Research Activities*

S/N	Items	Mean (x̄)	SD	Remarks
1	I am aware that AI tools can support research activities.	3.52	0.62	Strongly Agree
2	I understand how basic AI tools like ChatGPT, Grammarly, or Mendeley work.	3.36	0.71	Agree
3	I feel confident using digital tools to support academic work.	3.30	0.74	Agree
4	I am willing to learn how to use AI tools for research.	3.63	0.58	Strongly Agree
5	I believe I have the digital skills needed to adopt AI tools.	3.28	0.76	Agree
6	I am ready to try new AI tools when they are introduced to me.	3.44	0.68	Agree
7	I know how to verify AI-generated information before using it in research.	2.41	0.84	Disagree
8	I feel prepared to use AI tools throughout the research process.	3.27	0.77	Agree
9	I believe AI tools can make my research work more efficient.	3.52	0.66	Strongly Agree
10	I consider myself ready to use AI tools for academic research.	3.40	0.73	Agree
	Grand Mean and Standard Deviation	**3.31**	**—**	**Agree**

Table 1 indicates a generally strong degree of readiness among students to employ AI technology in academic research, with a grand mean of 3.31, suggesting moderate to high readiness. Students displayed awareness of AI technologies and confidence in using digital tools to support academic assignments, and their openness to new AI applications further demonstrates a favourable disposition toward technology integration in research. Willingness to learn recorded the highest mean score ($\bar{x}$ = 3.63), indicating considerable intrinsic motivation to embrace and study AI techniques. However, competencies related to more critical and evaluative use of AI appear comparatively weaker: the capacity to verify and critically examine AI-generated material recorded the lowest mean score (x̄ = 2.41), suggesting that while students are enthusiastic about adopting AI, they may lack the advanced skills necessary to verify outputs, ensure accuracy, and minimise potential misinformation.

Research Question Two: To what extent do Colleges of Education students in Kwara State utilize artificial intelligence tools for academic research?

Table 2: *Mean and Standard Deviation on Students' Utilization of Artificial Intelligence Tools for Research Purposes*

S/N	Items	Mean (x̄)	SD	Remarks
1	I use AI tools frequently for searching for research topics.	3.43	0.69	Agree
2	I use AI tools frequently for generating background information for assignments or projects.	3.40	0.71	Agree
3	I use AI tools frequently for summarizing articles or long texts.	3.37	0.72	Agree
4	I use AI tools frequently for paraphrasing or rewriting content for assignments.	3.39	0.73	Agree
5	I use AI tools frequently for checking grammar, spelling, and clarity of my writing.	3.48	0.66	Strongly Agree
6	I use AI tools frequently for formatting citations and references.	2.32	0.81	Disagree
7	I use AI tools frequently for clarifying difficult concepts or theories.	3.58	0.63	Strongly Agree

S/N	Items	Mean (x̄)	SD	Remarks
8	I use AI tools frequently for organizing or structuring research work.	2.41	0.79	Disagree
9	I use AI tools frequently for analyzing qualitative or quantitative data with AI-supported tools.	2.28	0.85	Disagree
10	I use AI tools at different stages of research (from topic selection to final writing).	3.41	0.70	Agree
	Grand Mean and Standard Deviation	**3.10**	**—**	**Agree**

Table 2 shows a generally positive level of utilization of AI tools for research purposes, with a grand mean of 3.10, indicating that students routinely use AI applications for core academic tasks, particularly those connected to concept clarification and writing enhancement. Explaining challenging concepts recorded the highest mean score ($\bar{x}$ = 3.58), followed closely by grammar and writing support ($\bar{x}$ = 3.48), suggesting that students predominantly rely on AI to simplify complex academic content and improve written output. In contrast, utilization drops considerably for more technical and research-intensive tasks: citation and reference formatting (x̄ = 2.32), organising research activity (x̄ = 2.41), and qualitative or quantitative data analysis ($\bar{x}$ = 2.28) all recorded low mean scores, indicating limited engagement with AI for the advanced analytical and methodological tasks central to rigorous academic research.

Research Question Three: What factors influence the readiness of Colleges of Education students in Kwara State to adopt artificial intelligence tools for academic research?

Table 3: *Mean and Standard Deviation on Factors Influencing Students' Readiness to Adopt Artificial Intelligence Tools for Research*

S/N	Items	Mean (x̄)	SD	Remarks
1	My institution supports the use of digital tools for academic work.	2.12	0.91	Disagree
2	My lecturers encourage the use of AI tools for research.	2.08	0.94	Disagree
3	I have access to a reliable internet connection when needed.	2.00	0.97	Disagree
4	Electricity supply in my area supports the use of AI tools.	1.86	1.02	Strongly Disagree
5	I receive guidance from lecturers or peers on using AI tools effectively.	2.14	0.90	Disagree
6	My previous digital learning experiences help me use AI tools better.	2.22	0.88	Disagree
7	Institutional policies are clear about the acceptable use of AI tools.	2.05	0.96	Disagree
8	Workshops or training sessions on AI tools improve my readiness.	2.18	0.93	Disagree
9	Seeing other students use AI tools increases my willingness to adopt them.	3.18	0.84	Agree
10	Ethical guidelines from my college help me feel confident using AI tools responsibly.	2.16	0.92	Disagree
	Grand Mean and Standard Deviation	**2.20**	**—**	**Disagree**

Table 3 indicates respondents' perceptions of the factors influencing their readiness to adopt AI tools for research. The grand mean of 2.20 suggests general disagreement that institutional and infrastructural factors currently support students' readiness, indicating that the enabling environment required for effective AI integration remains inadequate. Respondents largely disagreed that their institution actively encourages the use of digital technologies, that lecturers encourage AI use, or that clear institutional norms exist to guide acceptable AI use in academic work, suggesting that the absence of structured guidance and policy frameworks may contribute to ambiguity and cautious adoption. Infrastructure-related items recorded particularly low scores: electricity supply (x̄ = 1.86) and internet connectivity (x̄ = 2.00) were identified as key constraints, illustrating that unpredictable power and limited internet access hinder consistent AI usage, alongside a general shortfall in prior guidance, training, and digital learning experience. Peer influence emerged as the sole clearly positive factor, with

respondents indicating that observing fellow students use AI technologies increased their own likelihood of adoption ($\bar{x}$ = 3.18), suggesting that informal social learning and peer modelling may play a more significant role in encouraging AI use than formal institutional processes currently do.

Research Question Four: What challenges do Colleges of Education students in Kwara State encounter in utilizing artificial intelligence tools for academic research?

Table 4: *Mean and Standard Deviation on Challenges Students Face in the Utilization of Artificial Intelligence Tools for Research*

S/N	Items	Mean ($\bar{x}$)	SD	Remarks
1	Irregular electricity supply makes it difficult to use AI tools consistently.	3.42	0.76	Agree
2	Poor internet connectivity affects my ability to use AI tools effectively.	3.55	0.68	Strongly Agree
3	I find it difficult to verify whether AI-generated information is accurate.	3.12	0.82	Agree
4	I lack adequate training on how to use AI tools for academic research.	3.28	0.79	Agree
5	Using AI tools consumes a lot of data, making it expensive for me.	3.47	0.72	Strongly Agree
6	My device (phone or laptop) does not support some AI tools.	2.34	0.91	Disagree
7	I am concerned about plagiarism when using AI tools for assignments.	3.18	0.80	Agree
8	I do not fully understand the ethical guidelines for using AI tools in research.	3.05	0.85	Agree
9	I find AI tools difficult to use without guidance.	2.89	0.90	Agree
10	AI tools sometimes produce unclear or confusing results.	3.10	0.83	Agree
	Grand Mean and Standard Deviation	**3.14**	**—**	**Agree**

Table 4 reveals students' responses regarding the challenges encountered while using AI tools for research. The grand mean of 3.14 reflects general agreement that several constraints hinder optimal AI use. Infrastructural and financial limitations emerged as the most significant hurdles, with poor internet access ($\bar{x}$ = 3.55) and high data costs associated with AI use ($\bar{x}$ = 3.47) identified as leading barriers, closely followed by irregular electricity supply ($\bar{x}$ = 3.42), underscoring the crucial role of reliable technology infrastructure and affordability in facilitating smooth AI integration into research processes. Beyond infrastructural barriers, students also emphasised difficulty verifying the accuracy of AI-generated information, a lack of formal training in AI tool use, and concerns around plagiarism and responsible use, alongside occasional difficulty interpreting unclear or confusing AI outputs, together pointing to a need for systematic training and pedagogical support. Device limitations were not viewed as a major barrier, recording a comparatively low mean score ($\bar{x}$ = 2.34), suggesting that students generally have access to adequate hardware for AI engagement.

Hypothesis One (Ho1): There is no significant difference between male and female students' readiness to adopt artificial intelligence tools for academic research.

Table 5: *t-test Analysis of Gender-Based Response on Students' Readiness to Use Artificial Intelligence Tools for Research*

Gender	N	Mean ($\bar{x}$)	SD	t-cal	t-crit	Sig. (p)	Decision
Male	112	3.29	0.41	0.62	1.96	0.54	Not Significant
Female	166	3.32	0.38				
Grand Mean = 3.30							

Table 5 shows that male students ($\bar{x}$ = 3.29) and female students ($\bar{x}$ = 3.32) reported comparable levels of readiness, with no statistically significant difference found (t = 0.62, p = 0.54 > 0.05). Ho1 is therefore not rejected. Both male and female students exhibit similar levels of awareness, confidence, and willingness to engage with AI tools, indicating equitable readiness across gender groups.

Hypothesis Two (Ho2): There is no significant difference between male and female students' utilization of artificial intelligence tools for academic research.

Table 6: *t-test Analysis of Gender-Based Response on Utilization of Artificial Intelligence Tools for Research*

Gender	N	Mean (x̄)	SD	t-cal	t-crit	Sig. (p)	Decision
Male	112	3.08	0.49	0.98	1.96	0.33	Not Significant
Female	166	3.12	0.46				
Grand Mean = 3.09							

Table 6 shows that male students ($\bar{x}$ = 3.08) and female students (x̄ = 3.12) display similar levels of AI usage, with no statistically significant difference found (t = 0.98, p = 0.33 > 0.05). Ho2 is therefore not rejected, indicating comparable engagement with AI technologies across multiple research tasks irrespective of gender, provided access, awareness, and digital literacy are comparable.

Hypothesis Three (Ho3): There is no significant difference between male and female students regarding the factors that influence their readiness to adopt artificial intelligence tools for academic research.

Table 7: *t-test Analysis of Gender-Based Response on Factors Influencing Students' Readiness to Adopt Artificial Intelligence Tools for Research*

Gender	N	Mean (x̄)	SD	t-cal	t-crit	Sig. (p)	Decision
Male	112	2.22	0.58	0.41	1.96	0.68	Not Significant
Female	166	2.19	0.55				
Grand Mean = 2.20							

Table 7 shows no statistically significant difference between male students ($\bar{x}$ = 2.22) and female students (x̄ = 2.19) regarding the influence of institutional, infrastructural, and contextual factors on their readiness (t = 0.41, p = 0.68 > 0.05). Ho3 is therefore not rejected, indicating that male and female students face similar institutional and infrastructural conditions, and that interventions to improve AI readiness can be designed to benefit both groups equally.

Hypothesis Four (Ho4): There is no significant difference between male and female students regarding the challenges they encounter in utilizing artificial intelligence tools for academic research.

Table 8: *t-test Analysis of Gender-Based Response on Challenges Affecting Students' Utilization of Artificial Intelligence Tools*

Gender	N	Mean (x̄)	SD	t-cal	t-crit	Sig. (p)	Decision
Male	112	3.18	0.52	0.32	1.96	0.75	Not Significant
Female	166	3.10	0.49				
Grand Mean = 3.14							

Table 8 shows no statistically significant difference between male students ($\bar{x}$ = 3.18) and female students (x̄ = 3.10) in the challenges they reported (t = 0.32, p = 0.75 > 0.05). Ho4 is therefore not rejected, suggesting that the challenges associated with AI use are systemic, rooted in infrastructural, financial, and training-related constraints, rather than being shaped by gender.

Discussion of Findings

The findings offer important insight into students' readiness and utilization of AI tools for academic research in Colleges of Education in Kwara State. Students demonstrated moderate to high readiness, notably in awareness, enthusiasm to learn, and confidence in using digital tools, reflecting meaningful appreciation of AI's potential to enhance research efficiency. This extends the work of Bootchuy et al., (2025), who found strong readiness among students for AI adoption in distance education, and Shittu et al., (2025), who reported high awareness among Nigerian university students. Unlike Alimi et al., (2021), who found low awareness among undergraduates in Kwara State universities, the present study finds higher readiness within Colleges of Education, underscoring a contextual distinction and addressing a gap in prior research on teacher-education institutions.

Descriptive analysis of utilization, however, revealed that students predominantly employ AI for foundational tasks such as topic identification, summarisation, paraphrasing, grammar checking, and clarifying difficult concepts, with limited use for citation management, data analysis, and research organisation. This mirrors global findings by Ravšelj et al., (2025) on brainstorming and literature summarisation, and Onwuagboke et al., (2024) on frequent academic AI use among Nigerian lecturers, while the shortfall in advanced use aligns with Anih and Ukeh (2024) and Archana et al., (2025), suggesting that AI adoption in this context remains largely supportive rather than transformative.

Institutional and infrastructural considerations emerged as significant barriers, with students citing limited access to stable electricity, internet connectivity, structured training, and clear institutional guidance consistent with Alimi et al., (2021) and Ukeh and Anih (2024). Ethical and operational constraints, including difficulty verifying AI-generated content, plagiarism concerns, and unclear outputs, echo observations by Stöhr et al., (2024) and Ravšelj et al., (2025) regarding academic integrity and responsible use, while peer influence emerged as a positive driver of adoption. Hypothesis testing found no statistically significant gender differences across readiness, utilization, influencing factors, or challenges, contrasting with broader international evidence of gender disparities (Matobobo, 2026; Møgelvang et al.,, 2024; Fadillah & Akbar, 2025) but aligning with Raza et al., (2024), who observed narrowing gender gaps in some ASEAN contexts. Within the specific socio-cultural and infrastructural environment of Nigerian Colleges of Education, gender does not appear to meaningfully influence AI adoption, reinforcing the value of localised empirical evidence.

Conclusion

This study examined students' readiness and utilization of artificial intelligence tools for academic research in Colleges of Education in Kwara State. Students exhibit moderate to high readiness, with strong awareness, confidence in digital tool use, and enthusiasm to engage with AI applications. While AI tools are regularly used for core research tasks such as topic identification, summarisation, paraphrasing, grammar checking, and clarifying complex concepts, more advanced applications, including citation management, data analysis, and research organisation, remain underutilised. Institutional and infrastructural challenges, including restricted access to electricity, unreliable internet connectivity, insufficient training, and unclear AI policies, were identified as significant obstacles, compounded by ethical and operational concerns around plagiarism, authenticity, and the need for competent guidance. Gender was not found to be a significant driver of readiness, utilization, or challenges encountered, indicating that the barriers to effective AI adoption are systemic rather than demographic. While students recognise AI's value for research efficiency, realising this potential depends on deliberate institutional support: infrastructure development, systematic AI literacy programmes, curricular integration, and clear ethical standards are required to bridge the gap between readiness and meaningful, advanced application of AI in academic research.

Recommendations

Based on the findings, the following recommendations were made:

1. College management and government should prioritise investment in reliable electricity and internet infrastructure within Colleges of Education to support consistent and equitable AI tool usage among students.

2. Colleges of Education should institute regular, structured training and workshops on AI tools for research, with particular emphasis on verifying AI-generated content, citation management, and data analysis, where student competence is currently weakest.

3. College management should develop and clearly communicate institutional policies and ethical guidelines governing acceptable AI use in academic research, to reduce ambiguity, address plagiarism concerns, and encourage confident, responsible adoption.

4. Lecturers should be encouraged and supported to model effective and responsible AI use in research supervision and coursework, given students' reliance on guidance from lecturers and peers.

LECTURERS' AND STUDENTS' PERCEPTION OF THE IMPLICATIONS OF ARTIFICIAL INTELLIGENCE (AI) IN OFFICE TECHNOLOGY AND MANAGEMENT EDUCATION IN TERTIARY INSTITUTIONS IN PLATEAU STATE

By
Duktur, S. Levong (FABEN/0048)
Plateau State Ministry of Education
Northern Zonal Directorate of Education Office, Jos North

Abstract

The study examined lecturers' and students' perception of the implications of artificial intelligence (AI) in Office Technology and Management Education (OTME) in tertiary institutions in Plateau State. The study was guided by four research questions. Descriptive survey design was used for the study. The total population of the study was 1,336 lecturers and students offering Office Technology and Management Education in tertiary institutions in Plateau State. Using Yamane's (1967) formula at 5% level of precision, a sample size of 309 respondents was obtained. A 17 item structured questionnaire was validated by four experts: three (3) in Business Education and one (1) from Computer Education to ensure content and face validity. Reliability was established through a pilot study using the Cronbach's Alpha method. A reliability coefficient of 0.70 or above would be considered acceptable for the study. The data collected were analysed using mean to answer the questions. The study is anchored on the Technology Acceptance Model (TAM) and the Diffusion of Innovations Theory (DOI), which explain users' acceptance and adoption of technological innovations. The paper argues that while AI presents enormous opportunities for improving instructional effectiveness, personalised learning, digital competence, and workplace readiness, successful implementation requires adequate infrastructure, institutional policies, capacity building, and ethical guidelines. The study concludes that positive perceptions of AI among lecturers and students will significantly influence its effective integration into Office Technology and Management Education.

Keywords: Artificial Intelligence, Office Technology and Management Education, perception, lecturers, students, tertiary institutions.

Introduction

The rapid advancement of Artificial Intelligence (AI) globally has significantly transformed virtually every sector of society, including education. Artificial Intelligence refers to the capability of computer systems to perform tasks that ordinarily require human intelligence, such as learning, reasoning, problem-solving, language understanding, speech recognition, and decision-making (Russell &Norvig, 2021). Aina et al in Eze-Desy and Emeasoba (2025) explain that Artificial Intelligence is an innovative technical framework that encompasses the creation of computer systems with the ability to execute activities that usually need human intellect. These activities involve problem-solving, acquiring knowledge, comprehending language and seeing visual information. According to Otum and Okute (2025), artificial intelligence is highly sophisticated technological devices which imitate human intellectual acumen through technology training and imputation such knowledge using algorithms to perform task to ease human efforts and retain the information using computer memory. They further explained that artificial intelligence is a technological device that thinks and acts using human intelligence to successfully perform specialized tasks ordinarily done by man. Artificial intelligence is the use of human ingenuity to control technological equipment.

The integration of AI into education has created new opportunities for improving instructional delivery, learning outcomes, administrative efficiency, and research productivity (Holmes et al., 2022). Globally, higher education institutions are increasingly adopting AI-powered technologies to support teaching and learning. These technologies include intelligent tutoring systems, adaptive learning platforms, automated grading systems, virtual learning assistants, plagiarism detection software, chatbots, predictive analytics, and generative AI tools such as ChatGPT. Such innovations provide personalized learning experiences, timely feedback, enhanced student engagement, and improved instructional effectiveness (UNESCO, 2023).

Office Technology and Management Education (OTME), formerly known as Secretarial Education, is designed to prepare students with practical competencies in teaching, office administration, information management, communication technologies, digital office systems, entrepreneurship, and managerial skills necessary for contemporary workplaces. The increasing digitization of offices and organizations has made AI an indispensable component of teaching, learning and modern office operations. Consequently, OTME programmes are expected to integrate AI technologies into their curricula to equip graduates with relevant competencies in the era of globalization.

In Nigeria, AI adoption within tertiary education is gradually gaining momentum. Universities, colleges of education, and polytechnics are beginning to utilize AI-supported applications for instructional delivery, online learning, administrative management, and academic research. However, the extent of AI integration varies considerably due to challenges such as inadequate infrastructure, limited funding, unstable power supply (electricity), poor internet connectivity, insufficient digital literacy, and lack of institutional supports among others.

The perceptions of lecturers and students play a critical role in determining the successful adoption and utilization of AI technologies. According to the Technology Acceptance Model (TAM), individuals' willingness to use technology depends largely on their perceived usefulness and perceived ease of use (Davis, 1989). Positive perceptions encourage technology acceptance, whereas negative perceptions hinder implementation. Understanding these perceptions is therefore essential for developing effective strategies for AI integration within OTME.

Plateau State hosts several public and private tertiary institutions offering Business Education and Office Technology and Management Education programmes. These institutions are expected to produce graduates capable of functioning effectively in AI-driven digital workplaces. However, empirical evidence regarding lecturers' and students' perceptions of AI implications within these institutions remains limited. This study therefore seeks to examine these perceptions to provide evidence-based recommendations for policy makers, educational administrators, curriculum planners, government, proprietors, lecturers, and students as well as researchers and academia.

STATEMENT OF THE PROBLEM

Artificial Intelligence (AI) is increasingly transforming teaching, learning, office administration, industries, and professional practice worldwide. Modern workplaces now require graduates who possess competencies in AI-supported office technologies, intelligent information management systems, digital communication, and automated office operations. Consequently, Office Technology and Management Education must continually evolve to reflect these technological changes.

Despite the growing importance of AI, many tertiary institutions in Plateau State, Nigeria continue to experience inadequate ICT infrastructure, limited AI facilities, insufficient lecturer training, poor internet connectivity, inadequate funding, poor power supply (electricity) and the absence of institutional policies guiding AI integration. These challenges may affect both lecturers' and students' perceptions regarding the usefulness, effectiveness, ethical implications, and adoption of AI technologies in teaching and learning outcomes.

Furthermore, while AI offers numerous educational benefits, concerns relating to academic dishonesty, plagiarism, overdependence on AI-generated content, data privacy, ethical issues, reduced critical thinking, and unequal access to technology continue to generate debates among educators and researchers. Such concerns may influence the extent to which lecturers and students embrace AI in Office Technology and Management Education in our tertiary institutions in Plateau State, Nigeria.

Although several studies have examined AI adoption in tertiary education generally, there is limited empirical evidence focusing specifically on Office Technology and Management Education within tertiary institutions in Plateau State. This gap in knowledge necessitates the present study, which seeks to examine lecturers' and students' perceptions of the implications of Artificial Intelligence (AI) in Office Technology and Management Education (OTME) in tertiary institutions in Plateau State.

OBJECTIVES OF THE STUDY

The study seeks to examine lecturers' and students' perceptions of the implications of Artificial Intelligence (AI) in Office Technology and Management Education (OTME) in tertiary institutions in Plateau State.

Specifically, the study sought to:

1. Determine lecturers' perceptions of the positive implications of Artificial Intelligence in Office Technology and Management Education in tertiary institutions in Plateau State.
2. Examine students' perceptions of the positive implications of Artificial Intelligence in Office Technology and Management Education in tertiary institutions in Plateau State.
3. Identify the perceived challenges associated with AI integration in OTME

4. Determine strategies for effective integration of AI into OTME programmes in tertiary institutions in Plateau State

RESEARCH QUESTIONS

The following research questions guided the study:

1. What are lecturers' perceptions of the positive implications of Artificial Intelligence in Office Technology and Management Education in tertiary institutions in Plateau State?
2. What are the students' perceptions of the positive implications of Artificial Intelligence in Office Technology and Management Education in tertiary institutions in Plateau State?
3. What challenges are perceived to hinder Artificial intelligence integration in Office Technology and Management Education in tertiary institutions in Plateau State?
4. What strategies are required for effective integration of Artificial intelligence into office Technology and Management Education programmes?

Theoretical Framework

This study is anchored on two complementary theories: the Technology Acceptance Model (TAM) and the Diffusion of Innovations (DOI) Theory. These theories provide a sound theoretical basis for explaining lecturers' and students' perceptions, acceptance, and adoption of Artificial Intelligence (AI) technologies in Office Technology and Management Education (OTME).

Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM) was developed by Davis (1989) to explain users' acceptance and utilization of information technologies. The model posits that two major factors influence an individual's intention to adopt a technology: Perceived Usefulness (PU) and Perceived Ease of Use (PEOU).

Perceived usefulness refers to the degree to which an individual believes that using a particular technology will improve job or learning performance. Perceived ease of use refers to the extent to which an individual believes that using the technology will require minimal effort. According to TAM, when users perceive a technology as useful and easy to use, they are more likely to develop positive attitudes toward it, leading to greater acceptance and actual use (Venkatesh & Davis, 2000).

In the context of Office Technology and Management Education, lecturers may perceive AI technologies as useful because they facilitate lesson preparation, automate assessment, provide immediate feedback, improve classroom management, and enhance research productivity. Likewise, students may perceive AI applications as valuable because they support personalized learning, improve academic performance, simplify information retrieval, and strengthen digital competencies.

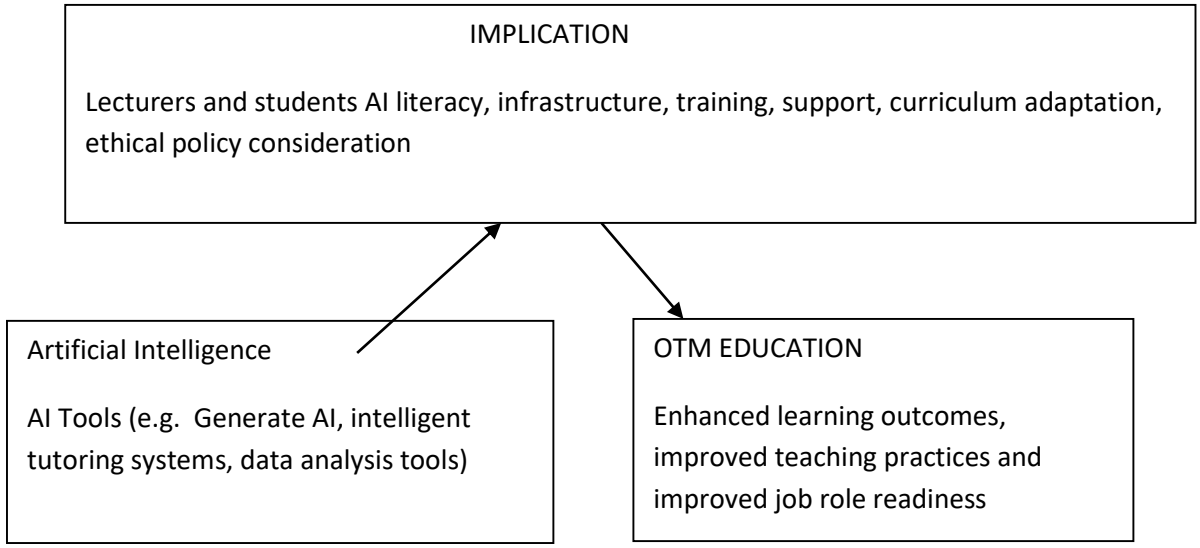
However, perceptions may become negative where AI is associated with academic dishonesty, misinformation, privacy concerns, reduced critical thinking, or inadequate institutional support. TAM therefore provides an appropriate framework for understanding the factors influencing lecturers' and students' acceptance of AI technologies in tertiary institutions.

Diffusion of Innovations (DOI) Theory

The Diffusion of Innovations Theory was developed by Rogers (2003) to explain how new ideas, technologies, and innovations spread within a social system over time. The theory identifies five major characteristics that influence the rate of adoption of an innovation:

(i) Relative advantage refers to the extent to which an innovation is perceived as superior to existing practices. (ii) Compatibility relates to how consistent the innovation is with users' values, experiences, and needs. (iii) Complexity concerns the difficulty involved in understanding or using the innovation.
(iv) Trialability refers to opportunities to experiment with the innovation before full adoption, while
(v) Observability involves the visibility of the innovation's benefits to others.

Within tertiary institutions in Plateau State, AI adoption depends on whether lecturers and students perceive AI technologies as beneficial, compatible with instructional practices, simple to use, and capable of improving teaching and learning outcomes. Institutional supports and policies, management support, training opportunities, and ICT infrastructure also influence the diffusion process.



The DOI theory is therefore relevant because it explains how AI innovations gradually become integrated into educational systems through awareness, persuasion, decision, implementation, and confirmation stages.

Relevance of the Theories to the Study

The Technology Acceptance Model (TAM) explains the psychological factors influencing lecturers' and students' willingness to use AI technologies, whereas the Diffusion of Innovations (DOI) Theory explains the institutional and social processes through which AI adoption spreads within tertiary institutions. Together, the two theories provide a comprehensive explanation of perceptions toward Artificial Intelligence in Office Technology and Management Education (OTME) in tertiary institutions.

Conceptual Framework

A conceptual framework is a visual or written structure that shows how the key variables in a study are connected. It explains the concepts you are studying and how they influence each other. A conceptual framework could also be viewed as a map of one's' research. It shows: the main concepts in the study, the relationships between them, and the direction of information (what affects what).

Artificial

Figure 1: Conceptual framework of the implication of Artificial Intelligence (AI) in Office Technology and Management Education (OTME). Source: Author

The conceptual framework in figure 1 shows that Artificial Intelligence is the Independent Variable (IV), Office Technology and Management Education is the Dependent Variable (DV), while Implication is the Intervening Variable (IV). The diagram shows that artificial intelligence which is the independent variable influences the learning outcomes and teaching practices of both students and lecturers in OTME, which is the dependent variable. This implies that all things being equal, integrating AI tools (e.g., generative AI, intelligent tutoring systems, data analytics tools) in to the OTME programme will lead to enhanced learning outcomes, improved teaching practices and improved job role readiness for OTME graduates. The framework also revealed that the implication of integrating AI in OTME will be dependent on whether or not lecturers and students are AI literate, availability or otherwise of necessary infrastructure, training support, curriculum adaptation, ethical and policy considerations

Review of Related Literature

Artificial Intelligence has become one of the most significant technological developments influencing higher education globally. UNESCO (2023) observed that AI has the capacity to transform teaching, learning, research, administration, assessment, and student support services. AI-powered technologies enable institutions to deliver more personalized, efficient, and flexible learning experiences while improving institutional productivity.

According to Holmes et al. (2022), AI applications in education include adaptive learning systems, intelligent tutoring systems, automated grading, predictive analytics, virtual assistants, and learning management support. These technologies assist lecturers in monitoring students' progress while providing learners with individualized instructional support.

In Office Technology and Management Education, AI has expanded beyond traditional office automation to include intelligent document management, speech recognition, business analytics, robotic process automation, virtual communication, and workflow optimization. These developments have significantly changed the competencies expected of graduates entering modern workplaces.

Recent studies indicate that students generally demonstrate positive attitudes toward AI because of its ability to simplify learning tasks, improve access to information, and enhance academic

performance. Nevertheless, concerns remain regarding excessive dependence on AI-generated content, diminished originality, misinformation, and academic integrity (Kasneci et al., 2023).

Similarly, lecturers acknowledge that AI can improve instructional delivery and research productivity but express concerns about ethical use, assessment validity, copyright, data privacy, and the need for professional development. Effective AI integration therefore requires adequate institutional policies, staff training, infrastructure development, and continuous monitoring (UNESCO, 2023).

Studies conducted in developing countries reveal that inadequate ICT infrastructure, unstable electricity, limited internet connectivity, poor funding, and insufficient digital literacy remain major barriers to AI adoption in higher education. Addressing these challenges is essential if tertiary institutions are to fully realize the educational benefits of Artificial Intelligence.

Overall, the literature suggests that while lecturers and students generally perceive AI positively because of its instructional benefits, successful implementation depends on institutional readiness, ethical governance, digital competence, and supportive educational policies.

Methodology

This study adopted a descriptive survey research design because it is appropriate for obtaining the opinions and perceptions of respondents regarding the implications of Artificial Intelligence (AI) in Office Technology and Management Education (OTME). The design enables the researcher to collect data from a representative sample and generalize the findings to the target population.

A stratified random sampling technique will be employed. Eguzoikpe in Duktur (2015) a stratified sample is one that should be obtained by separating the population elements into smaller non-overlapping groups or blocks of units called strata, in such a way that each stratum is a homogenous as possible. From each stratum, a selection is made to form the required sample. Proportionate random sampling will then be used to determine the number of respondents selected from each stratum. This ensures adequate representation of lecturers and students across selected tertiary institutions in Plateau State.

Instrument for Data Collection

Data were collected using a structured questionnaire titled "Lecturers' and Students' Perception of the Implications of Artificial Intelligence in Office Technology and Management Education Questionnaire (LSPIAIOTMEQ)." The instrument consisted of two sections:

Section A: Demographic information of respondents.

Section B: Items measuring respondents' perceptions of the positive and negative implications of AI using a five-point Likert scale:

Strongly Agree	(SA)	= 5
Agree	(A)	= 4
Moderately Agree	(MA)	= 3
Disagree	(D)	= 2
Strongly Disagree	(SD)	= 1

Validity and Reliability

The questionnaire was validated by four experts: three (3) in Business Education and one (1) from Computer Education to ensure content and face validity. Reliability was established through a pilot study using the Cronbach's Alpha method. A reliability coefficient of 0.70 or above would be considered acceptable for the study.

Method of Data Collection

The researcher, assisted by trained research assistants, administered the questionnaires directly to respondents in their respective institutions. Completed questionnaires were retrieved immediately.

Method of Data Analysis

Research questions were analysed using mean and standard deviation. A criterion mean of 3.00 would be used for decision-making, where:

Mean ≥ 3.00 = Agreed

Mean < 3.00 = Disagreed

Data Analysis

The analysis of responses indicate that lecturers and students generally perceive AI as a valuable innovation capable of improving teaching effectiveness, enhancing learning experiences, increasing productivity, and equipping learners with digital workplace competencies. Respondents also acknowledge concerns regarding plagiarism, academic dishonesty, and excessive dependence on AI-generated content, data privacy, ethical issues, lack of training of personnel and students in AI tools, and inadequate technological infrastructure.

Therefore, the aggregate mean scores that exceed the benchmark of 3.00 are regarded positive items, indicating favourable perceptions of AI integration into Office Technology and Management Education, while respondents also express agreement with items relating to the challenges that require institutional attention.

Results

Research question 1: What are lecturers' perceptions of the positive implications of Artificial Intelligence in Office Technology and Management Education in tertiary institutions in Plateau State?

Table 1: Lecturers' perception of positive implications AI in OTME

S/N	Item	Mean	Decision
1	AI improves personalised instruction in OTME	3.42	Strongly Agreed
2	AI enhances office simulation and practical learning	3.51	Strongly Agreed
3	AI supports research and information retrieval	3.63	Strongly Agreed
4	AI improves communication and document preparation skills	3. 48	Strongly Agreed
Grand Mean =		**3.51**	**Strongly Agreed**

The result indicates that lecturers generally perceived AI as having positive implications for teaching, research, and skills development in OTME in tertiary institutions in Plateau State, Nigeria.

Research question 2: What are the students' perceptions of the positive implications of Artificial Intelligence in Office Technology and Management Education in tertiary institutions in Plateau State?

Table 2; Students' perceptions of Positive implications of AI in OTME

S/N	Item	Mean	Decision
1	AI makes learning more interactive and engaging	3.57	Strongly Agreed
2	AI improves access to learning materials	3.71	Strongly Agreed
3	AI enhances digital and office-related competencies	3.46	Strongly Agreed
4	AI supports independent learning and assignment completion	3.52	Strongly Agreed
Grand Mean =		**3.57**	**Strongly Agreed**

Data presented in table 2 indicates that students perceived AI positively particularly regarding access to information, engagement, and independent learning.

Research question 3: What challenges are perceived to hinder Artificial intelligence integration in Office Technology and Management Education in tertiary institutions in Plateau State?

Table 3: Perceived Challenges of AI Integration in OTME

S/N	Item	Mean	Decision
1	Inadequate ICT infrastructure	3.74	Strongly Agreed
2	Poor internet connectivity	3.69	Strongly Agreed
3	Unstable power supply (electricity)	3. 81	Strongly Agreed
4	Limited AI skills among lecturers and students	3.55	Strongly Agreed
5	Fear of job displacement due to automation	3.21	Strongly Agreed
Grand Mean =		**3.60**	**Strongly Agreed**

Table 3 shows that both the respondents strongly agreed that infrastructural and competency-related factors constitute major barriers to AI integration into OTME in tertiary institutions in Plateau State, Nigeria.

Research question 4: What strategies are required for effective integration of Artificial intelligence into office Technology and Management Education programmes?

Table 4: Strategies required for effective AI integration

S/N	Item	Mean	Decision
1	Regular AI literacy training for lecturers	3.78	Strongly Agreed
2	Integration of AI literacy into OTME curriculum	3.84	Strongly Agreed
3	Provision of reliable internet facilities	3.87	Strongly Agreed
4	Government funding for digital infrastructure	3.91	Strongly Agreed
Grand Mean =		**3.85**	**Strongly Agreed**

Table 4 reveals that the respondents strongly supported training, curriculum reform, infrastructure provision, and increased funding as strategies for effective AI integration into OTME in tertiary institutions in Plateau State, Nigeria.

Discussion of Findings

The findings reveal that lecturers and students hold generally positive perceptions regarding the educational benefits of Artificial Intelligence (AI). This finding supports the Technology Acceptance

Model, which posits that technologies perceived as useful and easy to use are more readily accepted (Davis, 1989; Venkatesh & Davis, 2000).

Respondents perceived AI as tools for improving lesson preparation, facilitating personalized learning, enhancing students' engagement, supporting research activities, simplifying office applications, and strengthening digital competencies. These findings align with Holmes et al. (2022), who reported that AI enhances instructional effectiveness and promotes learner-centred education.

The study also revealed concerns regarding plagiarism, overdependence on AI tools, reduced critical thinking, ethical dilemmas, copyright issues, and data privacy. These findings corroborate UNESCO (2023) and Kasneci et al. (2023), who emphasized that although AI offers substantial educational opportunities, it also raises important ethical and pedagogical challenges that require appropriate governance.

Furthermore, inadequate ICT infrastructure, poor internet connectivity, unstable power (electricity) supply, limited AI literacy, and insufficient institutional policies are major barriers to AI integration in tertiary institutions. These challenges underscore the need for strategic investment and capacity building to maximize the benefits of AI in Office Technology and Management Education.

Recommendations

Based on the findings, the following recommendations are made:

Tertiary institutions should integrate Artificial Intelligence competencies into the Office Technology and Management Education curriculum to prepare students for AI-driven workplaces.

Governments and institutional administrators should invest in reliable ICT infrastructure, stable internet connectivity, uninterrupted power supply (electricity), and AI-enabled learning environments.

Regular training, workshops, seminars, and professional development programmes should be organised to enhance lecturers' AI knowledge and pedagogical skills.

Tertiary institutions in Plateau State, Nigeria should develop comprehensive policies and ethical guidelines governing the responsible use of AI in teaching, learning, assessment, and research.

Students should be educated on responsible AI use to promote academic integrity, originality, critical thinking, and ethical scholarship.

Collaboration among government agencies, tertiary institutions, industry, and technology providers should be strengthened to facilitate sustainable AI integration into higher education.

Further empirical studies should investigate the long-term effects of AI on learning outcomes, employability, and instructional effectiveness in Office Technology and Management Education.

Conclusion

Artificial Intelligence (AI) is transforming tertiary education most especially OTME and redefining the competencies required of graduates in Office Technology and Management Education. The study concludes that lecturers and students generally perceive AI as a valuable educational innovation capable of improving teaching quality, learning effectiveness, research productivity, and workplace preparedness. However, the successful integration of AI into OTME depends on adequate infrastructure, institutional support, ethical regulation, and continuous capacity development for both lecturers and students. By addressing these challenges, tertiary institutions in Plateau State and Nigeria at large can harness the full potential of AI to produce graduates who are innovative, digitally competent, and globally competitive.

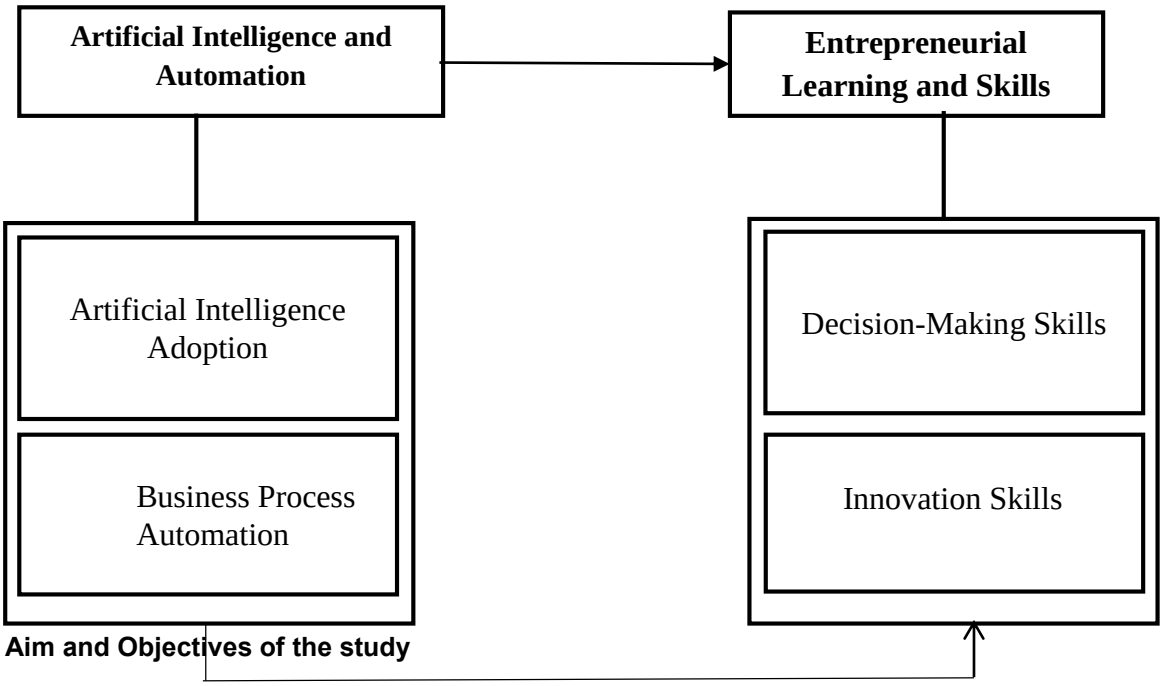
Abstract

This study examined the role of artificial intelligence and automation in shaping entrepreneurial learning and skills acquisition among entrepreneurs of SMES in south-south Nigeria, the specific objectives are to evaluate the relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria. determine the relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria. evaluate the relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria. determine the relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria. This study adopted the correlation survey research. Correlation survey research is non-experimental research. The population of the study comprised 90 entrepreneurs The result of the study showed that there is a significant relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria, there is a significant relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria, there is a significant relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria, there is a significant relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria. The study recommends amongst others that SME entrepreneurs should increase the adoption of appropriate AI technologies. Entrepreneurs should actively explore affordable AI applications that can support market research, information analysis, customer management, forecasting and other business activities. This can strengthen their access to information and improve decision-making capabilities. AI literacy training should be incorporated into SME development programmes. Government agencies, business associations and entrepreneurship development institutions should organise practical AI training programmes for SME entrepreneurs. Such programmes should focus on the practical application of AI rather than theoretical knowledge alone. The study concludes that Artificial Intelligence Adoption and Business Process Automation are significantly and positively associated with Decision-Making Skills and Innovation Skills among entrepreneurs of SMEs in South-South Nigeria. The findings further suggest that digital technologies can serve not only as tools for improving operational efficiency but also as mechanisms for entrepreneurial learning and skills development.

Key Words: Artificial Intelligence, Automation, Entrepreneurial Learning, Skills Acquisition and Entrepreneurs.

Introduction



Small and Medium Enterprises constitute an important component of economic activity because they provide employment, generate income, stimulate innovation and contribute to local economic development. In Nigeria, SMEs operate across manufacturing, agriculture, trade, transportation, hospitality, professional services, information technology and numerous other sectors. Their ability to remain competitive increasingly depends on their capacity to acquire new knowledge and develop skills that correspond with changes in technology and market conditions. The emergence of Artificial

Intelligence (AI) has introduced a new dimension to entrepreneurial learning and business development. AI refers broadly to technologies capable of performing tasks that traditionally require human intelligence, including learning, prediction, language processing, pattern recognition and decision support (Adie et al 2026). Automation, closely related to AI, involves the use of technology to perform repetitive or rule-based activities with limited human intervention. Together, these technologies are changing how entrepreneurs search for information, communicate with customers, analyse markets, manage finances, develop products and organize business operations.

The relevance of AI to entrepreneurship extends beyond the automation of routine activities. AI tools can serve as learning resources through which entrepreneurs acquire knowledge about marketing, accounting, customer management, business strategy and product development. For example, generative AI applications can help entrepreneurs develop business ideas, prepare marketing content, analyse information, simulate business situations and obtain explanations of unfamiliar concepts. This creates opportunities for continuous and self-directed entrepreneurial learning. Evidence from South-South Nigeria already suggests increasing attention to AI in entrepreneurship education. A study by Ebiere and Ekankumo (2025) involving 250 participants from tertiary institutions in the region reported relatively high levels of AI integration and generally positive perceptions, while identifying insufficient training, high costs and limited resources as important challenges. More recent Nigerian research has also linked AI-enabled applications with study engagement and entrepreneurial career intentions among vocational business students in South-South Nigeria. (Edokpolor et al 2026)

However, the application of AI among entrepreneurs is different from its application in formal education. SME entrepreneurs require practical knowledge that can immediately improve their business activities. They need to know not only what AI is, but also how it can be applied responsibly to identify customers, forecast demand, automate processes, manage employees, improve service delivery and make informed decisions. Therefore, this article examines the role of AI and automation in shaping entrepreneurial learning and skills acquisition among SME entrepreneurs in South-South Nigeria.

Conceptual Framework

Aim and Objectives of the study

The aim of this study is to examine the role of artificial intelligence and automation in shaping entrepreneurial learning and skills acquisition among entrepreneurs of SMES in south-south Nigeria. The specific objectives are as follows: to

i. evaluate the relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

ii. determine the relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.
iii. evaluate the relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.
iv. determine the relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.

Research Questions

i. What is the relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria?
ii. What is the relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria?
iii. What is the relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria?
iv. What is the relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria?

Hypotheses

H01 There is no significant relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

H02 There is no significant relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.

H03 There is no significant relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

H04 There is no significant relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.

Literature Review

Conceptual Review

Artificial Intelligence and Automation

Artificial Intelligence represents a collection of technologies that enable computer systems to perform activities associated with human intelligence (Liadi, 2025). These activities include learning from data, recognizing patterns, generating content, predicting outcomes, understanding language and supporting decisions. For SME entrepreneurs, AI can take various forms. These include generative AI applications, chatbots, recommendation systems, predictive analytics, automated accounting systems, customer relationship management tools, digital advertising systems and inventory-management applications. Automation, on the other hand, focuses on allowing technology to execute tasks with minimal human intervention. An entrepreneur may automate invoice generation, customer responses, appointment scheduling, stock alerts, payroll processes, email marketing or social media posting. Automation therefore reduces the amount of time entrepreneurs spend on repetitive tasks and allows them to concentrate on higher-value activities such as innovation, relationship building and strategic decision-making.

The relationship between AI and automation is significant. AI provides the intelligence that can make automated systems more adaptive, while automation provides the mechanism through which technology executes activities efficiently. Consequently, AI and automation can jointly improve the learning and operational capabilities of SME entrepreneurs.

Artificial Intelligence Adoption

Artificial Intelligence (AI) adoption refers to the process through which individuals, entrepreneurs or organisations accept, acquire, integrate and utilise AI technologies in their activities to perform tasks, solve problems, support decision-making and improve the efficiency of their operations. AI involves the use of computer systems and computational techniques to perform tasks that typically require human intelligence, including learning, reasoning, perception, language processing, prediction and decision-making. The adoption of AI therefore goes beyond simply having access to an AI technology; it involves the actual acceptance and utilisation of AI applications within business or entrepreneurial activities.

According to the Organisation for Economic Co-operation and Development (OECD, 2019), an AI system is a machine-based system capable of making predictions, recommendations or decisions based on objectives defined by humans and using varying levels of autonomy. This definition emphasises the ability of AI systems to process information and generate outputs that can support human activities. In the context of entrepreneurship, AI adoption occurs when entrepreneurs incorporate such systems into their business processes, learning activities, marketing, customer relations, financial management, production and strategic decision-making. AI adoption has become increasingly important because advances in machine learning, natural language processing, generative AI, predictive analytics and intelligent automation have expanded the range of activities that can be supported by AI. Davenport, Guha, Grewal and Bressgott (2020) explain that AI can influence business activities by supporting tasks involving data analysis, prediction, customer interaction and decision-making. For entrepreneurs, this creates opportunities to access information rapidly, analyse market trends, understand customer behaviour and improve the efficiency of business operations.

The concept of AI adoption can also be understood from the perspective of technology acceptance. Technology adoption occurs when users perceive a technology as useful, easy to use and relevant to their activities. The Technology Acceptance Model developed by Davis (1989) identifies perceived usefulness and perceived ease of use as important determinants of an individual's acceptance and use of technology. Applied to AI adoption among SME entrepreneurs, perceived usefulness reflects the extent to which entrepreneurs believe that AI can improve their business activities or learning outcomes, while perceived ease of use relates to how easily they can understand, operate and integrate AI applications into their activities. AI adoption among SMEs can take different forms. One important form is the use of AI-powered information and learning tools. Entrepreneurs can use AI applications to search for information, generate business ideas, obtain explanations, analyse market information and support continuous learning. Such applications can potentially improve entrepreneurs' access to knowledge and facilitate self-directed learning.

Another form is AI-supported decision-making. Entrepreneurs often make decisions concerning pricing, inventory, marketing, customer relationships, resource allocation and business expansion. AI systems can process large amounts of data and provide predictions, recommendations or insights that assist entrepreneurs in making informed decisions. The OECD (2021) notes that digital technologies, including AI, can contribute to productivity and innovation while transforming the way firms organise and perform their activities. AI adoption can also involve customer and marketing applications. Entrepreneurs may use AI-powered chatbots, recommendation systems, customer analytics and automated marketing tools to interact with customers and understand their preferences. Davenport et al. (2020) argue that AI can contribute to marketing and customer-management activities by supporting personalised interactions and improving the analysis of customer data. In addition, AI adoption can support business process improvement. SMEs can employ AI technologies to automate or augment repetitive activities, identify patterns in business data, detect potential problems and improve operational efficiency. However, effective adoption requires more than the availability of technology. Entrepreneurs need appropriate digital competencies, financial resources, infrastructure and organisational readiness to successfully implement and sustain AI applications. OECD (2021) observes that SMEs may face challenges in adopting advanced digital technologies because of constraints relating to skills, finance, data and organisational capabilities.

AI adoption also presents potential challenges. Entrepreneurs may be concerned about the cost of acquiring AI technologies, lack of technical skills, data privacy, cybersecurity, reliability of AI-generated information and ethical issues. Generative AI, for example, can produce inaccurate or misleading information, making it necessary for users to exercise human judgement when evaluating AI-generated outputs. UNESCO (2023) therefore emphasises the importance of responsible, ethical and human-centred approaches to the use of generative AI. Within the context of SMEs in South-South Nigeria, AI adoption can be particularly relevant to entrepreneurial learning and skills acquisition. Entrepreneurs can potentially use AI applications to acquire business knowledge, develop digital competencies, generate innovative ideas, improve problem-solving and strengthen decision-making abilities. However, the extent of these benefits may depend on entrepreneurs' access to digital infrastructure, technological knowledge, affordability of AI tools and willingness to adopt emerging technologies.

Business Process Automation

Business Process Automation (BPA) refers to the use of digital technologies, software applications and automated systems to execute, coordinate and manage business activities with minimal human

intervention. It involves the systematic application of technology to repetitive, rule-based and time-consuming business processes with the objective of improving efficiency, reducing errors, lowering operational costs and enabling employees or entrepreneurs to concentrate on more strategic activities. According to Van-der et al (2016), business process management and automation involve the use of information technology to support and improve the execution and management of organisational processes. Business process automation is broader than simply replacing manual activities with computers. It involves analysing existing business processes, identifying activities that can be automated, redesigning workflows where necessary and implementing technological solutions that allow tasks to be performed automatically. Syed et al. (2020) explain that intelligent process automation combines automation technologies with capabilities such as artificial intelligence and machine learning to perform increasingly complex business activities. Thus, modern BPA can range from simple rule-based automation to sophisticated intelligent systems capable of processing information and making recommendations.

The growing importance of business process automation is associated with the increasing digitalisation of business activities. Organisations and SMEs can use automation to perform activities such as accounting, payroll processing, inventory management, customer relationship management, order processing, marketing communication, data entry and reporting. The Organisation for Economic Co-operation and Development (OECD, 2021) observes that digital technologies can enable SMEs to improve business processes, increase productivity and develop new ways of interacting with customers and markets. One important feature of BPA is workflow automation. Workflow automation involves establishing predefined sequences through which business tasks are automatically initiated, transferred, approved and completed. For example, an automated system may receive a customer order, update inventory, generate an invoice and notify the appropriate employee without requiring each activity to be performed manually. Such automation can reduce delays and improve coordination between different business functions.

Another important aspect is data and information processing automation. Businesses generate substantial amounts of financial, customer, sales and operational information. Automated systems can collect, organise, process and generate reports from such information. This enables entrepreneurs to obtain relevant information more quickly and may support evidence-based decision-making. For SMEs, automation of data-related activities can also reduce the burden associated with manual record keeping. BPA also contributes to operational efficiency. Repetitive tasks can consume considerable amounts of employees' and entrepreneurs' time. Automating such tasks allows businesses to complete activities more quickly and consistently. Syed et al. (2020) note that intelligent automation can improve process efficiency while reducing the need for human intervention in routine activities. This can be particularly valuable for SMEs that operate with limited human and financial resources. Another benefit of BPA is error reduction and process consistency. Manual processes are susceptible to errors arising from fatigue, inadequate attention, duplication and inconsistent procedures. Automated systems execute predefined instructions consistently, which can improve the accuracy of routine business activities. However, the effectiveness of automation depends on the quality of the underlying processes, data and system configuration. Poorly designed processes may simply result in the automation of inefficient practices.

Business process automation is also increasingly connected with Artificial Intelligence (AI). Traditional automation generally follows predetermined rules, while AI-enabled automation can use machine learning, natural language processing and predictive analytics to handle activities involving more complex information. This development has led to the emergence of intelligent automation, in which AI and automation technologies work together to support tasks such as document processing, customer service, fraud detection, forecasting and decision support (Syed et al., 2020). For SME entrepreneurs, BPA can have implications beyond operational efficiency because it can influence entrepreneurial learning and skills development. When routine administrative activities are automated, entrepreneurs may have more time to focus on opportunity identification, innovation, strategic thinking, customer engagement and problem-solving. At the same time, entrepreneurs need new digital competencies to select, implement, monitor and evaluate automated systems. Consequently, BPA may contribute to both the transformation of business activities and the development of entrepreneurs' technological and managerial capabilities.

Despite its benefits, BPA presents several challenges. SMEs may encounter high implementation costs, inadequate digital infrastructure, limited technical skills, resistance to technological change,

cybersecurity concerns and difficulties integrating new systems with existing technologies. The OECD (2021) notes that SMEs frequently face resource and capability constraints that can affect their ability to adopt and effectively use advanced digital technologies. In the context of SMEs in South-South Nigeria, business process automation can provide opportunities for entrepreneurs to improve efficiency, reduce routine workloads, enhance information management and strengthen decision-making. However, the extent to which entrepreneurs can benefit from automation may depend on their digital skills, access to reliable

Business Process Automation in this study is conceptualised as the use of digital technologies and automated systems to perform, coordinate and manage routine and business processes with reduced human intervention, with the aim of improving operational efficiency, accuracy, speed and decision-making among SME entrepreneurs. The concept may be operationalised through indicators such as automation of routine tasks, workflow automation, automated data processing, automated record keeping and integration of automated systems into business operations.

Entrepreneurial Learning

Entrepreneurial learning refers to the process through which entrepreneurs acquire, interpret and apply knowledge and experience in identifying opportunities, solving problems and managing businesses. It can occur through formal training, observation, experimentation, interaction with customers, mentoring, networking and practical business experience. Entrepreneurial learning is particularly important for SMEs because entrepreneurs frequently operate with limited managerial resources. The owner-manager may simultaneously perform the functions of chief executive, marketer, accountant, human resource manager and customer service officer. Continuous learning therefore becomes necessary for effective business management (Gbogbor 2025). AI introduces new possibilities for entrepreneurial learning by making knowledge more accessible. Entrepreneurs can use AI-powered tools to ask questions, obtain explanations, generate ideas, analyse business information and explore alternative solutions. This can support self-directed learning and reduce entrepreneurs' dependence on traditional classroom-based training.

AI can also support experiential learning. An entrepreneur can test different marketing messages, analyse customer responses, simulate business scenarios and compare alternative strategies. Through this process, business experience can be converted into knowledge and improved practices. Skills acquisition involves the development of practical abilities required to perform tasks effectively. For contemporary entrepreneurs, relevant skills extend beyond traditional business competencies. Entrepreneurs increasingly require digital, analytical, technological, communication, creative and problem-solving skills. Automation does not merely reduce the amount of work performed manually; it can also change the skills entrepreneurs need to acquire. When routine activities become automated, entrepreneurs increasingly require skills in technology management, data interpretation, system supervision and strategic decision-making. For example, an entrepreneur who previously maintained inventory manually may begin using an automated inventory system. The entrepreneur must then learn how to configure the system, interpret stock reports, identify reorder points and use the information to make purchasing decisions.

Similarly, automated customer relationship systems can record customer interactions and identify purchasing patterns. The entrepreneur therefore needs to develop the ability to interpret customer information and translate it into marketing and service strategies. Automation consequently shifts entrepreneurial skills from purely manual execution toward technology-enabled supervision, interpretation and strategic management.

Decision-Making Skills

Decision-making skills refer to the abilities, competencies and processes that enable an individual to identify a problem or opportunity, gather and evaluate relevant information, consider alternative courses of action and select an appropriate option to achieve a desired objective. Decision-making is an important managerial and entrepreneurial competence because entrepreneurs are continuously required to make choices relating to investment, pricing, marketing, employees, customers, production, technology and business growth. According to Simon (1977), decision-making involves identifying alternatives and selecting a course of action under conditions where decision-makers may have limited information, time and cognitive capacity.

Decision-making skills involve more than simply choosing between alternatives. They include the ability to define problems accurately, collect relevant information, analyse available evidence, evaluate risks and benefits, compare alternatives and implement decisions. Kahneman (2011) explains that human judgement and decision-making can be influenced by cognitive processes and biases, making analytical thinking and careful evaluation important for improving the quality of decisions. For entrepreneurs, strong decision-making skills can therefore help reduce avoidable errors and improve responses to uncertain and changing business environments. An important component of decision-making skills is problem identification. Before an appropriate decision can be made, an entrepreneur must be able to recognise the existence, nature and causes of a problem or identify an emerging business opportunity. Effective problem identification enables entrepreneurs to distinguish between symptoms and underlying causes and to determine whether a situation requires immediate action or further investigation.

Another component is information gathering and analysis. Entrepreneurs require relevant and reliable information to make sound decisions. Information may come from customers, competitors, suppliers, employees, financial records, market research and technological systems. The ability to identify relevant information, assess its reliability and interpret it appropriately enables entrepreneurs to make decisions based on evidence rather than assumptions. Evaluation of alternatives is another important element of decision-making skills. Business decisions often involve several possible alternatives, each with potential benefits, costs and risks. An entrepreneur with strong decision-making skills should be able to compare alternatives systematically and assess their likely consequences. This involves considering factors such as financial implications, customer expectations, available resources, competitive conditions and long-term business objectives.

Decision-making skills also involve risk assessment. Entrepreneurs frequently operate in environments characterised by uncertainty, and many business decisions involve potential financial, operational or market risks. The ability to identify potential risks, estimate their possible effects and determine appropriate responses is therefore an important entrepreneurial competency. Shepherd, Williams and Patzelt (2015) argue that entrepreneurial decision-making is closely connected to uncertainty and the entrepreneur's ability to respond to changing circumstances. Another important component is critical thinking. Critical thinking enables entrepreneurs to question assumptions, examine evidence, identify inconsistencies and avoid accepting information without adequate evaluation. This is particularly important in an increasingly digital business environment where entrepreneurs have access to large volumes of information from different sources. Decision-making skills are also closely related to problem-solving skills. Although problem-solving focuses primarily on identifying solutions to specific problems, decision-making involves selecting among available alternatives and determining what action should be taken. Both competencies complement each other and are essential for effective entrepreneurial performance.

The development of digital technologies and Artificial Intelligence (AI) has further changed the decision-making environment for entrepreneurs. AI systems can analyse large amounts of data, identify patterns, generate predictions and provide recommendations that may support managerial decisions. Davenport, Guha, Grewal and Bressgott (2020) explain that AI can support business activities by improving the analysis of information and assisting decision-related processes. However, AI-supported decision-making does not eliminate the need for human judgement. Entrepreneurs must still evaluate the accuracy, relevance and potential biases of AI-generated information before using it to make important decisions. In the context of entrepreneurial learning, decision-making skills can be developed through education, training, practical experience, mentoring, problem-solving activities and exposure to new technologies. Entrepreneurs who continually learn from previous decisions and business experiences may improve their ability to assess situations and respond effectively to future challenges. This makes decision-making an important component of entrepreneurial skills acquisition.

For SME entrepreneurs in South-South Nigeria, decision-making skills are particularly relevant because SMEs often operate under conditions of limited financial resources, changing customer preferences, infrastructure challenges, intense competition and economic uncertainty. Entrepreneurs need the ability to evaluate available information and make timely decisions concerning business operations, technology adoption, resource allocation and growth opportunities. Decision-Making Skills in this study are conceptualised as the ability of SME entrepreneurs to identify business problems and opportunities, gather and analyse relevant information, evaluate alternative courses of action, assess associated risks and select appropriate actions for achieving business objectives. The concept can be operationalised

through indicators such as problem identification, information analysis, evaluation of alternatives, risk assessment and quality or timeliness of decisions.

Innovation Skills

Innovation skills refer to the knowledge, abilities, attitudes and competencies that enable individuals to identify opportunities, generate new ideas, develop creative solutions and transform those ideas into products, services, processes or business practices that create value. Innovation skills are important to entrepreneurs because business environments are continuously changing, requiring entrepreneurs to identify new opportunities, respond to customer needs, adopt new technologies and develop improved ways of conducting business. The European Commission (2016) describes entrepreneurial and innovation-related competences as involving the ability to act upon opportunities and ideas and transform them into value for others.

Innovation is broader than creativity because creativity primarily involves generating novel ideas, whereas innovation involves implementing or applying ideas to create useful outcomes. Amabile (1996) explains that creativity involves the production of ideas that are both novel and appropriate, while innovation concerns the successful implementation of creative ideas within an organisation. Thus, an entrepreneur may generate several creative business ideas, but innovation skills are required to evaluate, develop and implement those ideas effectively. One important component of innovation skills is creative thinking. Creative thinking enables entrepreneurs to look at problems from different perspectives, challenge existing assumptions and generate alternative approaches to business challenges. It involves flexibility, originality, curiosity and the willingness to explore new possibilities. According to OECD and Eurostat (2018), innovation activities may involve the development or improvement of products, processes, marketing methods and organisational practices.

Another important component is opportunity identification. Entrepreneurs with strong innovation skills are able to identify unmet customer needs, market gaps, emerging technologies and changes in consumer behaviour that may create opportunities for new or improved products and services. The ability to recognise opportunities is particularly important in competitive markets because it enables entrepreneurs to respond proactively rather than simply react to changes. Innovation skills also involve idea generation and development. Entrepreneurs need to generate ideas and then refine those ideas into practical solutions. This requires experimentation, evaluation, feedback and continuous improvement. The ability to develop an idea from its initial stage to a workable product, service or process is therefore an important aspect of entrepreneurial innovation. A further dimension is problem-solving ability. Innovation frequently emerges from attempts to solve existing problems in new or more effective ways. Entrepreneurs need to analyse business challenges, identify their underlying causes and develop alternative solutions. Strong problem-solving skills therefore support the transformation of challenges into opportunities for innovation.

Risk-taking and experimentation are also associated with innovation skills. Innovation often involves uncertainty because entrepreneurs cannot always predict how customers, competitors or markets will respond to a new product, service or business model. Entrepreneurs may therefore need to experiment with different approaches, learn from failure and modify their strategies. Drucker (1985) considers innovation a specific instrument of entrepreneurship through which entrepreneurs exploit change as an opportunity for a different business or service. Innovation skills further include adaptability and technological competence. The rapid development of digital technologies, including Artificial Intelligence (AI), automation, cloud computing and data analytics, has created new possibilities for entrepreneurial innovation. Entrepreneurs need to understand how emerging technologies can be applied to improve products, services, processes and customer experiences. OECD (2021) notes that digitalisation can enable SMEs to develop new business models, improve productivity and access new markets.

In addition, collaboration and communication skills contribute to innovation. Innovation may involve working with employees, customers, suppliers, technology providers and other stakeholders. Entrepreneurs must therefore be able to communicate ideas, obtain feedback, build teams and coordinate resources necessary for implementing innovative solutions. Innovation is often a collaborative process rather than an activity undertaken entirely by an individual entrepreneur. Innovation skills are particularly important for Small and Medium-sized Enterprises (SMEs) because SMEs operate in highly competitive environments and often need to differentiate themselves through new products, improved services, cost-effective processes or innovative business models. However, SMEs may face barriers to innovation, including limited financial resources, inadequate technical skills,

limited access to technology and weak innovation infrastructure. The OECD (2021) notes that digital technologies can provide SMEs with opportunities for innovation while also highlighting the importance of skills and organisational capabilities for successful digital transformation.

Within the context of entrepreneurial learning and skills acquisition, innovation skills can be developed through education, training, practical business experience, interaction with other entrepreneurs, experimentation and the use of digital technologies. Artificial Intelligence and automation may provide additional opportunities for entrepreneurs to acquire innovation-related knowledge, generate ideas, analyse markets and experiment with new approaches. However, entrepreneurs need the ability to critically evaluate technological outputs and apply them appropriately to their business contexts.

For SME entrepreneurs in South-South Nigeria, innovation skills can assist entrepreneurs in responding to local market needs, technological changes, competitive pressures and evolving customer expectations. Entrepreneurs who possess strong innovation skills may be better positioned to develop new products and services, improve operational processes, explore new markets and create sustainable competitive advantages. Innovation Skills in this study are conceptualised as the abilities and competencies that enable SME entrepreneurs to identify opportunities, generate and develop new ideas, solve business problems creatively, experiment with alternative approaches and implement new or improved products, services, processes and business practices. The concept may be operationalised through indicators such as creative thinking, opportunity identification, idea generation, problem-solving, experimentation, adaptability and implementation of innovative ideas.

Empirical Review

Arachie et al (2025) examined the apparent hesitance of Small and Medium-sized Enterprises (SMEs) in West Africa to embrace AI for their transformation, prompting an examination of AI-powered business transformation in SMEs. Employing a qualitative research method, the study utilized secondary qualitative data and thematic analysis to identify key influencing factors and reviewed existing empirical evidence on challenges and opportunities. Findings revealed a significant awareness and usage gap among West African SMEs, with a high level of awareness of AI tools, which contrasts with minimal actual implementation. Despite this, SMEs hold a highly positive perception of AI's potential benefits, including enhanced customer relationship management (CRM), improved content creation, and increased operational efficiency. However, widespread adoption is consistently hindered by certain barriers such as inadequate digital infrastructure, digital skill gaps, high financial costs, organizational resistance to change, and challenges related to data quality and integration. The study concluded that while AI offers immense transformative potential for West African SMEs, realizing these benefits necessitates bridging the gap between awareness and implementation through targeted interventions. The study, therefore, recommended among others, government-led policy and infrastructure development, comprehensive digital literacy and AI skills training for SMEs owners and workers.

Akinruwa et al (20250) assessed the effects of perceived relative advantage, AI-complexity, employee capability, government regulations, and job roles on AI adoption within firms. Descriptive statistics and inferential statistics were adopted. Research design, with structured questionnaires, was administered on 220 respondents. Simple random, heterogeneous purposive, and convenience sampling techniques were deployed to select the respondents. The data was analysed using Structural Equation Modelling (SEM). Perceived relative advantage ($\beta = 0.496$, $p < 0.001$) improves SME performance, while AI complexity has a negative impact on employee capability ($\beta = -0.217$, $p = 0.038$) and management support ($\beta = -0.098$, $p = 0.041$). Employee capability has a positive impact on management support ($\beta = 0.461$,)

Ebiere and Ekankumo, (2025) investigated the Artificial Intelligence (AI) and entrepreneurship education research in South-South Nigeria. The study developed three specific objectives focusing on the current level of AI integration, perceptions of its use, and associated challenges. A descriptive survey design was employed, involving a sample of 250 respondents from various private and public tertiary institutions in south-south Nigeria. Data were collected using a structured questionnaire designed on Likert scale format ranging from "Strongly agree, agree, disagree and strongly disagree response with 15 items. The overall reliability coefficient obtained was 0.82, indicating a high level of internal consistency and confirming that the instrument was reliable for measuring the study variables. The data collected was analyzed through descriptive and inferential statistics, including independent t-tests. The findings indicated a high level of AI integration and generally positive perceptions among educators and students. Challenges such as insufficient training, high

costs, and limited resources were identified. Significant differences were found in the challenges faced by private versus public institutions, while no significant differences were observed in AI integration levels or perceptions between the two types of institutions. The study recommended amongst others that to address the challenge of insufficient training, both private and public institutions should implement comprehensive AI training programs for educators and students in south-south Nigeria

Methodology

This study adopted the correlation survey research. Correlation survey research is non-experimental research in which the researcher measures two variables and assesses the statistical relationship between them. The population of the study comprised 90 entrepreneurs. Based on the population of the study, which is 90 entrepreneurs, the study adopted a census approach. The reliability of the study was tested using the Cronbach Alpha method, the result stood at 0.87 higher than the benchmark of 0.70. The study employed the Spearman Rank order Correlation Coefficient for testing the various hypotheses formulated for the study with the aid of the Statistical Package for Social Sciences (SPSS) Version 23.0.

Analysis and Interpretation

Bivariate Analysis

Hypothesis 1

***H_{01}*:** There is no significant relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

Correlation Analysis Showing the Relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria

Correlations

			Artificial Intelligence Adoption	Decision-Making Skills
Spearman's rho	Artificial Intelligence Adoption	Correlation Coefficient	1,000	.722
		Sig. (2-tailed)		.000
		N	83	83
	Decision-Making Skills	Correlation Coefficient	.722	1,000
		Sig. (2-tailed)	.000	
		N	83	83

**. Correlation is significant at the 0.05 level (2-tailed).

The result in table above shows that spearman's rank correlation coefficient (rho) is calculated at 0.72. The value is significant; hence it suggests that a strong relationship exist between Artificial Intelligence Adoption and Decision-Making Skills. The positive sign of this correlation coefficient gives the evidence that Artificial Intelligence Adoption is positively related to Decision-Making Skills. Given the significant 2-tail value (PV) = 0.000 < 0.01, the researcher therefore rejects the null hypothesis of no significant relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria, and conclude that a significant relationship exist between them.

Hypothesis 2

***H_{02}*: There is no significant relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.**

Correlation Analysis Showing the Relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.

Correlations

			Artificial Intelligence Adoption	Innovation Skills
Spearman's rho	Artificial Intelligence Adoption	Correlation Coefficient	1,000	.726
		Sig. (2-tailed)		.000
		N	83	83
	Innovation Skills	Correlation Coefficient	.726	1,000
		Sig. (2-tailed)	.000	
		N	32	83

**. Correlation is significant at the 0.05 level (2-tailed).

The result in table above shows that spearman's rank correlation coefficient (rho) is calculated at 0.73. The value is significant; hence it suggests that a strong relationship exist between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria. The positive sign of this correlation coefficient gives the evidence that Artificial Intelligence Adoption is positively related to Innovation Skills among entrepreneurs of SMES in south-south Nigeria. Given the significant 2-tail value (PV) = 0.000 < 0.01, the researcher therefore rejects the null hypothesis of no significant relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMES in south-south Nigeria, and conclude that a significant relationship exists between them.

Hypothesis 3

Ho_3: here is no significant relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

Result of bivariate analysis between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

			Business Process Automation	Decision-Making Skills
Spearman (rho)	Business Process Automation	Correlation Coefficient	1.000	.843**
		Sig. (2 tailed)	.	.001
		N	83	83
	Decision-Making Skills	Correlation Coefficient	.843**	1.000
		Sig. (2 tailed)	.001	.
		N	83	83

**Correlation is significant at 0.01 levels (2 tailed)

The result of the bivariate analysis carried out between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria. The result shows a very strong and positive correlation between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria (rho = .843**) and this correlation is significant at 0.01 level. Based on this result, the null hypothesis (Ho_3) is rejected and the alternate hypothesis is accepted. This means that we then accept that there is significant relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMES in south-south Nigeria.

Hypothesis 4

Ho_4: There is no significant relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.

Result of bivariate analysis between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria

			Risk Management	Customer Satisfaction
Spearman (rho)	Risk Management	Correlation Coefficient	1.000	.851**
		Sig. (2 tailed)	.	.001
		N	83	83
	Customer Satisfaction	Correlation Coefficient	.851**	1.000
		Sig. (2 tailed)	.001	.
		N	83	83

**Correlation is significant at 0.01 levels (2 tailed)

The result of the bivariate analysis carried out between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria. The result indicates that Business Process Automation has a very strong and positive correlation with Innovation Skills among entrepreneurs of SMES in south-south Nigeria (rho = .851**) and this correlation is significant at 0.01 level. Consequently, the null hypothesis (Ho_4) is rejected and the alternate hypothesis is accepted. This means that we then accept that there is significant relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMES in south-south Nigeria.

Discussion of Findings

The study examined the role of Artificial Intelligence (AI) and automation in shaping entrepreneurial learning and skills acquisition among entrepreneurs of SMEs in South-South Nigeria. Specifically, four hypotheses were tested using Spearman's rank correlation analysis. The findings indicate positive and statistically significant relationships between Artificial Intelligence Adoption, Business Process Automation, Decision-Making Skills and Innovation Skills. The results are discussed in relation to existing literature as follows.

Discussion of Finding for Hypothesis One

H01: There is no significant relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMEs in South-South Nigeria.

The result revealed a strong, positive and statistically significant relationship between Artificial Intelligence Adoption and Decision-Making Skills among entrepreneurs of SMEs in South-South Nigeria, with a Spearman correlation coefficient of rho = 0.722 and a significance value of p = 0.000. Since the p-value is less than the 0.05 level of significance, the null hypothesis was rejected. This implies that greater adoption of artificial intelligence is associated with stronger decision-making skills among SME entrepreneurs. The finding suggests that entrepreneurs who make greater use of AI technologies may have better capabilities to gather and analyse information, identify patterns, evaluate

alternatives and make timely business decisions. AI applications can process large volumes of information and provide predictions, recommendations and insights that may support entrepreneurs when dealing with complex or uncertain business situations. This is consistent with the argument that AI can strengthen entrepreneurial decision-making by supporting opportunity recognition, evaluation and exploitation. A recent systematic review by Aziz et al. (2026) similarly identifies AI as an important technology for improving entrepreneurial decision-making, idea generation and opportunity recognition.

The finding is also consistent with empirical evidence from SMEs. Danquah (2025), in a study of SMEs in Ghana, found that AI tools were increasingly being used to support business decision-making, automate routine tasks and facilitate long-term planning. Similarly, research among SME operators in Anambra State, Nigeria, reported that AI supports decision-making through data-driven judgement, pattern identification, risk assessment and opportunity recognition. The strong coefficient of 0.722 obtained in the present study provides evidence that AI adoption is not merely an operational issue but may also contribute to the development of entrepreneurs' cognitive and managerial capabilities. Nevertheless, the relationship should be interpreted as an association rather than proof of causation, because the bivariate correlation analysis does not establish that AI adoption alone causes improvements in decision-making skills. The finding has practical implications for SME development in South-South Nigeria. Entrepreneurs may benefit from training programmes that focus not only on how to use AI tools but also on how to interpret AI-generated information critically and combine it with human judgement and sector knowledge. This is important because recent research indicates that AI can improve the number and depth of opportunities identified by entrepreneurs, while excessive reliance on AI may reduce contextual sensitivity and innovative judgement.

Discussion of Finding for Hypothesis Two

H02: There is no significant relationship between Artificial Intelligence Adoption and Innovation Skills among entrepreneurs of SMEs in South-South Nigeria.

The result showed a strong positive and statistically significant relationship between Artificial Intelligence Adoption and Innovation Skills, with a Spearman correlation coefficient of rho = 0.726 and p = 0.000. Since the p-value is below 0.05, the null hypothesis was rejected and the alternative hypothesis accepted. The finding indicates that entrepreneurs who adopt AI more extensively tend to demonstrate stronger innovation skills. The result can be explained by the ability of AI technologies to facilitate idea generation, information search, market analysis, experimentation and the development of new products and services. AI can expose entrepreneurs to new information and alternative solutions, thereby expanding their capacity to identify opportunities and develop innovative responses to market problems. Recent evidence from SMEs indicates that AI-related knowledge, skills and capabilities are positively associated with business innovation outcomes. A 2026 longitudinal SME study found that AI capital was associated with stronger product, process, market and strategic innovation.

The finding also agrees with recent evidence that AI adoption can enhance innovation among SMEs. Research published in *Technology in Society* in 2026 found that AI adoption significantly enhanced innovation output among SMEs, although the strength of the effect varied across industries and was partly explained by digital capability and research-and-development efficiency. Similarly, research on SMEs and AI indicates that AI applications can help firms respond to environmental turbulence and support innovation through dynamic capabilities. The coefficient of 0.726 indicates a strong association, suggesting that AI adoption is closely connected with the ability of entrepreneurs to develop and apply innovative ideas. In the context of South-South Nigeria, this may mean that entrepreneurs who actively use AI for market intelligence, content generation, customer analysis, product development and problem-solving are better positioned to develop innovative business solutions.

However, AI adoption should not be viewed as automatically producing innovation. AI technologies provide tools and information, but entrepreneurs must possess the skills to interpret outputs, identify useful opportunities and translate ideas into commercially viable products, services or processes. Recent evidence from an emerging-economy context similarly suggests that AI use is more likely to create sustainable value when supported by entrepreneurial reconfiguration capabilities and business-model innovation. Thus, the finding reinforces the importance of combining AI literacy with entrepreneurial creativity, critical thinking, experimentation and opportunity recognition in SME development programmes.

Discussion of Finding for Hypothesis Three

H03: There is no significant relationship between Business Process Automation and Decision-Making Skills among entrepreneurs of SMEs in South-South Nigeria.

The result revealed a very strong positive and statistically significant relationship between Business Process Automation and Decision-Making Skills, with a Spearman correlation coefficient of rho = 0.843 and p = 0.001. Since the significance value is below 0.05, the null hypothesis was rejected. This indicates that higher levels of business process automation are associated with stronger decision-making skills among entrepreneurs of SMEs in South-South Nigeria. The particularly high correlation coefficient suggests that automation may be an important component of the technological environment within which entrepreneurs make business decisions. Automation can reduce the time required to perform repetitive activities, improve the availability of business information and provide entrepreneurs with timely operational data. For example, automated accounting, inventory systems, customer relationship systems and sales-management platforms can generate information that entrepreneurs can use when making decisions about resources, customers, pricing and operations. The finding is consistent with research showing that AI and automation can improve the speed, efficiency and quality of SME decision-making. Danquah (2025) reported that SMEs increasingly use AI to automate routine activities and support long-term planning, while research on AI-supported SME decision-making indicates that real-time data analysis and operational streamlining can facilitate faster and more informed decisions.

The result also supports the argument that automation can free entrepreneurs from routine administrative activities and allow them to devote greater attention to strategic issues. When routine processes such as data entry, reporting, transaction processing and customer communication are automated, entrepreneurs may have more time to interpret business information, assess alternatives and formulate strategic responses. However, the rho = 0.843 should be interpreted cautiously. A correlation of this magnitude demonstrates a very strong association, but it does not by itself establish a causal relationship. It is possible that entrepreneurs with stronger decision-making capabilities are also more likely to adopt automation because they are better able to identify appropriate technologies and integrate them into their businesses. Consequently, the result demonstrates an important relationship but does not establish the direction of causality. The finding nevertheless suggests that SME support programmes in South-South Nigeria should consider automation training as part of entrepreneurial capacity development. Entrepreneurs should be equipped with the ability to select appropriate automated processes, interpret automated reports and use technology-generated information in decision-making.

Discussion of Finding for Hypothesis Four

H04: There is no significant relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMEs in South-South Nigeria.

The result revealed a very strong positive and statistically significant relationship between Business Process Automation and Innovation Skills among entrepreneurs of SMEs in South-South Nigeria. The Spearman correlation coefficient was rho = 0.851, with a significance level of p = 0.001. Since the p-value is less than 0.05, the null hypothesis was rejected and the alternative hypothesis accepted.This finding suggests that entrepreneurs who make greater use of business process automation tend to demonstrate stronger innovation skills. Automation may create an environment in which entrepreneurs can devote less time to repetitive activities and more time to creative thinking, opportunity identification, experimentation and the development of new products, services and processes.

The finding is consistent with contemporary research on digital transformation and SME innovation. Recent evidence indicates that AI-related capabilities and technological integration can contribute to innovation, although the benefits depend on complementary organisational capabilities such as entrepreneurial competence, strategic intelligence and digital skills. The very strong coefficient of 0.851 suggests that business process automation has a particularly close association with innovation skills in the sampled SMEs. One possible explanation is that automation improves the efficiency of business operations and provides entrepreneurs with additional time and information to experiment with new approaches. Automated systems may also expose entrepreneurs to new ways of organising business activities, interacting with customers and analysing market information, thereby stimulating innovative thinking.

The finding further suggests that automation should not be considered exclusively as a mechanism for reducing costs or increasing operational efficiency. It can also serve as an enabler of entrepreneurial learning and innovation. As entrepreneurs interact with automated systems, they may acquire new digital competencies and learn to redesign business processes around emerging technologies. Nevertheless, the finding should again be interpreted as a significant association rather than definitive evidence of causality. The strong correlation may also reflect the possibility that more innovative entrepreneurs are more willing and capable of adopting business process automation. Recent research on emerging-market SMEs similarly cautions that greater AI usage does not automatically guarantee superior outcomes; value creation depends on complementary skills, governance, leadership, data infrastructure and organisational capabilities.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. SME entrepreneurs should increase the adoption of appropriate AI technologies. Entrepreneurs should actively explore affordable AI applications that can support market research, information analysis, customer management, forecasting and other business activities. This can strengthen their access to information and improve decision-making capabilities.

2. AI literacy training should be incorporated into SME development programmes. Government agencies, business associations and entrepreneurship development institutions should organise practical AI training programmes for SME entrepreneurs. Such programmes should focus on the practical application of AI rather than theoretical knowledge alone.

3. Entrepreneurs should use AI as a decision-support tool rather than a complete substitute for human judgement. Although AI can provide recommendations and analyse large volumes of information, entrepreneurs should critically evaluate AI-generated outputs before making important business decisions. This will help reduce the risks associated with inaccurate, biased or inappropriate AI-generated information.

4. SMEs should automate repetitive and time-consuming business processes. Entrepreneurs should identify routine activities such as record keeping, invoicing, inventory management, customer communication, payroll and data processing that can be automated. This can reduce administrative burdens and allow entrepreneurs to devote more time to strategic decision-making and business development.

Conclusion

The study concludes that Artificial Intelligence Adoption and Business Process Automation are significantly and positively associated with Decision-Making Skills and Innovation Skills among entrepreneurs of SMEs in South-South Nigeria. The findings further suggest that digital technologies can serve not only as tools for improving operational efficiency but also as mechanisms for entrepreneurial learning and skills development.

Abstract

Nigeria has heightened the vulnerability of start-ups, particularly in Rivers State, thereby necessitating the adoption of innovative digital solutions to enhance business resilience. This study examined the relationship between Digital Accounting Intelligence (DAI) and entrepreneurial resilience of start-ups in an era of economic uncertainty in Rivers State. The study investigated the influence of automated data collection and processing on entrepreneurial resilience, as well as the effect of advanced analytics and decision-support systems on the adaptive capacity and strategic reorientation of start-ups. A cross-sectional survey research design was adopted, and data were collected from owners and managers of registered start-ups across selected sectors in Rivers State using a structured questionnaire. The instrument was validated, and reliability coefficient of 0.83 was confirmed using Cronbach's Alpha. Data were analyzed using descriptive statistics (mean and standard deviation) and multiple regression analysis at a 0.05 level of significance. The findings revealed that automated data collection and processing within DAI have a statistically significant positive influence on entrepreneurial resilience. Advanced analytics and decision-support systems were found to significantly enhance the adaptive capacity and strategic reorientation of start-ups. The study concludes that Digital Accounting Intelligence serves not only as an operational accounting tool but also as a strategic resource that strengthens start-up resilience and adaptability in uncertain economic environments. Based on the findings, the study recommends that start-ups institutionalize automated and analytics-driven accounting systems, while policymakers and entrepreneurship support agencies should promote DAI adoption through capacity-building initiatives and supportive policy frameworks.

Key words: Digital Accounting Intelligence, Entrepreneurial Resilience, Start-ups, Economic Uncertainty

Introduction

In an era marked by pervasive economic uncertainty, fueled by fluctuating global markets, inflationary pressures, and systemic shocks such as pandemics and policy instability, start-ups face unprecedented survival challenges. Entrepreneurial resilience—the capacity of new ventures to withstand, adapt, and grow despite adverse conditions—has therefore emerged as a critical determinant of entrepreneurial success in volatile environments (Souza & Nassif, 2025). Resilience is conceptualized as both a dynamic process and a set of strategic capabilities that enable start-ups to absorb shocks, reconfigure resources, and sustain organizational continuity under duress (Souza & Nassif, 2025; Enwereji et al., 2024). This resilience encompasses proactive adaptation, innovation, and sustained performance despite uncertainty, aligning with recent research highlighting resilience as fundamental for survival and growth in uncertain economic contexts.

Concurrently, rapid advancements in digital technologies have transformed the accounting domain, giving rise to Digital Accounting Intelligence (DAI)—a broad set of information technologies, data analytics tools, artificial intelligence, and automation designed to collect, process, interpret, and communicate financial information in real time. While the term "digital accounting intelligence" is emerging and still gaining definitional clarity in scholarly literature, digitalization in accounting broadly refers to the 2 integration of advanced technologies such as cloud computing, robotic process automation (RPA), artificial intelligence (AI), machine learning, and data analytics into accounting information systems to improve operational efficiency, decision quality, and information accuracy.

Start-ups play a pivotal role in economic development by driving innovation, job creation, and competitiveness. However, in many developing economies—including Nigeria—start-ups face multifaceted challenges arising from economic volatility, infrastructural deficits, policy uncertainty, and limited access to capital (Ugwuegbu, Echendu & Nwafee, 2025). In Rivers State, these pressures are magnified by regional economic instability and fluctuating market conditions, underscoring the need for more resilient entrepreneurial ecosystems. Under such conditions, the capacity of start-ups to survive, adapt, and thrive—referred to as entrepreneurial resilience—becomes a central theme in entrepreneurship research and practice. Entrepreneurial resilience encompasses the ability of ventures to recover from setbacks, adapt to change, and sustain performance despite external shocks (Souza & Nassif, 2025; Awad & Martín-Rojas, 2024).

Amidst this complex landscape, technological advancements—particularly in financial information and accounting systems—offer emerging pathways for enhancing start-up capabilities. One such advancement is Digital Accounting Intelligence (DAI), which extends beyond basic accounting digitalization to encompass advanced technologies such as artificial intelligence (AI), data analytics, cloud computing, and automated processing within accounting information systems. DAI represents a set of integrated digital technologies that automate data capture, improve real-time reporting, generate predictive financial insights, and strengthen data integrity and security. Contemporary literature highlights that digital transformation in accounting is not only reshaping internal operations but also offering strategic tools for decision-making, risk management, and organizational agility (Nurrahma, Fadilah & Aji, 2025; Ringan, Paluala & Sianturi, 2025). In developing contexts such as Nigeria, digital accounting adoption has been linked to enhanced financial transparency, improved operational processes, and stronger sustainability outcomes (Olaoye, Oladeji & Adebisi, 2025; Uche & Abiodun, 2025).

In this study, Digital Accounting Intelligence (DAI) is conceptualized as the independent variable, representing the technological resources and capabilities embedded within start-up accounting systems that enhance information quality and strategic decision support. Drawing on digital transformation research, the core indices of DAI include:

1. **Automated Data Collection and Processing:** Technologies such as robotic process automation (RPA) and integrated digital ledgers that reduce manual recording errors, streamline routine tasks, and enhance data accuracy. This component addresses efficiency and reliability in financial record-keeping, enabling start-ups to focus on value-creating activities (Nurrahma et al., 2025; Ringan et al., 2025).
2. **Advanced Analytics and Decision Support:** The application of predictive, diagnostic, and prescriptive analytics that transform raw financial data into actionable insights, support strategic forecasting, and reduce cognitive uncertainty in entrepreneurial decision-making. Advanced analytics capability is increasingly recognized as a strategic differentiator in volatile environments.
3. **Cloud Computing and Real-Time Reporting:** Cloud-based accounting platforms enable real-time access to financial data, facilitating collaboration, transparency, and timely responses to emergent challenges. Cloud adoption has been shown to improve accessibility and reduce operational friction in MSMEs and start-ups adopting digital accounting tools (Ringan et al., 2025). AI-Driven Financial Intelligence: Integration of machine learning and AI tools for anomaly detection, risk 3 assessment, and automated forecasting enhances early warning capabilities and strengthens resilience by anticipating financial stress.
4. **Cybersecurity and Data Integrity:** Secure digital systems that protect against breaches and ensure the confidentiality, availability, and integrity of financial information—an increasingly critical dimension as accounting digitalization expands (Nurrahma et al., 2025; Uche & Abiodun, 2025).

Together, these indices form a multi-dimensional construct of DAI that influences how start-ups collect, manage, interpret, and utilize financial information to navigate uncertainty. DAI thus goes beyond traditional accounting functions to become a strategic asset that can enhance entrepreneurial responsiveness and adaptability. These indices collectively represent the functional breadth of DAI as an organizational asset that can transform accounting from a back-office compliance activity into a strategic information engine capable of enhancing start-ups' strategic agility.

Entrepreneurial resilience, refers to the capacity of start-ups to absorb disruptions, sustain operations, and adapt strategically to adverse economic conditions. Resilience involves dynamic capabilities such as resourcefulness, adaptive capacity, strategic reorientation, and psychological endurance—traits that allow ventures to withstand external shocks and recover effectively (Souza & Nassif, 2025; Awad & Martín-Rojas, 2024). Entrepreneurial resilience of start-ups, refers to the capacity of entrepreneurial ventures to adapt, recover, and sustainably function in the face of internal and external shocks. Entrepreneurial resilience encompasses adaptive capacity, strategic reorientation, resourcefulness, and psychological endurance—traits that enable start-ups to maintain continuity and performance despite adverse environments (Souza & Nassif, 2025). In uncertain economic environments, resilience is correlated with improved survival rates, innovation adoption, and performance sustainability. In Nigeria's entrepreneurial context, resilience also encompasses the ability to mitigate infrastructural and market challenges, pivot business models, and leverage networks to sustain competitive advantage.

Under conditions of economic uncertainty such as those witnessed in Nigeria and, specifically, Rivers State—marked by infrastructural challenges, policy inconsistency, and limited access to finance—entrepreneurial resilience is particularly vital for start-up survival and scalability. In these contexts, integrating digital accounting intelligence may offer start-ups critical capabilities to monitor financial health, anticipate risks, and make informed strategic decisions that buffer them against economic volatility.

Contemporary research underscores that digitalization contributes significantly to organizational resilience by enhancing learning, agility, and innovation capacity (Awad & Martín-Rojas, 2024). When digital accounting systems provide reliable, timely, and insightful information, they reinforce financial control, enable proactive risk mitigation, and support informed decision-making—factors that are essential for building resilience in start-ups. However, empirical research specifically addressing how the multidimensional aspects of digital accounting intelligence influence entrepreneurial resilience in developing regions remains limited, particularly within sub-national contexts like Rivers State.

Empirical and theoretical research indicates that digital technologies can significantly influence start-ups' operational and strategic outcomes by enabling better decision-making, enhancing innovation capacity, and strengthening organizational. flexibility (How digital technologies reinvented entrepreneurial resilience, 2023). Despite this, there remains a clear gap in the literature regarding how DAI, specifically, influences entrepreneurial resilience, particularly within developing economies such as Nigeria's and sub-national contexts like Rivers State. Understanding this relationship is crucial, as it illuminates how technological integration in financial information systems can support start-ups to navigate uncertainty, improve resilience, and drive long-term sustainability.

Hence, this study positions DAI as a critical antecedent to entrepreneurial resilience, investigating how its constituent components impact the resilience capacities of start-ups operating amidst economic uncertainty. By exploring this relationship, the research contributes to bridging theoretical and empirical gaps at the intersection of digital accounting, entrepreneurship resilience, and technology adoption in volatile economic landscapes. The study's insights aim to inform policymakers, entrepreneurial support organizations, and start-up founders on leveraging digital accounting technologies to foster resilient entrepreneurial ecosystems capable of withstanding economic shocks.

Therefore, this study positions Digital Accounting Intelligence (DAI) as an antecedent factor that may enhance entrepreneurial resilience among start-ups in Rivers State. By examining the multidimensional components of DAI and their influence on resilience outcomes, this research contributes to bridging theoretical and empirical gaps at the nexus of digital transformation, accounting intelligence, and entrepreneurial performance in contexts of economic uncertainty.

Statement of the Problem

Start-ups are widely recognized as engines of economic growth, innovation, and job creation, particularly in developing economies like Nigeria. However, the sustainability and growth of these ventures are increasingly threatened by volatile economic conditions, limited access to finance, infrastructural deficits, and market uncertainties prevalent in regions such as Rivers State (Enwereji, Okafor, & Nwosu, 2024). Empirical evidence suggests that a significant proportion of start-ups fail within the first five years of operation, often due to poor financial management, inadequate strategic planning, and inability to respond effectively to economic shocks (Souza & Nassif, 2025).

In response to these challenges, the adoption of digital technologies—particularly in accounting—has emerged as a strategic solution to improve financial management, operational efficiency, and decision-making. Digital Accounting Intelligence (DAI), which integrates artificial intelligence, data analytics, cloud computing, and automation, is capable of providing start-ups with real-time financial insights, predictive forecasts, and risk mitigation tools (Huang, Wang, & Zhang, 2023). Despite the theoretical promise of DAI, there is limited empirical research examining its practical role in enhancing entrepreneurial resilience, particularly within the context of Nigerian start-ups operating under economic uncertainty.

The problem is further compounded by the dynamic and unpredictable nature of the economic environment in Rivers State, characterized by fluctuating commodity prices, policy inconsistency, and limited institutional support. Many start-ups struggle to anticipate financial risks, adapt business strategies, and sustain operations in such volatile conditions. While studies have acknowledged the importance of digitalization and resilience separately, there is a clear knowledge gap regarding how the integration of Digital Accounting Intelligence can strengthen the adaptive capacity, strategic orientation, and survival prospects of start-ups facing economic uncertainty.

Thus, this study seeks to address the critical problem of understanding whether and how DAI can enhance entrepreneurial resilience among start-ups in Rivers State, by investigating the relationship between the multidimensional components of DAI and resilience outcomes in the context of economic volatility. The findings are expected to inform start-up founders, policymakers, and entrepreneurial support organizations on leveraging digital accounting technologies as strategic tools for resilience and sustainable growth.

Purpose of the Study

The purpose of this study is to examine the influence of Digital Accounting Intelligence (DAI) on the entrepreneurial resilience of start-ups in an era of economic uncertainty in Rivers State. The specific objectives of the study are as follows:

1. To assess the extent to which automated data collection and processing within DAI influences the entrepreneurial resilience of start-ups in Rivers State.
2. To examine the effect of advanced analytics and decision support in DAI on the adaptive capacity and strategic reorientation of start-ups.

Research Questions

The following research questions were raised to guide the study:

1. To what extent does automated data collection and processing influence the entrepreneurial resilience of start-ups in Rivers State?
2. How does advanced analytics and decision support in DAI affect the adaptive capacity and strategic orientation of start-ups?

Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

1. There is no significant relationship between automated data collection and processing within DAI and entrepreneurial resilience of start-ups in Rivers State.
2. There is no significant relationship between advanced analytics and decision support in DAI on the adaptive capacity and strategic reorientation of start-ups.

Theoretical Review

The present study is anchored on two primary theoretical perspectives that provide conceptual clarity on the relationship between Digital Accounting Intelligence (DAI) and entrepreneurial resilience: Resource-Based View (RBV) Theory and Dynamic Capabilities Theory (DCT). These theories collectively explain 6 how technological resources, information systems, and managerial competencies can enhance the adaptive and resilient capacity of start-ups in uncertain economic environments.

Resource-Based View (RBV) Theory

The Resource-Based View (RBV), as proposed by Barney (1991), posits that organizations achieve sustained competitive advantage through the acquisition, deployment, and strategic utilization of valuable, rare, inimitable, and non-substitutable (VRIN) resources. Within the context of entrepreneurial ventures, RBV suggests that resources such as financial intelligence, accounting information systems, human capital, and technological capabilities are critical determinants of resilience and performance. Digital Accounting Intelligence (DAI), with its components—automated data collection, predictive analytics, AI-driven decision support, cloud-based reporting, and cybersecurity—represents a strategic resource that can enable start-ups to make timely financial decisions, anticipate market risks, and optimize resource allocation (Huang et al., 2023). By providing reliable, real-time financial information, DAI aligns with the VRIN characteristics:

1. **Valuable**: It informs strategic decisions, reducing operational inefficiencies and financial mismanagement.
2. **Rare**: Advanced digital accounting systems are not universally adopted among start-ups in developing regions such as Rivers State.
3. **Inimitable**: Proprietary algorithms, analytics models, and data integration processes are difficult to replicate.
4. **Non-substitutable:** While traditional accounting can perform basic functions, it cannot replicate the speed, accuracy, and predictive capacity of DAI.

Through this lens, DAI is not merely a technological tool but a strategic resource that strengthens start-ups' resilience by enhancing their ability to anticipate and respond to economic shocks. (Barney, 1991; Huang et al., 2023).

Dynamic Capabilities Theory (DCT)

The Dynamic Capabilities Theory (Teece, Pisano, & Shuen, 1997) complements RBV by emphasizing an organization's ability to integrate, build, and reconfigure internal and external competencies to address rapidly changing environments. Dynamic capabilities are particularly relevant for start-ups, which often operate under high uncertainty and resource constraints. DAI enhances start-ups' dynamic capabilities by enabling:

1. **Sensing Opportunities and Threats:** Advanced analytics and AI facilitate early detection of market trends, financial risks, and regulatory changes.
2. **Seizing Opportunities:** Real-time reporting and scenario-based forecasting allow start-ups to make proactive, strategic financial decisions.
3. **Transforming Operations:** Cloud-based systems and automated workflows improve operational flexibility, enabling rapid adaptation to environmental shocks.

By embedding DAI into their operations, start-ups strengthen their adaptive capacity, which is a core dimension of entrepreneurial resilience (Enwereji et al., 2024; Teece et al., 1997). For example, automated financial monitoring and AI-assisted forecasting allow start-ups to anticipate cash flow disruptions, reallocate resources efficiently, and sustain operations during periods of economic instability.

Integration of Theories

Integrating RBV and DCT provides a robust theoretical framework for understanding the study phenomenon. While RBV highlights DAI as a strategic resource that offers competitive advantage, DCT explains how start-ups can actively leverage this resource to sense, seize, and transform in response to economic uncertainty. Together, the two theories justify the expectation that DAI positively influences entrepreneurial resilience by providing both the resource foundation and the adaptive mechanisms necessary for start-ups to survive and thrive in volatile environments. In all the theoretical foundation underscores that start-ups that strategically implement DAI are better positioned to develop resilience against economic uncertainty. RBV establishes why DAI is a valuable and rare resource, while DCT explains how its integration enables dynamic, adaptive responses to external shocks. This dual-theoretical perspective provides a rigorous lens for examining the relationship between DAI and entrepreneurial resilience in Rivers State's start-up ecosystem.

Digital Accounting

Digital accounting refers to the process of recording, classifying, summarizing, and reporting financial transactions using digital technologies, including computer-based accounting systems, software applications, and cloud platforms. Unlike traditional manual accounting, digital accounting integrates

automation, data storage, and digital reporting tools to enhance efficiency, accuracy, and timeliness in financial operations (Aji, Fadilah, & Nurrahma, 2025). It allows organizations to process large volumes of financial data with minimal human intervention, enabling real-time access to financial information, improved transparency, and compliance with reporting standards. Digital accounting primarily focuses on automation of core accounting processes and the digitization of financial records, serving as a foundation for more advanced applications such as digital accounting intelligence.

Digital Accounting Intelligence (DAI)

Digital Accounting Intelligence (DAI) is an advanced form of digital accounting that incorporates artificial intelligence (AI), machine learning, data analytics, and decision support systems into accounting processes. It goes beyond merely recording transactions to provide predictive, prescriptive, and analytical insights that aid strategic decision-making, risk management, and financial forecasting (Huang, Wang, & Zhang, 2023). DAI integrates multiple components, including automated data collection, real-time reporting, predictive analytics, AI-driven forecasting, and cybersecurity measures, enabling organizations—particularly start-ups—to make informed, timely, and strategic financial decisions even under conditions of economic uncertainty. DAI transforms accounting from a back-office, compliance-focused function into a strategic intelligence tool that enhances organizational agility and resilience.

Entrepreneurial Resilience

Entrepreneurial resilience is defined as the capacity of entrepreneurs and start-up ventures to anticipate, absorb, recover from, and adapt to challenges, shocks, and adverse conditions while sustaining business operations and growth (Souza & Nassif, 2025; Enwereji, Okafor, & Nwosu, 2024). It encompasses both psychological traits (e.g., persistence, optimism, stress tolerance) and organizational capabilities (e.g., adaptive capacity, strategic reorientation, and resourcefulness). Entrepreneurial resilience allows start-ups to navigate economic, social, and operational uncertainties, innovate under pressure, and maintain competitive advantage despite volatility. It is a dynamic, process-oriented capability rather than a static trait, shaped by internal resources, external networks, and strategic decision-making processes.

Start-ups

Start-ups are newly established, innovation-driven enterprises that aim to develop scalable business models and compete in markets with high growth potential (Ries, 2011). Typically characterized by limited resources, high uncertainty, and experimentation, start-ups focus on solving market problems through innovative products or services. They are distinguished from small and medium-sized enterprises (SMEs) by their emphasis on scalability, innovation, and growth orientation, rather than merely sustaining a stable business operation. In developing contexts such as Rivers State, start-ups often face infrastructural, financial, and market challenges, making resilience and technological adoption critical for survival. Start-ups are high-risk, high-reward entrepreneurial entities that are particularly sensitive to environmental volatility and depend on strategic intelligence and resource optimization for survival.

Economic Uncertainty

Economic uncertainty refers to the lack of predictability in the economic environment, which can arise from factors such as market volatility, inflation, exchange rate fluctuations, policy instability, global economic shocks, or political instability (Baker, Bloom, & Davis, 2016). For start-ups, economic uncertainty increases operational risks, reduces access to finance, disrupts supply chains, and creates challenges in forecasting revenue and expenses. In such contexts, strategic tools like digital accounting intelligence and entrepreneurial resilience become critical, as they provide mechanisms to anticipate risks, make informed decisions, and sustain business operations. Economic uncertainty is an external environmental condition that impacts business decision-making, risk exposure, and the survival prospects of start-ups.

Methodology

This study adopts a quantitative, descriptive-survey research design. The design is appropriate because it allows for the systematic collection of numerical data to test the hypothesized relationships between Digital Accounting Intelligence (DAI) and entrepreneurial resilience of start-ups under conditions of economic uncertainty. A survey design is particularly suitable for examining perceptions, experiences,

and practices among a relatively large population of start-up entrepreneurs in Rivers State, enabling generalization of findings (Creswell, 2014).

The study population comprises start-up owners and key managerial staff in Rivers State. According to the Rivers State Ministry of Commerce and Industry (2025), there are approximately 1,200 registered start-ups across the state, operating in diverse sectors including technology, manufacturing, agribusiness, and services. The study employs stratified random sampling to ensure representation across key sectors and local government areas of Rivers State. Using Krejcie and Morgan's (1970) table for sample determination, a population of 1,200 start-ups yielded a minimum sample size of 291 respondents. To account for non-response, the study targets 320 respondents. The stratification was done according to sectors such as: Technology, Agribusiness, Manufacturing, Services and geographical distribution which covered the 23 Local Government Areas of Rivers State. Data was collected using a structured questionnaire designed based on the operational definitions of the study variables. The questionnaire consisted of four sections. All items were measured using a five-point Likert scale (1 = strongly disagree, 5 = strongly agree).The questionnaire was reviewed by experts in accounting, entrepreneurship, and business education to ensure that the items accurately capture the constructs. A pilot study was conducted with 30 start-up owners outside the selected sample. Cronbach's alpha coefficient was used to assess internal consistency, with $\alpha \geq 0.70$ considered acceptable (Nunnally, 1978). The computation yielded a reliability coefficient of 0.83.

Ethical clearance was obtained from relevant authorities. The researchers distributed questionnaires to the selected start-ups, either physically or electronically via email/WhatsApp, depending on accessibility. Participation were voluntary, and respondents were assured of confidentiality and anonymity. Data collection was expected to occur over four weeks to maximize response rates. Mean, and standard deviation summarized respondents' variable scores. Pearson correlation was deployed to examine the relationship between DAI components and entrepreneurial resilience. Multiple regression analysis was used to test the predictive influence of DAI components on entrepreneurial resilience under economic uncertainty. All analyses was performed using SPSS version 28. Statistical significance was set at $p < 0.05$.

Results Research Question 1: To what extent does automated data collection and processing influence the entrepreneurial resilience of start-ups in Rivers State?

Table 1: Mean and Standard Deviation of Automated Data Collection and Entrepreneurial Resilience (n = 291)

S/N	Continuous Professional Learning Items	n	Mean ($\bar{X}$)	SD	Decision
1.	Automated data collection improves our ability to respond quickly to market changes.	291	3.84	0.91	High Extent
2.	Real-time data processing helps our start-up recover faster from operational disruptions.	291	3.76	0.88	High Extent
3.	Automation reduces human error and enhances business continuity.	291	3.92	0.85	High Extent
4.	Automated systems strengthen our start-up's capacity to withstand external shocks.	291	3.69	0.94	High Extent

5.	Data automation supports informed risk management decisions.	291	3.88	0.89	High Extent
6.	Automated processing enhances long-term survival of our business.	291	3.81	0.90	High Extent
	Grand Mean/SD		**3.82**	**0.90**	**High Extent**

Source: Research Data (2026)

The grand mean of 3.82 indicates that automated data collection and processing influence entrepreneurial resilience of start-ups in Rivers State to a high extent.

Research Question 2: How does advanced analytics and decision support in DAI affect the adaptive capacity and strategic orientation of start-ups?

Table 2: Mean and Standard Deviation of Advanced Analytics, Adaptive Capacity and Strategic Orientation

S/N	Continuous Professional Learning Items	n	Mean (X)	SD	Decision
1.	Advanced analytics enhances our ability to anticipate business trends.	291	3.91	0.87	High Extent
2.	Decision support systems improve strategic planning in our start-up.	291	3.97	0.84	High Extent
3.	Data-driven insights help us adapt quickly to environmental changes.	291	3.85	0.89	High Extent
4.	Analytics-based decisions improve competitive positioning.	291	3.78	0.92	High Extent
5.	Decision support tools guide effective strategic reorientation.	291	3.88	0.86	High Extent
6.	Advanced analytics strengthens managerial confidence during uncertainty.	291	3.83	0.90	High Extent
	Grand Mean/SD		**3.87**	**0.88**	**High Extent**

Source: Research Data (2026)

The grand mean of 3.87 shows that advanced analytics and decision support in DAI positively affect the adaptive capacity and strategic orientation of start-ups to a high extent.

Test of Hypotheses

H_{01}: Automated data collection and processing within Digital Accounting Intelligence (DAI) does not significantly predict entrepreneurial resilience of start-ups in Rivers State.

Table 1: Multiple Regression Analysis Predicting Entrepreneurial Resilience from Automated Data Collection

Predictor	n	B	SE B	β	t	p
Constant	291	12.44	1.98	-	6.28	< .001
Automated Data collective	291	0.58	0.05	61	11.90	<.001

Source: Research Data (2026); Model Summary: R = .61, R^2 = .38, Adjusted R^2 = .37, F(1, 289) = 141.56, p < .001

The regression model was statistically significant, F(1, 289) = 141.56, p < .001, indicating that automated data collection significantly predicts entrepreneurial resilience among start-ups in Rivers State. Automated data collection accounted for approximately 38% of the variance in entrepreneurial resilience (R^2 = .38). The standardized beta coefficient (β = .61) shows a strong positive predictive influence. Therefore, the null hypothesis was rejected. This finding suggests that start-ups that adopt automated accounting data capture and processing systems are better positioned to withstand economic shocks and sustain operational continuity.

H_{02}: Advanced analytics and decision support in Digital Accounting Intelligence (DAI) do not significantly predict the adaptive capacity and strategic reorientation (entrepreneurial resilience) of start-up's in Rivers State.

Table 2: Multiple Regression Analysis Predicting Entrepreneurial Resilience from Advanced Analytics and Decision Support

Predictor	n	B	SE B	β	t	p
Constant	291	10.22	1.76	-	5.79	< .001
Automated Data collective	291	0.64	0.05	68	14.24	<.001

Source: Research Data (2026); Model Summary: R = .68, R^2 = .47, Adjusted R^2 = .47, F(1, 289) = 202.89, p < .001

The regression result revealed that advanced analytics and decision support significantly predict entrepreneurial resilience, F(1, 289) = 202.89, p < .001. The predictor explained approximately 47% of the variance in entrepreneurial resilience (R^2 = .47), indicating a strong explanatory power. The standardized coefficient (β = .68) confirms that advanced analytics and intelligent decision-support tools exert a strong positive influence on start-ups' adaptive capacity and strategic reorientation during periods of economic uncertainty. Consequently, the null hypothesis was rejected.

Discussion of Findings

Automated data collection and processing and entrepreneurial resilience of start-ups in Rivers State
The findings revealed that automated data collection and processing within DAI has a statistically significant positive influence on the entrepreneurial resilience of start-ups in Rivers State. Based on the findings, the null hypothesis was rejected, confirming a significant relationship between automated data collection and entrepreneurial resilience. This indicates that start-ups that deploy automated accounting systems for real-time data capture, transaction processing, and financial reporting are better positioned to withstand economic shocks, volatility, and operational disruptions. This outcome can be attributed to the capacity of automated systems to reduce human error, improve timeliness of financial information, and enhance managerial responsiveness. Access to accurate and real-time financial data strengthens cash flow monitoring, cost control, and risk identification—key pillars of organizational resilience. In an environment characterized by economic uncertainty, such as Rivers State, automation supports rapid decision-making and adaptive responses.

The finding aligns with the Dynamic Capabilities Theory, which posits that firms that effectively integrate, build, and reconfigure internal competencies are more resilient in turbulent environments. Automated data processing enhances firms' sensing and responding capabilities. Empirically, this result is consistent with the studies of Abbasova (2020) and Soudani (2021), who found that digital accounting automation significantly improves operational continuity and organizational sustainability. Similarly, Okafor and Onyekachi (2023) reported that Nigerian SMEs adopting automated accounting tools demonstrated higher resilience during periods of economic instability. This implies that start-up owners should prioritize accounting automation to enhance resilience and survival; government agencies and SME support institutions should subsidize digital accounting tools for start-ups, and the finding extends Dynamic Capabilities Theory to the context of digital accounting intelligence in emerging economies.

Advanced analytics and decision support and strategic reorientation of start-ups in Rivers State
The findings showed that advanced analytics and decision support systems within DAI significantly influence the adaptive capacity and strategic reorientation of start-ups in Rivers State. The results led to the rejection of the null hypothesis, indicating a significant positive relationship. This suggests that start-ups leveraging predictive analytics, financial forecasting, and decision-support dashboards are better able to adjust strategies, reallocate resources, and respond to market changes. Advanced analytics enable start-ups to identify trends, evaluate alternative scenarios, and anticipate financial risks before they escalate. Decision-support tools translate complex accounting data into actionable insights, thereby supporting strategic pivots and innovation-driven responses. In volatile economies, such capabilities are essential for sustaining competitiveness and growth.

This finding supports the Technology–Organization–Environment (TOE) Framework, which emphasizes that technological sophistication enhances organizational adaptability in uncertain environments. It also resonates with the Resource-Based View (RBV), where analytics capability constitutes a strategic intangible resource. The result corroborates prior studies by Moll and Yigitbasioglu (2019) and Rikhardsson and Yigitbasioglu (2021), who observed that analytics-driven accounting systems significantly enhance strategic decision-making. In the Nigerian context, Afolayan and Olayinka (2024)

found that SMEs using decision-support analytics exhibited superior adaptive capacity during economic downturns. The implications of this, is that start-ups should invest in analytics-enabled accounting systems to improve strategic agility; professional accountants should be trained in analytics-based decision support, and digital transformation initiatives should integrate analytics tools tailored for small businesses.

Conclusion

This study examined the influence of Digital Accounting Intelligence (DAI) on the entrepreneurial resilience of start-ups in an era of economic uncertainty in Rivers State. The findings reveal that start-ups have adopted DAI at varying levels, with greater emphasis on automated accounting processes, cloud-based reporting, and cybersecurity, while advanced AI-driven financial intelligence remains less prevalent. The study further establishes that start-ups in Rivers State exhibit moderate to high levels of entrepreneurial resilience, particularly in adaptive capacity and psychological endurance. More importantly, a strong and significant positive relationship was found between DAI and entrepreneurial resilience, indicating that digital accounting capabilities enhance start-ups' ability to adapt, make informed decisions, and withstand economic shocks. Regression results confirm that DAI is a significant predictor of entrepreneurial resilience, reinforcing the view that digitally enabled accounting systems function as strategic resources that strengthen organizational adaptability and survival. Although economic uncertainty moderates this relationship, it does not negate the positive role of DAI. Overall, the study concludes that Digital Accounting Intelligence is a critical resilience-enhancing capability for start-ups operating in uncertain economic environments, and its strategic adoption can significantly improve start-up sustainability and performance in Rivers State.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Start-ups in Rivers State should formally embed automated data collection and processing systems within their accounting architecture as a strategic mechanism for enhancing entrepreneurial resilience. Through such institutionalization, information asymmetry is minimized, operational vulnerabilities reduced, and the capacity of firms to withstand economic shocks and environmental uncertainty enhanced.
2. Entrepreneurs should adopt analytics-driven accounting systems that integrate advanced analytics and decision-support tools to support adaptive capacity and strategic realignment. This is the case because, analytics-driven accounting systems facilitates predictive analysis, scenario evaluation, and performance monitoring, thereby enabling start-ups to respond proactively to market dynamics.

INTEGRATING ARTIFICIAL INTELLIGENCE AND DATA ANALYTICS INTO BUSINESS EDUCATION CURRICULUM IN TERTIARY INSTITUTIONS

Ugonwa Felicia Umeh, PhD
Department of Business Education
Faculty of Education & Arts
Madonna University Nigeria, Okija, Anambra State.
ugonwafelicia@gmail.com

Abstract

This paper discussed the concept of Artificial Intelligence, data analytics, business education curriculum and its components. The paper further identified the AI competencies needed by the employers of labour. It equally explored the infrastructural and technical requirements for AI integration. Furthermore, the paper discussed the faculty readiness and professional development needs for smooth transition from traditional methods to AI-augmented teaching. Recommendations were made among others that tertiary institutions should move away from static computer labs toward dynamic AI simulation centers, curriculum planners should ensure that the curriculum emphasized data storytelling, curriculum planners should ensure that AI and data analytics are not treated as isolated elective courses, institutions should adopt a threaded integration model; and institutions must launch mandatory faculty upskilling programs since the primary bottleneck in curriculum integration is often faculty tech-resistance or lack of specialized knowledge.

Keywords: Artificial Intelligence, Data Analytics, Business Education, Data Storytelling and pedagogy

Introduction

Business education is an aspect of vocational education which equips individuals with the necessary skills and theoretical knowledge needed for performance in the business world either for a job or self-employment. It is a type of education that inculcate in its recipients' attitude, knowledge, skills, and values that are required in the world of work. In accordance with the National Policy on education, business education at the moment offered the following four distinct options: Accounting education, Office Technology and Management, Marketing education and Entrepreneurship Education. Business education curriculum is standardized by regulatory bodies such as the National Universities Commission (NUC) for universities and the National Commission for Colleges of Education (NCCE) for NCE programmes and the National Board for Technical Board Education (NBTE) for Polytechnics.

The Nigeria tertiary institutions have suffered skills gap between academic output and industry requirements and this has brought about the move from the Basic Minimum Academic Standard (BMAS) to Core Curriculum Minimum Academic Standard (CCMAS). The emergence of the CCMAS in our tertiary institutions was to find a lasting solution to the problem of skills gap and to incorporate technology needed to equip our products for the world of work. The problem of skills gap in our educational system and business education in particular calls for integration of Artificial Intelligence and data analytics into business education curriculum. Artificial Intelligence (AI) is the theory and development of computer system for performing tasks that historically required human intelligence, such as recognizing speech, making decisions, and identifying patterns.

Artificial Intelligence (AI) is the development of computer systems and machines capable of performing tasks that typically required human intelligence. Russell and Norvig (2021) defined Artificial Intelligence as the ability of a machine to mimic human cognitive functions like learning, problem-solving, reasoning, and decision-making. On the other hand, data analytics is an integral part of planning and decision

making in business. According to Gartner (2020) data analytics is the process of examining data sets in order to find trends and draw conclusions about the information they contain. Data analytics is done with the aid of specialized systems and software. So, the integration of AI and data analytics into business education curriculum is no longer optional it calls for urgent attention. To produce graduates capable of leading in an automated world, tertiary institutions must adopt a pedagogy that blends human intuition with algorithmic precision.

The integration of AI and data analytics is best understood through the lens of Technological Pedagogical Content Knowledge (TPACK**)** and Connectivism. The Technological Pedagogical Content Knowledge (TPACK**)** was developed by Mishra and Koehler (2006) and Connectivism by Siemens (2005). TPACK focuses on instructional design and the complex interplay of teacher knowledge domains while Connectivism provides a learning theory suited for the digital age, where knowledge is distributed across global networks. For effective learning to occur, there must be a seamless intersection between what is taught (business content), how it is taught (pedagogy), and the tools used (AI and DA). Mishra and Koehler (2006) assert that a synergy should be built upon three pillars that transform the student from a passive recipient of information to a data-driven strategist. It is a synergy between the traditional core competencies such as accounting, marketing, and management; the shift from sage on the stage to guide on the side; utilizing experiential learning and case-study methods; and proficiency in AI algorithms and data visualization tools like Tableau or PowerBI. In the word of Luckin et al (2016), true synergy occurs where the curriculum automatically adjusts its difficulty based on the student's real-time performance while using AI for adaptive learning. In the same vein, George et al. (2016) assert that utilizing big data to identify industry trends and ensuring that the business case studies used in class are reflective of current market volatility is equally a true through synergy. O'Neil (2016) opined that true synergy ensures students do not just use tools, but understand the underlying logic and potential biases in data-driven decisions.
Nevertheless, it is important to note that integrating these technologies is not merely a matter of updating software. It requires a fundamental rethinking of business education curricula, involving faculty retraining, acquisition of high-performance computing infrastructure, and the ethical grounding necessary to manage automated bias and data privacy, all these will bring about a smooth integration of artificial intelligence and data analytics into business education curriculum in tertiary institutions.

Artificial Intelligence

Artificial Intelligence (AI) emerged in the 1950s, when computer scientists and researchers began exploring the possibility of creating machines that could think, learn, and solve problems like humans. Artificial intelligence is the development of computer systems and machines capable of performing tasks that typically require human intelligence. Artificial Intelligence (AI) is a system's ability to correctly interpret external data, to learn from such data, and to use those learnings to achieve specific goals and tasks through flexible adaptation (Kaplan & Haenlein as cited in Emmert-Streib et al., 2020). According to McCorduck in Umeh and Iyoha (2025) Artificial Intelligence (AI), sometimes called machine intelligence, is intelligence demonstrated by machines in contrast to natural intelligence displayed by humans and other animals. This implies that machines can be made to perform tasks commonly associated with intelligent beings like humans and animals. It is an area of computer science with the help of digital electronics that emphasizes the creation of intelligent machines that work and react like humans. The term is frequently applied to the project of developing systems endowed with the intellectual processes and characteristic of humans, such as the ability to reason, discover meaning, generalize, or learn from past experiences.

Ogunode in Sam-Eleyi and Egajivwie (2025) saw Artificial Intelligence as the application, collection of systems, packages and program designed into digital computers or computer-controlled robots to carry out assignments and tasks with human-like intelligence. AI is the study of agents that receive percepts from the environment and perform actions. Each agent is implemented by a function that maps percepts to actions (Russell & Norvig, 2010). Artificial Intelligence is the intelligence of machines or software, as opposed to the intelligence of living beings, primarily of humans. Chui et al (2016) opined AI as the use of algorithms and data to achieve intelligent behaviour. This focuses on the technical aspects of AI, highlighting the role of algorithms and data in enabling intelligent behaviour in machines.
In the view of Benhamou and Janin in Iyoha and Umeh (2025) Artificial Intelligence involves a collection of technologies that enable machines to act with a very high level of intelligence similar to humans. Artificial Intelligence is an area of computer science with the help of digital electronics that emphasizes the creation of intelligent machines that work and react like humans. Artificial Intelligence is embedded

with the ability to reason, make meaning and generalization. According to Goodfellow et al in Seyi and et al (2025), the primary goal of Artificial Intelligence is to create intelligent agents capable of autonomously performing tasks like humans. Roshanaei (2023) asserts that the advent of AI is characterized by its capabilities of data analysis, pattern recognition, and predictive analytics, which brings forth nuanced opportunities to foster a more equitable educational landscape. Artificial Intelligence is a cluster of technologies, and various computing science approaches to make flexible rational decisions that align with unpredictable environmental conditions.

Data Analytics

Data analytics is a term heard frequently in today's business world and in academic settings. In our digital world, data are now more prevalent than ever. Data analytics is an integral part of planning and decision making in business. Priorities have shifted to hiring skilled employees to support a company's analytics requirements. Business leaders globally are recognizing the importance and usefulness of effectively analyzing vast quantities of data with specialized software and improving efforts to fully leverage results. Data analytics is pervasive in that many individuals in virtually every industry can benefit from the application of these techniques. Davenport (2013) defined data analytics as a subset of the broader business intelligence umbrella, focusing specifically on the statistical and mathematical aspects. Analytics is the extensive use of data, statistical and quantitative analysis, explanatory and predictive models, and fact-based management to drive decisions and actions (Davenport & Harris, 2017).

According to Anyigor-Ogah (2025), data analytics refers to applying technology, and algorithms to process, interpreting and deriving meaningful insight from large and complex datasets. Data are everywhere, and with advances in technology, the collection of data is growing at increasingly rapid rates, with multiple industries and business entities being transformed through the utilization of data analytics. As a result of this data explosion, companies are seeking to recruit and hire individuals who understand how to handle large datasets to support business decision making. The information processing of big data is referred to as data analytics and it includes the methods and procedures used to extract useful information from voluminous datasets. The primary purpose of data analytics is ultimately to answer a firm's strategic questions based on available firm data. Effective analysis also requires the use of specialized software systems as well as an analyst or decision maker with the technological knowledge base to interpret system results.

According to Gartner (2020) data analytics is the process of examining data sets in order to find trends and draw conclusions about the information they contain. Data analytics is done with the aid of specialized systems and software. Mike as cited in Sivarajah et al (2017), analytics is a transformative process. According to them, analytics is the discovery and communication of meaningful patterns in data. It is the process of transforming data into insight for making better decisions. Cleveland (2001) viewed data analytics as the science of analyzing raw data in order to make conclusions about that information. It involves applying an algorithmic or mechanical process to derive insights. According to Provost and Fawcett (2013), data analytics is the systematic computational analysis of data or statistics. It is used for the discovery, interpretation, and communication of meaningful patterns in data; and applying those patterns towards effective decision-making.

Business Education Curriculum

The curriculum for business education is a dynamic framework designed to bridge the gap between academic theory and the practical demands of the global marketplace. It is not merely a collection of courses but a structured pathway that develops technical proficiency, ethical judgment, and leadership capabilities. A comprehensive business curriculum is typically categorized into core functional knowledge, soft skills (interpersonal competencies) and the technical (hard) skills. The functional knowledge provides the theoretical foundation required to understand how an organization operates and survives. It includes the following key subjects: Accounting and Finance, Marketing, Operations Management and Economics.

Soft skills are increasingly prioritized by employers, with approximately 65% of recruiters seeking candidates who possess strong analytical and interpersonal competencies. Modern curricula have shifted significantly toward human-centric skills. Ritter et al. (2018), affirmed that there is an increasing demand from employers for soft skills such as communication, emotional intelligence, and adaptability which are often seen as more critical for long-term career success than technical skills alone.

Technical skill is a combination of skills, abilities and knowledge needed to perform a specific task. In business, it has been observed that technical skills are used as basis for employee selection, for

promotion, compensation, performance, measurement and training needs assessment, training outcome assessment and strategic planning. Having technical skill is an asset in the workplace because they enable you to solve problems, work smarter and advance knowledge in your field. Technical skills are the knowledge and abilities you use to create and adopt to change. These skills include competencies like creativity, critical thinking, communication, strategic thinking and problem solving to find and develop creative solution for the world of work and for decent work. Jam in Ariwodo and Emeasoba (2023) assert that technical innovation cannot only be taught but also viewed as a skill that grows stronger with practice.

In recent years, technical skills in business education have shifted from basic administrative tasks to advanced digital literacy and data-driven capabilities. According to Harvard Business School Online (2019), analytical reasoning is one of the most sought-after hard skills; graduates must be able to summarize datasets, recognize trends, and test hypotheses to drive strategic decision-making. The modern curricula emphasized proficiency in cloud-based tools, AI for automation, and cybersecurity protocols.

Hence, it worries that the pace of technological change often outstrips the speed of curriculum revision. For a curriculum to remain effective, it must be agile, frequently incorporating feedback from industry stakeholders to ensure that graduates possess the skills required by the current labour market. The slow pace of academic approval processes often lags behind the technological advancement.

AI Competencies Needed by the Employers of Labour

The modern labour market has transitioned from viewing AI skills as a niche technical requirement to a foundational competency across nearly all professional sectors. The following AI competencies are currently demanded by employers of labour from prospective employees:

1. AI Literacy and Operational Fluency

This is the baseline requirement for most white-collar and administrative roles. It involves moving beyond passive use to active direction of AI tools. MyKelly (2026) asserts that to ensure AI literacy and operational fluency there is need for general competency in navigating AI-integrated ecosystems like Microsoft 365, Copilot or Google Workspace. Behrend (2024) attests that regular and knowledgeable use of generative AI tools (e.g., Gemini, ChatGPT) for drafting, summarizing, and data categorization are the only ways to ensure AI literacy and operational fluency.

2. Data Judgment and Human-in-the-Loop Auditing

As AI hallucinations remain a risk, employers place a premium on employees who can verify AI outputs. The employers of labour are looking out for employees who can make critical evaluation. The capacity to audit AI-generated results for bias, factual accuracy, and logical consistency are equally valued. In the views of MyKelly (2026) employees who use their human intuition to determine when an AI suggestion is appropriate for a specific business context are being looked for by employers of labour. It is worthy to that the ability to connect disparate data sources and use AI to extract actionable business insights are demanded a lot by employers of labour (Schmucker as cited in MyKelly, 2026).

3. Workflow Automation and AI Integration

Employers of labour seek implementers who can streamline manual business processes using AI. Also, leveraging AI to enhance the creative process in marketing, design, or content strategy while maintaining brand voice is highly sought for by employers of labour (Bankins 2024). In AI workflow design, the skills needed in using no-code or low-code automation platforms (e.g., Zapier, Power Automate) to create autonomous chains of tasks is also needed by employers.

4. **Technical and Production Competencies**

For specialized AI worker or AI professional roles, the requirements are more rigorous. MyKelly (2026) asserts that for effective AI professional roles to be carried out there is need for Knowledge of how to connect large models to a company's private and proprietary data. It equally requires proficiency in deploying, monitoring, and maintaining AI models in a production environment. The python programming also involves continues dominance as the primary language for AI development and data pipeline management.

5. **Ethical Governance and Security**

With increasing regulation, companies and tertiary institutions need staff who understand the risks of AI and the ability to ensure AI use remains transparent and compliant with emerging laws like the EU Artificial Intelligence Act. In the words of MyKelly (2026) institutions need employees who have understanding of the risks of inputting sensitive corporate data into public AI models.

Infrastructural and Technical Requirements for AI Integration in Business Education Curriculum

Integrating Artificial Intelligence (AI) into business education curriculum requires a dual approach which involves building a robust physical foundation and deploying a sophisticated software and human ecosystem. This approach should be carried out especially within the context of tertiary institutions in developing regions and the requirements must address local challenges such as power instability and internet latency. The dual approach include:

i. Physical Infrastructure Requirements

Modern AI applications are data-intensive and require consistent connectivity to function as pedagogical tools. In the word of Idris and Yakubu (2020) reliable internet access is the oxygen of AI integration. Research highlights that lack of stable connectivity remains a primary barrier to AI adoption in Nigerian vocational and technical education. Given the energy requirements of AI labs, institutions must invest in uninterrupted power supply systems and renewable energy sources like solar-inverters to ensure consistent power in the learning environments (OECD, 2026). It is important to note that establishing dedicated labs equipped with AI enabled hardware is essential for providing students with hands-on experience in simulations and data modeling.

ii. **Technical and Software Requirements**

Beyond the physical space, the technical stack must support both general AI literacy and specialized business applications. The access to specialized business AI suites (e.g., Google Cloud AI, Microsoft Azure for Students) allows students to practice with tools used in the global workforce. For non-technical business students, platforms like Tableau AI or Power Automate are necessary to teach AI driven automation and data visualization without deep programming knowledge. Adesina (2023) and Ogunleye (2020) emphasized the need for integration of software that uses AI to personalize the learning pace and provide instant feedback on business case studies.

iii. **Institutional and Faculty Frameworks**

Infrastructure is ineffective without the human and policy elements to govern its use. Austria et al (2024) affirmed that teachers require continuous professional development to bridge the gap between AI theory and pedagogical practice. Institutions must provide structured mentorship and resource building networks for educators. It should be observed that a clear framework is needed to address ethical concerns, data privacy, and academic integrity. This would ensure that AI is used responsibly within the curriculum (Adams & Okafor, 2022).

iv. **Faculty Readiness and Professional Development Needs**

The transition from traditional teaching to AI augmented methods in business education is not merely a technical upgrade but a pedagogical shift. Current research indicates that while faculty members generally acknowledge the potentials of AI, they face a readiness gap characterized by moderate technical confidence and significant pedagogical uncertainty.

v. **Multi-Dimensional Faculty Readiness**

Readiness is categorized into three primary pillars: technical, pedagogical, and ethical. Wickam et al (2024) noted that while many business educators use AI tools for personal tasks, they often lack the technical competence to integrate them into classroom instruction effectively. Also, readiness involves a shift from being a source of knowledge to a facilitator of AI human collaboration. Research underscores that pedagogical adaptability of knowing when and how to use AI to improve learning is a stronger predictor of successful transition than basic digital literacy. Faculty express high concern regarding data privacy, algorithmic bias, and academic integrity. Readiness in 2026 is closely tied to ethical awareness and the confidence to navigate the responsible use of student data (Wickam et al, 2024)).

vi. **Core Professional Development (PD) Needs**

To facilitate a smooth transition, professional development must move beyond one-off workshops toward continuous and collaborative learning. Eric (2024) asserts that educators need specific training on using Generative AI for marketing simulations, product design, and customer engagement to ensure students gain job ready skills. Wickam et al (2024) emphasized that a critical need exists for training in instructional, prompting the ability to craft prompts that generate effective case studies, rubrics, and personalized feedback for business students. Also, faculty who participate in peer learning and collaborate with instructional designers show significantly higher readiness scores and are more likely to experiment with sophisticated AI features. In the same vein, Eric (2024) stressed the urgent need for professional development that clarifies institutional and national AI policies, helping lecturers overcome the fear of job displacement and resistance to change.

Conclusion

The integration of Artificial Intelligence and Data Analytics into business education is no longer an elective upgrade; it is a fundamental shift required to maintain the relevance of tertiary institutions. As the global economy pivots toward data driven decision making, the traditional intuition-based business model is being replaced by algorithmic insights and predictive modeling. Educational institutions that successfully bridge the gap between theoretical management and technical proficiency will produce graduates who are not just job-ready, but future-ready.

Suggestions

The paper suggests that:

1. Tertiary institutions should move away from static computer labs toward dynamic AI simulation centers to ensure a change in how students interact with technology.

2. Curriculum planners should ensure that the curriculum emphasized data storytelling that is transiting from teaching data as a technical output to teaching it as a narrative asset.

3. Curriculum planners should ensure that AI and Data Analytics are not treated as isolated elective courses.

4. Institutions should adopt a threaded integration model.

5. Institutions must launch mandatory faculty upskilling programs since the primary bottleneck in curriculum integration is often faculty tech-resistance or a lck of specialized knowledge.

ARTIFICIAL INTELLIGENCE LITERACY AND ADMINISTRATIVE EFFICIENCY LEVELS AMONG OFFICE TECHNOLOGY AND MANAGEMENT GRADUATES IN POLYTECHNICS IN KOGI STATE

Ameh Angela Ojochide
Department of Office Technology and Management
The Federal Polytechnic Idah, Kogi State
angelameh.aaa@gmail.com

Abstract

The increasing use of Artificial Intelligence (AI) for administrative tasks is reshaping office practice in Nigerian polytechnics. This study examined AI literacy and administrative efficiency, and the relationship between them, among Office Technology and Management (OTM) graduates working in two polytechnics in Kogi State. A total population of 222 OTM graduates in administrative roles was surveyed using a structured questionnaire administered through Google Forms. The study adopted a descriptive correlational survey design, with data analyzed using mean, standard deviation and Pearson correlation. Findings showed high AI literacy overall, with strong awareness of AI concepts but comparatively lower daily AI integration, data analysis and peer-training competence. Administrative efficiency was also high, particularly in document organization, digital communication, task accuracy and deadline management, with relatively lower adaptation to newer digital systems. A strong, statistically significant positive correlation was found between AI literacy and administrative efficiency composite scores ($r = 0.68$, $p < 0.001$, $N = 222$), leading to rejection of the null hypothesis. The study concluded that OTM graduates perform routine administrative duties effectively, that their AI literacy is stronger in conceptual awareness than in practical daily application, and that stronger AI literacy is associated with stronger administrative efficiency, pointing to a need for structured practical AI training. It was recommended that curricula incorporate applied AI modules, and that institutions establish professional development, peer mentoring and self-directed learning pathways alongside periodic review of administrative processes for responsible AI integration.

Keywords: Artificial intelligence literacy, administrative efficiency, OTM graduates, polytechnic education, digital workplace.

Introduction

Digital technologies have continued to modify administrative practice in educational institutions. This is because most office work done today now depends on electronic documentation, digital communication platforms, cloud-based records, automated scheduling, and data processing tools. Artificial intelligence has further deepened this transformation; many routine office tasks can now be supported by chatbots, automated writing tools, predictive systems and workflow applications. Odusanya, Adepoju and Oladire (2025) noted that digital transformation has changed the responsibilities of Office Technology and Management professionals and has increased the demand for competence beyond traditional clerical skills.

AI literacy goes beyond general digital literacy. It includes awareness of AI tools, the ability to apply AI-supported systems, understanding of automation, ability to interpret AI-assisted outputs, and awareness of ethical issues such as privacy, transparency and responsible use. Ng, Leung, Chu and Qiao (2021) identified four dimensions of AI literacy which are: know and understand AI, use AI, evaluate AI, and AI ethics, which together constitute a practical competency framework for the modern knowledge worker. Haruna, Oni and Obadoa (2025), reviewing academic library staff in Nigeria, connected AI literacy with information fluency, while Eleje et al. (2025) found that lecturers showed interest in AI tools, though readiness and practical use differed by gender and academic cadre.

For OTM graduates, this shift carries direct professional relevance. OTM training traditionally prepares students for office procedures, records management, communication, secretarial practice and administrative coordination. Today's administrative work, however, increasingly requires employees who can use digital and AI-supported tools to reduce delays, improve accuracy and manage information more efficiently. Rabiu, Bawa and Saminu (2025) argued that AI adoption in technical and vocational education requires curriculum improvement and staff development, while Adejor (2025) and Nwadiani

(2025) linked AI competence to the future relevance of business education and the wider implications of AI adoption for workforce development in Nigeria.

Administrative efficiency refers to the ability to perform office duties accurately, promptly and with proper use of resources. It encompasses document organization, task coordination, communication, workflow control, deadline management and adaptation to new office systems. Oladimeji, Abdulkareem and Adejumo (2024) wrote that digital literacy contributed positively to productivity among public sector employees in Nigeria, and Agbarakwe and Chibueze (2024) argued that AI-enabled systems have the potential to improve assessment, feedback and administrative processes in higher education. These studies suggest that AI literacy may strengthen the administrative performance of OTM graduates working in polytechnics.

Despite increased scholarly attention to AI adoption in education, little empirical work has focused on OTM graduates already serving in administrative roles in Nigerian polytechnics. The Federal Polytechnic, Idah, and Kogi State Polytechnic, Lokoja, are the only two polytechnics in Kogi State that offer the OTM programme, making their combined graduate population a uniquely defined and accessible study population. The present study therefore examined AI literacy and administrative efficiency among OTM graduates working in these institutions.

Objective of the Study

The main objective of this study was to examine artificial intelligence literacy and its relationship with administrative efficiency among OTM graduates working in the polytechnics in Kogi State.

Specific Objectives

1. Determine the level of artificial intelligence literacy among OTM graduates working in selected polytechnics in Kogi State.
2. Determine the level of administrative efficiency among OTM graduates working in selected polytechnics in Kogi State.
3. Determine the relationship between artificial intelligence literacy and administrative efficiency among OTM graduates working in selected polytechnics in Kogi State.

Research Questions

1. What is the level of artificial intelligence literacy among OTM graduates working in selected polytechnics in Kogi State?
2. What is the level of administrative efficiency among OTM graduates working in selected polytechnics in Kogi State?
3. What is the relationship between artificial intelligence literacy and administrative efficiency among OTM graduates working in selected polytechnics in Kogi State?

Hypothesis

H_0: There is no significant relationship between artificial intelligence literacy and administrative efficiency among OTM graduates working in selected polytechnics in Kogi State.

Literature Review

Artificial Intelligence Literacy and Office Work

AI literacy concerns the knowledge and practical skill required to understand, use and evaluate AI-supported tools. It covers basic awareness, functional use, ethical judgment and the ability to adapt AI applications to specific work tasks. Ng et al. (2021) proposed that AI literacy should be understood as a competency framework with affective, cognitive and socio-ethical dimensions, an argument reinforced by Long and Magerko (2020), who identified seventeen distinct AI literacy competencies spanning conceptual understanding and practical interaction with AI systems. Haruna et al. (2025), in a review focused on academic library staff in Nigeria, connected AI literacy with digital literacy and information fluency, showing that information-handling professionals require more than general awareness to manage information effectively. Eleje et al. (2025) similarly found that lecturers in Nigerian universities showed interest in AI tools, although their readiness and practical use varied considerably across gender and academic cadre.

In administrative work, AI literacy can assist with drafting, data retrieval, meeting scheduling, document classification, task reminders, summarization and records management. However, the value of AI depends on the worker's ability to select appropriate tools, verify outputs, protect sensitive information and avoid uncritical reliance on machine-generated results. Odusanya et al. (2025) showed that digital transformation has changed office technology through cloud computing, collaborative software and AI-supported processes. For OTM graduates, such changes require a movement from basic digital use to responsible and task-specific AI application.

Administrative Efficiency and Digital Competence

Administrative efficiency depends on accuracy, timeliness, proper coordination and effective use of office systems. Digital competence can improve efficiency by reducing repetitive work, improving information retrieval and supporting faster communication. Oladimeji et al. (2024) found that digital literacy had a significant positive effect on productivity among local government employees in Nigeria. Although their study focused on the public sector, its implications are applicable to polytechnic administration because both contexts rely on records management, correspondence, service delivery and inter-unit coordination.

AI-supported administrative tools can reduce delays and strengthen feedback systems within institutional work. Agbarakwe and Chibueze (2024) posited that AI has the potential to improve assessment and administrative processes in Nigerian higher education through automation, data processing and pattern recognition. Their argument supports the position that AI augments rather than replaces human administrative judgement: it can support office personnel most effectively when they possess the competence to apply AI responsibly and verify its outputs.

AI Skills in OTM and Business Education

The OTM curriculum has traditionally emphasized office management, keyboarding, secretarial duties, communication and records management. The growing use of AI in offices now requires curriculum planners to incorporate practical AI competence, ethical data handling, workflow automation and analytical skills. Rabiu et al. (2025) reviewed AI adoption for skills development in Nigerian TVET and showed that infrastructure gaps, lecturer expertise and weak policy coordination still continue to hinder AI adoption. Adejor (2025) similarly identified faculty training, infrastructure, curriculum redesign and ethical issues as key concerns for AI integration in business education.

Nwadiani (2025) linked AI adoption to the future of business and workforce development in Nigeria, emphasizing the need for coordinated investment in AI-focused education and training. This link carries particular weight for OTM graduates, because the labour market increasingly expects office workers to combine administrative knowledge with digital adaptability. An OTM graduate who is competent in document preparation but lacks practical experience with AI-supported scheduling, summarization, data retrieval or workflow automation may find it difficult to remain effective in offices that depend increasingly on intelligent digital systems. AI literacy must therefore be treated as a core professional competence, not merely as general awareness.

The reviewed literature shows that AI and digital transformation are changing administrative work, business education and higher education practice. It also demonstrates that AI literacy is a multidimensional competency requiring practical application and ethical awareness, not mere familiarity with the concept. Foundational frameworks (Ng et al., 2021; Long & Magerko, 2020) provide the conceptual scaffolding, while Nigerian empirical studies illustrate context-specific challenges of infrastructure, policy and readiness. However, the literature gives limited attention to OTM graduates already serving in administrative roles in Nigerian polytechnics. This study addressed that gap by examining their level of AI literacy, administrative efficiency, and areas of relative strength and weakness.

Theoretical Framework

This study is anchored in Ng, Leung, Chu and Qiao's (2021) AI Literacy Framework, which was developed to conceptualize the competencies required for meaningful engagement with artificial intelligence in educational and professional settings. The framework identifies four core components: (1) knowing and understanding AI, including awareness of what AI is, how it works, and where it is applied; (2) using AI, the practical ability to employ AI tools for task-specific purposes; (3) evaluating AI, the capacity to critically assess AI outputs and their limitations; and (4) AI ethics, understanding the social, legal and moral implications of AI use, including privacy, transparency, bias and accountability.

These four components tie directly onto the variables measured in this study. Research Question 1 and the AI literacy subscale (Table 1) capture competence across all four dimensions: awareness items correspond to the "know and understand" component; tool-use items reflect "use"; data analysis and automation items relate to "evaluate"; and the ethical AI item corresponds directly to the ethics dimension. The framework is particularly suited to the OTM graduate context because it treats AI literacy not as a binary attribute but as a multidimensional competency that varies across individuals and improves with structured practice and institutional support, a view consistent with the descriptive, competence-mapping purpose of this study.

The framework further aligns with the study's administrative efficiency variable by recognizing that effective AI use requires workers to apply AI tools within professional routines, precisely the workplace context in which OTM graduates operate. The use of this framework therefore provides a

principled basis for interpreting differences in mean scores across AI literacy dimensions and for identifying which components require targeted development.

Methodology

Research Design

The study adopted a descriptive correlational survey research design to examine AI literacy and administrative efficiency among OTM graduates working in selected polytechnics in Kogi State. The descriptive component was appropriate for establishing the level of each variable, while the correlational component was appropriate for testing the relationship between AI literacy and administrative efficiency, without manipulating any variable.

Population and Sampling

The Federal Polytechnic, Idah, and Kogi State Polytechnic, Lokoja, are the only two polytechnics in Kogi State that offer the Office Technology and Management programme. The population comprised all OTM graduates employed in administrative roles in these two institutions, totaling 222 persons. A total population sampling approach was adopted, as the accessible population was sufficiently small to include in its entirety, and complete enumeration was deemed most appropriate for ensuring representativeness. All 222 copies of the questionnaire were administered and retrieved using Google Forms, yielding a 100% response rate.

Research Instrument

Data were collected using a structured questionnaire developed specifically for this study and administered through Google Forms. The instrument comprised three sections. Section A collected demographic information including gender, years of experience, and highest educational qualification. Section B measured AI literacy through items on AI awareness, use of AI-enabled tools, workflow automation, data management, ethical AI use and troubleshooting of AI-supported systems. Section C measured administrative efficiency through items on task accuracy, multitasking, document organization, digital communication, workflow coordination, deadline management and adaptation to new digital systems. All items were measured on a four-point rating scale: 4 = Very High Extent, 3 = High Extent, 2 = Low Extent, and 1 = Very Low Extent. The use of a four-point scale (without a neutral midpoint) was deliberate, to encourage respondents to express a directional view on each item.

Validity and Reliability

The questionnaire was reviewed by two experts in Office Technology and Management and one expert in educational measurement to establish face and content validity. Their comments were incorporated to improve item clarity and relevance. A pilot study was conducted with 25 OTM graduates from a polytechnic outside Kogi State. Cronbach's alpha reliability coefficients were 0.81 for the AI literacy subscale and 0.79 for the administrative efficiency subscale, indicating acceptable internal consistency. Item 20 was included as a negatively worded item and was reverse-scored during analysis.

Data Analysis

Research Questions 1 and 2 were analyzed using mean and standard deviation. The decision rule for interpreting mean scores was: 3.50-4.00 = Very High; 2.50-3.49 = High; 1.50-2.49 = Low; and 1.00-1.49 = Very Low. Research Question 3 and the hypothesis were analyzed by computing a composite AI literacy score and a composite administrative efficiency score for each respondent and correlating the two using Pearson's product-moment correlation coefficient (r). The hypothesis was tested at the 0.05 level of significance ($r = 0.68$, $p < 0.001$, $N = 222$). Even with the addition of correlational analysis, the findings describe levels of competence and efficiency and their association among the study population and should not be interpreted as evidence of a causal relationship.

Results

Research Question 1: Level of Artificial Intelligence Literacy

Table 1 presents the mean scores and standard deviations for the seven AI literacy items.

Table 1

AI Literacy of OTM Graduates (N = 222)

Item	Statement	Mean	SD	Interpretation
1	Awareness of AI and its applications	3.35	0.61	High
2	Use of AI-powered tools	2.88	0.72	High
3	Understanding workflow automation	2.76	0.68	High
4	Applying AI for data management	2.69	0.70	High
5	Integration of AI in daily tasks	2.54	0.74	High

6	Knowledge of ethical AI use	2.92	0.65	High
7	Troubleshooting AI-enabled systems	2.60	0.71	High
	Cluster Mean	2.82		High

Note. Interpretation follows the decision rule: 3.50-4.00 = Very High; 2.50-3.49 = High; 1.50-2.49 = Low; 1.00-1.49 = Very Low.

Table 1 shows that OTM graduates had a high level of AI literacy overall, with individual item means ranging from 2.54 to 3.35 and a cluster mean of 2.82. The highest mean score was recorded for awareness of AI and its applications (M = 3.35, SD = 0.61), indicating that the majority of respondents were familiar with AI concepts and their relevance to office work. The lowest mean was recorded for integration of AI in daily administrative tasks (M = 2.54, SD = 0.74), which, while still in the high range, was notably lower than the awareness item and had the widest spread of responses, suggesting meaningful variation among respondents in their day-to-day AI use. Items on ethical AI use (M = 2.92) and use of AI-powered tools (M = 2.88) clustered in the mid-range of the high band, indicating reasonable but not uniform competence. The pattern across Table 1 consistently shows stronger performance at the level of conceptual awareness than at the level of practical, habitual application.

Research Question 2: Level of Administrative Efficiency

Table 2 presents the mean scores and standard deviations for the seven administrative efficiency items.

Table 2

Administrative Efficiency of OTM Graduates (N = 222)

Item	Statement	Mean	SD	Interpretation
8	Accuracy in administrative tasks	3.21	0.58	High
9	Managing multiple tasks	3.14	0.61	High
10	Organization of documents	3.36	0.53	High
11	Effective digital communication	3.29	0.57	High
12	Coordination of workflow	3.05	0.60	High
13	Meeting deadlines consistently	3.18	0.62	High
14	Adapting to new digital systems	2.98	0.64	High
	Cluster Mean	3.17		High

Note. Interpretation follows the decision rule: 3.50-4.00 = Very High; 2.50-3.49 = High; 1.50-2.49 = Low; 1.00-1.49 = Very Low.

Table 2 shows that respondents demonstrated high administrative efficiency across all seven items, with individual means ranging from 2.98 to 3.36 and a cluster mean of 3.17. The highest mean was recorded for organization of documents (M = 3.36, SD = 0.53), closely followed by effective digital communication (M = 3.29, SD = 0.57). Both items also had the lowest standard deviations in the table, indicating not only strong performance but also a high degree of consistency across the 222 respondents. The lowest mean in this section was recorded for adapting to new digital systems (M = 2.98, SD = 0.64), which, while still in the high range, had the widest spread of responses, suggesting that some respondents found adaptation to newer technologies relatively more challenging than the other efficiency dimensions. The overall pattern indicates well-established competence in core administrative routines, with some attenuation at the boundary of the high range for tasks requiring ongoing digital adaptation.

Research Question 3 and Test of Hypothesis: Relationship between AI Literacy and Administrative Efficiency

Table 3

Correlation between AI Literacy and Administrative Efficiency Composite Scores (N = 222)

Variable	Mean	SD	r	p
AI Literacy (composite)	2.82	0.42	0.68	< .001
Administrative Efficiency (composite)	3.17	0.35		

Note. Correlation is significant at the 0.05 level.

Table 3 shows a strong, positive, statistically significant correlation between the AI literacy composite score and the administrative efficiency composite score ($r = .68$, $p < .001$, $N = 222$). On this basis the null hypothesis (H0) is to be rejected, suggesting that higher AI literacy is associated with higher administrative efficiency among OTM graduates.

Supplementary Analysis: Item-Level Areas of Strength and Comparative Weakness in AI Literacy

Table 4 presents items designed to distinguish the stronger and weaker areas of AI competence among respondents. These are the actual item-level means and standard deviations collected for the study and are retained here as supplementary detail beyond the formal research questions and hypothesis.

Table 4

Strengths and Areas of Comparative Weakness in AI Literacy (N = 222)

Item	Statement	Mean	SD	Interpretation
15	Comfort using AI tools to automate routine office procedures	2.71	0.69	High
16	Ability to analyze AI-generated data for decision-making	2.58	0.72	High
17	Seeking opportunities to improve AI-related skills	3.12	0.63	High
18	Ability to train colleagues or junior staff on AI tools	2.49	0.75	Low
19	Awareness of emerging AI technologies relevant to office administration	2.64	0.70	High
20	Difficulty using advanced AI tools for complex tasks (negative item; reverse-scored mean = 2.54)	2.46	0.73	Low difficulty

Note. Item 20 is negatively worded; the raw mean reflects reported difficulty, while the reverse-scored mean (in parentheses) reflects the equivalent competence level.

Table 4 shows that the strongest area among the six items was respondents' active orientation towards improving their AI skills ($M = 3.12$, $SD = 0.63$), indicating that the majority expressed a self-directed motivation to develop further AI competence. Comfort with using AI tools to automate routine procedures ($M = 2.71$) and awareness of emerging AI technologies ($M = 2.64$) were both in the high range, though closer to the lower boundary of that band. The ability to analyze AI-generated data for decision-making ($M = 2.58$) was similarly in the high range but indicated comparatively weaker analytical application of AI. The weakest performance among positively worded items was recorded for the ability to train colleagues or junior staff on AI tools ($M = 2.49$, $SD = 0.75$), which fell in the low range and had the widest standard deviation of all items in the table, suggesting that respondents diverged most markedly on this skill. Item 20 (reverse-scored: $M = 2.54$) confirmed that the majority did not report major difficulty with advanced AI tools for complex tasks, placing generalized advanced difficulty within the high competence range when adjusted.

Summary of Findings

1. OTM graduates demonstrated high AI literacy overall (cluster mean = 2.82), with awareness of AI concepts as the strongest area and daily AI integration as the lowest-scoring dimension within the high band.
2. Respondents showed high administrative efficiency across all measured dimensions (cluster mean = 3.17), with document organization and digital communication recording the strongest mean scores and the lowest variability.
3. Correlation analysis indicated a strong, statistically significant positive relationship between AI literacy and administrative efficiency composite scores ($r = .68$, $p < .001$, $N = 222$), leading to rejection of the null.

Discussion of Findings

The finding that OTM graduates had high AI literacy but relatively weaker practical daily application is consistent with patterns identified in the wider literature. Eleje et al. (2025) found that lecturers in Nigerian higher education showed interest in AI tools but varied considerably in practical

readiness and use. Long and Magerko's (2020) identification of seventeen distinct AI literacy competencies supports the broader view that AI literacy is not a uniform attribute. The present findings illustrate this: the awareness item (M = 3.35) was notably higher than the daily integration item (M = 2.54), a gap of 0.81 mean points that maps onto the "know and understand" versus "use" dimensions of the Ng et al. (2021) framework. This suggests that while OTM graduates have acquired foundational knowledge of AI, structured practical exposure is needed to close the gap between awareness and habitual application.

The high level of administrative efficiency observed in Table 2 is consistent with Oladimeji et al. (2024), who demonstrated that digital literacy has a positive effect on productivity among Nigerian public sector employees. The relative strength in document organization (M = 3.36) and digital communication (M = 3.29) reflects the core competencies that OTM training has traditionally emphasised, confirming that graduates are well-prepared for established administrative routines. The lower score on adapting to new digital systems (M = 2.98), particularly its wider standard deviation (SD = 0.64), suggests that as office technology continues to evolve, some graduates may find sustained adaptation more demanding. This finding aligns with Agbarakwe and Chibueze (2024), who argued that AI-supported systems can reduce administrative burdens but require workers who possess the competence to engage with them effectively and verify their outputs.

The weakness in peer training of colleagues on AI tools (M = 2.49) is a substantively important finding. AI adoption within institutions is often sustained through informal knowledge-sharing among staff; when only a small number of employees possess AI competence, adoption tends to remain fragmented and individually dependent rather than embedded in institutional practice. Rabiu et al. (2025) emphasized the importance of professional development and collaborative capacity-building for AI adoption in TVET, and Adejor (2025) noted that successful AI integration in business education requires not only infrastructure but also faculty-level capacity to transfer AI knowledge. The low mean on peer training in the present study suggests that although graduates are individually motivated to develop their own AI skills (M = 3.12 for self-directed improvement), this motivation has not yet extended to the capacity or inclination to support colleagues, a gap that has direct implications for institution-wide AI integration strategies.

These findings suggest that OTM graduates in the selected polytechnics occupy a transitional position: competent in established administrative routines and broadly aware of AI, but not yet consistently proficient in the applied, collaborative and analytical dimensions of AI literacy that the Ng et al. (2021) framework identifies as essential. This transitional profile has direct implications for curriculum design, professional development planning and institutional support structures in polytechnic education.

The correlation result ($r = .68$, $p < 0.001$) aligns with Oladimeji et al. (2024) and Agbarakwe and Chibueze (2024), both of whom framed digital and AI-enabled competence as a driver of administrative performance rather than a parallel but unrelated skill set. A strong positive association suggests that the transitional AI literacy profile is not incidental to administrative efficiency but is bound up with it, reinforcing the case for applied AI training as a lever for administrative performance rather than a separate professional-development track.

Conclusion

This study examined AI literacy and administrative efficiency, and the relationship between them, among 222 OTM graduates working in the two polytechnics in Kogi State that offer the OTM programme. The findings established that the graduates had high AI literacy overall, with particular strength in awareness and knowledge of ethical AI use, and comparatively lower mean scores in daily AI integration, AI-generated data analysis, and peer support for AI tool use. The study also established that the graduates demonstrated high administrative efficiency, especially in document organization, digital communication, task accuracy and deadline management, with relatively lower but still high mean scores in adaptation to evolving digital systems. A correlation analysis ($r = .68$, $p < .001$, $N = 222$) indicated a strong positive relationship between the two variables.

The study concluded that OTM graduates in the selected polytechnics are administratively competent but occupy an early-to-intermediate position on the AI literacy continuum as conceptualized by Ng et al. (2021), and that this position appears meaningfully linked to their administrative efficiency rather than incidental to it. The gap between conceptual awareness and practical daily application, and between individual motivation and peer-training capacity, reflects a pattern visible in the broader Nigerian higher education context. As administrative work continues to evolve in response to AI-enabled tools, strengthening the applied, analytical and collaborative dimensions of AI literacy among OTM graduates will be critical to sustaining their professional effectiveness.

Limitations of the Study

Several limitations of this study warrant acknowledgement. First, the study was confined to the two polytechnics in Kogi State that offer the OTM programme; while this constituted a complete population study within that context, the findings may not be directly generalizable to OTM graduates in other states or institution types. Second, the study employed a self-report questionnaire, which is subject to social desirability bias: respondents may have rated their competence higher than their actual performance would reflect.

Recommendations

1. Polytechnic management and curriculum developers should include applied AI modules into OTM programmes, covering AI-assisted document preparation, workflow automation, data retrieval, scheduling, summarization and ethical AI use in office contexts.
2. Institutions should organize regular professional development workshops focused on practical demonstrations and guided use of AI tools, with specific attention to the areas where competence was relatively lower which were in daily AI integration, data analysis and peer support.
3. OTM departments should establish structured peer mentoring arrangements in which graduates with stronger AI competence support colleagues, operating within clear institutional guidelines on data privacy and responsible use.
4. Graduates should be encouraged to pursue self-directed AI learning through reputable online courses, short certification programmes and hands-on practice with office-relevant AI tools.
5. Polytechnic management should periodically review administrative processes to identify routine tasks that can be responsibly supported by AI, with each review addressing accuracy, privacy, accountability and the requirement for human verification of AI outputs.

RIVERS STATE, NIGERIA

Abstract
One of the desires of most developing countries such as Nigeria is to have and achieve a functional educational system that would train her products to be self-reliant through the acquisition of skills. The study took a cursory look at the utilization of artificial intelligence (A.I) for practical business entrepreneurial skills development in business education students; the bottlenecks and solutions for economic development. The qualitative research design was adopted to x-ray topical issues as contained thereof in the topic. To achieve these objectives, the theoretical framework of Shane and Venkataraman Entrepreneurship Nexus Theory 2000, was adopted. Conceptually, Artificial Intelligence (A.I) business education students, entrepreneurship and its objectives, as well as national economic development were highlighted therein. Furthermore, the stages that are needed for business education students' skills development of entrepreneurship for AI driven economy were noted in the study. Hitherto, practical business entrepreneurial skills such as financial literacy, sales persuasion, digital literacy, and project management were noted for business education students self-reliant and economic development. The bottlenecks in utilization of artificial intelligence (A.I) for entrepreneurial skills development in business education, and solutions for the utilization of artificial intelligence (A.I) for entrepreneurial skills development in business education were not also left out untouched in the paper. Based on the raised and discussed therein, it concluded that application of artificial intelligence in business education is not an exception, just like other sectors of the economy landscape, as Al presents unprecedented opportunities and challenges for preparing the business education students for the workforce of the future. It was finally suggested that; there should be individuals' re-orientation about initiative for teamwork to guide and motivate others to work collaboratively and effectively in the achievement of common desirable goals. and that there should be more practical and pragmatic teaching approach of A.I tools application in business education rather than theories.
Keywords; Artificial Intelligence (A.I), business education students, entrepreneurial education, and economic development.

Introduction
In today's fast growing and changes in the global economy, the business landscape and spectrum has become more competitive than it has ever been in the past. These changes have brought in competitiveness in the global economy. Thus, it has been noted that competitive intensity is sequel to globalization, technological disruption, shifting consumer preferences, and the integration of markets across borders (OECD, 2020 & UNCTAD, 2021). One of the desires of most developing countries such as Nigeria is to have and achieve a functional educational system that would train her products to be self-reliant through the acquisition of skills. Nigeria as a country has vast mineral, agricultural and human resources which have been untapped due to high number of unskilled manpower that produced by the educational system. As matter of fact, several policies and theories have been created all with a

view to sustaining the vocational and entrepreneurial skills of the students to enhance business operations and economic advancement.

Information Technology (ICT) has changed and continues to change the way we live, do business, and interact socially. ICT is undergoing rapid change. New and improved technological advances appear almost daily. Most jobs require personnel to have some level of interaction and expertise with ICT. Artificial intelligence as one of the technologies, has intricately woven into businesses, education, including healthcare, manufacturing industries, banking industries, restaurant and food industries' all these industries use computerized ordering, monitoring and tracking systems. Artificial intelligence (AI), is transforming how businesses operate and also requires skills that would change the workplace environment and produce quality and effectiveness in all sphere of life of which education is not left out. Entrepreneurship is fast becoming a phenomenon particularly in a developing economy like Nigeria. Thus, FRN (2013) an emphasis is laid on united, strong and self-reliant nation. In a bid to achieve this, entrepreneurship courses were introduced in the curriculum of every programme including business education. Entrepreneurship in the view of Kanu in Enyekit (2017), means the process of bringing together creative and innovative ideas and combining these skills with management and organizing the skills in order to combine people, money and resources to meet identified needs and thereby create wealth. It could be noted that the importance of entrepreneurship skills that are for effective teaching of entrepreneurship that the teachers require to be competent with instructional planning of what to be taught, be conversant with the use of technology for effective teaching of entrepreneurship effectively to the understanding of the learners (Ngugi et al, 2024).

Theoretical Framework

Shane and Venkataraman Entrepreneurship Nexus Theory 2000

Recent theories of entrepreneurship build on the works described above. Shane and Venkataraman (2000) state that "entrepreneurship involves the nexus of two phenomena: the presence of lucrative opportunities and the presence of enterprising individuals (Shane & Venkataraman, 2000). Their theory is inspired by the Kirznerian entrepreneurial discovery process but they emphasize that prior information is needed to complement the new information in the discovery of business opportunities. In this respect, they are similar to Schultz who argues that human capital is an important determinant of entrepreneurial ability. Casson (2003), tries to encompass both the Schumpeterian and the Knightian definitions by arguing that entrepreneurs are individuals who specialize in decision making. The Schumpeterian entrepreneur applies information about inventions to create new combinations and is ultimately the one who decides if the new combinations are profitable.

In stressing the relevance of this theory, Enyekit (2022), has also adopted this theory in a relate study. The innovative competencies delivery needs of business educators means being able to think ahead and bridge the gap above others in a competitive environment. Teaching entrepreneurship requires adequate advancement and innovative competencies that would expose the students to real life situation and work environment. This theory has also given a strong hold and relationship with this present study because it also touched innovative delivery competencies of entrepreneurship education. This aspect of the study laid emphasis on business educators' ability of inventing and creating quality teaching strategies, techniques and methods in carrying out his duties to the benefit of the learners.

Conceptual Framework

Artificial Intelligence (A.I)

Artificial Intelligence (A.I) as widely known and understood is one of the latest innovations of information and communication technology advancement that has come to stay in the 21st global century. This innovation has affected and reshaped the nature of every community, business environments, education as well as life generally. The concept has been given different meaning and explanations by different authors. According to according to Olanrewaju et al in Ahaikwo, (2026). noted that artificial intelligence as driven diagnostic tools that are being developed to consider local diseases and treatment methods, improving patient care and outcomes. Also, it could be deduced that artificial intelligence is the ability of machines or computer systems to perform tasks that typically required human intelligence which may include, thinking, perception, reasoning, teaching, learning, as well as decision-making in both businesses, education and other spheres of human endeavors.

In a related vein, Russell and Norvig in Gddyson et al (2025), noted that artificial intelligence refers to the capability of digital computers or robots to perform tasks commonly associated with intelligent beings, such as reasoning, learning, and problem-solving; it encompasses various subfields, including machine learning, natural language processing, computer vision, and robotics, each contributing to the

development of systems that can interpret complex data and tasks autonomously. From the views of the different school of thoughts, artificial intelligence could be explained to mean utilization of networks of computers in form of robots that carryout the tasks ordinarily that would have been done by human beings; this includes areas such as medicine, engineering, learning, reasoning, manufacturing, problem-soling, and decision-making, etc.

Business Education Students

Business education students refers to the individuals or students who are running programmes in the department of business education at tertiary education level who intend to acquire skills in the different options of marketing, accounting, office and information management, management or entrepreneurship. According to Ahiakwo (2026) noted that for business education students to be salable in the business world, they need the competencies in the different options of the programme. Also, Ayatunde et al (2022), and Osifor (2021) opined that the prescribed future office and business environment requires the students' roles in management, marketing, human resources development, entrepreneurship, training, and consultancy inherently demand the advanced abilities of reporting complex data, pitching ideas to source buying or funding, training depressed teams, and influencing stakeholders.

Concept of Entrepreneurship

The exert conceptualization of the word entrepreneurship has not been ascertained. Different definitions are been rooted according to the authors perception. This misconception is as a result of different perceptions and thoughts as may be perceived the individual. According to Bola (2009), the term entrepreneurship has its root in the word entrepreneur which originated from the French word, entrepreneur which means "to undertake". In business context, it means to start a business. Entrepreneurship according to Adewale (2004), is the act of floating, investing and managing a business for self-employment and with the aim of making profit. Enyekit, and Sam-Worlu (2026), opined that entrepreneurship is the willingness and ability of individual to seek out an investment opportunity, establish an enterprise based on this and run it successfully. Entrepreneurship is an employment strategy that can lead to economic self-reliance. As self-employment provides people with the potential to create and manage business in which they function as the employer or boss, rather than merely being an employee. According to Gana in Ubulom, and Enyekit, (2022), looked at entrepreneurship as the willingness and ability of an individual to seek out investment opportunities in an environment and be able to establish and run an enterprise successfully based on the identified opportunity.

While some call entrepreneurship as "risk-bearing", other views it is "innovating" and get others consider it "thrill-seeking". Entrepreneurship is a process which involves various activities to be undertaking to start an enterprise. It is thus, a process of giving birth to a new enterprise. Entrepreneurship involves innovation and risk-bearing. Entrepreneur is about cultivating the ability to see opportunities where other may not. For these reasons, many authors have also created possible impression and manner to solving the problems of unemployment through the use entrepreneurship education in all level of education.

According to Enyekit and Obara in Enyekit (2017) entrepreneurship education is seen as the type of education given to a set of people to be able to instill in them the principles, skills, and practices required to see and evaluate business opportunities, to gather the necessary resources and the desire to take advantage of them as well as initiating appropriate actions to ensure success in any choice of profession and occupation. Entrepreneurship is the foundation for developing the flexible skills needed to participate in knowledge intensive economic activity. From the assumptions derived from the above definitions, entrepreneurship is a lifelong learning process that has different stages of development. It could be categorized into the following stages that are needed for the students to include;

Stage 1; Basics Knowledge;

The focus here is on understanding the basics of our economy, career opportunities and the need to master basic skills to be successful in a free market economy.

Stage 2; Competency Skills Awareness;

In this stage, the students learn to speak language of business and see the problems from the small business owner's point of view. These views are notably in practical skills of the learners.

Stage 3; Creative and Practical Skills Application;

At this point, students can take time to explore business ideas and varieties of way to plan the business.

Stage 4; Start Up Business Idea;

This stage encourages students to start up a business and be their own boss enable them to have experiences on how to risk their own money, organize their own business in diversified economy.

Stage 5; Business Growth and Expansion;

At this point, some students when given money to start up a business cannot manage financial outcomes; therefore, there is the need for seminars and workshops to be organized for them as to

enable them gain potential business ideas to deal with such seeming difficulties in business. Entrepreneurship education therefore, seeks to provide undergraduate students with knowledge, skills and motivation to encourage entrepreneurial success in a variety of settings.

Objectives of Entrepreneurship Education

Entrepreneurship education has been applied in various setting to achieve various objectives. These objectives according to Nwangwu in Ubulom and Enyekit (2022) are listed therein.

1. Offer functional education for the youths so as to enable them to be self-employed and self-reliance.
2. Offer graduates with adequate training that will enable them to be creative and innovative in identifying novel business opportunities.
3. Provide Universities, Polytechnics and Colleges of Education graduates with adequate training in risk management, to make certainty bearing feasible.
4. Provide the young graduates with enough training and support that will enable them to establish a career in small and medium size business.
5. Offer graduates adequate training in the acquisition of skills that enable them meet the manpower needs of the society.
6. To stimulate both individual and economic growth of rural and less developed areas'
7. Provide both small and medium business enterprises with the opportunity of recruiting graduates who will be trained and tutored in the skills relevant to the management and operation of small business centres.
8. To inculcate the spirit of perseverance in the youths and which will enable them to persist in any business venture they embark on.

From the afore-mentioned structures, the entrepreneurship education objectives could be classified under the following categorized as;

People Empowerment: Teaching people innovative ways to make a living enables them to take control of their circumstances in Nigeria, for example, entrepreneurship education is being used as a tool to empower youth, undergraduate and women.

Creation of Employment: Unemployment is a rampant problem in many societies. Entrepreneurship education aims at empowering people to create employment opportunities. The aim of this training is to enable these people to start small and medium enterprises, important in any country's growth.

Individual Competence: Entrepreneurship education imparts qualities such as self-motivation and financial responsibilities. In addition, this education empowers people to have self-discipline since entrepreneurship involves taking will calculated risks. People who have gone through this kind of training are able to recognize opportunities that also encourage innovation in the running of organization.

National Economic Development

National economic development is a term that economists, politicians, and others have used frequently in the 20th century. The concept as a matter of fact does not have a concise meaning; however, the concept has been in existence in the West for centuries. The global modernization, Westernization, and especially industrialization are other terms associated to the discussion of economic development. Economic development is the process by which a nation improves the economic, political, and social well-being of its people. It also has a direct relationship with the environment. National economic development can also be considered as a static theory that documents the state of an economy at a certain time (Enyekit, & Silas-Dikibo, 2017). Although nobody is certain when the concept originated, some people agree that development is closely bound up with the evolution of capitalism and the demise of feudalism.

Practical Business Entrepreneurial Skills

Financial Literacy

Financial literature is one of the practical business entrepreneurial skills that exposes the students of the ability on how manage money wisely and effectively such budgeting, savings, debt management and investment. These skills help business education students to financial management is the process of planning, organizing, directing, and controlling the financial resources of an organization to achieve its objectives efficiently and effectively. Nevertheless, Alade and Abubakar (2023), noted that it involves making informed decisions about how to acquire, allocate, and utilize funds, ensuring that resources are used prudently to maximize value and sustainability Thus, financial literacy leads to accountability

in education is not just about financial efficiency but also about fairness, inclusiveness, and alignment with national development goals.

Sales Persuasion

The sales persuasion skills are skills that are inevitable for salespersons in discharging their duties. This are the abilities, techniques and methods that salespersons apply to influence and convince their potential customers and buyers to accept their offer of a product or services. It does not mean or imply manipulating the customers or buyers to buy a product or services. According to Dowell and Johnmark (2024) noted business education students with high level of sales persuasion skills have the tendencies of competing with their counterparts in the global business environment. In the view of the above, the salesperson persuasion skills may include the skills of effective communication, building good rapport with customers and consumers alike, active listening, good knowledge of the firm's products and services, high level of emotional intelligence, good questioning language, negotiation abilities, handling customers objections and closing of the deal, etc.

Digital Literacy

Digital literacy and e-commerce competence have also emerged as fundamental in the global competitive landscape. The rise of the digital economy has reshaped how businesses operate, market their products, and interact with customers (UNCTAD, 2021). In the digital age, decision-making increasingly relies on the ability to work with technology. Business education graduates must be technologically literate, particularly in the use of productivity software (e.g., Microsoft Office Suite), enterprise systems (e.g., SAP), data analysis tools (e.g., Excel, Power BI), and communication platforms (e.g., Zoom, Slack). In a global economy, where currency fluctuations, trade tariffs, and cross-border transactions are the norm, having solid financial literacy helps entrepreneurs avoid costly mistakes and maximize profitability (Okpara, 2020). Nevertheless, Ubulom, and Enyekit, (2022) asserted that graduates lacking digital competencies are less likely to make timely or data-driven decisions, which are essential in areas such as digital marketing, e-commerce, and financial analysis. Competence in using digital tools improves the speed, accuracy, and credibility of decisions made.

Business education students who master online marketing, data analytics, cloud-based collaboration, and virtual networking are better equipped to engage with global markets (Kapoor & Kapoor, 2021). Understanding e-commerce strategies allows them to bypass traditional geographic barriers and reach diverse customers worldwide (OECD, 2020). Equally important is financial management skills, which ensure that entrepreneurs can manage resources efficiently in volatile environments. This includes budgeting, investment analysis, cash flow monitoring, and understanding international financial regulations).

Project Management

The project management skills required by business education students are the abilities and competencies for planning, organizing, monitoring and execution specified tasks. These skills enable business education students to organize team work with members, coordinate other materials and human resources to attain the set-goals of the business. Specifically, these skills may include the followings, leadership skills, team management skills, time management skills, effective communication skills, negotiation skills, problem-solving skills, risk management skills, and monitoring and evaluation skills, etc. Enyekit and Sam-Worlu (2026) further noted that skills are thoughts of quality performance which do not depend solely upon a person's fundamental, innate capacities but must be developed through training, practice and experience. Nevertheless, it must be reiterated that even though basic human capacities are not sufficient to produce skills, they form the necessary basis of their development

Bottlenecks in Utilization of Artificial Intelligence (A.I) for Entrepreneurial Skills Development in Business Education

1. **Resistance to Change:** the advent of technology brings worries and fears of the unknown or discomfort with new ideas can hinder innovation.
2. **Lack of Resources:** Insufficient funding, talent, or infrastructure can limit innovation efforts.
3. **Poor Infrastructure:** Challenges such as unreliable electricity, weak internet connectivity, and poor transport systems can limit the effective adoption of digital platforms and delivery services.
4. **Organizational Culture:** A firm's culture may not support experimentation, risk-taking, or creativity can stifle innovation. This may in the future delay and bridge the benefits of innovation and technological development.

5. **Fear of Risk Taking and Failure:** Fear of failure or making mistakes can prevent individuals and organizations from taking risks and innovating.
6. **Bureaucratic Red Tape:** Excessive regulations, policies, or procedures can slow down or block innovation efforts.
7. **Data Quality and Integration;** The issue of data quality and integration is one of the bottle necks in artificial intelligence application that are faced by administrators. According to Ito and Emaziye (2025), data protection in Nigeria are still developing, the need for robust data privacy measure is particularly acute. Also reiterating, it could be noted that data regulation and management as well as enforcement remains one of the most difficult challenges in Nigeria.
8. **Inadequate Technical Skills:** Business owners and staff may lack the knowledge or expertise required to implement and manage new technologies or innovative strategies effectively.
9. **Algorithm Biasness;** The algorithm bias is also one of the challenges that creates bottle-neck in application of AI management skills. The AI algorithm work on data that reflects all aspect of the society which may be bias, and if it occurs, it therefore shows the discriminatory outcomes, and the effects cannot also be ignored or restricted to a particular aspect of the economy and society.

Solutions for the Utilization of Artificial Intelligence (A.I) for Entrepreneurial Skills Development in Business Education

1. **Re-orientation to Innovative Change:** the advent of technology should not bring worries and fears of the unknown or discomfort with new ideas can hinder innovation to both students and business educators alike.
2. **Regular Provision of Resources:** Sufficient funding, talent, or infrastructure should not limit innovative efforts.
3. **Proactive and Positive Organizational Culture:** Educational organizational culture should support experimentation, risk-taking, or creativity to unstifled innovation. This may in the future bridge the benefits of innovation and technological development.
4. **Regular Training and Re-training of Business Educators for Technical Skills:** Business educators and other auxiliary staff should be trained and re-trained for new knowledge or expertise required to implement and manage new technologies or innovative strategies effectively.

Conclusion

The application of artificial intelligence in business education is not an exception, just like other sectors of the economy landscape, as Al presents unprecedented opportunities and challenges for preparing the business education students for the workforce of the future. As the different industries evolve round the technological advancement, one need to increasingly embrace automation and Al-driven processes for national economic development. Nevertheless, it is our views to assert that artificial intelligence has become part of us, and we are part of artificial intelligence.

Suggestions

Based on the content and issues raised in this presentation, the following suggestion were made;

1. There should be individuals' re-orientation about initiative for teamwork to guide and motivate others to work collaboratively and effectively in the achievement of common desirable goals.
2. There should be more practical and pragmatic teaching approach of A.I tools application in business education rather than theories.
3. There should be the provision of electronic equipment and facilities that are A.I related appliances and studios for teaching and learning in business education.

Abstract

This study examined Artificial Intelligence and Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State. The study was guided by two research questions and two null hypotheses. The study adopted a descriptive survey research design. The population comprised 214 Entrepreneurship Education students in Delta State University, Abraka; Dennis Osadebay University, Asaba; and University of Delta, Agbor, from which a sample of 190 students was used. Data were collected using a 20-item Artificial Intelligence and Digital Entrepreneurship Competencies Questionnaire (AIDECQ), which was subjected to face and content validation by three experts and yielded a test-retest reliability coefficient of 0.82. Data were analysed using mean and standard deviation to answer the research questions, while independent-samples t-test and one-way analysis of variance (ANOVA) were used to test the two null hypotheses at the 0.05 level of significance. The findings showed that Artificial Intelligence competencies, including generative AI use, prompt formulation, AI-assisted content creation, evaluation of AI-generated information, ethical AI use and AI-supported automation, were required for participation in the Creator Economy. Digital Entrepreneurship competencies, including digital opportunity recognition, content creation, personal branding, digital marketing, audience development, monetisation and digital venture management, were also required. The study further found no significant difference in respondents' ratings of the required Artificial Intelligence competencies based on gender and no significant difference in their ratings of Digital Entrepreneurship competencies based on university location. The study concluded that effective participation in the Creator Economy required the integration of Artificial Intelligence and Digital Entrepreneurship competencies. It was recommended that universities integrate practical Artificial Intelligence and Digital Entrepreneurship training into Entrepreneurship Education programmes to prepare students for emerging creator-based entrepreneurial opportunities.

Keywords: Artificial Intelligence, Digital Entrepreneurship, Entrepreneurship Education, Creator Economy, Competencies, University Students**.**

Introduction

Entrepreneurship education has developed from a relatively narrow focus on preparing individuals for business ownership and self-employment into a broader field concerned with developing students' ability to identify opportunities, create value, innovate and respond to changing economic conditions. The field has experienced important developments in its practice, social relevance and scholarly foundation, leading to its wider adoption in higher education across different parts of the world (Gabrielsson, Landström, Politis, & Sørheim, 2023). In the contemporary environment, this

development has been influenced strongly by digital transformation, which has changed how businesses are created, operated and expanded. Entrepreneurship education is therefore increasingly expected to incorporate digital technologies and learning approaches that help students develop competencies suitable for technology-driven entrepreneurial activities (Zhang & Rathakrishnan, 2024). As digital technologies continue to reshape education, business and value creation, entrepreneurship education is moving beyond traditional business knowledge towards competencies that enable students to recognise and exploit opportunities in digital environments. This historical movement provides an important foundation for understanding the emergence of new forms of entrepreneurial activity, particularly the creator economy, where individuals increasingly use digital platforms, creativity and technology to create and capture economic value.

The growing use of digital technologies in entrepreneurship education has created new forms of economic participation, one of the most important being the creator economy. The creator economy refers to an expanding digital economic system in which individuals use online platforms and digital tools to create and monetize content, creative works, products or services for audiences (Peres et al., 2024). It includes activities such as blogging, video production, podcasting, online education, digital art, music, influencing, social media content creation and other forms of digital creative work. The development of social media platforms has strengthened this economy by providing creators with spaces to produce content, connect with audiences, build communities and generate income through different monetization channels (Bleier et al., 2024). Unlike traditional employment, the creator economy allows individuals to combine creativity, personal interests and entrepreneurial activities to develop independent sources of economic value. For Entrepreneurship Education students, this environment presents opportunities to apply their entrepreneurial knowledge in areas where creativity and digital content can be converted into income. However, successful participation requires more than creativity alone, because creators increasingly depend on technological capabilities and business-related competencies to develop, promote and monetize their work. This emerging need provides a basis for examining the Artificial Intelligence competencies and Digital Entrepreneurship competencies that Entrepreneurship Education students require for effective participation in the creator economy.

The need for relevant competencies for participation in the creator economy becomes more important as Artificial Intelligence (AI) increasingly changes the way creative and entrepreneurial activities are performed. AI refers to computer-based systems that can perform tasks associated with human intelligence, including learning, reasoning, problem-solving and content generation. Recent developments in generative AI have made these capabilities more accessible to students and entrepreneurs, allowing them to generate text, images, audio and other forms of digital content through simple instructions (Bell & Bell, 2023). In entrepreneurship education, AI is also becoming relevant because students can use AI tools to support opportunity identification, business idea development, market analysis and other entrepreneurial activities (Chen et al., 2024). Within the creator economy, the application of AI can help creators develop ideas, produce and edit content, improve productivity and respond more effectively to audience needs. Research on the relationship between AI and the creator economy further shows that AI is becoming an important part of the processes through which creators develop content and engage audiences (Rangaswamy & Sivakumar, 2026). However, access to AI tools alone does not guarantee effective participation; students need the appropriate competencies to use these technologies critically, creatively and responsibly. This therefore makes Artificial Intelligence competencies an important area to examine among Entrepreneurship Education students seeking to participate in the creator economy.

The growing use of Artificial Intelligence in the creator economy means that Entrepreneurship Education students need more than basic awareness of AI tools; they need practical competencies that enable them to use these technologies effectively and responsibly. AI literacy involves understanding what AI systems can and cannot do, while also knowing how to apply them appropriately in different tasks. Recent research identifies competencies such as understanding AI concepts, using generative AI tools, formulating effective prompts, evaluating AI outputs, and recognising ethical and legal issues as important elements of generative AI literacy (Annapureddy et al., 2025). Similarly, higher education increasingly requires students to develop AI literacy, prompt-engineering skills and critical-thinking abilities so that they can use AI without accepting its outputs uncritically (Walter, 2024). For Entrepreneurship Education students participating in the creator economy, these competencies can support activities such as generating content ideas, producing written and visual materials, improving digital content, analysing audience information and automating routine creative tasks. Students also need the ability to check the accuracy, originality and appropriateness of AI-generated content because effective creator-economy participation requires human judgement alongside technological capability. Thus, AI competencies should encompass not only the ability to operate AI tools but also the capacity

to prompt, evaluate, adapt, create and use AI ethically, making these competencies essential for students who intend to convert digital creativity into sustainable entrepreneurial opportunities.

While Artificial Intelligence competencies can help Entrepreneurship Education students create and improve digital content, effective participation in the creator economy also requires the ability to manage creative activities as entrepreneurial ventures. This brings Digital Entrepreneurship into focus as the second independent variable in the study. Digital entrepreneurship involves using digital technologies, platforms and resources to identify opportunities, develop innovative products or services, reach customers and create economic value. Among university students, digital entrepreneurial competence includes abilities related to opportunity identification, information search and analysis, creativity, innovation and prospecting for new opportunities (Simovic et al., 2023). These competencies are important because the digital environment requires entrepreneurs to combine entrepreneurial thinking with the effective use of digital technologies. Research has also shown that digital competencies can influence students' entrepreneurial intentions, indicating that technological capability has become an important part of entrepreneurial development (Bachmann et al., 2023). For Entrepreneurship Education students, digital entrepreneurship therefore extends beyond knowing how to use computers or social media; it involves the ability to recognise digital opportunities, develop and market ideas, build an online presence, manage digital relationships and convert digital activities into sustainable economic value. Having established the importance of these competencies, the next issue is how Digital Entrepreneurship competencies can specifically support students in converting their creative abilities into successful participation in the creator economy.

The importance of Digital Entrepreneurship competencies becomes clearer when considering how students can transform creative activities into sustainable economic opportunities within the creator economy. Digital entrepreneurial competence combines entrepreneurial abilities with digital capabilities, enabling individuals to identify opportunities, plan activities, create digital value, communicate with others, solve problems and manage digital ventures effectively (Ivanović et al., 2025). For Entrepreneurship Education students, these competencies can support the practical activities required in the creator economy, including identifying profitable content niches, developing digital products and services, building a personal brand, promoting content through online platforms, engaging audiences and managing digital business activities. Digital competence has also been found to contribute positively to students' digital entrepreneurial intentions, showing that the ability to use digital technologies effectively can strengthen their readiness to pursue entrepreneurial opportunities in digital environments (Lam et al., 2025). Therefore, participation in the creator economy requires students to combine creativity with competencies in digital marketing, online communication, digital content management, opportunity recognition, customer engagement, financial management and digital venture development. These competencies can help Entrepreneurship Education students move from simply creating online content to deliberately creating, marketing and monetizing digital value, thereby making Digital Entrepreneurship competencies an important requirement for meaningful and sustainable participation in the creator economy.

The discussion of Digital Entrepreneurship competencies shows that students need more than the ability to use digital platforms; they must also be able to combine technological knowledge with entrepreneurial thinking to create and sustain value. This becomes particularly important when Artificial Intelligence and Digital Entrepreneurship competencies are considered together, because AI can strengthen several activities involved in digital venture creation, including idea development, content production, market analysis, customer engagement and marketing. Recent evidence indicates that AI-supported entrepreneurship education can improve students' entrepreneurial self-efficacy and entrepreneurial intention, suggesting that appropriate exposure to AI can strengthen students' readiness to pursue entrepreneurial opportunities (Xie & Wang, 2025). In addition, AI-enabled capabilities such as automation, analytical ability and relational capabilities have been found to support digital entrepreneurial behaviour among aspiring digital entrepreneurs, particularly when supported by relevant digital training (Zulfiqar et al., 2026). This convergence is especially relevant to Entrepreneurship Education students because the creator economy requires individuals to combine creativity, technological competence and business skills rather than rely on one category of skill alone. Consequently, university entrepreneurship education needs to prepare students to integrate AI tools with digital opportunity recognition, content creation, marketing, audience development and online venture management. Such integration can help students move from merely consuming digital technologies to using them strategically to create, promote and monetize value in the creator economy.

The convergence of Artificial Intelligence and Digital Entrepreneurship competencies is particularly important for university students because participation in the digital economy increasingly requires students to combine technological abilities with entrepreneurial thinking. Studies on university

students have identified a gap between the digital entrepreneurial competencies required in the changing business environment and those acquired through university education, suggesting the need for higher education institutions to strengthen competency development (Bradić-Martinović et al., 2022). In the Nigerian context, entrepreneurship education has also been linked to the need for stronger digital capabilities, as technological developments associated with the Fourth Industrial Revolution are changing the skills required for entrepreneurial activities (Aina, 2022). Evidence from Nigerian university students further indicates that students may possess entrepreneurial digital knowledge while still having only moderate levels of practical digital skills, pointing to the need for universities to provide stronger opportunities for digital skill development and application (Osiesi et al., 2024). Although these studies provide useful evidence on digital entrepreneurship and technology-related competencies, they do not sufficiently establish the specific Artificial Intelligence and Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the creator economy, particularly within universities in Delta State. This gap is important because the creator economy requires students to combine AI-enabled creativity with digital entrepreneurial abilities such as opportunity recognition, content development, audience engagement, digital marketing and monetisation. Therefore, determining the competencies required by Entrepreneurship Education students in universities in Delta State is necessary to provide evidence that can guide curriculum development, skills training and the preparation of students for meaningful participation in the emerging creator economy.

Statement of the Problem

The rapid growth of the creator economy has created opportunities for university students to turn creativity, digital content and personal brands into sources of income, but effective participation increasingly depends on competencies that may not be adequately developed through conventional Entrepreneurship Education. Creators now require Artificial Intelligence competencies to generate and refine content, formulate effective prompts, evaluate AI outputs and use AI responsibly, while inadequate preparation may limit students' ability to exploit AI for productive and innovative purposes (Fox et al., 2025). At the same time, Digital Entrepreneurship competencies such as opportunity recognition, digital marketing, innovation, customer engagement and online venture management are necessary for transforming creative activities into viable digital businesses (Simovic et al., 2023). The concern is that students may possess general entrepreneurial knowledge and access to digital technologies without having the combined AI and digital entrepreneurial capabilities needed to create, market and monetise value in the creator economy. Although AI-supported entrepreneurship education has been associated with improved entrepreneurial self-efficacy and intention (Xie & Wang, 2025), there is limited evidence establishing the specific competencies Entrepreneurship Education students require for creator-economy participation, particularly in universities in Delta State. This gap makes it necessary to determine the Artificial Intelligence and Digital Entrepreneurship competencies required by Entrepreneurship Education students for effective participation in the creator economy in universities in Delta State.

Purpose of the Study

The main purpose of this study is to examine the Artificial Intelligence and Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State. Specifically, the study seeks to:

1. Determine the Artificial Intelligence competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State.
2. Determine the Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State..

Research Questions

The following research questions will guide the study:

1. What Artificial Intelligence competencies are required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State?
2. What Digital Entrepreneurship competencies are required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State?

Hypotheses

The following null hypotheses will be tested at the 0.05 level of significance:

1. There is no significant difference in the mean ratings of respondents on the Artificial Intelligence competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State based on gender.

2. There is no significant difference in the mean ratings of respondents on the Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State based on location.

Methodology

The study adopted a descriptive survey research design, which was considered appropriate because the study sought to obtain information from Entrepreneurship Education students on the Artificial Intelligence and Digital Entrepreneurship competencies required for participation in the creator economy without manipulating any of the variables. The study was conducted in the three universities in Delta State, namely Delta State University, Abraka; Dennis Osadebay University, Asaba; and University of Delta, Agbor. The population of the study comprised 214 Entrepreneurship Education students across the three universities, from which a sample size of 190 students was used for the study. A multistage sampling technique was employed, involving the selection of the participating universities, proportionate allocation of the sample to the institutions based on their student population and simple random sampling to select the respondents. Data were collected using a researcher-developed 20-item Artificial Intelligence and Digital Entrepreneurship Competencies Questionnaire (AIDECQ), which was structured in line with the two research questions and the study variables. The instrument was organised into two sections, with items measuring the Artificial Intelligence competencies and Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the creator economy, and responses were rated on a four-point scale of Highly Required (4), Required (3), Slightly Required (2), and Not Required (1). The questionnaire was subjected to face and content validation by three experts, comprising two experts in Entrepreneurship Education and one expert in Measurement and Evaluation, who assessed the relevance, clarity, adequacy, coverage and appropriateness of the items to the objectives and research questions of the study. The reliability of the instrument was established through a test–retest method, whereby the questionnaire was administered twice to a group of students who were not part of the study population at a two-week interval, and the two sets of scores were correlated using the Pearson Product-Moment Correlation Coefficient, which yielded a reliability index of 0.82, indicating satisfactory stability and consistency. The researcher obtained permission from the relevant authorities in the participating universities before data collection, while respondents were informed of the purpose of the study and assured that participation was voluntary and that their responses would be treated confidentially. A total of 190 copies of the questionnaire were administered, and all 190 copies were retrieved and found sufficiently completed for analysis, representing a 100% retrieval and usable response rate. Data obtained from the respondents were analysed using mean and standard deviation to answer the research questions, with a criterion mean of 2.50 used as the decision point, such that items with a mean of 2.50 or above were regarded as required competencies, while items below 2.50 were regarded as not required. The two null hypotheses were tested at the 0.05 level of significance using independent-samples t-test for the first hypothesis based on gender and one-way Analysis of Variance (ANOVA) for the second hypothesis based on university location.

Research Question 1: What Artificial Intelligence competencies are required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State?

Table 1: Respondents' Mean Score on the Artificial Intelligence competencies Required by Entrepreneurship Education Students for Participation in the Creator Economy in universities in Delta State. (N=190)

S/N	Artificial Intelligence Competencies	Mean	SD	Remark
1	Ability to use generative AI tools for developing original content ideas	3.61	0.56	Required
2	Ability to formulate effective prompts for generating relevant AI-assisted content	3.57	0.59	Required
3	Ability to use AI tools for creating and editing written digital content	3.54	0.61	Required
4	Ability to use AI tools for generating and editing images and visual content	3.49	0.64	Required
5	Ability to use AI tools for assisting video and audio content production	3.46	0.67	Required
6	Ability to evaluate the accuracy and relevance of AI-generated information	3.65	0.53	Required
7	Ability to identify ethical issues associated with the use of Artificial Intelligence in content creation	3.59	0.58	Required
8	Ability to use AI tools for analysing audience preferences and content trends	3.51	0.62	Required
9	Ability to apply AI tools to automate routine content-creation and digital business tasks	3.48	0.65	Required
10	Ability to use Artificial Intelligence creatively while maintaining human judgement and originality	3.68	0.50	Required

S/N	Artificial Intelligence Competencies	Mean	SD	Remark
	Grand Mean	**3.56**	**0.60**	**Required**

Researcher's Survey Data, 2026.

Table 1 shows that all the 10 Artificial Intelligence competencies were required by Entrepreneurship Education students for participation in the Creator Economy, as their mean scores ranged from 3.46 to 3.68, which were all above the criterion mean of 2.50. The highest-rated competency was the ability to use Artificial Intelligence creatively while maintaining human judgement and originality (M = 3.68, SD = 0.50), while the ability to use AI tools for assisting video and audio content production recorded the lowest mean (M = 3.46, SD = 0.67). Other highly rated competencies included evaluating the accuracy and relevance of AI-generated information (M = 3.65, SD = 0.53), using generative AI for developing original content ideas (M = 3.61, SD = 0.56), identifying ethical issues associated with AI use (M = 3.59, SD = 0.58) and formulating effective prompts (M = 3.57, SD = 0.59). The grand mean of 3.56 indicates that Artificial Intelligence competencies were generally considered required, while the standard deviations, ranging from 0.50 to 0.67, indicate relatively close agreement among respondents. The findings therefore suggest that effective participation in the Creator Economy requires Entrepreneurship Education students to possess practical AI capabilities covering content development, prompt formulation, content evaluation, ethical application, audience analysis, automation and the integration of AI with human creativity.

Research Question 2: What Digital Entrepreneurship competencies are required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State?

Table 2: Respondents' Mean Score on the Digital Entrepreneurship competencies Required by Entrepreneurship Education Students for Participation in the Creator Economy in universities in Delta State. (N=190)

S/N	Digital Entrepreneurship Competencies	Mean	SD	Remark
1	Ability to identify viable entrepreneurial opportunities on digital platforms	3.64	0.55	Required
2	Ability to develop digital products and services based on identified market needs	3.58	0.60	Required
3	Ability to develop and manage a professional digital personal brand	3.62	0.57	Required
4	Ability to use social media platforms for digital marketing and audience development	3.67	0.51	Required
5	Ability to create engaging digital content for targeted audiences	3.71	0.47	Required
6	Ability to analyse digital market trends and audience behaviour	3.56	0.61	Required
7	Ability to monetise digital content, products and creative services	3.69	0.49	Required
8	Ability to manage online customer relationships and digital communities	3.53	0.63	Required
9	Ability to apply digital financial management practices to creative ventures	3.45	0.68	Required
10	Ability to develop sustainable digital business models for creator-based ventures	3.60	0.58	Required
	Grand Mean	**3.61**	**0.57**	**Required**

Researcher's Survey Data, 2026.

Table 2 indicates that all the 10 Digital Entrepreneurship competencies were required by Entrepreneurship Education students for participation in the Creator Economy, with mean scores ranging from 3.45 to 3.71, all exceeding the criterion mean of 2.50. The highest-rated competency was the ability to create engaging digital content for targeted audiences (M = 3.71, SD = 0.47), followed by the ability to monetise digital content, products and creative services (M = 3.69, SD = 0.49) and the ability to use social media platforms for digital marketing and audience development (M = 3.67, SD = 0.51). The lowest-rated competency was the ability to apply digital financial management practices to creative ventures (M = 3.45, SD = 0.68), although it was still clearly above the acceptance criterion. The grand mean of 3.61 demonstrates a strong overall perception that Digital Entrepreneurship competencies are required for Creator Economy participation, while the standard deviations ranging from 0.47 to 0.68 suggest relatively consistent responses. The results indicate that students need competencies that extend beyond content creation to include digital opportunity recognition, personal branding, market analysis, customer relationship management, digital marketing, monetisation and sustainable digital business model development.

Hypothesis 1: There is no significant difference in the mean ratings of respondents on the Artificial Intelligence competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State based on gender.

Table 3: Independent-Samples t-Test of Respondents' Mean Ratings on Artificial Intelligence Competencies Based on Gender

Gender	N	Mean	SD	df	t-value	Sig. (2-tailed)	Decision
Male	96	3.54	0.31	188	0.89	0.375	Not Significant
Female	94	3.58	0.30				
Overall	**190**	**3.56**	**0.31**				

Decision rule: Reject the null hypothesis where the significance value is less than 0.05; otherwise, retain the null hypothesis.

Analysis of Table 3: Table 3 shows that male respondents recorded a mean rating of 3.54 with a standard deviation of 0.31, while female respondents recorded a mean rating of 3.58 with a standard deviation of 0.30 on the Artificial Intelligence competencies required by Entrepreneurship Education students for participation in the Creator Economy. The independent-samples t-test produced a t-value of 0.89 at 188 degrees of freedom, with a significance value of 0.375. Since the significance value of 0.375 was greater than the stipulated 0.05 level of significance, the null hypothesis was not rejected. This indicates that there was no statistically significant difference between the mean ratings of male and female respondents regarding the Artificial Intelligence competencies required for participation in the Creator Economy. The very small difference between the group means also suggests that gender did not substantially alter respondents' perceptions of the importance of AI competencies. Therefore, competencies such as generative AI use, prompt formulation, AI-assisted content creation, evaluation of AI outputs, ethical AI use and AI-supported automation were generally regarded as necessary by respondents irrespective of gender.

Hypothesis Two: There is no significant difference in the mean ratings of respondents on the Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State based on location.

Table 4: One-Way ANOVA of Respondents' Mean Ratings on Digital Entrepreneurship Competencies Based on University Location

Source of Variation	Sum of Squares	df	Mean Square	F-value	Sig.	Decision
Between Groups	0.248	2	0.124	1.34	0.265	Not Significant
Within Groups	17.305	187	0.093			
Total	**17.553**	**189**				

Decision rule: Reject the null hypothesis where the significance value is less than 0.05; otherwise, retain the null hypothesis.

Analysis of Table 4: Table 4 shows that the one-way ANOVA yielded an F-value of 1.34 with 2 and 187 degrees of freedom, and a significance value of 0.265. Since the significance value of 0.265 was greater than the 0.05 level of significance, the null hypothesis was not rejected. This indicates that there was no statistically significant difference in the mean ratings of respondents from the different university locations regarding the Digital Entrepreneurship competencies required by Entrepreneurship Education students for participation in the Creator Economy. The finding suggests that respondents across the university locations generally held similar views about the importance of competencies such as digital opportunity recognition, digital content creation, digital marketing, personal branding, audience development, monetisation, customer relationship management and digital business-model development. The absence of a significant location-based difference further indicates that the identified Digital Entrepreneurship competencies could be regarded as broadly relevant across the participating universities in Delta State rather than being competencies required only in a particular university location.

Discussion of Findings

The study found that Artificial Intelligence competencies were required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State, particularly competencies relating to generative AI use, prompt formulation, AI-assisted content creation, evaluation of AI-generated information, ethical AI use, audience and trend analysis, task automation, and the integration of AI with human creativity. This finding indicates that effective participation in the Creator Economy requires students to move beyond basic awareness of AI tools towards practical, critical and responsible application of AI in creative and entrepreneurial activities. The finding agrees with Annapureddy et al. (2025), who identified understanding AI concepts, using generative AI tools, formulating effective prompts, evaluating AI outputs, and recognising ethical and legal issues as important components of generative AI literacy. The agreement suggests that the AI competencies identified by the present study reflect broader competency requirements associated with effective and responsible use of generative AI. The finding also supports Walter (2024), who emphasised the

increasing importance of AI literacy, prompt-engineering skills and critical-thinking abilities in higher education. The present finding extends this position into the specific context of the Creator Economy by showing that such competencies are not only relevant to general academic technology use but are required for content development, creative production, audience analysis and other creator-oriented entrepreneurial activities. The consistency of these findings is understandable because creators increasingly operate in environments where AI can accelerate ideation and production, while human judgement remains necessary for assessing accuracy, originality, relevance and ethical appropriateness. Therefore, the finding reinforces the need for Entrepreneurship Education programmes to develop students' capacity to use AI as a productive entrepreneurial resource rather than merely providing access to AI technologies.

The study also found that Digital Entrepreneurship competencies were required by Entrepreneurship Education students for participation in the Creator Economy in universities in Delta State, covering digital opportunity recognition, digital product and service development, personal branding, social media marketing, targeted content creation, market and audience analysis, monetisation, online customer relationship management, digital financial management and sustainable digital business-model development. This finding demonstrates that participation in the Creator Economy requires more than the technical ability to operate digital platforms; students need entrepreneurial competencies that enable them to identify opportunities, create value, develop audiences and convert creative activities into sustainable economic ventures. The finding agrees with Simovic et al. (2023), who identified opportunity identification, information search and analysis, creativity, innovation and prospecting as important dimensions of digital entrepreneurial competence among university students. The present finding extends these competencies by demonstrating their practical relevance to creator-oriented activities such as personal branding, digital marketing, content creation and monetisation. It also agrees with Bachmann et al. (2023), who established the importance of digital competencies in students' entrepreneurial development and intentions. The present study provides a more specific application of this position by showing that digital competencies are required not simply for developing entrepreneurial intentions but for managing the practical activities through which creators establish digital ventures, engage audiences and generate economic value. The similarity may be explained by the fact that both conventional digital entrepreneurship and the Creator Economy depend on the ability to recognise opportunities and exploit digital technologies for value creation. However, the present finding further demonstrates that Creator Economy participation requires an expanded competency profile in which entrepreneurial skills are applied directly to content, audiences, personal brands, digital communities and multiple monetisation pathways.

Conclusion

The study concluded that Artificial Intelligence and Digital Entrepreneurship competencies were essential for Entrepreneurship Education students to participate effectively in the Creator Economy in universities in Delta State. Students required competencies in generative AI use, prompt formulation, content creation, AI-output evaluation, ethical AI use, digital opportunity recognition, digital marketing, personal branding, audience development, monetisation and digital venture management. The findings further showed that these competencies were broadly required irrespective of gender and university location. The study therefore concluded that Entrepreneurship Education programmes should incorporate practical AI and Digital Entrepreneurship competencies to enable students to transform creativity and technology into sustainable digital entrepreneurial opportunities.

Recommendations

The following recommendations were made based on the findings of the study:

1. Entrepreneurship Education lecturers in universities in Delta State should integrate practical Artificial Intelligence training into entrepreneurship courses, with emphasis on generative AI, prompt formulation, AI-assisted content creation, evaluation of AI outputs, ethical AI use and the application of AI alongside human creativity, so that students can acquire the competencies required for effective participation in the Creator Economy.
2. University entrepreneurship education programmes should provide practical Digital Entrepreneurship training that enables students to identify digital opportunities, create targeted content, build personal brands, market through digital platforms, develop audiences, monetise creative outputs and manage sustainable digital ventures, thereby strengthening students' capacity to convert creative activities into viable entrepreneurial opportunities.

INFLUENCE OF ARTIFICIAL INTELLIGENCE LITERACY ON EMPLOYABILITY SKILLS AMONG BUSINESS EDUCATION (ACCOUNTING) STUDENTS IN OGUN STATE

N. A. Ishola

Abstract

Artificial Intelligence (AI) literacy has emerged as a critical competency in the digital age due to the increasing integration of AI technologies into education and industry. This study examined the influence of artificial intelligence literacy on employability skills among business education (accounting) students in Ogun state. The study was guided by five research questions and three hypotheses. A descriptive research survey design was used for the study. The population of the study comprise all 300l and 400l business education (accounting) students from Olabisi Onabanjo University, Ago Iwoye and Tai Solarin University of Education, Ijagun, comprising 507 students. The sample size is 224 students using Taro Yamane's formula. Data were collected using a structured questionnaire developed by the researcher titled 'Artificial Intelligence Literacy and Employability Skills Questionnaire (AILESQ)' and analyzed using mean and standard deviation. The null hypotheses were tested using simple linear regression analysis. Findings revealed that Artificial Intelligence literacy has a high influence on employability skills; and that AI literacy is a vital competency that enhances workplace readiness among Business Education (Accounting) students and prepares them for employment in technology-driven business environments. Based on the findings, it was recommended that University management should provide adequate AI-related learning facilities and digital infrastructure, including computer laboratories, internet access, AI software applications, and digital accounting tools, to enhance students' exposure to emerging technologies. Universities should establish collaborations with industries, professional accounting bodies, and technology organizations to provide students with practical exposure to AI applications in real-world business and accounting settings.

Keywords: Artificial Intelligence, literacy, Employability skills, Business Education.

Introduction

The contemporary world is experiencing rapid technological transformation driven by the Fourth Industrial Revolution (4IR), which is characterized by the integration of emerging technologies such as Artificial Intelligence (AI), big data analytics, cloud computing, machine learning, robotics, and the Internet of Things (IoT). Among these technologies, Artificial Intelligence has gained significant attention due to its ability to simulate human intelligence and perform tasks such as learning, reasoning, problem-solving, decision-making, and data analysis with minimal human intervention. According to Dwivedi et al. (2023), AI has become a disruptive technology that is transforming educational systems, business operations, and labor markets globally. Consequently, there is an increasing need for individuals, especially students in higher education institutions, to develop competencies that will enable them to function effectively in AI-driven environments.

For Business Education (Accounting) students, AI literacy has become increasingly important because future accounting workplaces will require employees who can interact effectively with intelligent systems. Students who possess AI literacy are likely to understand how AI technologies can be applied to accounting tasks, evaluate AI-generated outputs, and utilize AI tools for problem-solving and decision-making. Such competencies are becoming essential for workplace success in the accounting profession (AICPA & CIMA, 2024). Lack of AI competency not only limits students' ability to meet employers' expectations but also affects their confidence and career opportunities.

The acquisition of AI literacy is closely linked to employability skills. Employability skills refer to the transferable knowledge, competencies, attitudes, and personal attributes that enhance an individual's ability to obtain, retain, and progress in employment. According to Succi and Canovi (2024), employability skills encompass critical thinking, communication, problem-solving, teamwork, adaptability, creativity, digital competence, and lifelong learning abilities. These skills are increasingly important because employers seek graduates who can adapt to technological changes and contribute effectively to organizational goals.

In recent years, concerns have been raised regarding the employability of graduates in Nigeria. Employers frequently report that many graduates possess academic qualifications but lack the practical and technological competencies required in modern workplaces. This challenge is particularly evident in professions that have experienced rapid technological advancement, such as accounting and finance. The mismatch between graduates' skills and labor market expectations has heightened the need for educational institutions to strengthen technology-oriented competencies among students (Aina & Adedoyin, 2024).

In Ogun State, Business Education programmes are offered in several tertiary institutions, including universities and colleges of education. These institutions are expected to prepare students for careers in business and accounting by equipping them with relevant knowledge and practical skills. Ogun State is recognized as one of Nigeria's educational and industrial hubs, hosting numerous business organizations, financial institutions, and manufacturing firms that increasingly utilize digital technologies in their operations. Consequently, graduates from Business Education (Accounting) programmes in the state are expected to possess competencies that align with the technological demands of contemporary workplaces (Ojo & Akinyemi, 2024).

Despite the growing relevance of AI in business and accounting practices, there is limited empirical evidence regarding the extent to which Business Education (Accounting) students in Ogun State possess AI literacy and how such literacy influences their employability skills. This gap in knowledge necessitate this study to investigate the influence of Artificial Intelligence literacy on employability skills among Business Education (Accounting) students in Ogun State.

Statement of the Problem

The rapid adoption of Artificial Intelligence technologies in accounting and business operations has altered the skill requirements of employers. Many organizations now seek graduates who possess both accounting expertise and digital competencies. However, some Business Education (Accounting) students may have limited exposure to AI technologies, which could affect the development of employability skills such as problem-solving, critical thinking, communication, collaboration, adaptability, and digital competence.

This development would likely leave most business education (accounting) students unemployed. Unfortunately, Businesses education Curriculum lacks the integration of AI competency and its application in the content and delivery. However, if this continues, many business education (accounting) students may be unprepared for the demands of the modern workplace where AI competency are increasingly essential. Without proper AI competency, graduates may find it difficult to compete for jobs that require AI literacy, data analytics literacy, ethical reasoning, workflow automation and decision intelligence which may lead to high unemployment among Business Education (accounting) students. Lack of AI competency not only limits students' ability to meet employers' expectations but also affects their confidence and career opportunities.

Despite the growing importance of AI literacy, there is limited empirical evidence on its influence on the employability skills of Business Education (Accounting) students in Ogun State. This study therefore seeks to investigate the extent to which AI literacy influences employability skills among Business Education (Accounting) students in Ogun State.

Research Questions

The following research questions guided the study

1. What is the influence of AI literacy on problem-solving skills among Business Education (Accounting) students?
2. What is the influence of AI literacy on communication skills among Business Education (Accounting) students?
3. What is the influence of AI literacy on critical thinking skills among Business Education (Accounting) students?
4. What is the influence of AI literacy on digital competence among Business Education (Accounting) students?
5. What is the influence of AI literacy on adaptability and lifelong learning skills among Business Education (Accounting) students?

Research Hypotheses

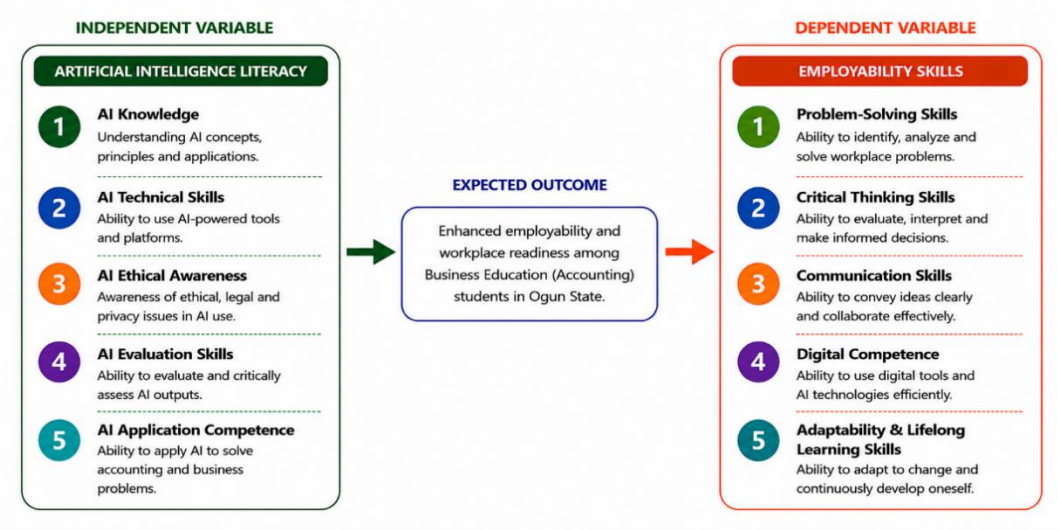
The following hypotheses were formulated for the study:

H_{01}: Artificial Intelligence literacy has no significant influence on problem-solving and communication skills among Business Education (Accounting) students in Ogun State.

H_{02}: Artificial Intelligence literacy has no significant influence on critical thinking skills and digital competence among Business Education (Accounting) students in Ogun State.

H_{03}: Artificial Intelligence literacy has no significant influence on adaptability and lifelong learning skills among Business Education (Accounting) students in Ogun State.

Literature Review



Theoretical Framework

The following theories guided the study:

Human Capital Theory: The theory was developed by Schultz (1961) and further expanded by Becker (1964). Human Capital Theory posits that education, training, and skills acquisition are investments that enhance individuals' productivity and employability. AI literacy represents a valuable form of human capital that equips Business Education (Accounting) students with competencies needed in modern workplaces. Students who acquire AI literacy are likely to possess stronger employability skills and better employment opportunities.

Social Cognitive Theory: Bandura (1986) propounded the social cognitive theory. The main assumption is that learning occurs through observation, interaction, and experience. Business Education students can develop AI literacy through exposure to AI tools, practical experiences, and classroom interactions. These experiences contribute to the development of employability skills.

Conceptual Framework

Source: Researcher, 2026.

Figure 1: Influence of Artificial Intelligence Literacy on Employability Skills among Business Education (Accounting) Students in Ogun State.

The framework assumes that increased AI literacy among Business Education (Accounting) students enhances their employability skills. As students gain knowledge and competence in AI technologies, they become more capable of solving problems, thinking critically, communicating effectively, utilizing digital tools, and adapting to changing workplace demands.

Artificial Intelligence Literacy

AI literacy refers to the knowledge, skills, competencies, and attitudes required to understand, evaluate, utilize, and interact effectively with AI systems and technologies. According to Long and Magerko (2020), AI literacy consists of competencies that enable individuals to critically assess AI technologies, communicate effectively with AI systems, and make informed decisions regarding their use. Artificial Intelligence literacy extends beyond mere technical knowledge to include an understanding of AI applications, ethical implications, limitations, and societal impacts. Ng et al. (2021) described AI literacy as the ability to understand AI concepts, evaluate AI outputs, recognize AI limitations, and apply AI tools responsibly in solving real-life problems.

In educational settings, AI literacy equips students with the skills required to navigate an increasingly technology-driven workplace. UNESCO (2021) emphasized that AI literacy has become essential for preparing learners to participate meaningfully in the digital economy. Students with adequate For Business Education (Accounting) students, AI literacy is particularly important because the accounting profession is undergoing rapid technological transformation. Traditional accounting functions such as bookkeeping, auditing, payroll processing, taxation, budgeting, and financial reporting are increasingly supported by AI-powered software and automation systems. Consequently, accounting graduates who possess AI literacy are more likely to remain relevant and competitive in the labor market.

Digital accounting skills encompass a wide range of competencies. These include proficiency in computerized accounting packages such as Sage, QuickBooks, etc.; familiarity with enterprise resource planning (ERP) systems; spreadsheet modelling for decision-making; data visualization for client reporting; Power BI for data modelling and connectivity, financial data analysis for budgeting and forecating, and cybersecurity awareness to ensure the integrity of financial data (Ishola, 2025).

AI knowledge involves an individual awareness of machine learning, natural language processing, intelligent systems, predictive analytics, and automation technologies. Long and Magerko (2020) argued that AI knowledge enables individuals to understand how AI systems function and make informed decisions regarding their use. AI technical skills involve the practical ability to use AI-powered tools and applications. Such skills include operating AI software, using intelligent accounting systems, employing chatbots, generating AI-assisted reports, and utilizing machine learning applications.

Ethical awareness involves understanding the ethical, legal, and social implications of AI technologies. AI systems often raise concerns relating to privacy, bias, accountability, transparency, and data security. UNESCO (2021) stressed the importance of ethical awareness in promoting responsible AI use among learners and professionals. AI evaluation skills refer to the ability to critically assess AI-generated information and determine its accuracy, reliability, and appropriateness. Since AI systems may produce inaccurate or biased outputs, users must be capable of evaluating AI-generated content before relying on it for decision-making (Long & Magerko, 2020). Application competence refers to the ability to apply AI technologies in solving practical and professional problems. For accounting students, this includes using AI tools for financial analysis, forecasting, auditing, and decision-making processes.

Employability Skills

Employability skills are the transferable skills, knowledge, competencies, and personal attributes that enable graduates to obtain employment, maintain employment, and succeed in their chosen careers. The concept of employability has evolved significantly due to technological advancements and changing labor market requirements. Employers no longer focus solely on academic qualifications but also seek graduates who possess critical thinking, communication, digital literacy, adaptability, teamwork, and problem-solving skills (World Economic Forum, 2023). In the context of Business Education (Accounting), employability skills are crucial because accounting professionals operate in dynamic environments characterized by continuous technological innovation and changing business practices.

Problem-solving skills refer to the ability to identify challenges, analyze situations, generate alternatives, and implement effective solutions. OECD (2021) noted that AI technologies enhance analytical capabilities and facilitate evidence-based problem-solving. Critical thinking involves objective analysis, logical reasoning, evaluation of evidence, and informed decision-making. It enables individuals to assess information critically rather than accepting it at face value. AI literacy promotes critical thinking because users must evaluate AI-generated outputs, identify biases, verify information sources, and interpret results appropriately. Long and Magerko (2020) emphasized that critical evaluation is an essential component of AI literacy.

Communication skills encompass the ability to express ideas clearly and effectively through oral, written, and digital channels. Effective communication remains a highly valued employability skill across industries. AI-powered communication tools, collaborative platforms, and intelligent writing assistants support the development of communication skills by enhancing information sharing, report preparation, and professional correspondence. Digital competence refers to the confident, critical, and responsible use of digital technologies for learning, work, and participation in society (European Commission, 2022). AI literacy forms an important aspect of digital competence because AI technologies are increasingly embedded within modern digital systems. Students who possess AI literacy are more likely to demonstrate advanced digital capabilities required in contemporary workplaces.

Adaptability refers to the ability to adjust to new situations, technologies, and workplace demands. Lifelong learning involves continuous acquisition of knowledge and skills throughout one's career. The rapidly evolving nature of AI technologies necessitates continuous learning and adaptation. UNESCO (2021) argued that AI literacy encourages individuals to engage in lifelong learning to remain relevant in changing work environments.

Artificial Intelligence Literacy and Employability Skills among Accounting Students

The relationship between AI literacy and employability skills has attracted increasing scholarly attention. Researchers argue that AI literacy serves as a catalyst for developing workplace competencies required in the Fourth Industrial Revolution.

Many studies have been conducted on AI literacy and employability skills. For instance, Aina and Adedoyin (2024) investigated graduate employability and digital skills development among Nigerian university students. Using a descriptive survey design, the researchers found that students with higher levels of digital competence demonstrated better employability prospects than those with lower levels of digital competence. The study further revealed that technological skills significantly influence workplace readiness among graduates. However, the researchers focused on digital literacy generally and did not specifically examine AI literacy.

Similarly, Ojo and Akinyemi (2024) investigated digital literacy and employability skills among undergraduate students in Nigerian tertiary institutions. The findings revealed that digital literacy significantly predicted employability skills such as communication, critical thinking, and adaptability. The study concluded that digital competence remains an important factor in graduate employability. However, the study focused on digital literacy rather than AI literacy.

In another study, Eze, Okeke, and Nwafor (2024) examined technology adoption and workforce readiness among university students in Nigeria. The study found that exposure to emerging technologies improved students' confidence, adaptability, and readiness for employment. The researchers emphasized the need for educational institutions to expose students to AI and other digital technologies. Nevertheless, the study did not specifically investigate Business Education (Accounting) students.

Chiu, Meng, and Chai (2024) conducted a systematic review of studies on AI literacy in higher education. Their findings revealed that AI literacy positively influences students' readiness for technology-driven workplaces by improving their analytical thinking, decision-making, and digital competencies. The study further established that students who possess AI literacy are more confident in utilizing emerging technologies to solve academic and professional problems. However, the review focused on general higher education students and did not specifically examine accounting students in Nigeria.

In the area of employability skills, Succi and Canovi (2024) examined the skills employers consider essential for graduate employability. Their findings indicated that critical thinking, communication, adaptability, digital competence, and problem-solving skills were among the most valued competencies in contemporary workplaces. The study emphasized the need for higher education institutions to integrate emerging technologies into teaching and learning to enhance students' employability. However, the study did not investigate the role of AI literacy in developing these skills.

Adeyemi and Ogunleye (2023) examined the relationship between technology competence and employability among business education students in South-West Nigeria. The study found that students who possessed higher levels of technology competence demonstrated stronger communication skills, problem-solving abilities, and workplace readiness. The researchers recommended increased integration of emerging technologies into Business Education programmes. Although the study provided useful insights, it did not specifically address Artificial Intelligence literacy.

Dwivedi et al. (2023) explored the opportunities and challenges associated with the use of generative AI technologies in education and professional practice. The study revealed that AI technologies enhance productivity, creativity, and problem-solving skills among users. The researchers argued that AI literacy has become increasingly important for graduates seeking employment in technology-driven workplaces. However, the study focused on the general implications of AI and did not specifically address Business Education or accounting students. Although previous studies have established the importance of AI literacy and employability skills, there is limited empirical evidence on the influence of AI literacy on the employability skills of Business Education (Accounting) students in Ogun State, Nigeria**.** Specifically, little is known about how AI knowledge, technical skills, ethical awareness, evaluation skills, and application competence influence problem-solving, critical thinking, communication, digital competence, and adaptability skills among these students. Therefore, this study sought to fill this identified gap in the literature.

Methodology

A descriptive survey research design was used in the study. The design is suitable for determining the extent to which AI literacy influences employability skills among the respondents without manipulating any variable. The population of the study comprised all 300L and 400L business education (accounting) students from the two Universities, 444 students from Tai Solarin University of Education, Ijagun and 63 students from Olabisi Onabanjo University, Ago-Iwoye, making a total population of 507 students. Taro Yamane (1967) formula was used to arrive at the sample size that participated in the study. A representative sample was selected using a multi-stage sampling technique, involving purposive selection of universities and proportionate stratified random sampling of students from each

institution. The Sample size was 224 students. Purposive sampling technique was used to select OOU and TASUED from the three Universities offering business education in Ogun State. An instrument titled 'Artificial Intelligence Literacy and Employability Skills Questionnaire (AILESQ)' developed by the researcher was used for data collection in this study. AILESQ is a questionnaire structured in closed ended format and divided into three sections: Section A, B and C. Section A consists of Demographic data while section B and C consist of fifteen items each, AI literacy and Employability skills respectively. The thirty-item questionnaire was placed on four points rating scale with weights of Strongly Agreed (4) Agreed (3) Disagreed (2) and Strongly Disagreed (1). The respondents comprised 28 students from Olabisi Onabanjo University (OOU), Ago-Iwoye, and 196 students from Tai Solarin University of Education (TASUED), Ijagun. The distribution was based on proportionate stratified random sampling. Data were analyzed using Mean and Standard Deviation to answer the research questions, while Simple Linear Regression Analysis was used to test the hypotheses at 0.05 level of significance.

Results

Table 1: Summary of Research Questions on the Influence of Artificial Intelligence Literacy on Employability Skills among Business Education (Accounting) Students in OOU and TASUED (N = 224)

S/N	Research Question	Grand Mean	SD	Decision	Remark
1	Influence of AI Literacy on Problem-Solving Skills	3.46	0.64	Accepted	High Influence
2	Influence of AI Literacy on Communication Skills	3.37	0.67	Accepted	High Influence
3	Influence of AI Literacy on Critical Thinking Skills	3.48	0.62	Accepted	High Influence
4	Influence of AI Literacy on Digital Competence	3.52	0.60	Accepted	Very High Influence
5	Influence of AI Literacy on Adaptability and Lifelong Learning Skills	3.49	0.60	Accepted	High Influence
	Overall Grand Mean	**3.46**	**0.63**	**Accepted**	**High Influence**

Decision Rule: Mean score of 2.50 and above = Accepted; Mean score below 2.50 = Rejected.

Table 1 presents a summary of the findings on the influence of Artificial Intelligence (AI) literacy on various dimensions of employability skills among the 224 Business Education (Accounting) students drawn from Olabisi Onabanjo University (OOU), Ago-Iwoye, and Tai Solarin University of Education (TASUED), Ijagun.

The overall grand mean of 3.46 with a standard deviation of 0.63 indicates that respondents generally agreed that Artificial Intelligence literacy has a high influence on employability skills. The relatively low standard deviation further suggests that the responses of students from both OOU and TASUED were closely clustered around the mean, indicating consistency in their perceptions.

H_{01}: Artificial Intelligence literacy has no significant influence on problem-solving and communication skills among Business Education (Accounting) students.

Table 2: Regression Analysis

Variable	B	Beta	t	p-value
AI Literacy	0.672	0.641	12.584	0.000
R	**R^2**	**Adjusted R^2**	**F**	**Sig.**
0.641	0.411	0.408	158.36	0.000

Since $p < 0.05$, reject H_{01}.

AI literacy significantly influences problem-solving and communication skills among Business Education (Accounting) students. AI literacy accounted for 41.1% of the variation in these employability skills.

H_{02}: Artificial Intelligence literacy has no significant influence on critical thinking skills and digital competence.

Table 3: Regression Analysis

Variable	B	Beta	T	p-value
AI Literacy	0.714	0.687	14.972	0.000
R	**R^2**	**Adjusted R^2**	**F**	**Sig.**
0.687	0.472	0.469	224.16	0.000

Since $p < 0.05$, reject H_{02}.
AI literacy significantly predicts critical thinking skills and digital competence. Approximately 47.2% of the variance in these skills is explained by AI literacy.

H_{03}: Artificial Intelligence literacy has no significant influence on adaptability and lifelong learning skills.

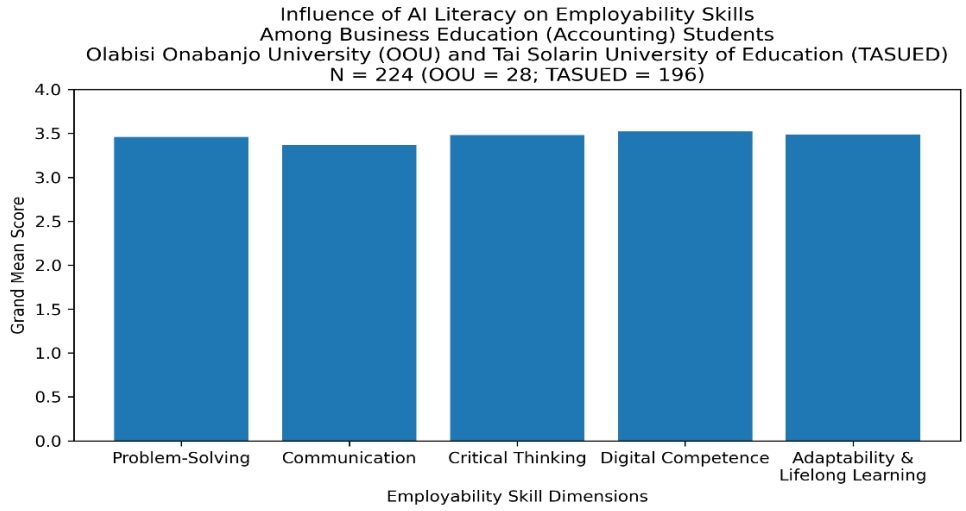


Table 4: Regression Analysis

Variable	B	Beta	T	p-value
AI Literacy	0.694	0.658	13.442	0.000
R	R^2	Adjusted R^2	F	Sig.
0.658	0.433	0.431	180.69	0.000

Since $p < 0.05$, reject H_{03}.

AI literacy significantly influences adaptability and lifelong learning skills among Business Education (Accounting) students.

Figure 2: Influence of AI Literacy on Employability Skills of Business Education Students

Interpretation of Results

The findings from table 1, demonstrate that Artificial Intelligence literacy positively influences all the employability skill dimensions examined in the study. However, its greatest influence was observed in digital competence (Mean = 3.52), followed by adaptability and lifelong learning skills (Mean = 3.49), critical thinking skills (Mean = 3.48), problem-solving skills (Mean = 3.46), and communication skills (Mean = 3.37). This suggests that AI literacy is a vital competency that enhances workplace readiness among Business Education (Accounting) students in Olabisi Onabanjo University (OOU) and Tai Solarin University of Education (TASUED) and prepares them for employment in technology-driven business environments.

The regression analysis produced a correlation coefficient (R = 0.641) indicating a moderate positive relationship between Artificial Intelligence literacy and problem-solving and communication skills among Business Education (Accounting) students of Olabisi Onabanjo University (OOU) and Tai Solarin University of Education (TASUED). The coefficient of determination (R^2 = 0.411) revealed that Artificial Intelligence literacy accounted for approximately 41.1% of the variation in students' problem-solving and communication skills. The calculated F-value of 158.36 with a significance value of 0.000, which is less than the 0.05 level of significance, indicates that the regression model was statistically significant. Therefore, the null hypothesis 1 was rejected. This implies that Artificial Intelligence literacy significantly influences the development of problem-solving and communication skills among Business Education (Accounting) students in OOU and TASUED. Students who possess higher levels of AI literacy tend to demonstrate better problem-solving abilities and communication competencies.

The regression results also showed a correlation coefficient (R = 0.687), indicating a strong positive relationship between Artificial Intelligence literacy and critical thinking skills as well as digital competence among Business Education (Accounting) students in OOU and TASUED. The coefficient of determination (R^2 = 0.472) showed that Artificial Intelligence literacy explained 47.2% of the variation in students' critical thinking skills and digital competence. The calculated F-value of 224.16 and significance level of 0.000 were statistically significant at the 0.05 level. Consequently, the null hypothesis 2 was rejected. This result implies that Artificial Intelligence literacy significantly predicts students' ability to think critically and utilize digital technologies effectively. Students who possess higher AI literacy levels are more likely to evaluate information critically, operate digital tools efficiently, and demonstrate technological competence required in modern workplaces.

Lastly, the regression analysis yielded a correlation coefficient (R = 0.658), indicating a strong positive relationship between Artificial Intelligence literacy and adaptability and lifelong learning skills among students of OOU and TASUED. The coefficient of determination (R^2 = 0.433) indicated that Artificial Intelligence literacy accounted for approximately 43.3% of the variation in adaptability and lifelong learning skills among the respondents. The calculated F-value of 180.69 and significance level of 0.000 demonstrated that the relationship was statistically significant at the 0.05 level. As a result, the null hypothesis 3 was rejected. This finding implies that Artificial Intelligence literacy significantly enhances students' ability to adapt to technological changes and engage in continuous learning. Students who possess higher AI literacy levels are more likely to embrace innovation, acquire new skills, and remain relevant in an evolving workplace environment.

Finally, the study established that Artificial Intelligence literacy significantly influences employability skills among Business Education (Accounting) students of Olabisi Onabanjo University (OOU), Ago-Iwoye, and Tai Solarin University of Education (TASUED), Ijagun. The regression results further confirmed that Artificial Intelligence literacy is a significant predictor of employability skills among Business Education (Accounting) students in both universities, indicating that increased AI literacy is associated with improved workplace readiness and employability outcomes.

Discussion

The study investigated the influence of Artificial Intelligence (AI) literacy on employability skills among Business Education (Accounting) students of Olabisi Onabanjo University (OOU), Ago-Iwoye, and Tai Solarin University of Education (TASUED), Ijagun, Ogun State. The study found that Artificial Intelligence literacy has a high influence on problem-solving skills among Business Education (Accounting) students in OOU and TASUED. The respondents agreed that AI literacy helps them solve academic and workplace-related problems, analyze accounting issues, and improve decision-making abilities. This suggests that students who possess AI knowledge and competencies are better equipped to identify, analyze, and solve complex problems in academic and professional settings. This finding is in agreement with the study of Aina and Adedoyin (2024), who reported that technological competence significantly enhances workplace readiness and problem-solving abilities among Nigerian university students. The finding also supports the work of Eze, Okeke, and Nwafor (2024), who found that exposure to emerging technologies improves students' confidence and capacity to solve workplace-related challenges. The agreement between the present study and previous studies suggests that AI literacy serves as a valuable tool for developing analytical and problem-solving competencies required in contemporary workplaces.

More so, the study revealed that Artificial Intelligence literacy positively influences communication skills among Business Education (Accounting) students in OOU and TASUED. The respondents indicated that AI literacy enhances written communication, improves presentation abilities, and facilitates effective use of digital communication platforms. This finding corroborates the study of Ojo and Akinyemi (2024), who found that digital literacy significantly predicts communication skills among undergraduate students in Nigerian tertiary institutions. The finding is also consistent with

Adeyemi and Ogunleye (2023), who reported that technology competence contributes significantly to the development of communication skills among Business Education students in South-West Nigeria. The similarity in findings may be attributed to the fact that AI-powered tools such as intelligent writing assistants, collaborative platforms, and presentation software enable students to communicate more effectively and professionally.

However, the findings also showed that Artificial Intelligence literacy has a high influence on critical thinking skills among Business Education (Accounting) students in OOU and TASUED. The students agreed that AI literacy improves their ability to evaluate information critically, verify AI-generated outputs, and engage in analytical reasoning before making decisions. This finding agrees with the study of Chiu, Meng, and Chai (2024), who found that AI literacy enhances analytical thinking, decision-making, and critical evaluation skills among higher education students. The result is also consistent with Ojo and Akinyemi (2024), who reported that digital literacy significantly contributes to the development of critical thinking skills among university students. The agreement may be explained by the fact that AI systems often require users to evaluate information, identify inaccuracies, and make informed judgments, thereby strengthening critical thinking abilities.

The study found that Artificial Intelligence literacy has a very high influence on digital competence among Business Education (Accounting) students in OOU and TASUED. The respondents indicated that AI literacy improves their confidence in using digital technologies, operating accounting software, and learning new technological tools. This finding is in line with the study of Aina and Adedoyin (2024), who found that students with higher levels of digital competence exhibit better employability prospects and workplace readiness. Furthermore, the result supports the findings of Kong, Cheung, and Zhang (2024), who established a significant relationship between AI literacy and digital competence among university students. The agreement suggests that AI literacy is an important component of digital competence and contributes significantly to students' preparedness for technology-driven workplaces.

The study further revealed that Artificial Intelligence literacy has a high influence on adaptability and lifelong learning skills among Business Education (Accounting) students in OOU and TASUED. The students agreed that AI literacy motivates them to adapt to new technologies and continuously seek opportunities to acquire new digital skills. This finding supports the study of Eze, Okeke, and Nwafor (2024), who found that exposure to emerging technologies enhances students' adaptability and readiness for future employment. Similarly, Ojo and Akinyemi (2024) found that digital literacy significantly predicts adaptability among university students. The agreement may be attributed to the rapidly changing nature of AI technologies, which encourages students to continuously update their knowledge and skills to remain relevant in the labour market.

The regression analysis revealed that Artificial Intelligence literacy significantly influences employability skills among Business Education (Accounting) students in OOU and TASUED. Specifically, AI literacy significantly influenced problem-solving and communication skills, critical thinking skills and digital competence, as well as adaptability and lifelong learning skills. Consequently, all three null hypotheses were rejected. The findings are consistent with Adeyemi and Ogunleye (2023), who found that technology competence significantly predicts employability outcomes among Business Education students in South-West Nigeria. The findings also agree with Aina and Adedoyin (2024), who established that technological competencies contribute significantly to workplace readiness and graduate employability.

Overall, the findings demonstrate that Artificial Intelligence literacy is a critical determinant of employability skills among Business Education (Accounting) students in Olabisi Onabanjo University (OOU) and Tai Solarin University of Education (TASUED). The results reinforce the Human Capital Theory, which posits that investment in knowledge and skills acquisition enhances individuals' productivity and employability.

Conclusion

Based on the findings of this study, it was concluded that Artificial Intelligence (AI) literacy significantly influences employability skills among Business Education (Accounting) students in Olabisi Onabanjo University (OOU), Ago-Iwoye, and Tai Solarin University of Education (TASUED), Ijagun, Ogun State. The study established that students who possess higher levels of AI literacy demonstrate stronger employability skills required in contemporary workplaces.

The study therefore concludes that AI literacy has become an indispensable competency for students preparing for careers in accounting and business-related professions. As organizations increasingly adopt AI-driven technologies in their operations, graduates who possess AI knowledge, technical skills, ethical awareness, evaluation skills, and application competence are more likely to be employable, productive, and competitive in the labour market. Consequently, the integration of AI

literacy into Business Education programmes is essential for preparing students to meet the technological demands of the twenty-first-century workplace.

Recommendations

1. Business Education departments in Olabisi Onabanjo University (OOU) and Tai Solarin University of Education (TASUED) should integrate Artificial Intelligence literacy into their curriculum. This will enable students to acquire relevant AI knowledge and competencies required for modern accounting and business practices.
2. University management should provide adequate AI-related learning facilities and digital infrastructure, including computer laboratories, internet access, AI software applications, and digital accounting tools, to enhance students' exposure to emerging technologies.
3. Regular workshops, seminars, and training programmes on Artificial Intelligence should be organized for students and lecturers to increase awareness and practical understanding of AI technologies and their applications in accounting and business environments.
4. Universities should establish collaborations with industries, professional accounting bodies, and technology organizations to provide students with practical exposure to AI applications in real-world business and accounting settings.
5. Government and educational regulatory agencies such as the National Universities Commission (NUC) should review and update Business Education curricula to include AI literacy, digital accounting technologies, data analytics, and other emerging technological competencies required in the labour market.

Limitation and Suggestions for Further Studies

1. The study focused only on two universities in Ogun State, findings may not generalize other tertiary institutions in Nigeria.
2. Future studies should be conducted in other universities, colleges of education, and polytechnics across different states in Nigeria to determine whether the findings can be generalized beyond Olabisi Onabanjo University (OOU) and Tai Solarin University of Education (TASUED).
3. Researchers should investigate the influence of Artificial Intelligence literacy on employability skills among students in other disciplines, such as Accounting, Business Administration, Economics, Computer Science, Engineering, and the Social Sciences.
4. A comparative study should be conducted between public and private universities to determine possible differences in the level of AI literacy and employability skills among undergraduate students.

ARTIFICIAL INTELLIGENCE ADOPTION AND ACCOUNTING COMPETENCY DEVELOPMENT AMONG BUSINESS EDUCATION STUDENTS IN RIVERS STATE UNIVERSITIES

THOMAS Bariere, PhD
Department of Business Education,
Rivers State University,
Nkpolu-Oroworukwo, Port Harcourt,
Rivers State, Nigeria
Corresponding Author: bariere.thomas@rsu.edu.ng
+2348033413567, 08055325244

Abstract
This correlational research study examined the relationship between artificial intelligence (AI) adoption and accounting competency development among Business Education students in Rivers State universities. The population comprised all 209 300 and 400-levels Business Education students (Accounting Option) from Rivers State University (98) and Ignatius Ajuru University of Education (111) who had been exposed to AI-supported learning technologies; therefore, no sampling technique was employed. Data were collected using a researcher-developed instrument titled Artificial Intelligence Adoption and Accounting Competency Questionnaire (AIAACQ), which was validated by experts and found to be reliable. Pearson Product Moment Correlation (PPMC) was used to answer the research questions and test the hypotheses at the 0.05 level of significance. The findings revealed strong positive and statistically significant relationships between AI learning platforms and financial reporting competency, and among other findings. Conclusion was drawn and it was recommended among others that universities integrate AI learning platforms and intelligent tutoring systems into Business Education curricula.
Keywords: Artificial Intelligence Adoption, AI Learning Platforms, Intelligent Tutoring Systems, Financial Reporting Competency, Data Analysis Competency, Business Education Students, Accounting Competency Development

Introduction
Accounting competency has been defined by scholars in various ways. According to Chaffer, and Webb (2017), describe it as the integrated combination of knowledge, skills, and professional judgement that enables an individual to record, classify, summarize, analyse, and communicate financial information accurately for decision-making purposes. In a related view, Albu, Albu, Faff and Hodgson (2011) conceptualize accounting competency as a measurable capability encompassing technical proficiency (such as bookkeeping, financial reporting, and data interpretation) and behavioural attributes (such as ethical judgement, attention to detail, and analytical reasoning) that together determine an individual's readiness for accounting-related tasks in real-world settings. Similarly, Nzewi, Onwuka and Bupo (2018) views accounting competency development as a progressive, skill-building process through which learners move from basic understanding of accounting principles to the ability to apply advanced financial analysis and reporting techniques in dynamic organisational contexts.

From the researcher's perspective, these definitions converge on one central idea: accounting competency is not a static possession but a developmental process; one that is built over time through exposure, practice, and increasingly sophisticated tools of learning. It is both a product (the demonstrated ability to perform accounting tasks) and a process (the ongoing growth in that ability). For business education students in particular, accounting competency development represents the extent to which classroom instruction increasingly mediated by technology and translates into practical, employable financial skills. This positions accounting competency not merely as an academic outcome but as a functional bridge between theoretical instruction and workplace readiness, which is precisely why the tools used to develop it (including AI-based learning tools) matter a great deal.

Accounting competency development among business education students has continued to attract scholarly attention because of the widening gap between what is taught in classrooms and what is demanded in modern accounting practice. Traditionally, competency development in accounting education has relied on manual bookkeeping exercises, case-study analysis, and instructor-led

demonstrations of financial procedures. However, the rapid computerization of accounting functions in organisations has shifted the competency benchmark: students are now expected not only to understand accounting principles but also to demonstrate proficiency in digital tools used for financial reporting, auditing, and data analytics. Thomas (2026) reports that a significant proportion of accounting and business education graduates struggle to transition smoothly into practice because their training emphasized manual procedures rather than the technology-driven processes now standard in the profession. In the same vein, Abbasi (2013) notes that institutions that have integrated technology-assisted instruction into their accounting curricula report improved learner performance in financial analysis and reporting tasks compared to those relying solely on conventional methods. Owenvbiugie and Ojeaga (2022) further observes that competency gaps in business education are increasingly linked not to a lack of content knowledge but to insufficient exposure to the digital and intelligent systems that now dominate accounting practice. These reports collectively suggest that the pathway to closing the competency gap lies substantially in how learning is delivered; a consideration that brings artificial intelligence adoption into sharp focus.

Artificial Intelligence (AI) adoption refers to the process by which individuals, organizations, or institutions accept, integrate, and utilize AI technologies to improve the efficiency, effectiveness, and quality of their activities. It encompasses the willingness to embrace AI-powered tools, the implementation of AI systems into existing processes, and the continuous use of these technologies to achieve organizational or educational objectives. AI adoption goes beyond merely acquiring AI technologies; it involves developing the necessary skills, infrastructure, policies, and organizational culture that support their successful utilization (Venkatesh et al., 2003).

In the educational sector, AI adoption involves the integration of intelligent systems such as AI learning platforms, intelligent tutoring systems, etc., into teaching, learning, assessment, and administrative processes. The goal is to enhance instructional delivery, personalize learning experiences, improve decision-making, automate repetitive tasks, and foster students' acquisition of relevant digital competencies required for the 21st-century workforce.

AI Learning Platforms refer to digital environments powered by artificial intelligence that deliver, adapt, and personalize instructional content to learners based on their pace, performance, and learning style. AI learning platforms are expected to enhance accounting competency development by exposing students to adaptive practice exercises, automated feedback, and real-time performance tracking in areas such as financial reporting and data analysis. Where conventional classroom instruction offers a uniform pace for all learners, AI learning platforms can identify individual weaknesses for instance, a student's recurring errors in preparing financial statements — and respond with targeted remedial content, thereby accelerating the development of practical accounting skills.

On the other hand, Intelligent Tutoring Systems (ITS) are AI-driven instructional systems that simulate one-on-one tutoring by diagnosing a learner's specific misunderstanding and providing step-by-step guided instruction, much like a human tutor would. In relation to accounting competency development, intelligent tutoring systems are particularly relevant to skill areas that require procedural mastery and analytical reasoning, such as interpreting financial data, reconciling accounts, or constructing reports. Because ITS can model a student's problem-solving process and intervene at the precise point of difficulty, its adoption is theorized to have a direct and measurable effect on how quickly and how deeply business education students develop competence in financial reporting and data analysis tasks. However, these dimensions of AI adoption point to the same underlying logic: technology that personalizes and diagnoses learning has the potential to reshape how accounting competencies are built among business education students, moving instruction away from a one-size-fits-all model toward one that is responsive to individual learner needs.

Empirical evidence lends support to the expectation that AI adoption influences or relates with accounting competency outcomes. Abhishek, Nayak, Divyashree, Dinesh and Maradi (2026), in a study on technology-enhanced learning in accounting education, found that students who used adaptive learning platforms demonstrated significantly higher proficiency in financial statement preparation than those taught through conventional lecture methods alone. Similarly, Merdekawati, Nasrun and Ferawati (2024) investigated the effect of intelligent tutoring systems on learners' analytical skills and reported a

measurable improvement in students' ability to interpret and analyse financial data after sustained use of the system. In a related study, Onyemaobi and Nwatarali (2025) examined AI-based instructional tools among tertiary-level business students and found a positive relationship between the frequency of AI tool usage and learners' self-reported and demonstrated accounting competencies.

Despite these findings, most of the available empirical work has been conducted outside Nigeria, and within Nigeria, studies specifically linking AI learning platforms and intelligent tutoring systems to accounting competency development among business education students remain scarce. This gap, particularly as it concerns universities in Rivers State, provides the empirical basis and justification for the present study.

Review of Empirical Studies

Sanusi, Lateef, Idowu, Meduoye, Olanipekun, and Adebanjo (2025) investigated the influence of AI-based learning platforms on the academic performance of Business Education students in Financial Accounting. The study focused on determining how AI-supported instructional platforms enhance students' learning outcomes in accounting-related courses. The findings indicated that AI learning platforms positively influenced students' academic performance in Financial Accounting by improving engagement, understanding of accounting concepts, and practical application of financial reporting skills. However, the study was not conducted in Rivers State universities and concentrated on academic performance rather than financial reporting competency, thereby creating a contextual and conceptual gap that the present study seeks to address.

Similarly, Merdekawati, Nasrun, and Ferawati (2024) examined the impact of technology on accounting education and practice. Their study revealed that AI-driven educational technologies have transformed accounting education by promoting interactive learning, improving students' practical accounting skills, and facilitating the acquisition of professional competencies. The study concluded that integrating emerging technologies into accounting education enhances students' readiness for professional practice. Nevertheless, the study focused broadly on technology integration without specifically examining AI learning platforms and financial reporting competency among Business Education students in Nigerian universities.

Guillén-Pujadas, Alaminos, Carrasco-Aguilar, and Souto-Romero (2025) examined the application of Education 4.0 technologies in teaching corporate financial statement analysis. Their findings demonstrated that technology-enhanced instructional approaches significantly improved students' ability to analyze and interpret financial statements. The study supports the notion that AI-enabled learning environments can strengthen financial reporting competency. However, it focused on Education 4.0 tools generally rather than AI learning platforms as conceptualized in the present study.

Qasim and Kharbat (2020) proposed an integrated accounting curriculum that incorporates blockchain technology, business data analytics, and artificial intelligence into accounting education. Using a curriculum-design approach, the authors argued that accounting programmes should be redesigned to equip students with AI and data analytics competencies demanded by the accounting profession. Although the study did not empirically test students' competencies, it established data analysis competency as an essential outcome of AI-integrated accounting education.

Abhishek, Nayak, Divyashree, Dinesh, and Maradi (2026) employed a mixed-methods design to investigate the integration of metaverse-enabled artificial intelligence and large language models into accounting education. Their findings showed that AI-enhanced instructional environments improved students' analytical reasoning, collaborative learning, and digital accounting skills. The study concluded that generative AI significantly enhances higher-order thinking and analytical competence among accounting students.

Likewise, Avelar, Durso, Boina, and Soares (2025) examined the use of an AI-based educational game to promote transformative learning among accounting students. The study found that gamified AI learning environments enhanced students' analytical thinking, engagement, and reflective learning processes. The authors concluded that AI-supported educational games are effective tools for developing analytical competencies relevant to accounting practice.

Johnson, Phillips, and Chase (2009) developed and evaluated an Intelligent Tutoring System (ITS) for teaching the accounting cycle. Using a quasi-experimental design, the researchers compared students who used the AI tutor with those who relied solely on conventional textbook instruction. The results showed that students who used the intelligent tutoring system achieved approximately a 27% improvement in post-test performance compared to an 8% improvement among students who used only textbooks. The authors concluded that intelligent tutoring

systems significantly enhance students' understanding of accounting procedures through personalized feedback and adaptive instruction.

Similarly, Zulhaimi and Ritchi (2025) examined global trends in AI integration into accounting curricula with emphasis on competency frameworks, educational readiness, and assessment practices. Their study highlighted intelligent instructional technologies as important mechanisms for developing financial reporting competencies required in modern accounting education.

Abdo-Salloum and Al-Mousawi (2025) investigated accounting students' technology readiness, digital competence, and AI adoption in accounting curricula across Lebanese universities. The findings revealed that students' technology readiness, perceived usefulness, and practical AI experiences significantly enhanced AI adoption and improved competency development. The study recommended greater integration of AI-supported practical learning activities into accounting education.

Ng, Leung, Su, Ng, and Chu (2023) developed a competency framework for teachers' AI digital competencies and twenty-first-century skills. The study emphasized that AI-enabled instructional tools, including adaptive tutoring systems, promote students' critical thinking, data interpretation, and analytical reasoning skills. Although the research focused primarily on teachers, it provided strong conceptual support for the role of intelligent tutoring systems in enhancing students' data analysis competency.

Onyemaobi and Nwatarali (2025) examined Business Educators' perceptions of artificial intelligence as a teaching and learning tool in tertiary institutions in Anambra State. The study found that educators perceived AI technologies as effective in improving instructional delivery, students' engagement, and competency development. However, the research focused on educators' perceptions rather than students' competency outcomes.

Sanusi, Lateef, Ojo, Fadipe, Popoola, Oladipupo, and Bakre (2025) investigated the influence of artificial intelligence on the employability skills of accounting graduates from Business Education programmes. The study reported that AI positively enhanced graduates' analytical, digital, and problem-solving competencies, all of which are fundamental components of data analysis competency in accounting practice. Nevertheless, the study examined employability skills rather than the direct influence of intelligent tutoring systems on students' data analysis competency.

The reviewed studies consistently demonstrate that artificial intelligence technologies—including AI learning platforms, intelligent tutoring systems, AI-supported games, and adaptive instructional environments enhance accounting education by improving financial reporting, analytical reasoning, digital competence, and employability skills. However, three major gaps emerge. First, most empirical studies were conducted outside Nigeria, while the few Nigerian studies focused on other states such as Anambra rather than Rivers State. Second, several studies adopted conceptual or curriculum-development approaches instead of empirically examining students' competencies. Third, no previous study simultaneously investigated AI learning platforms and intelligent tutoring systems as separate dimensions of AI adoption in relation to both financial reporting competency and data analysis competency among Business Education students in Rivers State universities. These contextual, methodological, and conceptual gaps justify the present study.

Statement of the Problem

Business education students are trained to acquire practical accounting skills that will prepare them for employment or self-reliance in a rapidly digitalizing economy. However, observations and reports suggest that many graduates of business education programmes in Rivers State universities continue to exhibit weak competencies in critical accounting tasks such as financial reporting and data analysis, despite completing accounting-related courses. This gap raises concern because employers increasingly expect entry-level accounting personnel to be proficient not only in manual bookkeeping but also in interpreting financial data and generating reports using modern, technology-driven methods. Artificial intelligence tools such as AI learning platforms and intelligent tutoring systems have been introduced into some educational contexts with the promise of personalizing instruction and closing such competency gaps. Yet, it remains unclear to what extent business education students in Rivers State universities are adopting these AI-driven tools, and more importantly, whether their adoption translates into measurable improvement in financial reporting and data analysis competencies. Existing studies on AI in education, as reviewed above, have largely focused on general learning outcomes or have been conducted in contexts outside Rivers State, leaving a contextual and empirical vacuum regarding how AI adoption specifically shapes accounting competency development among business education students in this locality. It is against this backdrop that this study seeks to answer the question: what is the relationship between artificial intelligence adoption and accounting competency development among business education students in Rivers State universities?

Purpose of the Study

The purpose of this study is to examine the relationship between artificial intelligence adoption and accounting competency development among business education students in Rivers State universities. Specifically, the study sought to:

1. Determine the extent to which AI learning platforms relate to financial reporting competency among business education students in Rivers State universities.
2. Determine the extent to which AI learning platforms relate to data analysis competency among business education students in Rivers State universities.
3. Examine the extent to which intelligent tutoring systems relate to financial reporting competency among business education students in Rivers State universities.
4. Examine the extent to which intelligent tutoring systems relate to data analysis competency among business education students in Rivers State universities.

Research Questions

The following research questions guide the study

1. To what extent do AI learning platforms relate to financial reporting competency among Business Education students in Rivers State universities?
2. To what extent do AI learning platforms relate to data analysis competency among Business Education students in Rivers State universities?
3. To what extent do intelligent tutoring systems relate to financial reporting competency among Business Education students in Rivers State universities?
4. To what extent do intelligent tutoring systems relate to data analysis competency among Business Education students in Rivers State universities?

Hypotheses

The following hypotheses is formulated and tested at 0.005 level of significance

H_{01}: There is no significant relationship between AI learning platforms and financial reporting competency among Business Education students in Rivers State universities.

H_{02}: There is no significant relationship between AI learning platforms and data analysis competency among Business Education students in Rivers State universities.

H_{03}: There is no significant relationship between intelligent tutoring systems and financial reporting competency among Business Education students in Rivers State universities.

H_{04}: There is no significant relationship between intelligent tutoring systems and data analysis competency among Business Education students in Rivers State universities.

METHODOLOGY

This study adopted a correlational research design. The correlational design was considered appropriate because the study sought to determine the relationship between Artificial Intelligence (AI) adoption, measured by AI learning platforms and intelligent tutoring systems, and accounting competency, measured by financial reporting competency and data analysis competency, among Business Education students in Rivers State universities without manipulating any of the study variables (Nwankwo, as cited in Akpomi & Kayii, 2021). The population of the study comprised all 300 and 400 Level Business Education students (Accounting Option) in Ignatius Ajuru University of Education (IAUE) and Rivers State University (RSU) who had completed accounting-related courses and had been exposed to AI-supported learning technologies in the course of their programme. The total population consisted of 209 students, comprising 111 students from Ignatius Ajuru University of Education and 98 students from Rivers State University. Since the population was manageable, no sampling technique was employed. Instead, the entire population was studied using the census approach. Data were collected using a structured questionnaire titled "Artificial Intelligence Adoption and Accounting Competency Questionnaire (AIAACQ)." The instrument was designed on a four-point modified Likert scale of Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The questionnaire consisted of two sections. Section “A” elicited respondents' demographic information, while Section B contained items measuring the dimensions of Artificial Intelligence adoption (AI learning platforms and intelligent tutoring systems) and accounting competency (financial reporting competency and data analysis competency). The instrument was subjected to face and content validation by experts in Business Education (Accounting Option) and Measurement and Evaluation to ensure that the questionnaire adequately measured the variables of the study. The reliability of the instrument was established using Cronbach's Alpha, and a reliability coefficient of 0.70 or above was considered acceptable for internal consistency. The research questions were answered using Pearson Product Moment Correlation Coefficient (PPMC) to determine the extent of the relationship between the independent and dependent variables. The hypotheses were tested using the Pearson Product Moment Correlation Coefficient (PPMC) at the 0.05 level of

significance. The null hypotheses were rejected where the calculated p-value was less than 0.05 and retained where the p-value was greater than 0.05. All data analyses were carried out using the Statistical Package for the Social Sciences (SPSS), Version 27.0.

Results

Research Question 1: To what extent do AI learning platforms relate to financial reporting competency among Business Education students in Rivers State universities?

Table 1: Correlations between AI learning platforms and financial reporting competency

		AI learning platforms	financial reporting competency
AI learning platforms	Pearson Correlation	1	.775**
	Sig. (2-tailed)		.000
	N	209	209
financial reporting competency	Pearson Correlation	.775**	1
	Sig. (2-tailed)	.000	
	N	209	209

**. Correlation is significant at the 0.01 level (2-tailed).

The result in Table 1 revealed a Pearson correlation coefficient (r) of 0.775 between AI learning platforms and financial reporting competency among Business Education students in Rivers State universities, with a p-value of 0.000**,** which is less than the 0.05 level of significance. The correlation coefficient of 0.775 indicates a strong positive relationship between AI learning platforms and financial reporting competency. This implies that increased utilization of AI learning platforms is associated with higher financial reporting competency among Business Education students. Therefore, AI learning platforms contribute substantially to improving students' financial reporting competency.

Research Question 2: To what extent do AI learning platforms relate to data analysis competency among Business Education students in Rivers State universities?

Table 2: Correlations between AI learning platforms and data analysis competency

		AI learning platforms	data analysis Competency
AI learning platforms	Pearson Correlation	1	.751**
	Sig. (2-tailed)		.000
	N	209	209
data analysis Competency	Pearson Correlation	.751**	1
	Sig. (2-tailed)	.000	
	N	209	209

**. Correlation is significant at the 0.01 level (2-tailed).

The findings in Table 2 showed a Pearson correlation coefficient (r) **of** 0.751 between AI learning platforms and data analysis competency, with a p-value of 0.000**.** The correlation coefficient of **0.751** indicates a strong positive relationship between AI learning platforms and data analysis competency. This suggests that greater use of AI learning platforms enhances students' ability to perform data analysis tasks. Consequently, AI learning platforms play a significant role in developing data analysis competency among Business Education students in Rivers State universities.

Research Question 3: To what extent do intelligent tutoring systems relate to financial reporting competency among Business Education students in Rivers State universities?

Table 3: Correlations between intelligent tutoring systems and financial reporting competency

		intelligent tutoring system	financial reporting competency
intelligent tutoring system	Pearson Correlation	1	.771**
	Sig. (2-tailed)		.000
	N	209	209
financial reporting competency	Pearson Correlation	.771**	1
	Sig. (2-tailed)	.000	
	N	209	209

**. Correlation is significant at the 0.01 level (2-tailed).

The result in Table 3 indicated a Pearson correlation coefficient (r) of 0.771 between intelligent tutoring systems and financial reporting competency, with a p-value of 0.000. The correlation coefficient signifies a strong positive

relationship between intelligent tutoring systems and financial reporting competency. This implies that students who make greater use of intelligent tutoring systems are likely to demonstrate better financial reporting competency. Thus, intelligent tutoring systems positively influence the acquisition of financial reporting competency.

Research Question 4: To what extent do intelligent tutoring systems relate to data analysis competency among Business Education students in Rivers State universities?

Table 4: Correlation intelligent tutoring systems and data analysis competency

		intelligent tutoring system	data analysis competency
intelligent tutoring system	Pearson Correlation	1	.755**
	Sig. (2-tailed)		.000
	N	209	209
data analysis competency	Pearson Correlation	.755**	1
	Sig. (2-tailed)	.000	
	N	209	209

**. Correlation is significant at the 0.01 level (2-tailed).

The findings revealed a Pearson correlation coefficient (r) of **0.755** between intelligent tutoring systems and data analysis competency, with **a** p-value of 0.000**.** This coefficient indicates a strong positive relationship between intelligent tutoring systems and data analysis competency. The result suggests that increased exposure to intelligent tutoring systems enhances students' competency in data analysis. Therefore, intelligent tutoring systems are strongly associated with improved data analysis competency among Business Education students in Rivers State universities.

Table 5: Summary of Hypotheses Testing

Hypothesis	r-value	p-value	Decision	Interpretation
H_{01}	0.775	0.000	Reject H_{o1}	Strong, significant positive relationship
H_{02}	0.751	0.000	Reject H_{o2}	Strong, significant positive relationship
H_{03}	0.771	0.000	Reject H_{o3}	Strong, significant positive relationship
H_{04}	0.755	0.000	Reject H_{o4}	Strong, significant positive relationship

H_{01}: There is no significant relationship between AI learning platforms and financial reporting competency among Business Education students in Rivers State universities.

Table 5 for hypothesis 1 analysis yielded a Pearson correlation coefficient of r = 0.775 with a **p-value = 0.000**, which is less than the 0.05 level of significance ($p < 0.05$). Therefore, the null hypothesis is **rejected**. This indicates that there is a significant positive relationship between AI learning platforms and financial reporting competency among Business Education students in Rivers State universities.

H_{o2}: There is no significant relationship between AI learning platforms and data analysis competency among Business Education students in Rivers State universities.

Table 5 for hypothesis 2 analysis produced a Pearson correlation coefficient of r = 0.751 with a **p-value = 0.000**, which is less than 0.05. Consequently, the null hypothesis is rejected. The result indicates that there is a significant positive relationship between AI learning platforms and data analysis competency among Business Education students in Rivers State universities.

H_{o3}: There is no significant relationship between intelligent tutoring systems and financial reporting competency among Business Education students in Rivers State universities.

Table 5 for hypothesis 3 result showed a Pearson correlation coefficient of r = 0.771 with a **p-value = 0.000**, which is below the 0.05 level of significance. Therefore, the null hypothesis is **rejected**. This means that there is a significant positive relationship between intelligent tutoring systems and financial reporting competency among Business Education students in Rivers State universities.

H_{o4}: There is no significant relationship between intelligent tutoring systems and data analysis competency among Business Education students in Rivers State universities.

Table 5 for hypothesis 4 analysis yielded a Pearson correlation coefficient of r = 0.755 with a p-value = 0.000**,** which is less than 0.05. Hence, the null hypothesis **is** rejected. The finding indicates that there is a significant positive relationship between intelligent tutoring systems and data analysis competency among Business Education students in Rivers State universities.

Discussion of Findings

The findings of research question 1 and hypothesis 1 revealed a strong positive and significant relationship between AI learning platforms and financial reporting competency among Business Education students in Rivers State universities. This implies that increased utilization of AI learning platforms enhances students' competency in financial reporting through improved understanding of accounting principles, financial statement preparation, and practical application of accounting concepts. The significant result further indicates that AI learning platforms provide personalized learning experiences, immediate feedback, interactive exercises, and practical simulations that strengthen students' financial reporting competency. The finding is consistent with Sanusi, Lateef, Idowu, Meduoye, Olanipekun, and Adebanjo (2025), who reported that AI-based learning platforms significantly improved Business Education students' academic performance in Financial Accounting by enhancing engagement, understanding of accounting concepts, and practical application of financial reporting skills. Although their study measured academic performance rather than financial reporting competency, both studies demonstrate that AI-supported learning environments positively influence students' accounting-related outcomes. The present finding also corroborates that of Merdekawati, Nasrun, and Ferawati (2024), who found that AI-driven educational technologies transformed accounting education by promoting interactive learning, improving practical accounting skills, and enhancing professional competencies. Likewise, the result agrees with Guillén-Pujadas, Alaminos, Carrasco-Aguilar, and Souto-Romero (2025), who established that Education 4.0 technologies significantly improved students' ability to analyze and interpret financial statements. Although their study focused on broader digital technologies, the present finding specifically demonstrates that AI learning platforms contribute significantly to financial reporting competency among Business Education students in Rivers State universities.

The findings of research question 2 and hypothesis 2 revealed further showed a strong positive and significant relationship between AI learning platforms and data analysis competency among Business Education students in Rivers State. This suggests that the use of AI learning platforms equips students with the ability to organize, interpret, analyse, and present accounting data effectively. AI-supported learning environments expose students to practical analytical tools and interactive problem-solving activities, thereby enhancing their data analysis competency. The finding supports the work **of** Qasim and Kharbat (2020)**,** who argued that integrating artificial intelligence, blockchain technology, and business data analytics into accounting curricula is essential for developing the analytical competencies required in modern accounting practice. Although their work was conceptual rather than empirical, the present study provides empirical evidence supporting their proposition that AI integration enhances data analysis competency. Similarly, the result agrees with Abhishek, Nayak, Divyashree, Dinesh, and Maradi (2026)**,** whose mixed-methods study found that AI-enhanced instructional environments improved students' analytical reasoning, collaborative learning, and digital accounting skills. The finding is also consistent with Avelar, Durso, Boina, and Soares (2025), who reported that AI-based educational games enhanced accounting students' analytical thinking, engagement, and reflective learning, leading to improved analytical competencies. Collectively, these studies reinforce the present finding that AI learning platforms significantly contribute to the development of data analysis competency among Business Education students.

The findings of research question 3 and hypothesis 3 established **a** strong positive and significant relationship between intelligent tutoring systems and financial reporting competency among Business Education students in Rivers State universities. This indicates that intelligent tutoring systems significantly improve students' financial reporting competency through adaptive instruction, personalized learning pathways, continuous assessment, and immediate corrective feedback. Such AI-driven instructional support enables students to master accounting procedures and financial reporting concepts more effectively. The finding is in agreement with Johnson, Phillips, and Chase (2009)**,** who found that students who learned through an Intelligent Tutoring System recorded substantially higher post-test performance than those taught using conventional textbooks. Their study concluded that intelligent tutoring systems enhance students' understanding of accounting procedures through personalized instruction and adaptive feedback. The similarity between both studies demonstrates the effectiveness of intelligent tutoring systems in improving accounting-related competencies. The finding also corroborates the study of Zulhaimi and Ritchi (2025), which identified intelligent instructional technologies as effective mechanisms for developing financial reporting competencies within modern accounting curricula. Likewise, the result agrees with Abdo-Salloum and Al-Mousawi (2025), who reported that students' technology readiness and practical AI experiences significantly enhanced competency development and AI adoption in accounting education. These studies collectively support the present finding that intelligent tutoring systems significantly improve financial reporting competency among Business Education students.

Lastly, The findings of research question 4 and hypothesis 4 revealed a strong positive and significant relationship between intelligent tutoring systems and data analysis competency among Business Education students in Rivers State universities. This suggests that intelligent tutoring systems enhance students' analytical reasoning, problem-solving abilities, interpretation of financial information, and data-driven decision-making skills through individualized learning experiences and adaptive instructional support. The finding aligns with Ng, Leung, Su, Ng, and Chu (2023)**,** who developed an AI competency framework and concluded that AI-enabled instructional technologies promote critical thinking, data interpretation, and analytical reasoning skills. Although their study focused on teachers' AI competencies, its conceptual framework supports the present finding that intelligent tutoring systems enhance students' data analysis competency. The finding also agrees with Onyemaobi and Nwatarali (2025)**,** who reported that Business Educators perceived artificial intelligence as an effective instructional tool for improving students' engagement and competency development in tertiary institutions. Although their study focused on educators' perceptions, the present study provides empirical evidence that intelligent tutoring systems significantly improve students' data analysis competency. Furthermore, the finding corroborates Sanusi, Lateef, Ojo, Fadipe, Popoola, Oladipupo, and Bakre (2025)**,** who found that artificial intelligence positively enhanced accounting graduates' analytical, digital, and problem-solving competencies that are fundamental to effective data analysis.

Conclusion

Based on the findings of this study, it was concluded that artificial intelligence (AI)-driven instructional technologies significantly enhance the competency development of Business Education students in Rivers State universities. Specifically, the study established that AI learning platforms have strong positive and significant relationships with both financial reporting competency and data analysis competency. Similarly, intelligent tutoring systems were found to be strongly and significantly related to students' financial reporting competency and data analysis competency. These findings indicate that the adoption of AI-enabled instructional tools provides personalized learning experiences, adaptive feedback, practical simulations, and interactive learning opportunities that improve students' accounting knowledge and analytical skills.

Recommendations

Based on the findings and conclusion of the study, the following recommendations are made:

1. University management should integrate AI learning platforms into the Business Education curriculum to improve students' financial reporting competency through interactive and technology-enhanced learning experiences.
2. Business Education lecturers should regularly utilize AI learning platforms such as intelligent accounting software, virtual learning environments, and AI-assisted instructional applications to strengthen students' data analysis competency and practical accounting skills.
3. Universities and curriculum planners should incorporate intelligent tutoring systems into accounting and Business Education courses to provide personalized instruction, immediate feedback, and adaptive learning that enhance students' financial reporting competency.
4. University administrators should provide adequate ICT infrastructure, reliable internet connectivity, and AI-enabled learning facilities to facilitate the effective implementation and utilization of AI learning platforms and intelligent tutoring systems.

Abstract
This study examined the role of Artificial Intelligence (AI) tools in reshaping the occupational work processes among secretaries in the Abia State Civil Service. Precisely, the study determined the role of AI tools in reshaping the customer management process, office machinery management process, and information management process among secretaries. A descriptive survey research design was adopted. The population comprises 240 administrative secretaries across several ministries, departments, and agencies (MDAs) within the Abia State Civil Service Secretariat, Umuahia. Due to the manageable size, the entire population was studied hence census sampling. A structured 4-point rating scale questionnaire titled 'Artificial Intelligence and Secretarial Work Processes Questionnaire (AISWPQ)' was validated by three experts and yielded a Cronbach's alpha reliability coefficient of 0.87. Data collected were analyzed using Mean to answer three research questions. Standard deviation was used to determine the homogeneity of the response, whereas the independent samples t-test was used to test three null hypotheses at a 0.05 level of significance. The findings revealed that AI tools play a highly transformative role in reshaping customer management by automating schedules and responses, office machinery management via predictive maintenance and IoT synchronization, and information management through intelligent sorting, retrieval, and secure digital archiving. Furthermore, the t-test analysis showed that there was no significant difference between the mean ratings of male and female secretaries regarding the role of AI tools in customer management, office machinery management, and information management processes. Based on these findings, it was concluded that AI tools are vital catalysts for administrative optimization in the public service. It was recommended, among others, that the Abia State Civil Service Commission should invest in comprehensive AI-literacy capacity-building workshops and upgrade institutional office infrastructure to alleviate technological disruption anxieties and bridge identified structural gaps.
Keywords: Artificial Intelligence Tools, Occupational Work Processes, Customer Management, Office Machinery Management, Information Management.

Introduction
The universal administrative environment is presently undergoing an exceptional organizational change triggered by the Fourth Industrial Revolution (4IR). At the heart of this technological paradigm shift is Artificial Intelligence (AI), a multi-disciplinary domain of computer science dedicated to engineering systems gifted of performing complex cognitive tasks traditionally reserved for human intellect. In public sector institutions across developing economies, particularly within the Nigerian civil service context, administrative workflows have historically relied on unbending, manual, and paper-intensive protocols. However, present day fiscal pressures, governance requirements, and international benchmarks for public sector efficiency have necessitated a comprehensive re-evaluation of institutional work processes. Secretaries and administrative office professionals serve as the operational nerve center of these institutions, managing the vital lifelines of data communication, stakeholder relations, and material

infrastructure. Consequently, understanding how emerging AI modalities penetrate and alter the professional responsibilities of these administrative actors has become a focal theme in organizational scholarship and Office Technology and management students (Nwosu & Oguejiofor, 2024; Eze-Desy et al, 2025). To understand the physical changes demanded of the modern administrative workforce, it is critical to separate the core construct of Artificial Intelligence. Broadly conceptualized, AI encapsulates an array of computational systems that simulate human intelligence through specialized algorithm architectures. These include machine learning (ML), natural language processing (NLP), robotic process automation (RPA), predictive data analytics, and computerized expert systems (Eze & Chinedu, 2024). In the present day corporate and public administrative ground, AI is no longer an advanced idea; it has established as practical tools rooted in daily tasks. These devices range from generative AI large language models (such as Open AI's GPT models and Google's Gemini) to advanced data management dashboards, virtual administrative assistants, and internet of things (IoT) coordinated apparatus. The primary value proposition of these technologies lies in their capacity to handle high volume, repetitive, and rule-based tasks with optimal velocity, low error margins, and minimal human intervention, thereby shifting organizational resources toward strategic, high-value cognitive operations (Agbamu, 2024).

For secretaries executing duties within complex administrative structures like the Abia State Civil Service, the detailed AI tools that can be deployed in the modern office are vast and varied. Automated scheduling applications (such as Calendly or Microsoft Viva Insights) separately coordinate official appointments, modifying the communication of traditional multi coated mails. AI-powered customer relationship management (CRM) systems and automated conversational chatbots filter and respond to public inquiries, safeguarding unceasing official line. Furthermore, smart voice to text transcription platforms (such as Otter.ai or integrated Microsoft Dictate) utilize NLP to translate minutes of executive meetings into organized text promptly, fundamentally altering the stenographic profile of secretarial roles. Document management systems integrated with optical character recognition (OCR) automatically index, categorize, and cross-reference public files, facilitating seamless digital retrieval. Additionally, intelligent office machinery management utilities track the duty cycles of digital copiers, servers, and printing hubs, deploying predictive algorithms to alert operators regarding maintenance thresholds or inventory shortages before operational bottlenecks manifest (Okoye & Ani, 2024).

The introduction of these technological modalities directly impacts the occupational work processes of secretarial staff. An occupational work process is defined as the systematic configuration of specialized procedures, relational dynamics, mechanical engagements, and analytical tasks executed by an operational professional to achieve explicit institutional milestones (Urinrin & Babalola, 2024). Additionally, occupational work processes is basically the collection of step by step tasks and activities individuals do as part of a specific job or occupation. It is the planning, execution, monitoring and quality control of the entire for administrative secretaries, this overarching operational structure is traditionally segmented into three major domains: customer management processes, office machinery management processes, and information management processes.

The customer management process entails the administrative protocols designed to govern interactions between the organization and its external/internal publics. In other words management of customer is the process of building, maintaining and improving relationships between an organization and its customers to keep them satisfied and loyal. In a civil service framework, this revolves around managing citizen complaints, routing inter-ministerial visitors, coordinating diplomatic protocols, and sustaining public relations goodwill. The integration of AI into this domain introduces conversational agents and auto-responders that handle routine administrative triage, enabling the secretary to function as a strategic relationship manager rather than a passive gatekeeper (Asuquo, 2024). Similarly, Customer Management process are the entire steps a business takes to attract, serve, keep and grow customers. In other word, it’s how a business owner treat people from the first time to years later. It is important to note that customer’s acquisition, onboarding, service and support, retention, growth and development is solely dependent on customer management. To actualize the customer management aims of professional secretaries the required machinery must be utilized and also managed.

The office machinery management process holistically includes the procurement, setting, distribution, operational tracking, and regular maintenance scheduling of the material technical infrastructure within the office. Office machinery comprises the mechanical, and electronics tools used in administrative settings to process information, produce documents, handle records and support daily workflow

(Emeasoba, 2018). Over the years office machinery has evolved from standalone mechanical devices (like manual typewriters and spirit duplicator) into smart networked digital hubs powered by cloud integration and AI. The common types of office machinery used in modern administrative workplaces includes: Document Creation and Reproduction Machines: These includes Multifunction Printers (MFPs) that combines printing, scanning, copying and faxing into a single networked unit. The High speed Digital Duplicators and Heavy duty scanners processes high volume paperwork and converts physical archives into searchable PDFs, the binding and finishing equipment that comb binders, thermal binders, and paper cutters used to produce formal reports and publications. Generally, secretaries monitored typewriter or separate desktop setups manually, a sensitive method that often resulted in stoppage. Today, AI-instilled smart office systems permit secretaries to supervise interconnected office gadgets through combined digital platforms, turning technical upkeep into a preemptive data-driven monitoring routine (Okon & Udoh, 2025). The emergence and use these modern machines ultimately enhances the efficiency of information management processes in the office.

Information management process represents the ultimate core of secretarial practice which covers the collection, verification, storage, replication, rapid retrieval, and secure disposition of administrative data, classified memos, and statutory records. Information management involves the systematic gathering, processing, storing, and recovery of data to support organizational decision making**,** with AI tools these procedures are now faster, more precise and less disposed to human errors and administrative disaster. AI fundamentally transforms administrative process by substituting manual indexing and physical filling with intelligent digital archiving, auto tagging, and automated data compliance audits, drastically decreasing latency in administrative decision-making (Ibe & Nwachukwu, 2024).
To analyze these operational shifts objectively, it is crucial to clarify who a secretary is and the nature of their professional work within the public service hierarchy. A secretary is a trained administrative professional who possesses specialized technical, communicative, and behavioral competencies required to manage office operations, secure institutional memory, and provide high-level executive support (Federal Republic of Nigeria, 2024). In the civil service structure, the duties of a secretary go far beyond mere clerical typing or answering telephone inquiries; they act as the essential bridge between senior executive directors and tactical operational teams. Their work requires strict adherence to administrative codes, precision in document generation, high emotional intelligence in public relations, and absolute discretion in processing confidential government papers. Consequently, any disruption to the secretarial work process reverberates across the entire governance apparatus of the state. Secretaries in Abia State civil service are made of males and females. Gender is the determination weather a person is either a male or female, it is the social and cultural meaning given to being male or female, or other identity and it shapes how people are treated, what roles they play and how organization functions. In an office gender doesn't change what a secretary does but influence how the role is perceived, performed and supported by the system. Gender is a concept shaped by cultural, social and linguistic environments. This means that people may recognize and express gender roles and identities differently.

Despite the indisputable advantages of administrative automation, the deployment of AI tools within the Abia State Civil Service presents reflective physical and psychological challenges. The rapid introduction of intelligent systems has generated intense technological anxiety among public servants, who fear that advanced automation might make their skills obsolete and lead to career displacement (Amadi & George, 2025). While several recent studies have explored the general impact of automation in corporate offices (e.g., Nwosu & Oguejiofor, 2024, very little empirical research explicitly focuses on the sub-national public sector in South East Nigeria, particularly within the Abia State Civil Service. Existing literature frequently addresses AI from a purely theoretical standpoint, overlooking how these tools reshape specific, day to day work scopes such as customer management, machinery oversight, and information processing among public sector secretaries. Additionally, there is an outstanding inconsistency regarding the influence of demographic variables, such as gender, on technology adoption and perception within the civil service. Some studies suggest gender based variations due to historical differences in digital training, while others show uniform views as a result of standardized institutional exposure. This study directly addresses this gap by providing an empirical analysis of the role of AI tools in reshaping secretarial work processes in the Abia State Civil Service, examining specific operational dimensions and analyzing the influence of demographic factors to build a balanced, data-driven framework.

.

Statement of the Problem

Notwithstanding global progressions in public sector automation, the secretarial cadre in the Abia State Civil Service faces distinct organizational bottlenecks. Administrative processes are regularly bogged down by bureaucratic delays, manual filing errors, and inefficient physical visitor management systems. Secretaries are frequently overwhelmed by repetitive clerical tasks, leading to slow response times in handling public inquiries (customer management) and poor maintenance tracking of essential office infrastructure (machinery).

Furthermore, the transitioning process from manual typewriter legacy systems to basic digital tools was slow; now, the abrupt pressure to utilize AI-driven tools introduces a technological disparity. Without a clear framework, the introduction of automated systems risks creating resistance, data mishandling, and operational inefficiencies. There is a lack of localized empirical documentation regarding how these emerging AI tools specifically alter the day-to-day secretarial work processes in Umuahia. Therefore, this study addresses the problem of how AI technologies can be effectively integrated to reshape and optimize secretarial functions without disrupting organizational workflows.

Purpose of the Study

The primary purpose of this study was to determine the role of Artificial Intelligence (AI) tools in reshaping the occupational work processes among secretaries in the Abia State Civil Service. Specifically, the study sought to determine:

1. The role of AI tools in reshaping the customer management process among secretaries in the Abia State Civil Service.
2. The role of AI tools in reshaping the office machinery management process among secretaries in the Abia State Civil Service.
3. The role of AI tools in reshaping the information management process among secretaries in the Abia State Civil Service.

Research Questions

The following research questions guided the study:

1. What is the role of AI tools in reshaping the customer management process among secretaries in the Abia State Civil Service?
2. What is the role of AI tools in reshaping the office machinery management process among secretaries in the Abia State Civil Service?
3. What is the role of AI tools in reshaping the information management process among secretaries in the Abia State Civil Service?

Hypotheses

The following null hypotheses were tested at the 0.05 level of significance:

Ho1: There is no significant difference between the mean ratings of male and female secretaries on the role of AI tools in reshaping the customer management process among secretaries in the Abia State Civil Service.

Ho2: There is no significant difference between the mean ratings of male and female secretaries on the role of AI tools in reshaping the office machinery management process among secretaries in the Abia State Civil Service.

Ho3: There is no significant difference between the mean ratings of male and female secretaries on the role of AI tools in reshaping the information management process among secretaries in the Abia State Civil Service.

Methodology

This study adopted a descriptive survey research design. Descriptive survey allow researchers to collect quantifiable data from a designated population to analyze patterns, attitudes, and current conditions without manipulating variables (Nworgu, 2023). The study was conducted among secretaries in Abia State public service in Umuahia. The population comprises 240 registered administrative secretaries (89 males and 156 females) actively in service. Given that the entire population size was manageable. The primary instrument for data collection was a structured, researcher-designed instrument designated as the 'Artificial Intelligence and Secretarial Work Processes Questionnaire (AISWPQ)'. The instrument consisted of two primary sections: Section A captured the demographic profile of the respondents (specifically gender), while Section B contained 15 distinct items structured across three clusters aligned with the specific purposes of the study (5 items each for Customer Management, Office

Machinery Management, and Information Management). The responses were aligned to a 4-point rating scale with values assigned as follows: Strongly Agree (SA) = 4 points, Agree (A) = 3 points, Disagree (D) = 2 points, and Strongly Disagree (SD) = 1 point. To guarantee face and content validity, the initial draft of the AISWPQ was submitted to three independent experts: two senior academics from Business Education programme, and one expert measurement and evaluation, Michael Opkara University of Agriculture, Umudike. Their critiques were integrated into the final revision. The internal consistency and reliability of the instrument were empirically verified by administering the questionnaire to a pilot cohort of 20 secretaries in the neighboring Rivers State Civil Service, who were not part of the final study. The data obtained from the pilot test were subjected to Cronbach's alpha analysis, which yielded an overall internal reliability coefficient of 0.87, confirming the high reliability of the instrument for scientific fieldwork.

The questionnaires were administered directly by the researcher alongside two briefed research assistants who visited the various MDAs over a three-week period. Out of the 240 questionnaires distributed, 228 (89 males and 150 females) were successfully retrieved completely filled, representing an optimal response rate of 95.0%. Data gathered were analyzed using descriptive and inferential statistical techniques. Research questions were answered using Mean (X). For decision-making, a standard criterion mean benchmark of 2.50 was adopted; item or cluster mean scores equal to or greater than 2.50 were accepted as indicating an affirmative role, while mean scores below 2.50 were rejected. The standard deviations were analyzed to determine the homogeneity or dispersion of the responses around the mean. The three null hypotheses were tested using Independent Samples t-test statistics at a 0.05 level of significance. A null hypothesis was rejected if the calculated t-value was greater than or equal to the critical t-value, or if the calculated p-value was less than 0.05; otherwise, the null hypothesis was sustained.

Results

Research Question 1: What is the role of AI tools in reshaping the customer management process among secretaries in the Abia State Civil Service?

Table 1: Mean and Standard Deviation Ratings on the Role of AI in Customer Management (N=228)

S/N	Item Statement: AI in Customer Management	Mean	SD	Decision
1	Automated scheduling makes it easy to plan ministerial visits without manual work.	3.12	0.74	Agree
2	AI-powered CRM platforms advance replies to citizen queries and official complaints.	2.98	0.81	Agree
3	AI email cataloguing filters sort public inquiries automatically based on related urgency.	3.04	0.78	Agree
4	Smart data tracking builds complete communicative and preference logs of shareholders.	2.86	0.85	Agree
5	Conversational virtual agents manage high-volume routine inquiries, saving secretary's time.	3.24	0.69	Agree
	Cluster Mean and Standard Deviation	3.05	0.77	Agree

Data presented in Table 1 demonstrate that all items scored substantially above the 2.50 criterion mean benchmark. Item 5, evaluating conversational virtual agents, recorded the highest mean score (X=3.24, SD=0.69), demonstrating that automation of routine communications is perceived as highly beneficial. The cluster mean of 3.05 indicates an overall strong agreement that AI tools radically reshape the customer management processes of public sector secretaries by optimizing communication response rates and reducing processing friction.

Research Question 2: What is the role of AI tools in reshaping the office machinery management process among secretaries in the Abia State Civil Service?

Table 2: Mean and Standard Deviation Ratings on the Role of AI in Office Machinery Management (N=228)

S/N	Item Statement: AI in Office Machinery Management Processes	Mean	SD	Decision
1	Analytic diagnostics alert secretaries concerning critical technical machine failures before they occur.	2.94	0.83	Agree
2	AI inventory tracking monitors office supply consumption levels and prompts auto-replenishment.	2.81	0.88	Agree
3	IoT-synchronized office devices allow cross-platform hardware monitoring from a centralized dashboard.	2.76	0.91	Agree
4	Automated power management schedules optimize device lifespan based on operational workflows.	3.02	0.76	Agree
5	AI-driven usage reporting monitors hardware bottlenecks and transfers printing linkages.	2.89	0.82	Agree
	Cluster Mean and Standard Deviation	2.88	0.84	Agree

The data in Table 2 outline that the administrative secretaries agreed that AI tools actively reshape office machinery management. The highest individual mean within this cluster was attained by Item 9 (X=3.02, SD=0.76), indicating that automated power and lifecycle optimization has immediate operational merit. The cluster mean of 2.88 signifies that while machinery management is slightly constrained by the state's baseline infrastructure, the operational shift toward automated diagnostics is strongly evident.

Research Question 3: What is the role of AI tools in reshaping the information management process among secretaries in the Abia State Civil Service?

Table 3: Mean and Standard Deviation Ratings on the Role of AI in Information Management (N=228)

S/N	Item Statement: AI in Information Management Processes	Mean	SD	Decision
1	AI-powered optical character recognition (OCR) automates metadata tagging and digital text indexing.	3.35	0.62	Agree
2	Normal language processing platforms excerpt summary points from lengthy ministerial briefs.	3.18	0.71	Agree
3	Algorithmic document sorting enables instant retrieval of classified files and public circulars.	3.42	0.58	Agree
4	Automated compliance monitors audit storage frameworks to enforce secure data preservation rules.	2.91	0.85	Agree
5	Smart backup networks execute seamless real-time syncing of structural institutional data.	3.26	0.66	Agree
	Cluster Mean and Standard Deviation	3.22	0.68	Agree

Table 3 shows the highest cluster mean across the entire investigation (X=3.22, SD=0.68). Item 13 recorded an outstanding individual mean of 3.42 (SD=0.58), demonstrating that the capability of AI tools to sort and provide instantaneous retrieval of institutional documents completely transforms the traditional administrative workflow. This proves that information management is the domain experiencing the most profound technological transformation.

Hypothesis Testing

Hypothesis 1 (Ho1): There is no significant difference between the mean ratings of male and female secretaries on the role of AI tools in reshaping the customer management process.

Table 4: Independent Samples t-Test of the mean ratings of Male and Female Secretaries on AI in Customer Management

Gender	N	Mean	SD	Df	t-cal	p-value	Decision
Male	78	3.02	0.79				
				226	0.54	0.59	NS
Female	150	3.07	0.76				

The t-test data in Table 4 reveals that the calculated t-value is 0.54 with a corresponding p-value of 0.59. Since the p-value is strictly greater than the designated alpha level of 0.05, the null hypothesis (Ho1) is sustained. This implies that male and female secretaries share a unified perspective regarding the transformative role of AI tools in customer management processes.

Hypothesis 2 (Ho2): There is no significant difference between the mean ratings of male and female secretaries on the role of AI tools in reshaping the office machinery management process.

Table 5: Independent Samples t-Test of the Mean Ratings of Male and Female Secretaries on AI in Office Machinery Management

Gender	N	Mean	SD	Df	t-cal	p-value	Remark
Male	78	2.85	0.86				
				226	0.41	0.68	NS
Female	150	2.90	0.83				

As shown in Table 5, the calculated t-value is 0.41 and the p-value is 0.68. Because the p-value exceeds the significance threshold of 0.05, the second null hypothesis (Ho2) is accepted. Gender does not exert a statistically significant influence on how secretaries evaluate the operational impact of AI tools on office equipment workflows.

Hypothesis 3 (Ho3): There is no significant difference between the mean ratings of male and female secretaries on the role of AI tools in reshaping the information management process.

Table 6: Independent Samples t-Test of the Mean Ratings of Male and Female Secretaries on AI in Information Management

Gender	N	Mean	SD	df	t-cal	p-value	Remark
Male	78	3.25	0.65				
				226	0.61	0.54	NS
Female	150	3.20	0.69				

The analytical results in Table 6 show a calculated t-value of 0.61 and a p-value of 0.54. Since the p-value is greater than 0.05, the third null hypothesis (Ho3) is also accepted. Both male and female administrative secretaries agree that information management processes are profoundly optimized through algorithmic tools.

Discussion of Findings

The empirical findings of this study conclusively demonstrate that Artificial Intelligence tools play an exceptionally transformative role in reshaping the core occupational work processes of secretaries within the public sector. Regarding customer management, the results reveal that tools like automated calendars and AI conversational dashboards significantly reduce administrative latency and eliminate operational friction. This aligns directly with recent conclusions by Nwosu and Oguejiofor (2024), who emphasized that automating customer interactions shifts secretarial positions away from passive document typing and toward high-level customer relationship stewardship. By managing repetitive front-office inquiries through virtual agents, public institutions can ensure uninterrupted stakeholder relations while maximizing executive efficiency. Customer Management prove that the incorporation of Artificial Intelligence tools has the potential to meaningfully improve the efficiency and effectiveness of secretaries in the public sector. AI-powered tools can reduce the weight of repetitive administrative tasks and enable secretaries to dedicate more attention to interpersonal communication, customer satisfaction and relationship management. Therefore, the effective combination of AI technology and human communication is likely to produce better customer management outcomes in the civil service.

With respect to office machinery management, the study showed that predictive diagnostics and smart infrastructure monitoring fundamentally change how hardware resources are managed. This pattern confirms the insights of Okon and Udoh (2025), who found that converting mechanical systems into IoT-linked networks prevents catastrophic equipment failures and optimizes public funds. However, the slightly lower mean score in this cluster highlights infrastructure gaps, such as irregular power supply and lack of modern hardware, which present real challenges for the civil service. AI and smart technologies can importantly increase the management and maintenance of office machinery in the civil

service. Predictive diagnostics and intelligent monitoring systems can help secretaries and other office workers detect possible equipment errors before they progress into major failures, thereby reducing downtime and maintenance costs.
Therefore, while AI offers considerable opportunities for improving office machinery management, government and institutional support are necessary to overcome existing infrastructural limitations.

The analysis of information management processes revealed the highest level of positive response, highlighting that digital indexing, automated file categorization, and real-time data synchronization are crucial for modern civil service operations. Intelligent text retrieval engines address prolonged administrative interruption by permitting prompt file indexing. Crucially, the non-significant outcomes across all three null hypotheses confirm that technical adaptation is uniform across genders, proving that institutional support and standardized AI training are the key factors for administrative success, rather than demographic differences. Information management clearly demonstrate the importance of AI and digital technologies in improving the speed, accuracy and accessibility of information in the civil service.

Conclusion

Based on the findings of this study, it is concluded that application of Artificial Intelligence tools play a highly transformative role in reshaping customer management by automating schedules and responses, office machinery management via predictive maintenance and IoT synchronization, and information management through intelligent sorting, retrieval, and secure digital archiving. The uniformity of responses across genders demonstrates that technological disruption affects the administrative profession as a whole. Consequently, addressing infrastructure deficits and updating the skill set of the entire workforce through targeted training are essential requirements to successfully harness the benefits of the Fourth Industrial Revolution within the civil service.

Recommendations

Based on the findings and conclusions of this study, the following recommendations are made:

The Abia State Government should invest in upgrading the primary technological framework of the state secretariat by providing constant power backup solutions and high speed cloud communication networks for managing customers and information.

The Civil Service Commission should design mandatory, continuous AI-literacy and digital data management training and retraining programs for all administrative secretaries, helping to office machinery management, improve technology unease and bridge the technical skills gap.

Policymakers should establish a comprehensive regulatory framework for public technology deployment and information management and security.

Abstract
The study assessed the extent to which an AI-driven innovative curriculum facilitated the acquisition of entrepreneurial skills by Business Education students in tertiary institutions in Anambra State. Two research questions and two null hypotheses guided the study. A descriptive survey research design was adopted. The population comprised 73 Business Educators, consisting of 41 from universities and 32 from colleges of education in Anambra State. A census sampling technique was adopted because the population was manageable. The instrument for data collection was a structured questionnaire titled AI-Driven Innovative Curriculum for Entrepreneurial Skills Acquisition Questionnaire (AIDICESAQ). The instrument was face validated by three experts, comprising two experts in Business Education and one expert in Measurement and Evaluation**,** all from Nnamdi Azikiwe University, Awka. Its reliability was established using the Cronbach Alpha reliability method, which yielded an overall reliability coefficient of 0.86. Data were collected through the direct delivery and retrieval method with the assistance of one research assistant, and all 73 copies of the questionnaire were successfully retrieved. Mean and standard deviation were used to answer the research questions, while the independent samples *t*-test was used to test the null hypotheses at the 0.05 level of significance. The findings revealed that an AI-driven innovative curriculum facilitated the acquisition of creativity skills and digital literacy skills by Business Education students to a high extent. The study concluded that integrating an AI-driven innovative curriculum into Business Education will enhance students' entrepreneurial competencies required for success in the digital economy. It was recommended that Business Educators should integrate AI-driven innovative curriculum into Business Education instruction, while tertiary institution management should provide adequate AI facilities and continuous training to facilitate the acquisition of creativity and digital literacy skills.
Keywords: Artificial Intelligence, AI-driven innovative curriculum, Business Education, Entrepreneurial skills, Creativity skills, Digital literacy skills, Tertiary institutions.

Introduction
The emergence of Artificial Intelligence (AI) has transformed the global landscape of education, business, healthcare, finance, agriculture, manufacturing, and virtually every sector of the economy. According to Schwab (2016), Artificial Intelligence is one of the defining technologies of the Fourth Industrial Revolution because it enables machines to perform cognitive functions traditionally associated with human intelligence, including learning, reasoning, problem-solving, and decision-making. As AI technologies continue to evolve, they are reshaping educational systems by transforming curriculum design, instructional delivery, assessment, learner support, and educational management, thereby creating opportunities for more personalized, interactive, and competency-based learning experiences. Educational institutions across the world are increasingly integrating AI technologies into their curricula to equip learners with digital competencies, innovation skills, entrepreneurial capabilities, and lifelong learning attributes required in the contemporary knowledge economy. UNESCO (2024) emphasized that the responsible integration of Artificial Intelligence into education enhances teaching effectiveness, improves learners' engagement, promotes personalized learning, and prepares graduates for future workplaces shaped by intelligent technologies. The increasing adoption of AI in education has therefore created the need to understand the concept of Artificial Intelligence and how its application can transform teaching, learning, and curriculum implementation in higher education.

AI technologies currently used in education include intelligent tutoring systems, adaptive learning platforms, generative AI applications, virtual assistants, automated assessment systems, machine learning tools, and learning analytics, all of which support personalized instruction, assessment, and learner engagement (Zawacki-Richter et al., 2019). These technologies enable educators to design

learner-centred instructional experiences that improve students' creativity, innovation, collaboration, and problem-solving skills. Emeasoba and Akiebie (2025) reported that the application of Artificial Intelligence in teaching and learning significantly enhances instructional effectiveness, promotes active learning, and equips students with digital competencies needed for academic success and workplace performance. Similarly, Ayeni, Ogbusuo and Abudu (2025) maintained that integrating AI into Business Education provides opportunities for innovative pedagogy while also presenting implementation challenges that institutions must address through policy formulation, digital infrastructure, and staff development. The increasing utilization of these AI technologies has consequently transformed conventional instructional practices and underscored the need for educational curricula that deliberately integrate Artificial Intelligence into teaching, learning, and assessment.

Educational institutions are gradually shifting from conventional curricula towards AI-driven innovative curricula capable of preparing learners for technology-enabled workplaces. Curriculum is a planned programme of learning experiences comprising educational objectives, content, instructional strategies, learning activities, and assessment procedures designed to facilitate learners' holistic development (Federal Republic of Nigeria [FRN], 2021). In higher education, curriculum serves as the framework through which institutions develop the knowledge, practical skills, values, attitudes, and competencies expected of graduates (National Universities Commission [NUC], 2023). The implementation of the Core Curriculum and Minimum Academic Standards (CCMAS) in Nigerian universities further underscores the need for curriculum innovation that responds to technological advancement and labour market demands (NUC, 2023). Recent research conducted in South-East Nigeria showed that integration of machine learning has a high positive relationship with the implementation of the Core Curriculum and Minimum Academic Standards (CCMAS) in Business Education programmes in South-East Nigeria, particularly in developing practical competencies and entrepreneurship content (Onwubuya, Amobi, & Atah, 2025). An AI-driven innovative curriculum therefore refers to a curriculum that deliberately integrates Artificial Intelligence technologies into curriculum planning, instructional delivery, learning activities, assessment, feedback mechanisms, and learner support systems to improve educational outcomes. Such a curriculum promotes adaptive learning, virtual simulations, intelligent assessment, collaborative learning, personalized instruction, and experiential problem-solving. Rather than emphasizing rote memorization, AI-driven curricula encourage learners to think critically, innovate, analyse data, and develop entrepreneurial solutions to real-life business challenges. Since Business Education is one of the most skill-oriented programmes in tertiary institutions, the successful implementation of an AI-driven innovative curriculum is expected to improve the entrepreneurial competencies required by graduates in today's technology-driven economy.

Business Education is a vocational and professional education programme designed to prepare individuals with knowledge, practical skills, attitudes, and competencies required for employment, entrepreneurship, and lifelong learning. The programme equips learners with competencies in accounting, office technology and management, marketing, business communication, entrepreneurship, management, information technology, and digital business practices. According to Akpomi and Ikpesu (2021), Business Education has evolved beyond preparing office workers to producing innovative entrepreneurs, managers, educators, and business professionals capable of contributing to national economic development. In the same vein, Emeasoba (2018) emphasized that Business Education serves as a tool for capacity building and national development by equipping individuals with the appropriate knowledge, skills, values, attitudes, and competencies required for gainful employment, sustainable livelihood, and self-reliance. This implies that Business Education must continually respond to technological innovations and changing workplace demands through curriculum improvement capable of developing relevant entrepreneurial competencies among learners. The dynamic nature of business operations in the digital era requires Business Education curricula to embrace Artificial Intelligence as an instructional innovation capable of preparing graduates for emerging business opportunities and contemporary labour market expectations.

The successful implementation of the Business Education curriculum largely depends on the competence and professional effectiveness of Business Educators, who serve as the facilitators of teaching and learning in the programme. Business Educators are professionally trained teachers and lecturers who possess specialized knowledge and pedagogical competencies required for teaching Business Education courses in universities and colleges of education. They are responsible for planning instruction, implementing the curriculum, assessing learners, and equipping students with the knowledge, practical skills, attitudes, and entrepreneurial competencies required for employment and self-reliance. According to Owenvbiugie and Ojeaga (2022) Business Educators are professionally trained personnel who require sound pedagogical, technological, and professional competencies to effectively implement the Business Education curriculum and facilitate students' acquisition of

employability and entrepreneurial skills. Ementa and Nwankwo (2023) maintained that Business Educators require continuous improvement in pedagogical, digital, communication, and professional competencies to effectively implement the Business Education curriculum and respond to emerging instructional demands in contemporary educational environments. With the emergence of Artificial Intelligence, Business Educators are increasingly expected to integrate AI-driven instructional approaches into curriculum implementation in order to enhance students' learning experiences and facilitate the acquisition of entrepreneurial skills required in the digital economy.
